Annual twining glabrous herbs. *Leaves* cordate and angled or lobed, sometimes pinnately divided. *Flowers* axillary, in few-flowered cymes; bracts small. *Calyx* of 5 aristate sepals, subequal or the outer rather the smaller. *Corolla* salver-shaped, slightly irregular, the tube slender or slightly funnel-shaped, the limb spreading. *Stamens* 5, much exserted; filaments unequal. *Ovary* glabrous, 4-celled, with 4 ovules; style rather longer than the stamens; stigma 2-globose; pollen-grains spinulose. *Fruit* a 4-celled 1-valved capsule, the septa thin, persistent. *Seeds* 4, black, pubescent or glabrous.

Leaves ovate-cordate, acute, entire or lobed; calyx-lobes acuminate; corolla scarlet or orange; seeds pubescent.....1. *phoenicea*.
Leaves deeply pinnately dissected, the segments linear; calyx-lobes elliptic; corolla dark red or white; seeds nearly glabrous.....2. *pinnata*.

1. QUAMOCLIT PHOENICEA, Choisy. *Ipomaea coccinea*, C. B. Clarke; F. B. I. iv. 199.
All plains Districts, run wild, introduced from S. America. A weak slender twiner.
2. QUAMOCLIT PINNATA, Boj. *Ipomaea Quamoclit*, Linn.; F. B. I. iv. 199.
All plains Districts, cultivated and run wild, introduced from Tropical America.

7. *Calonyction*, Choisy.

Large herbaceous climbers; stems often warted. *Leaves* large, cordate, entire or angled. *Flowers* solitary or in few-flowered axillary cymes; bracts caducous. *Calyx* of 5 herbaceous sepals, subequal or the outer smaller, usually aristate. *Corolla* large, glabrous, regular, salver-shaped, white or rose-purple; tube narrow, long, cylindric; limb plicate. *Stamens* 5, exserted; pollen-grains spinulose. *Ovary* 2-celled, 4-ovuled; style filiform; stigma 2-globose. *Fruit* a 4-valved capsule. *Seeds* 4, dull, glabrous.

Corolla white, tube about 3 in. long; stamens exserted; seeds yellow; stout plant

1. *Bona-nox*.

Corolla rose-purple, tube 1—2 in. long; stamens included; seeds black; slender plant.....2. *muricatum*.

1. CALONYCTION BONA-NOX, Boj. *Ipomaea Bona-nox*, Linn.; F. B. I. iv. 197.

Most Districts, in hedges and ravines, wild and cultivated, but perhaps not truly indigenous, Moonflower.

A large climber with large cordate long apiculate leaves and large white flowers. The flowers, which are sweet-scented, open only at night and are succeeded by a capsule with 4 yellow seeds.

2. CALONYCTION MURICATUM, G. Don. *Ipomaea muricata*, Jacq.; F. B. I. iv. 197.

East Coast (Wight, Shuter), probably cultivated only; Rampa Hills of Godavari (Narayanswami).

A slender climber with cordate leaves. The purplish flowers, sometimes white streaked with pink, have thickened peduncles which are sometimes eaten.

8. *Lepistemon*, Bl.

Climbing herbs with villous stems. *Leaves* cordate, often lobed. *Flowers* in very dense axillary cymes; bracts narrow, deciduous. *Calyx* of 5 subequal sepals, acute or obtuse. *Corolla* urceolate, the limb shortly 5-lobed. *Stamens* 5, included; filaments at the base arising from the backs of 5 subequal concave scales arched over the ovary; anthers ovate, pollen grains spinulose. *Disk* large, cupular. *Ovary* 2-celled, ovules 2 in each cell; style very short; stigma capitate. *Fruit* a 4-valved capsule. *Seeds* glabrous.

LEPISTEMON LEIOCALYX, Stapf in Kew Bull. 1895, 113.

W. Ghâts, hills of Travancore near Koni, in secondary forest (Bourdillon); Wynaad, at Nadugani (Lawson).

A villous climber with ovate deeply cordate long acuminate leaves up to 5 in. long, 4 in. broad, and yellow flowers, the calyx-lobes with a few hairs at the base only.

9. *Porana*, Burm.

Large climbing shrubs. *Leaves* alternate, entire, petioled. *Flowers* white blue or purple, in racemes often much paniced; bracts persistent. *Calyx* of 5 small sepals when in flower, when in fruit the outer or all

much enlarged, spreading, prominently ribbed and nerved. *Corolla* campanulate or funnel-shaped, usually small, with a wide or narrow mouth; limb plicate, sub-entire or lobed. *Stamens* 5, usually included; filaments filiform; pollen grains not spinulose. *Ovary* 1- or 2-celled; ovules 2 or 4; style slender with a single 2-lobed or 2 capitate stigmas. *Fruit* a globose, oblong or obconic, membranous capsule, indehiscent or 2-valved. *Seed* 1, glabrous; cotyledons plicate.

PORANA MALABARICA, C. B. Clarke; F. B. I. iv. 223.

W. Gháts, from the Bababudan Hills of Mysore to the Nilgiris, Anamalais, Pulneys and hills of Travancore, up to 6,000 ft.

An extensively ramified climber with slender branches, ovate-cordate long-acuminate leaves and white flowers in lax racemes, the papery fruiting sepals elliptic, about .5 in. long, .25 in. broad, with 5—7 prominent ribs and prominent reticulation.

P. paniculata, Roxb., a large species common in N. India, is occasionally cultivated in gardens. It has dense masses of white flowers which hang in festoons from its supports. It is sometimes called the Bridal Creeper. *P. volubilis*, Burm., a Malay species, is also common in gardens on both coasts of the Peninsula.

10. *Neuropeltis*, Wall.

Large climbing shrubs, the shoots and inflorescence rufous-pubescent. *Leaves* alternate, oblong, petioled. *Flowers* in racemes, axillary or subpaniculate towards the ends of the branches; bract under the calyx inconspicuous in flower, much enlarged in fruit. *Calyx* of 5 subequal suborbicular sepals, scarcely enlarged in fruit. *Corolla* broadly campanulate, deeply 5-lobed, the lobes induplicate-valvate in bud. *Stamens* exserted or included; filaments filiform; anthers oblong. *Ovary* imperfectly 2-celled, 4-ovuled; styles 2, separate from the base, shortly linear; stigmas large, globose. *Fruit* a globose 4-valved 1-seeded capsule, sessile or shortly stalked in the middle of the flat enlarged bract. *Seed* globose, glabrous, albuminous, the cotyledons plicate.

NEUROPELTIS RACEMOSA, Wall.; F. B. I. iv. 225; Bedd. Ic. t. 291.

W. Gháts, Tambracheri Ghát in Malabar (Beddome).

A large climber with conspicuous peltate bracts in fruit, the leaves elliptic-oblong, up to 4.5 in. long, rufous-pubescent when young, afterwards nearly glabrous.

11. *Cressa*, Linn.

Small erect branching undershrubs, grey-pubescent. *Leaves* small, entire. *Flowers* small, sessile in the upper axils or in terminal spikes or clusters. *Calyx* of 5 subequal imbricate sepals. *Corolla* small, funnel-shaped, the tube short; lobes 5, ovate, imbricate in bud. *Stamens* 5, exserted; filaments filiform. *Ovary* 2-celled, ovules 2 in each cell; styles 2, distinct; stigmas capitate. *Fruit* a 2—4-valved capsule 1—4-seeded. *Seeds* glabrous; cotyledons linear, plicate.

CRESSA CRETICA, Linn.; F. B. I. iv. 225.

Dry plains Districts, on sandy plains, fallow fields and black cotton soil.

A small dwarf shrub up to 15 in. high, very grey, the corolla white, the small leaves elliptic, acute.

12. *Evolvulus*, Linn.

Small herbs or undershrubs, prostrate or erect, usually silky-pubescent. *Leaves* small, entire, often distichous. *Flowers* small, white blue or pink, solitary or in few-flowered pedunculate cymes. *Calyx* of 5 subequal sepals, not enlarging in fruit. *Corolla* rotate or funnel-shaped; limb plicate, subentire. *Stamens* 5, included or exerted; filaments filiform; anthers ovate or oblong. *Ovary* 2- rarely 1-celled; ovules 4; styles 2, distinct from the base, each cleft into 2 linear or subclavate branches, stigmatic on the inner face. *Fruit* a 4-2-valved capsule. *Seeds* 4 or 2, rarely solitary, glabrous; cotyledons twice folded.

EVOLVULUS ALSINOIDES, Linn.; F. B. I. iv. 220.

All plains Districts, on open ground, by roadsides and in other dry grassy places, common.

A perennial herb with a woody root-stock and many spreading prostrate wiry branches, the flowers light blue, the leaves variable, lanceolate oblong ovate or even suborbicular, the hairiness also variable, in one form (*E. hirsutus*, Lamk.) fulvous-hirsute.

13. *Breweria*, R. Br.

Herbs or undershrubs or shrubs, erect or climbing. *Leaves* entire. *Flowers* in axillary peduncled heads or terminal close panicles or 1-3 together; bracts small. *Calyx* of 5 equal or unequal sepals, scarcely enlarged in fruit. *Corolla* campanulate or funnel-shaped; limb 5-plaited or shortly and broadly lobed. *Stamens* included; filaments filiform, often dilated at base. *Ovary* 2-celled; ovules 4; styles filiform, free from the base or united to about the middle and then equally or unequally 2-lobed; stigmas capitate. *Capsule* globose or ovoid, 4-valved, membranous or coriaceous. *Seeds* normally 4, often less, glabrous or nearly so.

Climbing shrub; leaves large, up to about 4 in. long, ovate-cordate, fulvous-tomentose; flowers large, in pedunculate rather stout cymes; styles united to nearly half their length.....1. *cordata*.
Erect rigid undershrub; leaves very small, under .5 in. long, oblong, nearly glabrous; flowers small, 1-3 together on slender pedicels or nearly sessile; styles distinct from the base.....2. *evolvuloides*.

1. *BREWERIA CORDATA*, Blume; F. B. I. iv. 223. *B. Roxburghii*, Wt. Ic. t. 1370.

N. Circars, forests of Godavari; W. Gháts, Anamalais and hills of Travancore.

A large densely pubescent or tomentose climber with white flowers.

2. *BREWERIA EVOLVULOIDES*, Choisy; F. B. I. iv. 224. *Seddera evolvuloides*, Wt. Ic. t. 1369.

Carnatic, coast region of Tinnevely and S. Travancore.

An erect branching undershrub, with small white, usually solitary, axillary flowers.

14. *Hewittia*, W. & A.

A pubescent twining herb. *Leaves* ovate, cordate, entire angled or lobed. *Flowers* axillary, solitary or in few-flowered cymes; bracts 2, below the calyx, linear-lanceolate. *Calyx* of 5 unequal large sepals, the 3 outer large, ovate, decurrent, enlarged in fruit, the 2 inner smaller, lanceolate, unaltered. *Corolla* widely campanulate, yellow or white with a purple eye, silky pubescent without; limb plicate. *Stamens* 5, included; filaments linear, dilated at the base; pollen-grains smooth. *Ovary* with long white silky erect hairs, 1- or imperfectly 2-celled; ovules 4; style filiform; stigma of 2 ovate-oblong lobes. *Fruit* a globose, 4-valved, 1-celled, normally 3-seeded capsule. *Seeds* black, glabrous.

HEWITTIA BICOLOR, W. & A.: F. B. I. iv. 216; Wt. Ill. t. 168, Ic. t. 835.
N. Circars, Godavari: W. Coast, Malabar and Cochin.

A climber with angled or palmately lobed leaves up to about 4 in. long, a conspicuous calyx and very thin-walled capsule.

15. *Aniseia*, Choisy.

Twining herbs. *Leaves* ovate or oblong, often mucronulate. *Flowers* axillary, solitary or in few-flowered cymes. *Calyx* of 5 herbaceous sepals, the 3 outer large ovate, decurrent on the peduncle, enlarged in fruit, the 2 inner lanceolate, not enlarged in fruit. *Corolla* widely tubular campanulate or funnel-shaped; limb subentire. *Stamens* 5, included; filaments filiform. *Ovary* 2-celled, 4-ovuled; style filiform, stigma 2-globose. *Fruit* a 2-celled, 4-valved capsule. *Seeds* 4, black, smooth.

ANISEIA UNIFLORA, Choisy; Wt. Ic. t. 850. *Ipomaea uniflora*, Roem. & Sch.; F. B. I. iv. 201.

E. Coast, near Negapatam (Wight); W. Coast, in Travancore, margins of tanks and backwaters.

A prostrate herb, with many fibrous roots from the stems rooting in mud. *Leaves* long-petioled, elliptic-oblong, often emarginate and mucronate at apex, cuncate at base, up to 3 in. long, 1 in. broad; corolla white; calyx-lobes greenish-white.

16. *Convolvulus*, Linn.

Herbs or undershrubs, erect prostrate or twining, sometimes spinescent. *Leaves* entire, toothed or lobed. *Flowers* axillary, solitary or in few-flowered cymes; bracts usually narrow. *Calyx* of 5 usually subequal sepals. *Corolla* campanulate or funnel-shaped; limb plicate, nearly entire. *Stamens* included; filaments usually unequal. *Ovary* 2-celled; ovules 4; style filiform; stigmas 2, linear or oblong, distinct. *Fruit* a globose capsule, 2-celled, 4-valved or breaking irregularly. *Seeds* normally 4, glabrous, smooth or minutely tuberculate.

Erect undershrub, silky-villous with tawny hairs; flowers 1—3 in a lax raceme; sepals ovate, acuminate; corolla tubular, under .5 in. long, villous on parts exposed in bud, shortly 5-lobed; leaves linear, narrow, up to 2 in. long

1. *Rotlerianus*.

Twining herbs:—

Glabrous or slightly pubescent; peduncles 1—3-flowered; sepals obtuse, nearly glabrous; corolla broadly funnel-shaped, about 1 in. broad; leaves linear- or triangular-oblong, hastate at base, up to 2 in. long.....2. *arvensis*.

More or less rusty-pubescent; peduncles 1—5-flowered, sepals acuminate, pubescent; corolla small, tubular-funnel-shaped, about .5 in. broad; leaves triangular-hastate or cordate, deeply lobed and toothed, up to 3 in. long, 1.5 in. broad.

3. *flavus*.

1. *CONVOLVULUS ROTTLEMANUS*, Choisy; F. B. I. iv. 219.

Deccan, in Western Districts, Bellary to Coimbatore, in dry grass lands.

A perennial, up to about 2—3 ft. high.

2. *CONVOLVULUS ARVENSIS*, Linn.; F. B. I. iv. 219.

Deccan and hills of W. Gháts, a weed of cultivation. Bindweed.

A trailing or twining herb with pink or white flowers.

3. *CONVOLVULUS FLAVUS*, Willd.; F. B. I. iv. 219. *C. rufescens*, Choisy; Wt. Ic. t. 1365.

W. Gháts, Nilgiris, hills of Coimbatore, Pulneys, at 3,000—6,000 ft.

A climbing plant with yellowish flowers.

17. *Jacquemontia*, Choisy.

Climbing herbs or undershrubs, usually pubescent. *Leaves* elliptic or cordate, entire or rarely toothed or lobed. *Flowers* in axillary compound umbellate or capitate cymes, rarely solitary; bracts small. *Calyx* of 5 equal or unequal sepals. *Corolla* small, tubular or funnel-shaped; limb plicate, the vertical bands ending in 2 distinct nerves. *Stamens* 5, included. *Ovary* glabrous, 2-celled; ovules 4; style filiform; stigmatic lobes 2, linear or elliptic-oblong. *Fruit* a globose 8-valved rarely 4-valved, 2-celled capsule. *Seeds* normally 4, glabrous or minutely rugose, sometimes slightly winged marginally.

JACQUEMONTIA PANICULATA, Hallier f. *Convolvulus parviflorus*, Vahl; F. B. I. iv. 220.

Most plains Districts and up to 3,000 ft. in the hills.

A slender climber with pink or white flowers, ovate or cordate long-acuminate leaves up to about 2.5 in. in diam., and globose capsules with 4 seeds which are trigonous, slightly winged, and often minutely rugose.

J. caerulea, Choisy, is a pretty blue-flowered climber, common in gardens in the plains. It is an introduction from S. America.

18. *Merremia*, Dennst.

Herbs or shrubs, usually climbing, sometimes erect or prostrate. *Leaves* alternate, entire or lobed. *Flowers* axillary, solitary or in cymes and usually with long peduncles. *Calyx* of 5 subequal sepals, various in shape. *Corolla* campanulate or funnel-shaped, usually white or yellow, the vertical bands defined by violet lines; limb plicate, the margin slightly lobed. *Stamens* 5, unequal, included or exerted; filaments filiform, often villous at the base; anthers usually twisted; pollen with longitudinal folds, not spinulose. *Ovary* 2—4-celled; ovules 4; style filiform; stigma 2-globose. *Fruit* a 4-valved capsule; 1—4-celled, the style sometimes separating with a small operculum. *Seeds* 4, dull, glabrous or rarely puberulous or with long hairs, cotyledons crumpled.

Corolla more or less hairy externally; seeds hairy:—

Seeds with long recurved spreading hairs; sepals .3 in. long; corolla villous near the apex, 1—1.5 in. long; cymes subumbellate; capsules globose; leaves ovate- or oblong-lanceolate, acute or acuminate, rounded or cordate or hastate at base, up to 3 in. long, 2 in. broad, glabrous or pubescent.....1. *umbellata*. Seeds minutely velvety, the margins almost villous; sepals .5—7 in. long; corolla densely shaggy without, 1.5—2 in. long; cymes subracemose; capsules ovoid; leaves broadly ovate, acute, truncate or sub-cordate at base, up to 4 in. in diam., glabrous.....2. *crispatula*.

Corolla glabrous externally:—

Corolla large, more than 1 in. long:—

Leaves palmately 5-lobed, occasionally 7-lobed, the lobes triangular-acuminate, the margins often dentate, more or less long-hairy, up to 6 in. in diam.; flowers in pedunculate cymes of 1—7; sepals .5—7.5 in. long, elliptic, obtuse; corolla yellow, 1—2 in. long.....3. *vitifolia*. Leaves digitate, leaflets 5, lanceolate, acuminate at both ends, subsessile, up to 4 in. long, 1.5 in. broad, hirsute; flowers in long-peduncled laxly dichotomous cymes with yellow strigose hairs; sepals .7 in. long, elliptic-oblong, unequal, enlarged in fruit and very strigose; corolla white, 1 in. long.....4. *aegyptia*. Leaves pedately 7-lobed, up to 8 in. in diam., the leaflets lanceolate, deeply and prominently toothed, glabrous; flowers large, in long-peduncled few-flowered cymes; sepals elliptic-ovate, acute, glabrous, 1 in. long, enlarged in fruit; corolla 1.5 in. long; seeds large, glabrous.....5. *dissecta*.

Corolla small, under 1 in. long:—

Sepals long-ciliate, the inner 3 larger and deeply emarginate, nearly .25 in. long, the outer 2 apiculate, shorter; corolla campanulate, .25 in. long; stems creeping and rooting at the nodes; leaves reniform or ovate-cordate, toothed, usually broader than long but under 1 in. in diam.....6. *emarginata*. Sepals not ciliate, the inner ones not emarginate; stems not rooting at the nodes:—

Flowers 1—3 together on axillary peduncles; seeds glabrous:—

Peduncles short, under 1 in. long; sepals elliptic, mucronate, glabrous; corolla campanulate, about .4 in. long; leaves variable, linear-hastate or oblong-obovate, the former usually acute, the latter obtuse and 3-toothed, all auricled at the base and toothed, up to 1 in. long.....7. *tridentata*. Peduncles long, often 3 in. long; sepals lanceolate acuminate, glabrous; corolla campanulate, .6—8 in. long; leaves linear-oblong, hastate and toothed at base on the auricles, acute and mucronate at apex, up to 3 in. long, .5 in. broad8. *hastata*.

Flowers in rather dense axillary dichasiod cymes; sepals truncate and cucullate, obtuse or apiculate, spreading later and then enlarged and often wrinkled; corolla campanulate, .35 in. long; leaves ovate, sometimes 3-lobed, entire or coarsely toothed, acute and apiculate, deeply cordate at base, up to 3 in. long; seeds pubescent.....9. *chryseides*.

1. MERREMIA UMBELLATA, Hallier f. *Ipomaea cymosa*, Roem. & Sch.; F. B. I. iv. 211.

N. Circars, E. Ghát Hills to the Godavari, up to 4,000 ft.; Deccan, Kambakam Hill in Chingleput (leaves hastate); W. Gháts, in all Districts up to 4,000 ft.

A very variable climber as regards hairiness and shape of leaves, the flowers white or cream-coloured.

2. MERREMIA CRISPATULA, Prain. *Ipomaea petaloidea*, Choisy; F. B. I. iv. 212.

N. Circars, in Godavari (Gamble).

A large climber with large leaves and yellow flowers.

3. MERREMIA VITIFOLIA, Hallier f. *Ipomaea vitifolia*, Sweet; F. B. I. iv. 213.

All plains Districts and up to 3,000 ft. in the hills, common.

- A perennial twining plant with yellow flowers, globose capsules and glabrous seeds, the stems and leaves with deciduous hairs.
4. *MERREMIA AEGYPTIA*, Urban. *Ipomaea pentaphylla*, Jacq. ; F. B. I. iv. 202. *Batatas pentaphylla*, Wt. Ic. t. 834.
N. Circars, Deccan, Carnatic and W. Coast, occasional.
An annual twining plant with white flowers, ovoid papery capsules and glabrous seeds.
5. *MERREMIA DISSECTA*, Hallier f. *Ipomaea sinuata*, Ortega ; F. B. I. iv. 214.
Deccan, Carnatic and W. Coast, in various places, a tropical American species now run wild.
A twining plant with glabrous or hirsute stems and pretty flowers, white or pink with a purple throat.
6. *MERREMIA EMARGINATA*, Hallier f. *Ipomaea reniformis*, Choisy ; F. B. I. iv. 206.
N. Circars, Deccan and Carnatic, up to 3,000 ft. in the hills, in damp places and on black cotton soil.
A creeping and rooting herb with yellow flowers and globose small capsule.
7. *MERREMIA TRIDENTATA*, Hallier f. *Ipomaea tridentata*, Roth ; F. B. I. iv. 205.
All plains Districts.
A perennial herb with thick rootstock giving off many elongate prostrate slender branches, the flowers pale yellow, the capsules globose.
8. *MERREMIA HASTATA*, Hallier f. *Ipomaea angustifolia*, C. B. Clarke ; F. B. I. iv. 205, *not of* Jacq.
East and West Coast Districts, apparently scarce inland.
A biennial twining herb with thick rootstock giving off slender branches, the flowers creamy-yellow or white, the capsules depressed-globose.
9. *MERREMIA CHRYSEIDES*, Hallier f. *Ipomaea chryseides*, Ker-Gawl. ; F. B. I. iv. 206 ; Wt. Ic. t. 157.
All plains Districts and up to 3,000 ft. in the hills, common.
A branched climbing herb, often with rough stems and variable leaves, the flowers yellow.

19. *Operculina*, Silva Manso.

Large climbing herbs, stems petioles and peduncles often winged. *Leaves* large, entire or lobed, rarely peltate. *Flowers* large, axillary, solitary or in few-flowered cymes ; bracts oblong, deciduous. *Calyx* of 5 large ovate glabrous sepals, enlarging and thickening in fruit, at length splitting irregularly from the tip. *Corolla* funnel-shaped, rarely campanulate, the tube with 5 vertical smooth bands. *Stamens* 5 ; filaments filiform, broadening at base ; anthers large, at length twisted. *Ovary* glabrous, 2-celled, 4-ovuled ; style filiform ; stigma 2-globose. *Fruit* a capsule, the epicarp circumscissile above the middle, the cap

carrying away the style, sometimes irregularly splitting. *Seeds* large, often solitary, black, smooth; radicle large.

OPERCULINA TURPETHUM, Silva Manso, Enum. Subst. Braz. 16, 49.
Ipomaea Turpethum, R. Br.; F. B. I. iv. 212.

N. Circars, common in Godavari; Deccan and Carnatic to S. Travancore, occasional.

A stout climber with white flowers and leaves very variable in shape, ovate or oblong, entire or lobed, truncate or cordate at base. In fruit the enlarged sepals and thickened pedicels are conspicuous.

20. *Erycibe*, Roxb.

Scandent or rambling shrubs, rarely trees. *Leaves* alternate, entire, coriaceous. *Flowers* small, in axillary or terminal racemose or paniced cymes; bracts small, lanceolate. *Calyx* 5-lobed, the lobes orbicular, coriaceous, appressed to the base of the fruit. *Corolla* white or yellowish, subrotate, the tube villous without; lobes 5, deeply obcordate and so seemingly 10, contorted in bud, margins entire or crenate. *Stamens* 5, on the corolla-throat; filaments short; anthers ovate-lanceolate. *Ovary* 1-celled, with 4 erect ovules; style 0; stigma subglobose, 5- or 10-ridged. *Fruit* an ovoid or ellipsoid fleshy berry. *Seed* solitary, glabrous; albumen scanty, irregularly intruded between the folds of fleshy plicate cotyledons; radicle large, inferior.

Corolla yellowish; leaves elliptic-oblong or obovate, abruptly sharply acuminate, base attenuate, up to 5 in. long, 2 in. broad, the petiole 3—5 in. long; cymes axillary or in terminal panicles; berry 5 in. long, ellipsoid.....1. *paniculata*. Corolla white; leaves elliptic or obovate, sometimes almost orbicular, sometimes even lanceolate, abruptly and usually obtusely acuminate, base cuneate or rounded, up to 4 in. long, 2 in. broad, the petiole 25 in. long; cymes axillary and elongate or in terminal panicles; berry 5 in. long, ovoid.....2. *Wightiana*.

1. *ERYCIBE PANICULATA*, Roxb. Cor. Pl. t. 159; F. B. I. iv. 180; Wt. Ill. t. 180.

N. Circars, hills of Ganjam to Godavari, in forest ravines at low levels; occasional in Mysore and Malabar.

A large climbing shrub, the branches, inflorescence and young leaves with much rusty tomentum, the leaves dull above and not strongly reticulate beneath. Bark brown with large corky lenticels; wood soft, porous, of peculiar structure. Vern. *Ur. Katapergu*.

2. *ERYCIBE WIGHTIANA*, Grah.: Hallier f. Bull. Herb. Boiss. v. 737. *E. paniculata*, Roxb. var. *Wightiana*, C. B. Clarke; F. B. I. iv. 181. W. Coast and W. Ghâts, from S. Canara and Mysore southwards, up to about 4,000 ft.

A large climbing shrub, rusty-tomentose like the preceding, the flowers very fragrant, the leaves shining above, prominently reticulate beneath.

21. *Cuscuta*, Linn.

Leafless twining parasitic herbs, yellow or reddish. *Flowers* small, white or rose coloured, sessile or shortly pedicelled, solitary or in lateral

fascicles or short racemes; bracts small or 0. *Calyx* of 5 (or 4) subequal sepals, free or connate at the base. *Corolla* ovoid globose or campanulate, usually with a ring of fimbriate or lobed scales near the base or below the stamens, sometimes wanting; lobes 5 (or 4) short, imbricate. *Stamens* as many as the corolla lobes, inserted on or below the throat of the corolla; filaments linear; anthers oblong, exsert. *Ovary* more or less completely 2-celled; ovules 4; styles 1 or 2; stigmas 2. *Fruit* a globose or ovoid, dry or succulent capsule, circumscissile or irregularly breaking up; seeds 4—2. *Seeds* glabrous, albumen fleshy; embryo slender, spiral, the cotyledons obscure.

Style 1, short, stout, stigmas 2, ovoid, acute, diverging; branches stout, fleshy; scales at the base of the corolla; capsule succulent.....1. *reflexa*.
Styles 2, distinct, elongate, stigmas capitate; branches filiform; capsule dry, papery:—

Scales on the corolla-tube 0; sepals ovate-acuminate; corolla-lobes long-acuminate; seeds with few minute lines.....2. *hyalina*.
 Scales on the corolla-tube below the stamens fimbriate; sepals deltoid; corolla lobes shortly acuminate; seeds very minutely rugose.....3. *chinensis*.

1. *CUSCUTA REFLEXA*, Roxb. Cor. Pl. t. 104; F. B. I. iv. 225.

All plains Districts and up to 6,000 ft. in the hills of the Nilgiris and Pulneys.

A stout-branched, yellow, much intertwining plant, parasitic on many species of shrubs or trees and sometimes almost completely covering them.

2. *CUSCUTA HYALINA*, Roth. F. B. I. iv. 226; *C. arabica*, Wt. Ic. t. 1371. Deccan and Carnatic.

A very slender-stemmed parasite, recorded as growing on *Amaranthus*, *Polygonum*, *Tribulus*, *Trianthema*, etc.

3. *CUSCUTA CHINENSIS*, Lamk.; F. B. I. iv. 226; Wt. Ic. t. 1373. *C. hyalina*, Wt. Ic. t. 1372, not of Roth.

Carnatic.

A very slender-stemmed parasite, found on *Ipomaea Pescaprae* and other plants, but apparently scarce.

Family CVI. SOLANACEAE.

Herbs or shrubs erect or climbing or rarely small trees. *Leaves* alternate, often in unequal pairs, rarely clustered, never truly opposite, entire lobed or pinnatifid; stipules 0. *Flowers* regular, hermaphrodite or rarely dioecious, in terminal or lateral axillary or extra-axillary cymes or on solitary or clustered pedicels; bracts and bracteoles 0. *Calyx* inferior, limb usually 5-lobed or -toothed, usually persistent, often accrescent in fruit. *Corolla* funnel-shaped campanulate or rotate, often plicate; lobes 5, rarely 10 or the limb subentire. *Stamens* 5, on the corolla-tube; anthers ovate or oblong, dehiscing by apical pores or longitudinally. *Ovary* 2-celled or imperfectly 1- or 4-celled, rarely 3—5-celled; ovules many, on prominent peltate placentas; style linear; stigma capitate or very shortly lobed. *Fruit* a berry or a circumsciss or valvate capsule, usually 2-celled, many-seeded. *Seeds* compressed discoid or subreniform; testa usually crustaceous; albumen fleshy; embryo peripheric with linear cotyledons or rarely straight.

Fruit indehiscent, a berry:—

 Anthers connivent in a cone, longer than the filaments:—

 Anthers dehiscing by apical pores or short slits; leaves entire lobed or pinnatifid

1. *Solanum*.

 Anthers dehiscing introrsely by longitudinal slits, the tips empty; leaves pinnatisect..... *Lycopersicum*.

 Anthers not connivent in a cone, not longer than the filaments, dehiscing by lateral slits:—

 Calyx in fruit small, the flowers solitary or in pairs..... *Capsicum*.

 Calyx in fruit enlarged, overtopping the berry:—

 Pedicels solitary; corolla broadly campanulate, the lobes plicate in bud; leaves pubescent or glabrous:—

 Calyx in fruit inflated, shortly lobed.....2. *Physalis*.

 Calyx in fruit deeply cleft, much enlarged, 5-angled..... *Nicandra*.

 Pedicels clustered; corolla narrowly campanulate, the lobes valvate in bud; leaves and stems stellate-tomentose.....3. *Withania*.

Fruit capsular:—

 Flowers axillary, solitary; corolla-lobes plicate; embryo curved.....4. *Datura*.

 Flowers in terminal panicles; corolla-lobes induplicate-valvate; embryo straight..... *Nicotiana*.

1. *Solanum*, Linn.

Herbs or shrubs, sometimes subscandent, rarely small trees, unarmed or prickly. *Leaves* alternate or subopposite, entire lobed or pinnatifid. *Flowers* in dichotomous or racemose, lateral or terminal cymes. *Calyx* 5—10-lobed, rarely 4-lobed or subentire, accrescent or not in fruit. *Corolla* rotate, rarely campanulate: tube short; limb plicate, usually 5-lobed. *Stamens* 5, rarely 4 or 6, attached to the throat of the corolla; filaments short; anthers oblong, often narrowed upwards, connivent in a cone, opening by terminal pores or short slits. *Ovary* 2-, rarely 3—4-celled; style columnar; stigma small. *Fruit* a globose or elongated berry. *Seeds* very many, small, usually discoid; testa crustaceous, often pitted; albumen fleshy; embryo peripheric, the cotyledons linear, radicle terete.

Unarmed:—

 Roots mixed with tubers; stems herbaceous, faintly angular; leaves pinnatifid; flowers large, blue or white..... *tuberosum*.

 Roots not mixed with tubers:—

 Annual herb; flowers white, in axillary or lateral umbellate cymes; leaves thin, glabrous, ovate-lanceolate, acute or acuminate, entire or sinuate-toothed; berry globose, .25 in. in diam., black but sometimes red or yellow, shining; seeds discoid, minutely pitted.....1. *nigrum*.

 Perennial shrubs or undershrubs:—

 Densely stellately tomentose; flowers in lateral or axillary though often apparently terminal cymes:—

 Flower cymes corymbose, corolla white; calyx cup-shaped, .25 in. long, lobes short, deltoid; leaves velvety-tomentose, tawny beneath, elliptic-lanceolate, acuminate, up to 10 in. long, 5 in. broad, entire; berry yellow, globose, with few stellate hairs, .3 in. in diam.; seeds minutely papillose-scaly.....2. *verbascofolium*.

 Flower cymes racemose, corolla purple; calyx .2 in. long, deeply lobed, lobes lanceolate, acuminate; leaves rather sparsely stellate-tomentose, ovate, subacute, rhomboid or slightly cordate at base, up to 4 in. long, 2.5 in. broad, entire or sinuately lobed; berry red, glabrous, globose, shining, .3 in. in diam.; seeds scaly.....3. *pubescens*.

 Sparsely stellately pubescent or glabrous or pilose; corolla white:—

 Flowers in extra-axillary pedunculate racemose cymes; calyx-lobes linear-lanceolate, acuminate, stellate-pubescent, .15—2 in. long; corolla deeply lobed, the lobes oblong, .35 in. long, recurved; leaves elliptic-lanceolate,

acute at both ends, repand-sinuate, long-petioled, up to 5 in. long, 2 in. broad; seeds flat, 1.5—2 in. long, slightly scaly.....4. *ragum*.
Flowers axillary, solitary or in sessile umbels, seeds angular, reticulately pitted; leaves with usually unequal pairs:—

Calyx glabrous or nearly so, entire or with reflexed protuberances outside the margin or with 5 subulate teeth, saucer-shaped in fruit; branchlets usually quadrangular, often zigzag; leaves membranous, elliptic-lanceolate, long-acuminate, up to 9 in. long, 3 in. broad, slightly setose above or glabrous; berries yellow or red.....5. *larue*.
Calyx pilose with 5—10 short teeth, which are usually reflexed in fruit; branchlets usually round, sometimes zigzag; leaves membranous, elliptic-lanceolate, acuminate, up to 6 in. long, 2 in. broad, very pilose when young, sparsely so when old, often with few prominent acute teeth on the upper half; berries red.6. *denticulatum*.

Armed with prickles:—

Erect herbs, shrubs or small trees:—

Leaves entire, nor prickly, prickles only on the stem; leaves oblong, oblanceolate, abruptly acuminate, up to 12 in. long, 4 in. broad, glabrous above when mature, densely white-stellate-tomentose beneath; flowers in dense stellately-woolly lateral or subterminal corymbose cymes; calyx-lobes triangular; corolla pale blue-purple, small, .3 in. long; berry glabrous, .3 in. in diam.; seeds flat, minutely dotted.....7. *giganteum*.

Leaves sinuately or pinnatifidly lobed:

Lobes shallow, few:—

Corollas over 2 in. in diam., blue, the flowers in axillary umbels of 1—3 on very short peduncles, the long pedicels deflexed in fruit; stamens unequal (3 long, 2 short); leaves ovate, acute at apex, cordate at base, softly tawny pubescent, up to 4 in. long, 2 in. wide; prickles on stems, petioles and leaves few and small; berry globose, enclosed in accrescent calyx; seeds flat, reticulate.....8. *Wightii*.
Corollas under 2 in. in diam., the flowers in axillary or lateral racemes or corymbose cymes:—

Flowers white; calyx not enlarging in fruit; berry globose; style glabrous; seeds small, flat, nearly smooth:—

Berry large, 1—1.5 in. in diam., densely covered with yellowish needle-like hairs; cymes few-flowered; corolla .75 in. in diam., densely stellate-strigose without; leaves ovate or subrectangular in outline with large triangular lobes, densely fulvous stellately woolly, up to 18 in. long, 12 in. broad; prickles many, on stems, petioles and leaf-neres

9. *ferox*.

Berry small, .3 in. in diam., smooth; cymes corymbose, many-flowered; corolla .75 in. in diam., stellate-pubescent without; leaves ovate or subrectangular in outline, acute, often cordate at base, with few large triangular lobes, softly fulvous-tomentose, up to 9 in. long, 7 in. broad; prickles very few, on stem and petioles only.....10. *torvum*.

Flowers blue; berry smooth; corolla sparsely pubescent; style stellately villous; seeds minutely pitted:—

Racemes few-flowered; calyx-lobes lanceolate, enlarging in fruit, in wild forms often prickly; leaves ovate, few-sinuate, unequal and acute or subcordate at base, up to 6 in. long, 4 in. broad in cultivated, 4 in. long, 2 in. broad in wild forms, softly stellately-pubescent; prickles few in cultivated, many in wild form, on stem, leaves and calyx.....11. *Melongena*.

Racemes many-flowered; calyx-lobes triangular, often prickly, not enlarging in fruit; leaves variable, normally few-sinuate lobed but sometimes deeply lobed or pinnatifid, stellately woolly beneath, usually less so above, up to 6 in. long, 4 in. broad; prickles many, stout, curved, on stem and leaves; berry globose, .3 in. in diam.

12. *indicum*.

Lobes deep, many:—

Calyx-tube inflated in fruit, deeply cup-shaped, ultimately reflexed; flowers racemose, white or pale blue; leaves oblong-lanceolate in outline, deeply pinnatifid or twice pinnatifid, up to 8 in. long, 4 in. broad, softly

stellate-pubescent; prickles very numerous, yellowish, straight and sharp, on stem, leaves and calyx; berry globose, 1 in. in diam., yellow, smooth; seeds large, pitted.....13. *sisymbriifolium*. Calyx-lobes not or only slightly inflated in fruit, ovate or lanceolate, abruptly acute; flowers in few-flowered cymes, blue-purple; leaves ovate or elliptic, acute, pinnatifid half-way down, sometimes only sinuate, up to 4 in. long, 2 in. broad, sparsely stellate-pubescent to nearly glabrous; prickles very numerous, yellow, straight, often .5 in. long, on stems, leaves and calyx; berry globose, yellow or white with green blotches, .5—75 in. in diam.; seeds small, smooth.....14. *xanthocarpum*.

Climbing undershrubs, the stems with very numerous short strong recurved prickles; leaves ovate in outline, sinuate or 3—5-lobed, obtuse, truncate or subcordate at base, up to 3 in. long, 1.5 in. broad, nearly glabrous; cymes lateral with short peduncles and long pedicels, about 2—8-flowered; calyx-lobes ovate, acuminate, prickly; corolla large, white to purple; berry globose, scarlet, smooth, .3 in. in diam.; seeds flat, slightly pitted.....15. *trilobatum*.

1. *SOLANUM NIGRUM*, Linn.; F. B. I. iv. 229. *S. rubrum*, Roxb.; Wt. Ic. t. 344.
All Districts and at all elevations, a cosmopolitan weed of roadsides and cultivated land.
An erect annual herb.
2. *SOLANUM VERBASCIFOLIUM*, Linn.; F. B. I. iv. 230; Wt. Ic. t. 1398.
All Forest Districts, usually in ravines or shady places under big trees.
A large shrub or small tree up to 20 ft. high. Bark grey, smooth; wood soft, light yellow.
3. *SOLANUM PUBESCENS*, Willd.; F. B. I. iv. 230; Wt. Ic. t. 1402.
Deccan and Carnatic to the E. slopes of the W. Gháts in open scrub forest on arid soil, up to 3,000 ft.
A usually low, but occasionally large, shrub, up to 6 ft. high (15 ft. or more, *Wight*); the flowers in loose racemes.
4. *SOLANUM VAGUM*, Heyne; F. B. I. iv. 230.
W. Gháts, hills of Tinnevely, probably at 4,000—6,000 ft.
A glabrescent shrub with white flowers.
5. *SOLANUM LAEVE*, Dunal; F. B. I. iv. 231. *S. bigeminatum*, Nees; F. B. I. iv. 231.
N. Circars, Madgol Hills of Vizagapatam at 3,000 ft. (A. W. Lushington); W. Gháts, in all Districts in evergreen forests, up to 6,000 ft.
A straggling undershrub with variable calyx-teeth, always, however, saucer-shaped in fruit.
6. *SOLANUM DENTICULATUM*, Blume; F. B. I. iv. 231; Wt. Ic. t. 1397.
Hills of the Carnatic; W. Gháts, in Nilgiris and Pulneys up to 7,000 ft., chiefly in moist places.
A shrub reaching 6 ft. in height but weak and scarcely woody. The leaves have sometimes prominent angular lobes (var. *Gouakai*, C. B. Clarke).
7. *SOLANUM GIGANTEUM*, Jacq.; F. B. I. iv. 233; Wt. Ic. t. 893.
N. Circars, hills of Vizagapatam to 4,000 ft. (A. W. Lushington); Deccan, in hilly country of Mysore and Coimbatore, to 5,000 ft.; W. Gháts, in almost all Districts, above 4,000 ft.
A large shrub or small tree, reaching a height of even 25 ft., easily known by the dense white stellate tomentum covering the

- whole plant except the upper surface of the leaves, the stem prickles conical, quite small. The berries are red.
8. *SOLANUM WIGHTII*, Nces; F. B. I. iv. 234; Wt. Ic. t. 841.
W. Gháts, E. side of Nilgiris at 4,000–6,000 ft.; hills of Coimbatore at 4,500 ft. (Fischer).
An erect herbaceous plant with handsome large blue flowers with angular lobes, the calyx-lobes lanceolate.
 9. *SOLANUM FEROX*, Linn.; F. B. I. iv. 233; Wt. Ic. t. 1399 (var. *majus*).
W. Gháts, in most Districts, up to 4,000 ft., but not very common.
A stout straggling herbaceous plant up to 10 ft. high with very woolly stems and leaves and large orange hispid fruit. The leaves are often very large.
 10. *SOLANUM TORVUM*, Swartz; F. B. I. iv. 234; Wt. Ic. t. 345.
Almost all Districts, in the hills up to about 3,000 ft., in waste places and by roadsides, common.
A shrub reaching about 12 ft. in height, very variable in shape and lobes of leaf according to climate and soil. Berries yellow, shining.
 11. *SOLANUM MELONGENA*, Linn.; F. B. I. iv. 235; Wt. Ill. t. 166.
All Districts, usually in cultivation. The Egg-plant. Vern. *Hind.* Baigun, brinjal.
A well-known vegetable, the fruits often very large and purple.
Var. *insanum*, Prain. *Solanum insanum*, Willd.
All Districts, in waste places and by roadsides, a wild form.
A very prickly herb with smaller and more grey-pubescent stems and leaves and a globose yellow fruit under 1 in. in diam.
 12. *SOLANUM INDICUM*, Linn.; F. B. I. iv. 234; Wt. Ic. t. 346.
All Districts in the plains and the lower hills, chiefly by roadsides, on rubbish heaps and in similar places.
A branching very prickly undershrub reaching 5 ft. in height, very variable in pubescence, size and shape of leaf and length of raceme. The berries are dark yellow. Vern. *Hind.* Barhanta.
Var. *multiflora*, C. B. Clarke. *S. ferox* var. *minus*, Wt. Ic. t. 1400.
A large form with very stellate-tomentose leaves and long racemes with many flowers recurved in fruit. The berries are yellow, rather small and shining and long.
W. Gháts, Nilgiri and Pulney Hills, about 6,000–7,000 ft.
 13. *SOLANUM SISYMBRIIFOLIUM*, Lam.
W. Gháts, Nilgiris and Pulneys, at 5,000–7,000 ft.; hills of Coimbatore. A S. American plant now run wild in many places in India.
A viscid undershrub, the large flowers often 1–1·5 in. in diam. in lateral racemes.
 14. *SOLANUM XANTHOCARPUM*, Schrad. & Wendl.; F. B. I. iv. 236. *S. Jacquinii*, Willd.; Wt. Ic. t. 1401.
All Districts in the plains and low hills, a weed of roadsides and waste land.
A diffuse perennial conspicuous herb, the flowers often 75 in. in diam.

15. *SOLANUM TRILOBATUM*, Linn.; F. B. I. iv. 236; Wt. Ic. t. 854.
N. Circars, Deccan and Carnatic, especially near the coast.
A very prickly trailing or climbing undershrub.

SOLANUM TUBEROSUM, Linn., is the Potato, Vern. *Hind.* Alu, introduced from America and largely cultivated in the hills. Besides it and *S. Melongena*, the Brinjal, several species of the genus are cultivated in gardens and some are found run wild. *S. robustum*, Wendl., a large species resembling *S. ferox* but with the stems winged by the decurrent leaf-bases, is found about Coonoor in the Nilgiris. It is a S. American species and has leaves and stems covered with dense golden tomentum. *S. aculeatissimum*, Jacq., is a very prickly Malay species found apparently run wild about Quilon in Travancore. *S. Wrightii*, Benth., is a Mexican shrub with large handsome purple flowers frequently found in gardens.

2. *Physalis*, Linn.

Annual or perennial herbs. *Leaves* alternate, entire sinuate or shortly lobed. *Flowers* solitary, axillary, pedicelled. *Calyx* campanulate, 5-fid, in fruit accrescent, then inflated, membranous, loosely enclosing the berry; teeth small, connivent. *Corolla* campanulate, lurid yellow, often with purple spots near the base. *Stamens* 5, attached near the base of the corolla; anthers oblong, shorter than the filaments, dehiscing longitudinally. *Ovary* 2-celled; ovules numerous; style linear; stigma obscurely 2-lobed. *Fruit* a globose berry, enveloped in the bladder-like calyx. *Seeds* many or few, compressed, smooth or rugose; embryo peripheric.

Corolla .5 in. across or more, with 5 purple spots near the base within; calyx more than 1 in. long, ovoid-conical; leaves ovate, sinuate or angular, usually entire, pubescent, up to 3 in. long, 2 in. broad; berry orange-yellow.....1. *peruviana*.
Corolla under .25 in. across, sometimes spotted; calyx under 1 in. long, ovoid or subglobose; leaves ovate, acute, sinuate or toothed, pubescent or nearly glabrous, up to 2.5 in. long, 1.5 in. broad; berry small, yellow.....2. *minima*.

1. *PHYSALIS PERUVIANA*, Linn.; F. B. I. iv. 238.
Hills of the Deccan and Carnatic, Bababudans, Shevaroyes, Kollimalais and Sirumalais; W. Gháts, Nilgiris and Pulneys, usually at 5,000—7,000 ft., in undergrowth of forests, especially plantations; introduced from America and run wild, often cultivated. Cape Gooseberry. Vern. *Hind.* Tipari.
2. *PHYSALIS MINIMA*, Linn.; F. B. I. iv. 238.
All Districts, a common weed of undergrowth, roadsides and waste places.
A herbaceous annual. The glabrous form with angular fruiting calyx is var. *indica*, C. B. Clarke. *P. angulata*, Linn., seems to differ very little from it. It is only a weed of cultivated ground.

3. *Withania*, Pauq.

Unarmed shrubs, often hoary-tomentose. *Leaves* alternate, entire. *Flowers* axillary, sometimes polygamo-dioecious, fascicled or solitary, sessile or shortly pedicelled. *Calyx* campanulate, 5—6-toothed, accrescent and subglobose in fruit. *Corolla* campanulate; lobes 3—6, short,

valvate in bud. *Stamens* 5, attached near the base of the corolla; anthers dehiscing longitudinally. *Ovary* 2-celled, ovules many; style linear; stigma shortly bifid. *Fruit* a globose berry, enclosed in the enlarged calyx. *Seeds* very many, discoid, testa pitted; embryo peripheric.

WITHANIA SOMNIFERA, Dun.; F. B. I. iv. 239; Wt. Ic. t. 853.

Deccan, Ceded Districts Mysore and Coimbatore, in dry localities; occasional in E. Carnatic.

An erect branching undershrub reaching 5 ft. in height, all parts minutely stellate-tomentose. Leaves broadly ovate, up to 4 in. long and little less in breadth; flowers in axillary fascicles. The seeds are sometimes used as rennet. Vern. *Hind.* Asgánd; *Tel.* Pennerugadda; *Tam.* Amkulang.

4. *Datura*, Linn.

Coarse rank shrubby herbs. *Leaves* large, entire, sinuate or deeply toothed. *Flowers* large, purple or white, solitary, erect or pendulous. *Calyx* long-tubular, herbaceous, 5-lobed, in fruit the upper part deciduous leaving the circumsciss base. *Corolla* long-tubular, funnel-shaped, the mouth wide; limb plaited, entirely or shortly 5- or 10-lobed. *Stamens* 5, attached near the base of the tube; filaments filiform; anthers included, linear, longitudinally dehiscing. *Ovary* 2- or spuriously 4-celled; style filiform; stigma 2-lobed. *Fruit* an ellipsoid spinescent 4-celled capsule, 4-valved or irregularly bursting near the apex. *Seeds* very many, compressed, rugose; embryo peripheric.

Capsule opening irregularly near the apex:—

Capsule covered with short spines or blunt tubercles; flowers white or white with purple outside; leaves ovate, acute, entire or coarsely toothed, with acute lobes, base very unequal-sided, up to 8 in. long, nearly glabrous.....1. *fastuosa*. Capsule covered with long slender spines; flowers white tinged with green; the fruiting calyx very large; leaves ovate-lanceolate, acute, base very unequal, up to about 4 in. long or more, minutely grey-tomentose.....*Metel*. Capsule deeply 4-valved, erect; flowers white; leaves ovate, many-toothed or sinuate, up to about 7 in. long.....*Stramonium*.

DATURA FASTUOSA, Linn.; F. B. I. iv. 242; Wt. Ic. t. 1396.

Almost all Districts, in gardens and on waste land and roadsides, apparently wild.

A large annual somewhat succulent herb with often zigzag stems, soft leaves and subglobose capsules seated on the short persistent saucer-like calyx base. Flowers usually white but purple outside and frequently double. Vern. *Hind.* Dhatura.

Var. *alba*, C. B. Clarke, similar but with the flowers white, not often double, the capsule spines sharper. Same distribution.

D. Metel, Linn.; F. B. I. iv. 243, said to be the most poisonous species, is found about Madras and is at once recognized by the tomentum, the large persistent calyx and the sharp capsule-spines. *D. Stramonium*, Linn.; F. B. I. iv. 242; Wt. Ic. t. 852, is the Thorn Apple, occasionally found in the Hill country. The large shrubby species with beautiful white flowers so commonly found in gardens in the Hills is *D. arborea*, Linn., and the one with orange-scarlet flowers is *D. sanguinea*, Ruiz. & Pav. They were both introduced from S. America.

Lycopersicum esculentum, Mill., is the Tomato, commonly cultivated and occasionally found run wild.

Capsicum annuum, Linn., and *Capsicum frutescens*, Linn., are the plants which are cultivated so extensively as Chillies. They both were originally introduced from S. America and the latter species is now frequently found run wild. For the most usual varieties see Prain, 'Bengal Plants,' p. 747 (old edn.), and Cooke, 'Fl. Bomb.,' ii. 276 (old edn.).

Nicandra physaloides, Gaertn., is a S. American plant, sometimes cultivated but often found run wild or as a weed in gardens in the Hills. It has pretty blue flowers and a dry berry enclosed in the much enlarged heart-shaped calyx-lobes.

Nicotiana Tabacum, Linn., is the Tobacco plant, cultivated in most Districts but especially in Godavari, Kistna, Guntur and Coimbatore. The Family also contains several genera, such as *Browallia*, *Brunfelsia*, *Cestrum* and *Petunia*, affording well-known garden ornamental plants. *Cyphomandra betacea*, Sendt., is the Tree Tomato, a S. American shrub cultivated for its fruit, excellent for stewing and tarts.

Family CVII. SCROPHULARIACEAE.

Herbs or shrubs, rarely trees, often semi-parasitic. *Leaves* all or the lower only opposite, rarely all alternate or whorled; stipules 0. *Flowers* hermaphrodite, usually irregular; inflorescence centripetal or composite. *Calyx* inferior, usually persistent; lobes 5, rarely 4. *Corolla* hypogynous, more or less 2-lipped or sometimes personate, 4—5-lobed. *Stamens* usually 4, didynamous or subequal, with or without a staminode, rarely 5 or only 2; anthers various, 1- or 2-celled, the cells distinct or more or less confluent, sometimes imperfect. *Disk* annular cupular or glandular. *Ovary* 2-celled; ovules many, rarely few, in each cell; style simple; stigma capitate dilated, 2-lobed or 2-lamellate. *Fruit* a capsule, rarely a berry; placentas on a free central axis or attached to the margins of the valves. *Seeds* small, various in shape; albumen fleshy, rarely 0; embryo straight or curved.

Leaves all alternate; corolla subrotate, the tube short; large erect herbs:—

Stamens 5.....1. *Verbascum*.

Stamens 4.....2. *Celsia*.

Leaves, at least the lower, if not all, opposite; corolla-tube usually elongate:—

Corolla spurred in front at the base; capsule opening by pores.....3. *Linaria*.

Corolla not spurred in front at the base; capsule opening by valves:—

Corolla-lobes subequal; anthers 1-celled; capsule septicidal.....4. *Sutera*.

Corolla distinctly bilabiate:—

Stamens 4, included within the corolla-tube:—

Corolla-throat 2-lobed on the palate; anther-cells divaricate:—

Calyx 5-angled and 5-toothed; anther-cells confluent at the apex; leaves all opposite.....5. *Mimulus*.

Calyx widely campanulate with 5 leafy lobes; anther-cells distinct; lower leaves opposite, upper alternate.....6. *Mazus*.

Corolla-throat not lobed on the palate; anther-cells distinct:—

Calyx widely campanulate; corolla-palate with two folds; anther-cells stipitate; capsule loculicidal.....7. *Lindenbergia*.

Calyx 5-partite; corolla-palate without folds; capsule both loculicidal and septicidal:—

Anther-cells stipitate:—

Stamens 4, 2 or all with one anther-cell imperfect; uppermost lobe of calyx much the largest.....8. *Adenosma*.

- Stamens with all cells perfect:—
 Placentas separating in fruit or if joined in a column not winged;
 seeds terete.....9. *Stemodia*.
 Placentas joined in a column winged by the remains of the
 septa; seeds angular.....10. *Limnophila*.
 Anther-cells contiguous, not stipitate; three lobes of the calyx larger
 than the other two, which are very narrow.....11. *Moniera*.
 Stamens 2 perfect, the anterior pair reduced to staminodes, all inserted in
 the corolla-tube.....12. *Dopatrium*.
 Stamens, if 4 the anterior (lower) pair, if 2 the staminodes, attached to
 the corolla-throat, the posterior or only perfect pair inserted within the
 corolla-tube; capsule septicidal:—
 Stamens 4, all perfect:—
 Calyx-lobes broad; stout erect herbs.....13. *Artanema*.
 Calyx-lobes narrow; slender herbs, erect or trailing:—
 Calyx winged or keeled, mouth oblique.....14. *Torenia*.
 Calyx-lobes equal, not winged or keeled.....15. *Vandellia*.
 Two upper stamens only perfect, the lower pair reduced to staminodes
 16. *Ilysanthes*.
 Corolla small, almost or quite uniform with subequal lobes; lower stamens
 perfect, upper 0 or reduced to staminodes:—
 Calyx tubular, 5-lobed; leaves opposite:—
 Anther-cells confluent; leaves narrow.....17. *Microcarpaea*.
 Anthers 1-celled; leaves broad, fleshy.....18. *Peplidium*.
 Calyx campanulate, 3—4-lobed; anther cells confluent at the tips; minute
 herbs with fascicled leaves.....19. *Glossostigma*.
 Corolla-lobes flat, spreading:—
 Corolla-lobes subequal, the throat bearded; stamens 4; capsule globose,
 septicidal.....20. *Scoparia*.
 Corolla-lobes subequal, the 2 lateral the wider; stamens 2; capsule com-
 pressed, usually loculicidal.....21. *Veronica*.
 Corolla-tube elongate, the lobes spreading; stamens 4, didynamous, the anther-
 cells distinct, equal or one imperfect or wanting; semi-parasitic herbs:—
 Calyx tubular, ribbed, 5-lobed:—
 Corolla-tube straight or nearly so, the lobes subequal.....22. *Buchnera*.
 Corolla-tube abruptly incurved near the middle, the 2 upper lobes the
 smaller.....23. *Striga*.
 Corolla-tube broad; calyx campanulate, oblique; anthers 2-celled
 24. *Alectra*.
 Corolla-tube straight or curved; anthers 1-celled.....25. *Rhamphicarpa*.
 Corolla-tube straight; anthers 2-celled:—
 Anthers with one cell imperfect.....26. *Sopubia*.
 Anthers 2-celled, the cells subequal, both perfect.....27. *Micrargeria*.
 Calyx spathaceous, split down the front:—
 Corolla-lobes subequal, broad, spreading; anthers 2-celled, one cell often
 imperfect.....28. *Centranthera*.
 Corolla strongly 2-lipped, the upper lip erect, hooded; anther-cells both
 perfect.....29. *Pedicularis*.

1. *Verbascum*, Linn.

Erect, tomentose or woolly, usually tall and biennial or perennial herbs. *Leaves* alternate, entire, sinuate or pinnatifid. *Flowers* usually yellow, rarely purple red or white, in simple or paniced terminal bracteate racemes or spikes. *Calyx* 5-lobed, usually deeply, the lobes imbricate. *Corolla* rotate; lobes 5, the two posterior ones outside in bud. *Stamens* 5; filaments all or the 3 upper bearded; anthers transverse or oblique, the cells confluent. *Ovary* rounded; style dilated towards the stigmatose apex. *Fruit* a globose oblong or ovoid septicidal capsule, the valves separating from the axis. *Seeds* many, rugose; embryo straight.

Viscid pubescent herbs; leaves oblong-lanceolate or oblanceolate, the upper coarsely dentate, cordate and amplexicaul at base, the lower almost pinnatifid and auricled; flowers bright yellow, purple at base, the filaments with purple woolly hairs.1. *virgatum*.
 Stellately grey-tomentose herbs; leaves lanceolate-acuminate, decurrent along the stem at base, entire or slightly crenate; flowers yellow in a densely woolly spike; 3 of the filaments with white hairs, 2 longer glabrous.....2. *Thapsus*.

1. *VERBASCUM VIRGATUM*, With.; F. B. I. iv. 250; Wt. Ic. t. 1404—5.
 W. Ghâts, Nilgiris and Pulneys, at high levels, introduced from Europe and run wild.
 A tall erect herb, reaching sometimes 6 ft. in height.
2. *VERBASCUM THAPSUS*, Linn.; F. B. I. iv. 250.
 W. Ghâts, Nilgiri Hills, about Ootacamund, introduced from Europe or N. India and now rapidly spreading (Bourne).
 A tall handsome and conspicuous woolly herb, reaching to about 3 ft. in height.

2. *Celsia*, Linn.

Annual or biennial erect herbs. *Leaves* alternate, crenate sinuate dentate or pinnatifid. *Flowers* in terminal bracteate spikes or racemes, rarely branched. *Calyx* deeply 5-lobed. *Corolla* rotate, tube almost none; lobes 5, broad, somewhat unequal, the upper outermost in bud. *Stamens* 4, didynamous or subequal; filaments bearded; anthers transverse or oblique, with confluent tips. *Ovary* ovoid or globose, ovules many; style entire; stigma compressed, terminal. *Fruit* a globose or ovoid septicidal capsule; valves 2, each usually bifid. *Seeds* many, very small, transversely rugose.

CELSIA COROMANDELIANA, Vahl; F. B. I. 251; Wt. Ic. t. 1406.

All plains Districts, chiefly as a weed on cultivated lands.

An erect, grey-pubescent annual with yellow flowers in a branching racemose inflorescence, the leaves lyrate-pinnatifid at base, gradually smaller up the stem.

3. *Linaria*, Juss.

Herbs. *Leaves* usually opposite or whorled below, alternate above. *Flowers* axillary, solitary or passing into terminal racemes or spikes with the floral leaves reduced to bracts; pedicels slender. *Calyx* 5-partite; lobes imbricate. *Corolla* 2-lipped and personate, the upper lip erect, 2-lobed, the lower spreading, 3-lobed, spurred at the base. *Stamens* 4, didynamous, ascending; anthers with distinct parallel cells. *Ovary* ovoid or globose, many-ovuled; style filiform; stigma minute. *Fruit* an ovoid or globose 2-celled capsule, each cell or the anterior only opening by an apical pore. *Seeds* many, angled rugose and wingless or discoid and winged.

LINARIA RAMOSISSIMA, Wall. Pl. As. Rar. t. 153; F. B. I. iv. 251; Wt. Ill. t. 165.

Deccan, Bellary District; Bababudan Hills of Mysore; E. slopes of Anamalais, on walls and rocks and in stony places.

A glabrous or slightly pubescent perennial prostrate herb with very slender branches, variable but usually triangular-hastate lobed leaves and small yellow flowers.

4. *Sutera*, Roth.

Herbs or small shrubs, often viscid. *Leaves* opposite or the upper alternate, subentire pinnatifid or toothed. *Flowers* axillary or in simple terminal racemes; bracts small, leafy. *Calyx* deeply 5-lobed, lobes narrow. *Corolla* tubular; tube slender, cylindric, straight or curved; lobes 5, the two upper outside in bud and rather smaller than the 3 lower. *Stamens* 4, didynamous, included; anthers confluent, 1-celled. *Ovary* with many ovules in each cell; style filiform; stigma slightly 2-lobed. *Fruit* an ovoid-oblong septicidal capsule, the valves bifid. *Seeds* many, minute, rugose.

SUTERA GLANDULOSA, Roth; F. B. I. iv. 258; Wt. Ic. t. 856.

N. Circars, Deccan and Carnatic, west to Coimbatore, south to near Madras, not common.

An annual erect branching herb with much cut pinnatifid leaves, and very small nearly white flowers.

5. *Mimulus*, Linn.

Erect prostrate or creeping herbs. *Leaves* opposite. *Flowers* solitary, axillary. *Calyx* tubular, 5-angled, lobes 5, short. *Corolla* 2-lipped; upper lip 2-lobed, erect or reflexed; lower 3-lobed, spreading, the throat with usually a swollen 2-lobed palate. *Stamens* 4, didynamous; anther-cells divergent, subconfluent. *Ovary* ovoid; style slender; stigma 2-lamellate. *Fruit* a compressed loculicidal capsule, the valves separating from the placentiferous dissepiment. *Seeds* many, minute, oblong.

MIMULUS ORBICULARIS, Benth.; F. B. I. iv. 259.

N. Circars, Chilka Lake, Ganjam (D. Hooper).

A prostrate creeping and rooting herb with fleshy orbicular nerveless leaves about 1 in. in diam. on thick petioles, the long-pedunculate flowers with campanulate calyx and corollas about 4 in. long apparently pale blue, the seeds minutely punctulate in lines.

6. *Mazus*, Lour.

Small herbs, often with runners. *Leaves* opposite or rosulate below, above opposite or alternate. *Flowers* in terminal subsecund racemes; bracts minute, bracteoles 0. *Calyx* campanulate, 5-lobed, the lobes leafy. *Corolla* 2-lipped, the tube short; upper lip 2-lobed, erect; lower much larger, spreading, 3-lobed; throat with a two-lobed palate. *Stamens* 4, didynamous; anther-cells divaricate. *Ovary* with many ovules; style short; stigma 2-lamellate. *Fruit* a small globose or compressed loculicidal capsule, the 2 valves entire. *Seeds* many, very minute, rugose.

MAZUS RUGOSUS, Lour.; F. B. I. iv. 259.

N. Circars, in Ganjam (Barber); W. Ghâts, in Coorg (Bourne) and Nilgiris (Lawson, Fischer) up to 7,000 ft.

A small herb without runners, the radical leaves in rosette, obovate-spathulate, crenate, the scapes usually leafless, the flowers pale blue or white streaked with blue, the leafy calyx-lobes conspicuous.

7. *Lindenbergia*, Lehm.

Annual or perennial herbs; branches erect or straggling. *Leaves* opposite or the upper alternate toothed. *Flowers* usually yellow, axillary or passing into terminal spikes or racemes; bracts leafy, bracteoles 0. *Calyx* widely campanulate, 5-lobed. *Corolla* 2-lipped; tube cylindric; upper lip outermost, short, 2-lobed; lower larger, 3-lobed, the palate with 2 folds. *Stamens* 4, didynamous, included; anthers with separate stalked cells. *Ovary* with many ovules; style filiform, clavate upwards; stigma capitate. *Fruit* a loculicidal capsule, the 2 valves separating from the placentiferous dissepiment. *Seeds* very many, minute.

Perennial herb; leaves rather thick, ovate, cuneate at base, coarsely serrate except at base, up to 2.5 in. long, 1.5 in. broad, or sometimes larger; softly pubescent; flowers large, the corolla about 1 in. long; calyx campanulate, .3 in. long; capsule acute at tip and exsert.....1. *grandiflora*.
Annual slender herb; leaves thin, ovate, cuneate at base, coarsely serrate except at base, up to 1.5 in. long, .75 in. broad, sometimes more, pubescent or glabrous; flowers small, the corolla about .5 in. long; calyx campanulate, .15 in. long; capsule acute, scarcely exsert.....2. *urticaefolia*.

1. *LINDENBERGIA GRANDIFLORA*, Benth.; F. B. I. iv. 261; Bot. Mag. t. 7738.

N. Circars, Mahendragiri Hill in Ganjam, at 4,000 ft. (Gamble, Fischer), on banks in shady woods.

A slender glandular hairy fairly stout plant with bright yellow flowers.

2. *LINDENBERGIA URTICAEOFOLIA*, Link and Otto; F. B. I. iv. 262.

Shevaroy Hills of Salem (Wight), on walls and banks.

A very slender glandular rather flaccid herb with yellow flowers.

8. *Adenosma*, R. Br.

Annual, villous or glandular, aromatic herbs. *Leaves* opposite or whorled, serrate or crenate, rugose. *Flowers* axillary or in leafy spikes racemes or heads; bracteoles conspicuous or 0. *Calyx* deeply lobed, the uppermost lobe the largest, sometimes all enlarging in fruit. *Corolla* 2-lipped, the tube cylindric; upper lip erect, entire or notched, outermost in bud; lower spreading, 3-lobed. *Stamens* 4, didynamous; anther-cells separate, stipitate, one cell of each anterior stamen or of all stamens imperfect. *Ovary* with many ovules; style filiform below, dilated at the tip, winged upwards under the entire or 2-lamellate stigma. *Fruit* an ovoid ellipsoid or lanceolate capsule, both loculicidally and septicidally 4-valved. *Seeds* many, minute, scabrous-punctate, reticulate or pitted.

Flowers axillary; 3 outer sepals in fruit ovate lanceolate, reticulate, ciliate on the margins and midrib, 2 inner linear lanceolate, narrow; leaves broadly ovate, crenate, up to 1 in. long, .75 in. broad, petiole .3 in.; seeds pitted in lines

1. *subrepens*.

Flowers axillary below, uppermost in leafy heads; 3 outer sepals in fruit lanceolate, one rather larger, hirsute, 2 inner subulate-lanceolate; leaves ovate to ovate-oblong, crenulate, up to 1.25 in. long, .6 in. broad, petiole .1 in.; seeds minutely dotted in lines.....2. *malabaricum*.

Flowers in dense terminal heads at the ends of opposite or whorled peduncles; all the sepals lanceolate, one slightly larger, ciliate; leaves ovate to ovate-oblong, coarsely crenate, up to 2 in. long, 1 in. broad, petiole 0—2 in.; seeds scabrous

3. *capitatum*.

1. *ADENOSMA SUBREPENS*, Hook. f.; F. B. I. iv. 263.
Travancore, at Valur, 1,000 ft. (Meebold); Malabar (Wight).
A trailing herb, rooting at the nodes, the flowers bluish-purple.
2. *ADENOSMA MALABARICUM*, Hook. f.; F. B. I. iv. 264.
W. Coast, in Malabar (Wight).
An erect herb, up to about 1 ft. high.
3. *ADENOSMA CAPITATUM*, Hook. f.; F. B. I. iv. 264.
W. Coast and W. Gháts, S. Canara to Travancore, in rice fields.
An erect herb, up to 2 ft. high, with blue flowers.

9. *Stemodia*, Linn.

Herbs, sometimes woody below, glandular-pubescent, often aromatic. *Leaves* opposite or sometimes whorled, serrate. *Flowers* axillary, solitary, passing into terminal leafy spikes or close racemes; bracts leafy; bracteoles 1 or 2, small. *Calyx* deeply 5-lobed; lobes narrow, equal, or the upper a little larger. *Corolla* 2-lipped; tube cylindric, often villous within; upper lip 2-lobed, erect, entire or notched; lower 3-lobed, spreading. *Stamens* 4, didynamous, included; filaments filiform; anther-cells distinct, stalked, all perfect. *Ovary* with many ovules; style filiform; stigma 2-lobed. *Fruit* a globose or ovoid capsule; valves 2, septicidal, bifid, or valves 4, dehiscent both septicidally and loculicidally; placentas not winged. *Seeds* numerous, very minute, terete.

STEMODIA VISCOSA, Roxb.; F. B. I. iv. 265; Wt. Ic. t. 1408.

Most plains Districts, in wet ground and rice fields.

A many-branched aromatic viscid-pubescent herb with sessile more or less oblong usually cordate and amplexicaul leaves and violet corolla.

10. *Limnophila*, R. Br.

Marsh or water plants, glabrous or pubescent, aromatic. *Leaves* with transparent dots, opposite or whorled, toothed or incised, or, if submerged, with capillaceo-multifid lobes. *Flowers* axillary, sessile or pedicelled, solitary or passing into terminal spikes or racemes; bracts leafy, bracteoles small or 0. *Calyx* 5-partite, the lobes subequal or the posterior larger. *Corolla* 2-lipped; tube cylindric; upper lip outermost, suberect, entire or 2-lobed; lower spreading, 3-lobed. *Stamens* 4, didynamous, included; anther-cells separate, stalked. *Ovary* with many ovules; style slender, deflexed at tip; stigma 2-lamellate. *Fruit* an ovoid or globose capsule, often acute, dehiscent both loculicidally and septicidally, the placentiferous dissepiment separating with the valves and usually winged with the remains of the septa. *Seeds* many, minute, angular, truncate.

Leaves pinnately nerved, not ribbed; no whorls of pinnatifid or multifid lower leaves; calyx usually striate:—

Flowers sessile in close axillary heads; leaves opposite, elliptic or ovate, up to 3.5 in. long, petioled; calyx in fruit not striate but with a strong midrib to the acuminate lobes; capsule oblong, compressed.....1. *Roxburghii*.

Flowers axillary, solitary or in spikes or racemes:—

Leaves all opposite, subsessile, elliptic-ovate or obovate, crenate-serrate, the serratures often crustaceously thickened, punctate, up to 1 in. long, .5 in. broad; flowers axillary, solitary or in spikes or racemes; calyx lobes lanceolate, acuminate, hirsute.....2. *conferta*.

Leaves opposite or 3—4-nately whorled; flowers pedicelled; calyx-lobes lanceolate-acuminate:—

Leaves sessile, semi-amplexicaul at base, linear-oblong or lanceolate, serrulate, up to 2.5 in. long, .5 in. broad; flowers in axillary or terminal many-flowered racemes, rarely solitary; calyx-lobes glabrate.....3. *gratissima*.

Leaves sessile or very shortly petioled, elliptic-oblong or -obovate, serrulate, up to 1.5 in. long, .5 in. broad; flowers usually solitary, sometimes in short axillary racemes; calyx-lobes hirsute.....4. *hirsuta*.

Leaves 3—5-ribbed from the base; lower leaves usually pinnatifid or multifid; calyx not striate:—

Flowers sessile or nearly so:—

Flowers solitary, axillary:—

Leaves all opposite, none pinnatifid or multifid, ovate-oblong or elliptic, semi-amplexicaul, crenate-serrate, up to 1 in. or rather more in length and .5 in. broad; calyx-lobes ovate, acuminate.....5. *hypericifolia*.

Upper leaves opposite, middle ones whorled, pinnatifid, lowest capillaceo-multifid; calyx-lobes glabrous, ovate, abruptly acuminate.....6. *heterophylla*.

Flowers in terminal or axillary often divaricately branched spikes, the upper leaves opposite or whorled, linear-oblong, crenulate, up to about 1.5 in. long, the lower capillaceo-multifid; calyx-lobes ovate, acuminate.....7. *polystachya*.

Flowers pedicelled, the lowest leaves always capillaceo-multifid:—

Stem 1—2 ft. high; corolla over .5 in. long; upper leaves conspicuous, oblong-lanceolate, serrate, sessile and semi-amplexicaul, up to 2 in. long, .5 in. broad, middle ones whorled, lacinate; calyx-lobes ovate abruptly acuminate, at first glandular, in fruit glabrous.....8. *racemosa*.

Stem 3—8 in. high; corolla under .3 in. long; upper leaves frequently none, sometimes linear-oblong, up to .75 in. long, .2 in. broad, middle ones whorled, lacinate; calyx-lobes ovate, acuminate, pubescent.....9. *gratioloides*.

1. *LIMNOPHILA ROXBURGHII*, G. Don; F. B. I. iv. 265.

N. Circars, Rampa Hills of Godavari, at 3,000 ft. (V. Narayanswami), in wet places in shade.

An aromatic annual herb, creeping and rooting at the base, the flowers blue-purple with a yellow mouth.

2. *LIMNOPHILA CONFERTA*, Benth.; F. B. I. iv. 266.

W. Coast Districts, in wet places, rice fields, etc., to 2,000 ft. in the W. Gháts.

A very variable erect or prostrate or floating plant, rooting at the nodes, the flowers violet-pink.

3. *LIMNOPHILA GRATISSIMA*, Bl.; F. B. I. iv. 268.

W. Coast Districts, in wet places, margins of ponds and backwaters; W. Gháts, Anamalais at 2,000 ft. (Fischer).

A tall glabrous plant, decumbent at base and rooting at the lower nodes, then erect; flowers purple, usually in terminal panicles of racemes with small bracts.

4. *LIMNOPHILA HIRSUTA*, Benth. ; F. B. I. iv. 268.
W. Coast Districts and lower hills of W. Gháts, in wet places.
A tall hirsute plant, reaching 18 in. in height, usually very hirsute, but occasionally (var. *glabra*, C. B. Clarke MS. from the E. Gháts) nearly glabrous and with always opposite leaves.
5. *LIMNOPHILA HYPERICIFOLIA*, Benth. ; F. B. I. iv. 269 ; Wt. Ic. t. 1409.
W. Gháts, Nilgiris, Pulneys and hills of Travancore, at 3,000—7,000 ft., in bogs and other wet places.
A tall glabrous herb, reaching 2 ft. in height with rose-purple flowers.
6. *LIMNOPHILA HETEROPHYLLA*, Benth. ; F. B. I. iv. 270.
S. Canara, Mysore and Tinnevely, apparently scarce, in rice fields and wet places.
A rather tall erect herb, with leaves of all three forms, the stems often from the nodes of a long under-water horizontal stem with many capillary leaves.
7. *LIMNOPHILA POLYSTACHYA*, Benth. ; F. B. I. iv. 269 ; Wt. Ic. t. 860.
Carnatic, in Tanjore (Wight) and other places, in rice fields and wet places, but scarce.
A water plant, with the upper parts erect and recognized by the racemes of small white flowers in terminal panicles.
8. *LIMNOPHILA RACEMOSA*, Benth. ; F. B. I. iv. 271 ; Wt. Ic. t. 861.
Cyrilla aquatica, Roxb. Cor. Pl. t. 189.
N. Circars, Deccan and W. Coast, in rice fields and flooded land, common.
A water plant, often rising to 1 or 2 ft. above the surface, the flowers pale violet with reddish blotches on the lip, usually in long bracteate racemes.
9. *LIMNOPHILA GRATIOLOIDES*, R. Br. ; F. B. I. iv. 271.
All plains Districts, in pools, swamps and rice fields.
A small much branched plant, glabrous or pubescent, smelling of turpentine, very variable, chiefly according to the amount of wetness of the locality, in mud or shallow water short and leafy, in deeper water elongate and with the capillaceo-multifid leaves developed (var. *elongata*, Benth.). Flowers white with a pink ring at the mouth of the corolla.

11. *Moniera*, B. Juss.

Glabrous herbs. *Leaves* often punctate, entire or toothed or multifid when submerged. *Flowers* axillary, solitary or racemose, yellow blue or white ; bracteoles small or 0. *Calyx* 5-partite ; lobes imbricate, the upper largest, the 2 innermost often very narrow. *Corolla* 2-lipped, tube cylindric ; upper lip outside in bud, emarginate or 2-lobed, lower 3-lobed. *Stamens* didynamous, included ; anther-cells contiguous, distinct. *Ovary* with many ovules in each cell ; style dilated at top ; stigma entire or 2-lobed. *Capsule* globose or ovoid, 2-grooved, valves 2 or 4 separating from the entire placentiferous dissepiment. *Seeds* many, minute, often striate.

Creeping herb, rooting at the nodes, the numerous branches ascending; leaves obovate-oblong, about .5 in. long, obtuse; flowers solitary, pedicelled, capsule ovoid.....1. *cuneifolia*.

Erect herbs, the stems often branched; leaves linear-lanceolate, up to 1.25 in. long, acute; capsule globose:—

Flowers solitary in the leaf axils, sessile; placentas separating, winged

2. *Hamiltoniana*.

Flowers 1—3 together in the axils, pedicelled; placentas combined, not winged

3. *floribunda*.

1. MONIERA CUNEIFOLIA, Michx. *Herpestis Monniera*, H. B. & K.; F. B. I. iv. 272. *Gratiola Monniera*, Linn.; Roxb. Cor. Pl. t. 178.

All plains Districts, and in the hills to about 4,000 ft., in wet places, even in saltish water.

A somewhat succulent creeping herb with blue flowers.

2. MONIERA HAMILTONIANA, T. Cooke. *Herpestis Hamiltoniana*, Benth.; F. B. I. iv. 272.

W. Coast, S. Canara to Cochin, in wet places.

An erect rather thick herb, the stems terete, the flowers pink.

3. MONIERA FLORIBUNDA, T. Cooke. *Herpestis floribunda*, R. Br.; F. B. I. iv. 273.

Carnatic, in Nellore and Chingleput; S. Canara (Hohenacker).

An erect slender herb with subquadrangular stems and white corolla having purplish stripes on the upper lip (Fischer).

12. Dopatrium, Buch.-Ham.

Annual slender glabrous marsh herbs. *Leaves* few, opposite, the lower pairs small, the upper minute, remote. *Flowers* small, solitary, axillary, violet; bracteoles 0. *Calyx* small, 5-partite, lobes narrow, imbricate. *Corolla* 2-lipped; tube slender, dilated to a broad throat; upper lip outside in bud, 2-lipped; lower 3-lobed, spreading. *Stamens* 2 upper perfect; filaments filiform; anthers with parallel distinct equal cells; lower pair reduced to minute staminodes. *Ovary* with many ovules; style short; stigma 2-lamellate. *Fruit* a small globose or oblong capsule, opening loculicidally, the valves placentiferous. *Seeds* many, very small, reticulately pitted or tuberculate.

Capsule linear-oblong, the fruiting pedicel deflexed; stem usually branched from the base, the many slender branches erect, up to about 6 in. high, the radical leaves few, subrosulate, obovate, at most .5 in. long, the cauline minute, linear; corolla .3 in. long.....1. *nudicaule*.

Capsule globose:—

Fruiting pedicels 0 or under .5 in. and capillary, erect; stems much branched from the base with fleshy erect branches up to 12 in. high, the radical leaves elliptic-oblong or obovate, up to 1 in. long, the cauline small, larger below but gradually smaller upwards; corolla very small, .2 in. long.....2. *junceum*.

Fruiting pedicels capillary, up to 1 in. long, horizontally spreading; stems erect, usually single or at most 2—3 from the base, fleshy, up to 18 in. high, lower leaves obovate-oblong or spatulate, up to 2 in. long, .5 in. broad, cauline very small and distant; corolla .5 in. long.....3. *lobelioides*.

1. DOPATRIUM NUDICAULE, Buch.-Ham.; F. B. I. iv. 274.

Carnatic, Nellore to Tinnevely, on damp ground near the coast.

A slender erect herb.

2. *DOPATRIUM JUNCCEUM*, Buch.-Ham.; F. B. I. iv. 274.
All plains Districts and up to 4,000 ft. in the hills, in wet places,
ponds and rice fields.
An erect very slender fleshy herb with pink flowers.
3. *DOPATRIUM LOBELIOIDES*, Benth.; F. B. I. iv. 274; Wt. Ic. t. 859.
Carnatic, near Madras, in tanks and wet places.
A rather tall slender fleshy herb with comparatively large
flowers.

13. *Artanema*, D. Don.

Erect herbs, the stems tetragonal, scabrid on the angles. *Leaves* opposite, entire or serrate. *Flowers* large, blue or purple, in terminal bracteate but ebracteolate racemes, the bracts foliaceous. *Calyx* 5-partite, the lobes broad, imbricate, acuminate. *Corolla* 2-lipped; tube broad; upper lip erect, broad, emarginate, lower 3-lobed, spreading. *Stamens* 4, didynamous, perfect, the 2 upper with short filaments included in the tube, the 2 lower with long arched filaments broadly appendiculate at the base, arching to become connivent under the upper lip; anther-cells connivent at their tips. *Ovary* many-ovuled; style slender; stigma 2-lamellate. *Fruit* a globose capsule, dehiscing septically, the valves separating from the broadly-winged placentiferous axis. *Seeds* many, small, truncate, papillose.

ARTANEMA SESAMOIDES, Benth.; F. B. I. iv. 274; Wt. Ic. t. 1410.

W. Coast, in Malabar and Travancore, rising to about 3,000 ft. in the Wynaad and Coorg.

A stout erect herb or undershrub, 2—3 ft. high, with large violet-purple flowers and lanceolate-acuminate usually serrate leaves up to 4 in. long.

14. *Torenia*, Linn.

Herbs, glabrous or pubescent, usually trailing and rooting. *Leaves* opposite, entire crenate or serrate. *Flowers* axillary or in terminal or pseudo-axillary umbels or racemes; bracteoles 0. *Calyx* usually 2-lipped, oblique at the mouth, 3—5-lobed, the back of the lobes or of some of them winged or keeled. *Corolla* 2-lipped; tube cylindric, somewhat curved, dilated upwards; the upper outer lip erect, concave, notched or 2-fid, the lower larger, 3-lobed, spreading. *Stamens* 4, didynamous, the 2 upper included, the two lower arched to meet under the upper lip, often with appendages about the middle; anthers connate in pairs. *Ovary* with many ovules; style slender; stigma 2-lamellate. *Fruit* a linear or oblong septicidal capsule, the valves separating from the placentiferous dissepiment which is often winged. *Seeds* many, rugose or cancellate.

Calyx, especially in fruit, rather broadly winged:—

Calyx and *corolla* both small, together under .7 in. long:—

Calyx broadly ovoid with ciliate wings; pedicels slender, .5—1 in. long; lower filaments without appendages; leaves ovate, acute, sharply serrate, cuneate or sub-cordate at base, up to 1.25 in. long, petiole .25—5 in. long

1. *cordifolia*.

Calyx narrowly oblong with ciliate wings; pedicels slender, 1—2 in. long; lower filaments with clavate appendages; leaves triangular-ovate, acute, crenate-serrate, obtuse at base, up to 1.5 in. long, petiole 1—2 in. long

2. *courtallensis*.

Calyx and corolla both long, the calyx narrowly oblong, especially in fruit, not ciliate, .7—1 in. long, the lobes acuminate, decurrent at base; corolla up to 1.25 in. long; lower filaments with subulate appendages; pedicels up to nearly 2 in. long, thick and usually deflexed in fruit; leaves ovate-lanceolate, acuminate, obtuse at base, serrate, up to 2 in. long, petiole 1—5 in. long

3. *travancorica*.

Calyx, especially in fruit, narrowly winged, the wings often only keeled not decurrent, hirsute, ciliate; corolla small, up to .75 in. long; lower filaments with short rounded appendages; pedicels 1—1.5 in. long, thickened and deflexed in fruit; leaves ovate to ovate-oblong, sub-obtuse, truncate or subcordate at base, distantly serrate, up to 1.5 in. long, petiole 1—2 in. long.....4. *vagans*.

Calyx not winged:—

Calyx in fruit glabrous, narrowly oblong, .5—75 in. long, strongly keeled, the keels decurrent on the stout pedicel; corolla 1—1.25 in. long; appendages of lower filaments shortly subulate; leaves deltoid-ovate, crenate, subcordate, sparsely hirsute, .75 in. long, petiole up to .5 in. long.....5. *bicolor*.

Calyx in fruit not strongly keeled, hirsute:—

Calyx .75 in. long, reticulate in fruit; pedicels 1.5 in. long; corolla up to 1.5 in. long, broad at mouth; appendages subulate; leaves deltoid-ovate, acute, truncate or cordate at base, coarsely serrate, up to 2 in. long, 1 in. broad, but usually smaller, very pubescent, petiole .3—5 in. long.....6. *hirsuta*.

Calyx .4 in. long, hirsute, cleft nearly to the base, the lobes lanceolate; pedicels 2—4 at the node, spreading, .3—4 in. long; corolla short; appendages minute; leaves ovate or ovate-lanceolate, acute, serrate, up to 1 in. long, petiole under .25 in. long.....7. *parviflora*.

1. *TORENIA CORDIFOLIA*, Roxb. Cor. Pl. t. 161; F. B. I. iv. 276.

N. Circars, on Mahendragiri Hill, Ganjam (Fischer); W. Gháts, Carcoor Ghát in Malabar (Beddome).

A low erect trichotomously branching herb up to 10 in. high, the stems and branches tetragonous; corolla small, pale bluish purple.

2. *TORENIA COURTALLENSIS*, Gamble in Kew Bull. 1923, ined. *T. cordifolia*, Roxb.; F. B. I. iv. 276 in note by Sir J. D. Hooker.

W. Gháts, Anamalais and hills of Madura, Tinnevely and Travancore, at about 4,000 ft.

A trailing herb with long decumbent stems and long pedicels; flowers lilac, the lower lip mottled with purple (Blatter and Hallberg).

3. *TORENIA TRAVANCORICA*, Gamble n. comb. *T. asiatica*, Hook. f.; F. B. I. iv. 277 in part; Wt. Ic. t. 862; Bot. Mag. t. 4249.

W. Gháts, hills of Travancore and Tinnevely.

A creeping annual herb with large flowers, white with blue blotches on the lobes of the lower lip.

4. *TORENIA VAGANS*, Roxb.; F. B. I. iv. 277. *T. hirtella*, Hook. f.; F. B. I. iv. 277 in part.

W. Gháts, Nilgiris, especially on the E. side, at 5,000—6,000 ft. (Clarke, Gamble).

A diffuse trailing and rooting herb with pale blue corolla having darker blotches on the lobes of the lower lip.

5. *TORENIA BICOLOR*, Dalz.; F. B. I. iv. 278.
W. Gháts and W. Coast from S. Canara to Travancore, up to 2,000 ft.
A small trailing and rooting herb with small leaves and the corolla with dark blue or violet upper and white lower lip. It might be the "Kaka-pu" of Rheede Hort. Mal. ix. t. 53.
6. *TORENIA HIRSUTA*, Benth.; Bot. Mag. t. 5167. *T. asiatica* var. *hirsuta*, Hook. f.; F. B. I. iv. 277.
W. Gháts, in most Districts, but especially W. Nilgiris, at 3,000—6,000 ft.
A rather stout hirsute diffuse herb with handsome flowers, white on the mid-lobe of the lower lip, deep blue on the side lobes, pale blue on the upper lip.
7. *TORENIA PARVIFLORA*, Ham.; F. B. I. iv. 278.
N. Circars, Bison Hills, Godavari (Barber).
A small decumbent annual up to 8 in. in height, with blue pedicellate flowers clustered in the upper axils.

Torenia Fournieri, Linden. is an introduction from Cochin China, which is frequently grown in gardens for its showy flowers of a pale blue with bright purple blotches on the lobes of the lower lip and yellow in the throat and tube (Bot. Mag. t. 6747).

15. *Vandellia*, Linn.

Herbs, usually annual, glabrous or pubescent. *Leaves* opposite, often toothed. *Flowers* small, axillary or racemose; bracteoles 0. *Calyx* campanulate not winged, cleft in 5 lobes, sometimes to the base. *Corolla* 2-lipped; tube cylindric; upper lip outer, erect, notched or bifid, lower 3-lobed spreading. *Stamens* 4, didynamous, the 2 upper on the corolla throat, usually included, the 2 lower with arched filaments having a subulate or rounded appendage towards the base; anthers cohering in pairs, the cells divaricate. *Ovary* with many ovules; style slender; stigma 2-lamellate. *Fruit* a globose ovoid or linear septicidal capsule, the valves separating from the placentiferous septum, which is usually more or less winged. *Seeds* many, rugose.

Leaves pinnately nerved:—

Capsule about equalling the calyx; placentiferous dissepiment broadly winged:—
Calyx not divided below the middle, lobes acute, glabrous except the prominent rib; flowers pedicelled, axillary or subracemose at the ends of the branches; filaments of lower stamens with subulate appendages; leaves suborbicular ovate or lanceolate, shortly serrate, up to .75 in. long; petiole about .1—3 in. long

1. *crustacea*.

Calyx divided to the base or near it, the lobes strigosely white hispid; filaments of lower stamens with rounded appendages:—

Erect herb with the flowers in lax axillary and terminal racemes; leaves at the main nodes large, ovate or elliptic, obtuse, serrate, membranous, up to 2 in. long, 1 in. broad, petioled, those on branch nodes smaller and sometimes sessile.....2. *hirsuta*.

Diffuse herb, many-branched, with axillary flowers solitary or in pairs; leaves ovate or ovate-cordate, entire or serrate, about .5 in. long, subsessile

3. *scabra*.

Capsule longer than the calyx; placentiferous dissepiment narrowly winged:—

Calyx not divided to the base in flower, scarcely so in fruit; capsule ellipsoid:—

Erect simple or little-branched herb with suborbicular, shortly serrate leaves up to .75 in. long and broad, nearly sessile; pedicels very slender

4. *nummularifolia*.

Much branching low herb with ovate-cordate or suborbicular, crenate-serrate leaves .7—1 in. in diam. nearly sessile; pedicels none, the flowers congested in the leaf axils.....5. *sessiliflora*.

Calyx divided to the base in narrow linear-lanceolate lobes; narrowly oblong; capsule .3—5 in. long; pedicels usually axillary, deflexed in fruit; leaves ovate, obtuse or subacute, obscurely crenate-serrate, up to 1 in. long, petiole about .1 in. long.....6. *pedunculata*.

Leaves with 3—5 ribs from the base, sessile, elliptic, obtuse, up to .75 in. long; calyx divided to the base, shorter than the ovoid capsule, whose placentiferous dissepiment is tufted at top, but scarcely winged, the calyx-lobes linear, hispid at tip; pedicels solitary, axillary, filiform, longer than the leaves; staminal appendages subulate.....7. *pyxidaria*.

1. *VANDELLIA CRUSTACEA*, Benth.; F. B. I. iv. 279; Wt. Ic. t. 863.

All plains Districts, usually in wet places or rice fields, often in gardens.

A glabrous or pubescent annual herb, branching diffusely and rooting, the corolla purplish or white.

2. *VANDELLIA HIRSUTA*, Ham.; F. B. I. iv. 280.

W. Coast, S. Canara to Travancore, in fields.

A pubescent erect herb, with pale violet corolla and globose capsule.

3. *VANDELLIA SCABRA*, Benth.; F. B. I. iv. 281.

W. Deccan, W. Gháts and W. Coast, up to 4,000 ft., in rice fields, etc.

A diffuse herb with corolla having the lower lip white and the upper one brown (Lawson).

Var. *laxa* Hook. f. Much elongate and very slender, the leaves so reduced that the inflorescence becomes a raceme; lower leaves rather larger. Without locality (Wight); Guindy (Lawson).

4. *VANDELLIA NUMMULARIFOLIA*, D. Don.; F. B. I. iv. 282.

Hills of Coimbatore, at Minchiguli, 4,800 ft. (Fischer); Nilgiris, at Naduvatum, 6,000 ft. (Lawson).

A small herb with red-purple corolla.

5. *VANDELLIA SESSILIFOLIA*, Benth.; F. B. I. iv. 282.

W. Gháts, Nilgiri, Anamalai and Pulney Hills at 2,000—6,000 ft. (Lawson, Fischer).

An erect herb with close clusters of sessile flowers, often cleistogamic (Lawson).

6. *VANDELLIA PEDUNCULATA*, Benth.; F. B. I. iv. 282.

N. Circars, on the Godavari (Bourne); W. Gháts, in the Anamalai and Pulney Hills, up to 2,000 ft.; W. Coast, in Travancore, in rice fields and other wet places.

A creeping herb with long branches rooting at the lower nodes, the corolla white with a pale violet margin or pale blue with a white spot.

7. *VANDELLIA PYXIDARIA*, Maxim. *V. erecta*, Benth.; F. B. I. iv. 281.
N. Circars in the Upper Godavari (Gamble); Gazalhati Pass,
N. Coimbatore (Wight).
A slender divaricatingly branched herb with small apparently
white flowers.

16. *Ilysanthes*, Rafin. (including *Bonnaya*, Link and Otto).

Annual glabrous herbs, usually of marshes. *Leaves* opposite, entire or toothed, ribbed from the base or penninerved. *Flowers* small, axillary and solitary or in terminal racemes, bracteate, not bracteolate, peduncles often deflexed in fruit. *Calyx* 5-lobed, usually deeply, the lobes narrow. *Corolla* 2-lipped; tube cylindric, or widening above; upper lip outside, broad, usually shortly bifid, lower spreading, 3-lobed. *Stamens* 2, upper alone perfect, subincluded; lower reduced to 1—2-lobed often glandular hairy staminodes. *Ovary* with many ovules; style slender; stigma 2-lamellate. *Fruit* an ovoid oblong or linear septicidal capsule, the valves entire, separating from the placentiferous septum. *Seeds* numerous, rugose.

Leaves with 3—5 ribs from the base; staminodes usually bilobed; capsule ovate or shortly oblong:—

Erect herbs, 4—18 in. in height:—

Corolla rather large, 3—5 in. long or longer, glandular-hairy within; lower leaves oblong or oblong-lanceolate up to .75 in. long, upper linear smaller; flowers solitary, axillary, the pedicels filiform, up to 1 in. long, deflexed in fruit; capsule ovoid-oblong, up to .25 in. long.....1. *hyssopioides*.
Corolla small, about .25 in. long; lower leaves ovate lanceolate or oblong, up to 1 in. long, upper smaller; flowers solitary axillary or in slender terminal racemes, the pedicels filiform, up to .75 in. long; capsule ovoid-oblong up to .2 in. long.....2. *parviflora*.

Erect minute herbs with single stems under 3 in. high; corolla .2—3 in. long, the lobes broadly spreading; leaves ovate or elliptic-oblong, under .25 in. long, obtuse; pedicels capillary; capsule subglobose.....3. *minima*.
Creeping and rooting herbs with stems up to 10 in. long; corolla 3—4 in. long, the lips spreading; leaves ovate or orbicular, 3—5 in. in diam., obtuse, entire or slightly dentate; pedicels very short; capsule globose.....4. *rotundifolia*.

Leaves penninerved; staminodes entire; capsule narrow, linear:—

Leaves sharply deeply and closely serrate:—

Erect, diffusely branched; leaves sessile, oblong, obtuse or subacute, glabrous, spinous-serrate, up to 1 in. long, .5 in. broad; flowers in lax terminal racemes with subulate bracts, pedicelled; capsules narrowly linear-oblong, .5 in. long.....5. *serrata*.

Prostrate, creeping and rooting at the nodes; leaves petioled, elliptic-oblong, rounded at apex, finely serrate, up to 2 in. long, .75 in. broad; flowers in axillary and terminal racemes with narrow lanceolate bracts; capsules very slender, .75 in. long.....6. *reptans*.

Leaves distantly and shallowly serrate:—

Stems decumbent at base, rooting at the nodes, the branches ascending; leaves oblong obovate-lanceolate or oblanceolate, up to 1.5 in. long, .4 in. broad, broadly petioled to sessile; flowers in terminal and axillary racemes with linear-lanceolate bracts, sometimes solitary; capsules up to .5 in. long.....7. *veronicaefolia*.

Stems erect, short, much-branched; leaves linear-oblong, shortly and distantly serrate, up to 1 in. long, .15 in. broad, sessile; flowers in leafy terminal or axillary racemes, the bracts setaceous; capsules up to .4 in. long.....8. *oppositifolia*.

Leaves entire or very nearly so, linear, up to 1.5 in. long and very narrow, scarcely over .1 in. broad, sessile; flowers in slender racemes terminal or axillary, sometimes solitary, the slender pedicels deflexed, bracts subulate; capsules very slender, up to .5 in. long.....9. *tenuifolia*.

1. *ILYSANTHES HYSSOPIOIDES*, Benth.; F. B. I. iv. 283; Wt. Ic. t. 857.
Most Districts, in wet places, especially rice fields, up to 4,000 ft. in the hills.
A straggling slender herb reaching 18 in. in height, the flowers pale blue or white with darker markings, sometimes nearly 1 in. long, the staminodes large and clavate, obscurely bilobed, glandular.
2. *ILYSANTHES PARVIFLORA*, Benth.; F. B. I. iv. 283. *Gratiola parviflora*, Roxb. Cor. Pl. t. 203.
Most Districts in the plains, in wet places.
An erect branching herb, smaller than the last and with smaller blue or white flowers, the staminodes bilobed.
3. *ILYSANTHES MINIMA*, Benth.; F. B. I. iv. 284.
Vandalur in Chingleput (Bourne); Tinnevely, about Pallamcottah, in rice fields (Wight).
A minute erect herb with rather large yellow flowers.
4. *ILYSANTHES ROTUNDIFOLIA*, Benth.; F. B. I. iv. 284. *Gratiola rotundifolia*, Linn.; Roxb. Cor. Pl. t. 204.
E. Coast (*fide* Roxburgh); W. Coast, S. Canara to Travancore, in wet places, banks of ponds, etc.
A creeping herb with round leaves and white flowers, the staminodes rather large.
5. *ILYSANTHES SERRATA*, Urban. *Bonnaya brachiata*, Link and Otto; F. B. I. iv. 284.
All plains Districts and up to about 4,000 ft. in the hills, in wet places, pasture lands, on rocks, etc., common.
A stiff erect herb with pink, purple or white flowers.
6. *ILYSANTHES REPTANS*, Urban. *Bonnaya reptans*, Spr.; F. B. I. iv. 284. *B. veronicaefolia*, Wt. Ic. t. 1411 not of Spr.
Madras (Shuter); Malabar (Wight); Travancore (Bourdillon, Venkoba Row) in swampy places.
A creeping herb with light purple flowers.
7. *ILYSANTHES VERONICAEOFOLIA*, Urban. *Bonnaya veronicaefolia*, Spr.; F. B. I. iv. 285. *Gratiola veronicaefolia*, Roxb. Cor. Pl. t. 154. *G. grandiflora*, Roxb. l. c. t. 179. *Bonnaya verbenaeefolia*, Spr.; Wt. Ic. t. 1412.
All Districts in the plains and up to 5,000 ft. in the hills, in wet places, common.
A very variable species, whether in habit, in leaf or in flower, the flowers usually violet with darker lines. The varieties *grandiflora* and *verbenaeefolia* are connected by intermediates with the species.

8. *ILYSANTHES OPPOSITIFOLIA*, Urban. *Gratiola oppositifolia*, Roxb. Cor. Pl. t. 155. *Bonnaya oppositifolia*, Spr.; F. B. I. iv. 286.
Deccan and Carnatic, also W. Coast, in wet places, not common.
A small inconspicuous plant with blue flowers.
9. *ILYSANTHES TENUIFOLIA*, Urban. *Bonnaya tenuifolia*, Spr.; F. B. I. iv. 286.
W. Coast, Malabar and Travancore.
A small very slender tufted weak marsh herb with pale blue flowers.

LATE OF THE INDIAN FOREST DEPARTMENT

PART VI
SCROPHULARIACEAE TO PLANTAGINACEAE

PUBLISHED UNDER THE AUTHORITY
OF THE GOVERNMENT OF INDIA

CALCUTTA

1956

INTRODUCTION TO PART VI.

I HAVE thought it best to add a few pages to the proper number of the Part, in order to complete the Families of the GAMOPETALÆ. Part VII will therefore be able to start at once with the MONOCHLAMYDEÆ.

Such Supplementary Notes as are necessary for Parts V and VI will soon appear in the 'Kew Bulletin,' but they are not many.

J. S. GAMBLE.

Liss: March, 1924.

17. *Microcarpaea*, R. Br.

A very small slender diffuse or creeping nearly glabrous herb. *Leaves* opposite, sessile, oblong, obtuse, entire. *Flowers* minute, axillary, solitary, sessile; bracteoles 0. *Calyx* tubular, 5-angled, 5-lobed, the ribs thick. *Corolla* very short; tube broad; lobes 5, broad, spreading, the 2 upper partially connate. *Stamens* 2 perfect; filaments filiform; anthers confluent, 1-celled; staminodes 0. *Ovary* many-ovuled; style filiform; stigma capitate recurved. *Fruit* a small ovoid loculicidal capsule, included in the calyx, valves separating from the placentiferous dissepiment. *Seeds* very small, ellipsoid.

MICROCARPAEA MUSCOSA, R. Br.; F. B. I. iv. 287.

W. Coast, S. Canara to Travancore, in marshy places.

A minute tufted slender herb, the branches interlacing, the stems rooting at the nodes, the leaves about 25 in. long.

18. *Peplidium*, Delile.

Small prostrate or creeping glabrous herbs. *Leaves* opposite, fleshy, entire, more or less obovate. *Flowers* small, axillary, sub-sessile, 1—3-nate. *Calyx* tubular, 5-ribbed, obtusely 5-lobed, enlarged and ovoid-globose in fruit. *Corolla*-tube short; lobes 5, broad, subequal or one broader. *Stamens* 2, included; filaments broad, curved; anthers 1-celled; staminodes 0. *Ovary* many-ovuled; style short; stigma large, flat, recurved over the anthers. *Fruit* a globose or ovoid capsule, the walls fragile, bursting irregularly, the placentiferous dissepiment winged. *Seeds* numerous, angular, truncate, dotted.

PEPLIDIUM MARITIMUM, Wettst. *P. humifusum*, Del.; F. B. I. iv. 287. *Microcarpaea cochlearifolia*, Sm.; Wight in Hook. Bot. Misc. iii. Suppl. t. 29.

E. Coast Districts, on the margins of tanks and in similar wet places; W. Ghâts, swamps and ponds in the Pulney Hills (Bourne).

A small prostrate herb, rooting at the nodes, the small flowers pale pink, the capsules bursting very easily, the leaves orbicular obovate or spatulate.

19. *Glossostigma*, Arn.

Minute glabrous creeping herbs. *Leaves* opposite or fascicled, linear or spatulate, entire. *Flowers* minute, axillary, solitary, bracteoles 0. *Calyx* campanulate, obtusely 3—4-lobed. *Corolla*-tube short; lobes 5, subequal, spreading. *Stamens* 2 (in the Indian species) or 4; filaments filiform; anthers with diverging cells, their tips confluent. *Ovary* many-ovuled; style short; stigma dilated, spatulate, recurved. *Fruit* a small loculicidal capsule, enclosed in the calyx; valves entire, separating from the columnar not winged placentiferous axis. *Seeds* minute, ellipsoid.

GLOSSOSTIGMA SPATHULATUM, Arn.; F. B. I. iv. 288. *Microcarpaea spathulata*, Benth.; Wight in Hook. Bot. Misc. ii. Suppl. t. 4.

Carnatic, margins of tanks and other wet places.

A minute tufted herb creeping and rooting at the nodes, the branches much interwoven. The flowers in Wight's fig. are pale pink.

20. *Scoparia*, Linn.

Herbs or undershrubs, with twiggly branches. *Leaves* opposite or whorled, entire or toothed, punctate. *Flowers* small, white or yellow, axillary, solitary or binate; bracteoles 0. *Calyx* small, 4-5-partite, the lobes imbricate. *Corolla* rotate, 4-lobed, the throat densely bearded; lobes obtuse, subequal. *Stamens* 4, subequal; filaments filiform; anther-cells distinct, parallel or diverging. *Ovary* with many ovules; style subclavate; stigma notched or truncate. *Fruit* a small globose or ovoid septicidal capsule, enclosed in the calyx, the valves membranous, separating from the placentiferous axis. *Seeds* many, angled, scrobiculate.

SCOPARIA DULCIS, Linn.; F. B. I. iv. 289.

All plains Districts and to about 3,000 ft. on dry hills, a tropical American plant now run wild and very common in India, on waste lands and fallow fields.

A glabrous undershrub sometimes up to 3 ft. in height, with small white flowers and lanceolate or elliptic-lanceolate coarsely serrate leaves.

21. *Veronica*, Linn.

Herbs or shrubs, rarely trees. *Leaves* opposite, the upper ones only or sometimes all occasionally alternate. *Flowers* solitary axillary, or in terminal or axillary racemes, bracteate but not bracteolate. *Calyx* 4-5-partite, the lower lobes connate, the upper if present smaller. *Corolla* rotate or shortly salver-shaped, blue purple or white; lobes 4 or 5, the upper and lower usually narrower. *Stamens* 2, exserted, adnate to the corolla-tube on either side of the upper lobe; anther-cells confluent at their tips. *Ovary* many- or few-ovuled; style simple; stigma subcapitate. *Fruit* a compressed or turgid 2-grooved capsule, dehiscing in various ways. *Seeds* many or few, smooth or rugose, sometimes winged.

Prostrate herbs, the leaves of flowering branches alternate; flowers solitary in the leaf-axils:—

- Pedicels about as long as the leaves; capsule-cells globose, turgid, hispid; leaves ovate-cordate or orbicular, coarsely serrate, up to .75 in. in diam.....1. *agrestis*.
 Pedicels much longer than the leaves; capsule-cells flattened, reticulate; leaves ovate, coarsely crenate-serrate, up to 1.5 in. long.....2. *persica*.

Erect herbs, capsules broadly obcordate:—

- Flowers in long terminal bracteate racemes; leaves very small, ovate-cordate, crenate, subsessile, those of the flowering raceme alternate.....3. *arvensis*.
 Flowers in axillary slender racemes; leaves rather large, ovate, crenate-serrate, truncate at base, opposite.....4. *javanica*.

1. *VERONICA AGRESTIS*, Linn.; F. B. I. iv. 294.

Nilgiri Hills, usually above 5,000 ft., a weed of cultivation, probably introduced.

A prostrate annual weed with small blue flowers.

2. *VERONICA PERSICA*, Poir.; F. B. I. iv. 294.
Nilgiri Hills, about Ootacamund, at 7,000 ft., a weed of cultivation, probably introduced but likely to spread as in other countries.
A prostrate annual weed with rather large blue flowers.
3. *VERONICA ARVENSIS*, Linn.; F. B. I. iv. 296.
Nilgiri Hills, above 6,000 ft., a weed of cultivation and waste land, probably introduced.
An erect annual weed, with very small blue or white flowers.
4. *VERONICA JAVANICA*, Bl.; F. B. I. iv. 296.
W. Ghâts, Nilgiris, Pulneys and hills of Travancore above 6,000 ft.
A pubescent annual herb with many-branched slender stems and small flowers and capsules.

22. *Buchnera*, Linn.

Annual rigid herbs, black when dry. *Leaves*: lower opposite, broad; upper alternate, narrow. *Flowers* sessile, axillary or in bracteate spikes, bracteoles 2. *Calyx* tubular, 5-lobed, 10-ribbed, the lobes short. *Corolla*-tube slender; lobes 5, flat, subequal, spreading, the upper inmost in bud. *Stamens* 4, didynamous, included; anthers 1-celled, vertical, dorsifixed, the connective sometimes mucronate. *Ovary* with many ovules; style thickened or clavate above; stigma entire or notched. *Fruit* an oblong loculicidal capsule; valves entire, coriaceous, separating from the placentas. *Seeds* very many, angled, obovoid or oblong.

BUCHNERA HISPIDA, Ham.; F. B. I. iv. 298; Wt. Ic. t. 1413.

Most Forest Districts, in grassy places.

An erect hispid herb with pale purple flowers growing to about 18–24 in. in height, the lower leaves obovate or oblong, coarsely serrate, the upper lanceolate or linear.

23. *Striga*, Lour.

Herbs, usually scabrid, discoloured or black when dry, generally parasitic. *Leaves*: the lower opposite, the upper alternate, linear, entire, rarely toothed, sometimes reduced to scales. *Flowers* axillary or the upper in bracteate spikes; bracteoles usually 2. *Calyx* tubular, the tube with 5, 10 or 15 ribs; lobes 5. *Corolla*-tube slender, abruptly incurved at or above the middle; limb spreading, the upper lip inner in bud, usually short, notched or 2-fid, the lower 3-lobed. *Stamens* 4, didynamous, included; anthers 1-celled, vertical, dorsifixed, the connective sometimes mucronate. *Ovary* many-ovuled; style slender, thickened upwards; stigma entire. *Fruit* an oblong obovoid or subglobose capsule, loculicidal, the valves entire septiferous, separating from the placentas. *Seeds* very many, ovoid or oblong, usually reticulate.

Calyx 5-ribbed, the ribs running to the apex of each lobe:—

A reddish-brown root parasite with tuberous rootstock, often many branched; leaves scale-like; corolla pink.....1. *orobanchoides*.

A green plant, not recorded as parasitic, the root not tuberous, little branched; leaves linear with crustaceous glandular scabrid margins; corolla white

2. *densiflora*.

Calyx 10-ribbed, occasionally 15-ribbed, but the secondary ribs always ending at the sinus between the lobes, the ribs with stiff hairs on bulbous bases; an erect parasitic herb, little branched; leaves linear; corolla yellow or sometimes white

3. *lutea*.

Calyx 15-ribbed, all ribs continued to the apex of the lobe:—

Corolla small, white, tube under .75 in. long, limb about .5 in. in diam.; calyx-ribs usually with crustaceous glands bearing minute spines and sometimes almost quite white; leaves linear, up to 2 in. long and sometimes with 1—2 teeth on the margins; parasitic.....4. *euphrasioides*.

Corolla large, tube over .75 in. long, limb nearly 1 in. in diam.; calyx slender, the lobes long acuminate with close glandular and pubescent ribs; leaves linear, up to 2 in. long, narrow.....5. *Masuria*.

1. *STRIGA OROBANCHOIDES*, Benth.; F. B. I. iv. 299; Wt. Ic. t. 1414.

Deccan, in most Districts; Carnatic, in Tinnevely; W. Gháts, in S. Canara and Malabar, up to 6,000 ft. in the hills, usually on red and gravelly soils.

A parasitic plant found on the roots of various plants, chiefly on *Lepidagathis* in Acanthaceae (Wight and others), also on *Euphorbia antiquorum* (Fischer), *Dysophylla* (Barber). The pink corolla has a white spot at the base of each lobe. The calyx is hispid-pubescent, the flowers in dense terminal spikes with short bracts.

2. *STRIGA DENSIFLORA*, Benth.; F. B. I. iv. 299.

N. Circars, Deccan and Carnatic.

An erect scabrid herb, the leaves up to 1.5 in. long, very narrow, the flowers in slender spikes with long bracts and linear bracteoles, the calyx with crustaceous glandular subulate lobes.

3. *STRIGA LUTEA*, Lour.; F. B. I. iv. 299.

All Districts and up to 7,000 ft. in hills, in dry grassy places and among crops.

An erect scabrous hirsute branching parasitic herb, usually pale when dry, the leaves up to 1.5 in. long, very narrow and rough, the flowers in slender spikes with long bracts and minute bracteoles. Watt in Comm. Prod. Ind. records it as parasitic and harmful on sugarcane and Sorghum. I have found it myself on the latter.

4. *STRIGA EUPHRASIOIDES*, Benth.; F. B. I. iv. 299; Wt. Ic. t. 855.

Most Districts, both in the plains and up to about 4,000 ft. in the hills.

A very variable erect herb either slender and rather short, turning black when dry, or stout and branching and greenish-grey when dry. Duthie (Fl. Gang. Pl. ii. 157) says that it is parasitic and destructive in crops of sugarcane and Sorghum, but this is not recorded from Madras. The leaves reach 2 in. in length and are scabrous.

5. *STRIGA MASURIA*, Benth.; F. B. I. iv. 300.

Carnatic, at Guindy near Madras (Shuter).

A slender erect scabrid herb.

24. *Alectra*, Thunb.

Erect rigid usually scabrid herbs, black when dry. Leaves opposite or alternate, sometimes reduced to scales. Flowers in terminal spikes

or racemes, bracteate and bracteolate. *Calyx* campanulate, 5-lobed, the lobes valvate or open in bud. *Corolla* tube broad, the limb oblique; lobes 5, spreading, the lower outer in bud. *Stamens* 4, didynamous, the anthers touching in pairs; cells parallel, their bases mucronate. *Ovary* 2-celled; ovules very many; style simple; stigma elongate, oblong-clavate. *Fruit* a subglobose or ovoid loculicidal capsule, the valves entire, bearing the placentas. *Seeds* very many, minute, linear-cuneate, the testa lax, reticulate longitudinally.

ALECTRA THOMSONI, Hook. f.; F. B. I. iv. 297.

N. Circars, Ethakonda in Godavari, 1,700 ft. (V. Narayanswami).
An erect stiff herb with stems having the leaves reduced to green brown or purple scales, and corolla yellow with red nerves. It is apparently parasitic and usually on Acanthaceae like *Strobilanthes auriculatus*.

25. *Rhamphicarpa*, Benth.

Erect glabrous herbs, drying black. *Leaves*: lower opposite, upper alternate, narrow, entire or pinnatisect. *Flowers* axillary and pedicelled or in bracteate racemes; bracteoles 1—2 or 0. *Calyx* campanulate with 5 acuminate lobes. *Corolla*-tube slender, elongate, straight or incurved; lobes 5, broad, spreading, subequal or the upper connate. *Stamens* 4, didynamous, included; anthers 1-celled, vertical, dorsifixed. *Ovary* many-ovuled; style slender, thickened above; stigma simple. *Fruit* a capsule compressed at right angles to the septum, usually beaked, loculicidal; valves septiferous, placentas large. *Seeds* small, obovoid or oblong; testa reticulate.

RHAMPHICARPA LONGIFLORA, Benth.; F. B. I. iv. 300; Wt. Ic. t. 1415.

W. Coast, in S. Canara, in marshy pastures.

An erect herb reaching 2—12 in. in height with white corolla and beaked capsule, the leaves pinnatisect with filiform segments.

26. *Sopubia*, Ham.

Erect perennial herbs. *Leaves* opposite, or the upper alternate, narrow, linear trifid or pinnatisect. *Flowers* in spikes or racemes with leafy bracts; bracteoles 2. *Calyx* campanulate, 5-lobed. *Corolla*-tube funnel-shaped, dilated at the throat; lobes 5, spreading, the 2 upper inmost in bud. *Stamens* 4, didynamous, the anthers meeting in pairs; one anther-cell fertile, longitudinally dehiscent, the other small and imperfect. *Ovary* many-ovuled; style slender; stigma thickened and tongue-shaped, obtuse or capitate at apex. *Fruit* an ovoid or oblong loculicidal capsule, the valves entire or bifid, separating from the dissepiment which bears large placentas. *Seeds* numerous, oblong or cuneate, often truncate; testa lax, striate or reticulate.

Calyx-teeth subulate, very slender, glabrous within, longer than the ribbed tube; corolla purple, 1—1.5 in. long, the lobes broad, spreading; sterile anther-cells acuminate; lower leaves pinnatisect 1—1.5 in. long, the lobes filiform, these passing gradually into trifid and then to simple floral bracts; capsule oblong, seeds truncate, striate. 1. *delphinifolia*.
Calyx-teeth deltoid-ovate, acute, woolly within, equalling the tube; corolla yellow with a purplish eye, under .5 in. long, the limb rotate; sterile anther-cells obtuse;

lower leaves trifid, .5—1.5 in. long, the lobes linear or filiform, passing into linear floral bracts; capsule emarginate, seeds oblong, spirally reticulate.....2. *trifida*.

1. *SOPUBIA DELPHINIFOLIA*, G. Don; F. B. I. iv. 302. *Gerardia delphinifolia*, Roxb. Cor. Pl. t. 90.

Deccan, Carnatic and E. side of W. Gháts, up to 7,000 ft., less common on W. Coast, in rocky places in the forests, fields and grassy slopes.

A pretty erect herb, reaching 1—3 ft. in height. Fyson says it is a root parasite.

2. *SOPUBIA TRIFIDA*, Ham.; F. B. I. iv. 302.

N. Circars, Mahendragiri in Ganjam at 4,500 ft. (Gamble); Deccan, on Ramandrug in Bellary (Beddome); W. Gháts, Bababudan Hills of Mysore, Nilgiris, Anamalais, Pulneys and Travancore Hills at 3,000—7,000 ft. in grassy pasture land.

A pretty herb, 1—2 ft. high.

27. *Micrargeria*, Benth.

Rigid scabrid erect herbs, black when dry. *Leaves* alternate or the lower opposite, entire or pinnatifid. *Flowers* small, in the upper axils or in long terminal bracteate spikes or racemes; bracteoles 2. *Calyx* campanulate or hemispheric; lobes 5, broad. *Corolla*-tube dilated above, incurved; lobes 5, broad, spreading, entire, subequal, the 2 upper inner in bud. *Stamens* 4, didynamous, included; anthers free, meeting in pairs, cells distinct, subequal, attached by their tips. *Ovary* many-ovuled; style slender; stigma, tongue-shaped. *Fruit* a small globose loculicidal capsule; the valves separating from 2 small globose placentas. *Seeds* numerous, oblong-cuneate; testa lax.

MICRARGERIA WIGHTII, Benth; F. B. I. iv. 303; Wt. Ic. t. 1417.

Deccan, in Mysore and Coimbatore; Carnatic in Tinnevely.

An erect herb reaching 18 in. high, with small corolla and pubescent much ~~curved~~ leaves, the lobes filiform in upper ones, spatulate in lower.

28. *Centranthera*, R. Br.

Scabrid herbs, probably more or less parasitic. *Leaves* opposite or the upper alternate, entire or toothed. *Flowers* axillary or in bracteate spikes or racemes; bracteoles 2. *Calyx* spathaceous, split on one side, compressed, entire or shortly 3—5-lobed. *Corolla*-tube long, tubular or funnel-shaped, incurved and dilated above; limb oblique; lobes subequal, spreading, the 2 upper inside in bud. *Stamens* 4, didynamous, included; anthers meeting in pairs, cells transverse, spurred or mucronate at base; one cell often imperfect. *Ovary* with many ovules; style simple, dilated above; stigma tongue-shaped, acute. *Fruit* an ovoid or subglobose loculicidal capsule; valves entire, the placentas in the middle. *Seeds* very many, conical or cuneate; testa lax, reticulate.

Leaves oblong; corolla funnel-shaped; leaves hispid, the hairs on tubercular bases; seeds conical, the testa spirally reticulate:—

Calyx .25 in. long, ovate, acute; corolla rose-coloured or white, up to .75 in. long; leaves elliptic- or linear-oblong, up to 1.5 in. long; lower filaments pilose

1. *hispida*.

Calyx .5 in. long or longer, oblong, acute; corolla white with a brownish-red blotch in the tube, .75—1 in. long; leaves oblong, the tubercles conspicuous, .5—1 in. long; all filaments pilose.....2. *indica*.
Leaves linear, up to 1 in. long, sparsely tubercular-hispid; corolla tubular, short, yellow; calyx ovoid, .2 in. long, obtuse or subacute; filaments glabrous; seeds cuneate, truncate, the testa reticulate with shining areoles.....3. *humifusa*.

1. CENTRANTHERA HISPIDA, R. Br.; F. B. I. iv. 301; Wall. Pl. As. Rar. t. 45.
Deccan, in Mysore, up to 3,000 ft.; W. Coast, S. Canara to Travancore in wet places and rice-fields.
An erect herb reaching 2 ft. in height.
2. CENTRANTHERA INDICA, Gamble n. comb. *C. procumbens*, Benth.; F. B. I. iv. 301; Trimen Fl. Ceyl. t. 68.
W. Coast in Malabar and Travancore (Wight, Fischer); S. E. Wynaad (Beddome), in wet places.
An erect diffuse herb with bright orange-coloured roots (Trimen).
3. CENTRANTHERA HUMIFUSA, Wall.; F. B. I. iv. 301.
E. Coast, Tada in Nellore (Bourne); W. Coast, S. Canara to Travancore, in wet places.
A diffuse small, erect or prostrate, herb.

29. Pedicularis, Linn.

Perennial or rarely annual semiparasitic herbs. *Leaves* alternate opposite or whorled, pinnatifid or pinnatisect. *Flowers* in bracteate terminal spikes or racemes; bracteoles 0. *Calyx* tubular or campanulate, entire or split down one side, 2—5-toothed, lateral teeth free or connate, entire or crested, lower small or 0. *Corolla* 2-lipped; tube cylindric; upper lip erect, hooded compressed obtuse acute or beaked; lower with 3 spreading or deflexed lobes. *Stamens* 4, didynamous; anthers under the upper lip meeting in pairs; cells distinct, equal, parallel, both perfect. *Ovary* many-ovuled; style slender; stigma subcapitate. *Fruit* a compressed capsule, usually more or less oblique and often beaked, loculicidal; valves often joined to the middle. *Seeds* numerous, various in shape and markings of the testa, usually reticulate.

Calyx .25—5 in. long, cleft to near the base, the teeth crested; corolla rose-pink, .75—1 in. long, the upper lip very slightly beaked; capsule obliquely ovate-falcate, .6 in. long; leaves oblong, prominently crenate, up to 2.5 in. long, .6 in. broad, pubescent.....1. *zeylanica*.
Calyx 1 in. long, tubular, the teeth crested; corolla white, 3—6 in. long with slender tube, the upper lip rounded; capsule falcate, 1 in. long; leaves pinnatifid, cut more than half way to the midrib with crenate lobes, 1.5—2.5 in. long, glandular-hairy.....2. *Perrottetii*.

1. PEDICULARIS ZEYLANICA, Benth.; F. B. I. iv. 317; Wt. Ic. t. 1419; Prain Ann. Calc. iii. 153; t. 14.
W. Ghâts, in all Districts at about 5,000—7,000 ft. in open grass lands in dampish localities; Shevaroy Hills of Salem.
A handsome species of which there are two forms, one erect up to about 2 ft. high, the other branching near the ground and diffuse, but they have no varietal differences.
2. PEDICULARIS PERROTTETII, Benth.; F. B. I. iv. 317; Wt. Ic. t. 1418; Prain Ann. Calc. iii. 119. t. 8.

W. Gháts, Nilgiris above 7,000 ft., not rare near Avalanché and Nilgiri and Mukurti Peaks in the Kundahs; Anamalais above Iyearpadi, 7,000 ft. (Barber), on grass lands.

A striking species with very long corolla-tube. The host plant, if any, has not been recorded.

Calceolaria mexicana, Benth., is a pretty yellow-flowered weed from Mexico now naturalised on the higher parts of the Nilgiris and Pulneys, also on the hills of N. Coimbatore and the Bababudan Hills of Mysore. *Antirrhinum Orontium*, Linn., has been found as an escape in the Nilgiris, and *A. majus*, Linn., the Snapdragon, in both the Nilgiri and Pulney Hills. *Scrophularia peregrina*, Linn., a herb of Asia Minor, is found as a roadside weed in the Nilgiris (Bourne). *Digitalis purpurea*, Linn., the Foxglove, is said to have lately run wild in the Nilgiris. Many handsome-flowered species may be found in gardens, such as those of *Alonsoa*, *Angelonia*, *Maurandia*, *Pentstemon*, *Russelia*.

Family CVIII. OROBANCHACEAE.

Leafless root-parasites; stem usually simple, sometimes branched, the stem or branches with scales. *Flowers* hermaphrodite, irregular, solitary or in spikes or racemes; bracts large, scale-like; bracteoles 1—2 scale-like, or 0. *Calyx* spathaceous or 2-lipped or with 4 or 5 free or connate lobes. *Corolla* hypogynous, curved, usually 2-lipped, sometimes subequally 5-lobed; upper lip often arched, lower 3-lobed, throat often with 2 villous folds. *Stamens* 4, didynamous, adnate to the corolla-tube; anthers 1—2-celled, one cell often imperfect, cells frequently spurred at the base, dehiscence by slits or apical pores. *Disk* usually obscure. *Ovary* of 2 rarely 3 connate carpels, 1-rarely 2-celled; ovules many, on free or confluent parietal placentas. *Fruit* a capsule, usually 1-celled; valves 2 rarely 3. *Seeds* many, minute; testa pitted or reticulate; albumen fleshy; embryo ovoid, often undivided.

Corolla-lobes broad, subequal, spreading:—

Calyx spathaceous, split in front nearly to the base; anther-cells unequal

1. *Aeginetia*.

Calyx tubular-campanulate, 5-lobed:—

Anthers 2-celled, 1 cell often imperfect, spurred at base; stigma peltate

2. *Christisonia*.

Anthers 1-celled, not spurred; stigma clavate.....3. *Campbellia*.

Corolla 2-lipped, upper lip 2-lobed, lower 3-lobed; anther-cells equal...4. *Orobanche*.

1. *Aeginetia*, Linn.

Leafless herbs with simple or branched, naked or scaly scapes or stems. *Flowers* few, large, solitary or corymbose; bracteoles 0. *Calyx* spathaceous, split in front nearly to the base. *Corolla*-tube broad, incurved, obscurely 2-lipped; lobes 5, broad, spreading, the two upper connate, outer in bud. *Stamens* 4, didynamous, included; anthers meeting in pairs with 1 perfect cell adnate to the filament not spurred below, the other absent from the upper pair, empty clavate and deflexed in the lower. *Ovary* 1-celled; placentas 2- or more-lobed, filling the cavity, bearing ovules all over; style slender; stigma large, peltate. *Fruit* a partially 2-valved capsule. *Seeds* crowded, minute, reticulate.

Scape slender, naked; corolla deep purple-red; placentas multiseptate.....1. *indica*.
 Scape short, stout, bracteate; corolla-tube yellow, mouth blue; placentas 2-lamellate
 2. *pedunculata*.

1. *AEGINETIA INDICA*, Linn. ; F. B. I. iv. 320; Roxb. Cor. Pl. t. 91; Wt. Ic. t. 895.

Hills of the N. Circars; W. Gháts, in almost all Districts up to about 3,000 ft.

Parasitic herb of a purplish red colour, the root of interlaced fleshy fibres. It grows apparently on the roots of many different plants.

2. *AEGINETIA PEDUNCULATA*, Wall. Pl. As. Rar. t. 219; F. B. I. iv. 320; Wt. Ic. t. 1421.

W. Ghats, S. Canara to Travancore, up to 4,000 ft.

Parasitic on the roots of grasses. A reddish or yellowish herb with short stem underground and many often long branches with sheathing bracts, the calyx orange colour.

2. *Christisonia*, Gardn.

Fleshy parasitic herbs, the stems simple or tufted on the root-stock and bearing alternate obtuse or acute scales instead of leaves. Flowers usually peduncled, with or without bracteoles. Calyx tubular, 2-lipped or with 5 lobes. Corolla-tube tubular or funnel-shaped, straight or slightly curved, the mouth with 5 nearly equal lobes or obscurely 2-lipped. Stamens 4, usually included; filaments stout, anthers 2-celled, one cell perfect the other imperfect and spurred, the upper pair sometimes with both cells perfect. Ovary 1-celled, placentas large, 2- or more-lobed, bearing all over very numerous ovules; style long; stigma large, peltate. Fruit a partially 2-valved capsule. Seeds very many, minute, testa reticulate.

Stems elongate, up to 12 in. long or longer, with few distant peduncled flowers with one bract, no bracteoles, glabrous except the corolla; anthers 2-celled, one fertile, the other sterile sharply spurred; calyx subbilabiate:—

Stem scales very small, under .25 in. long, obtuse, bracts rather longer; calyx-tube .5 to 1 in. long with triangular lobes; corolla large, up to 2.5 in. long, the lobes broad, rounded, spreading, 1.5 in. in diam. at the mouth.....1. *tubulosa*.

Stem scales oblong, up to .5 in. long, obtuse, bracts longer; calyx-tube .5—.75 in. long, the lobes triangular; corolla rather small, up to 1.5 in. long, the lobes short, obtuse, suberect, .75 in. in diam. at the mouth.....2. *Saulièrei*.

Stems short, up to about 8 in. long, glandular-hairy, with many ovate obtuse pubescent scales, flowers up to about 10, corymbosely arranged on stout peduncles or nearly sessile, bracteoles 2, large; anthers 2-celled, one perfect, the other imperfect long and sharply spurred; calyx and corolla each tubular, glandular-hairy with equal lobes.....3. *bicolor*.

Stems very short, scarcely 1 in. long or none, glabrous, with large scales; flowers crowded on stout short peduncles without bracteoles; anthers: those of longer stamens, with 1 perfect cell, the other a fleshy spur; those of shorter stamens both perfect; calyx large, 2-lipped, with long acute lobes; corolla longer with equal lobes.....4. *subacaulis*.

1. *CHRISTISONIA TUBULOSA*, Hook. f.; F. B. I. iv. 321. *Oligopholis tubulosa*, Wt. Ic. t. 1422.

W. Gháts, Mysore, Nilgiris, Anamalais, Pulneys and hills of Tinnevely and Travancore, usually at about 3,000—4,000 ft.,

about Courtallum on roots of bamboo (Wight), in S. E. Wynaad on rice (Gamble).

A tall parasitic herb, with large sparse flowers, the stems and calyx light brown, the flowers pink, yellowish on the lower lip.

2. *CHRISTISONIA SAULIÈREI*, Dunn in Kew Bull. 1914, 30.

W. Ghâts, Pulney Hills, at Kodaikanal, 7,000 ft. (Saulière).

A slender erect herb, like the former, but with smaller flowers and shorter peduncles.

3. *CHRISTISONIA BICOLOR*, Gardn.; F. B. I. iv. 322. *C. aurantiaca*, Wt. Ic. t. 1486; Spic. Neilgh. t. 167.

Nilgiri Hills, sholas at the head of the Ochterlony Valley at 6,000 ft., probably chiefly parasitic on Acanthaceae like *Strobilanthes*; Pulney Hills at Periyar Shola (Bourne); Bolampatti Hills of Coimbatore (Wight).

A fleshy plant with thick brownish yellow scaly stem, orange-coloured calyx and yellow corolla. The Pulney specimens are very small and differ slightly; they are said to have corolla and calyx rose-coloured.

4. *CHRISTISONIA SUBCAULIS*, Gardn.; F. B. I. iv. 321; Wt. Ic. t. 1423 (corrected in text).

Tinnevely Hills, about Courtallum, probably parasitic on the roots of bamboos (Trimen in Fl. Ceyl.).

A fleshy plant, scarcely showing above ground and covered with a viscid mucilage. The flowers are white, the margins of the corolla-lobes pale blue (Wt. in MS.).

3. *Campbellia*, Wt.

Fleshy parasitic herbs with thick rootstock, the stems with many obtuse scales, usually much imbricate, at any rate at first. *Flowers* peduncled, in crowded heads; bracteoles 2. *Calyx* tubular-campanulate with 5 equal lobes. *Corolla* funnel-shaped, more or less bilabiate; lobes 5, the upper lip 2- the lower 3-lobed, the lobes spreading. *Stamens* 4, exserted; filaments stout; anthers 1-celled opening by a pore at the apex, the opening then extending upwards. *Ovary* 1-celled; placentas 2, meeting in the centre, bearing very numerous ovules; style simple; stigma ovoid or clavate. *Fruit* an imperfectly 2-celled capsule. *Seeds* very many, minute, oblong; testa loose, reticulate.

CAMPBELLIA CYTINOIDES, Wt. Ic. t. 1425. *Christisonia neilgherrica*, Gardn.; F. B. I. iv. 322.

W. Ghâts, Nilgiri and Pulney Hills, in sholas at about 5,000—7,000 ft., parasitic on roots of *Strobilanthes*.

A thick plant of a yellow colour, at first with the scales much imbricate, but they become more distant as the stem elongates with age. The capsules are open quite globose.

4. *Orobanche*, Linn.

Scapigerous herbs; scapes simple or branched; scales acute. *Flowers* in spikes or racemes, each with a scale-like bract; bracteoles 2 or 0. *Calyx* unequally 4-fid or bipartite from back to front, the

lobes entire or bifid with rarely a fifth lobe. *Corolla* 2-lipped; tube curved, dilated above, circumscissile at the base; upper lip erect, crenulate notched or bifid, lower somewhat spreading, 3-lobed. *Stamens* 4, didynamous, included; anther-cells equal, parallel, the bases usually mucronate. *Disk* 0 or glandular. *Ovary* 1-celled, placentas 4, equidistant or in pairs; ovules very many; style simple; stigma funnel-shaped peltate or somewhat laterally bilobed. *Fruit* a 2-valved capsule, the valves often cohering with the style. *Seeds* very many, small, globose or ovoid.

OROBANCHE CERNUA, Loeffl.; F. B. I. iv. 325.

Var. *desertorum*, Beck. *O. nicotianae*, Wt. Ill. t. 158; F. B. I. iv. 326.

N. Circars and Deccan, parasitic on tobacco (see Wight's remarks in Spic. Neilg.) and perhaps other plants.

An erect herb with pale brown stems, the corolla with a white tube and pale blue or violet lobes.

Family CIX. LENTIBULARIACEAE.

Herbs, aquatic or in wet places, often insectivorous. *Leaves* rosulate or, when submerged, capillaceo-multifid, sometimes obsolete. *Flowers* irregular, hermaphrodite, in 1-many-flowered simple or branched scapes; bracts small or 0; bracteoles 2 or 0. *Calyx* inferior, 2—5-lobed or -partite. *Corolla* 2-lipped, spurred; the upper lip usually the smaller, entire or emarginate, the lower usually much larger, 3—5-lobed. *Stamens* 2, attached to the base of the corolla; filaments curved; anthers 2-celled, dorsifixed, the cells transversely confluent, longitudinally dehiscent. *Ovary* 1-celled, globose; ovules very many, on a free basal placenta; style short; stigma unequally 2-lobed. *Seeds* very many, minute, exalbuminous.

Utricularia, Linn.

Herbs, floating and rootless, or, on wet ground and rocks, rooting among other plants, sometimes twining, often furnished with minute bladder-like insect traps, sometimes also in floating species with floating supports to the scape. *Leaves* in floating species multifid with capillary segments, in erect or twining species entire. *Flowers* on simple or branched scapes, racemose; pedicels bracteate and often bibracteolate. *Calyx* 2-partite; lobes entire or nearly so, often accrescent. *Corolla* 2-lipped, the upper lip entire or emarginate, the lower larger and lobed, the spur straight or curved. *Stamens* 2; filaments broad. *Ovary* 1-celled, many-ovuled. *Seeds* of various shapes, minute, the testa often lax and reticulate.

Water plants, the stolons submerged; leaves whorled, with capillary segments mostly interspersed with minute bladders:—

Peduncles with a whorl of spongy floats below the inflorescence; pedicels short; seeds tabular prismatic, with 4—6 usually sharp angles and slightly winged margins.....1. *stellaris*.

Peduncles without a whorl of spongy floats; pedicels long:—

Peduncles and pedicels stout; submerged leaves very many, long, sometimes the uppermost with the rhachis inflated; seeds prismatic with sharp angles

and slightly winged margins; flowers rather large, usually 3—8....2. *flexuosa*.
 Peduncles and pedicels slender; submerged leaves very short, lobes capillary;
 seeds lenticular, with a broad dentate corky wing; flowers small, 1—3

3. *exoleta*.

Terrestrial plants, the stems rooted in mud or moss or among the roots of other plants; leaves often disappearing before flowering and sometimes capillary and furnished with minute bladders:—

Leaves more or less linear or linear-spathulate:—

Scales and bracts of the scape attached by their base:—

Flowers chiefly blue or purple:—

Scapes erect:—

Pedicels recurved in fruit; seed testa reticulate longitudinally:—

Scapes 3—8 in. high, 3—8-flowered, very slender, sometimes bifid;
 sepals ovate, acute, subequal; lower lip of corolla large, 5 in. in
 diam.; spur long, slender, conspicuously curved under the lower lip
 of the corolla, seeds ellipsoid.....4. *arcuata*.

Scapes 3—6 in. high, 3—10-flowered, rather stout, sometimes bifid;
 sepals ovate, acute, subequal, decurrent; lower lip of corolla .25 in.
 in diam.; spur straight, conical, deflexed; seeds obovoid

5. *stricticaulis*.

Pedicels not recurved in fruit:—

Scapes slender, simple, 2—6 in. high, 3—6-flowered; sepals ovate,
 acute; corolla small with obovate upper and orbicular entire lower
 lip, the latter 2—3 in. broad with straight conical spur slightly
 curved forwards; seeds subglobose, the testa with subhexagonal
 scrobiculate areoles.....6. *uliginosa*.

Scapes slender, sometimes slightly twining; spur narrowly-conic,
 curved; seeds reticulate with elongate areoles:—

Scapes short, 4—6 in. long rarely longer, the scales few distant
 lanceolate; calyx-lobes ovate, acuminate; corolla with obovate upper
 and broadly ovate reticulate lower lip; seeds reticulate with elongate
 areoles.....7. *graminifolia*.

Scapes long, 6—18 in. long, very slender, with numerous ovate acute
 small scales; calyx-lobes lanceolate, acuminate; corolla with obovate
 upper and suborbicular lower lip, the spur often much incurved;
 seeds globose, scrobiculate (Wight).....8. *squamosa*.

Scapes twining:—

Flowers large, on scapes up to 10 in. long, erect or twining, scales few
 minute; calyx-lobes ovate, one obtuse, the other acute; corolla with
 obovate upper and broadly suborbicular lower lip .5 in. broad, the spur
 conical and curved, nearly as long; seeds globose, scrobiculate (Wight)

9. *Smithiana*.

Flowers large, on twining often interlacing flexuose scapes up to 2 ft.
 long, the scales few, ovate, very small; calyx-lobes ovate acuminate,
 much enlarged and decurrent in fruit; corolla with broadly obovate
 upper and large sub-orbicular lower lip, .5—1 in. broad, the spur shorter
 slightly curved; seeds rhomboid, reticulate.....10. *reticulata*.

Flowers very small, on exceedingly slender twining scapes at most 6 in.
 long, the scales minute, ovate; calyx-lobes ovate, acute in flower, obtuse
 in fruit; corolla with ovate obtuse upper and ovate lower lip the spur
 conical pendent; seeds minute, reticulate, scrobiculate.....11. *scandens*.

Flowers yellow:—

Scapes erect, glabrous; pedicels recurved in fruit; corolla with rounded
 upper and emarginate lower lip, the palate swollen, the spur as long
 (.25 in.) slightly curved; seeds obovoid, the testa reticulate.....12. *bifida*.

Scapes filiform, twining; pedicels suberect in fruit; corolla with obovate
 slightly emarginate upper and similar but larger lower lip, the spur nearly
 as long and curved outwards; seeds ellipsoid, reticulate...13. *Wallichiana*.

Scales and bracts of the scape attached by their middle; flowers subsessile;
 capsule globose, the seed-testa reticulate:—

Spur longer than the lower lip of the corolla, acute and curved upwards;
 the upper lip oblong-obovate, obtuse, the lower 2 in. long, the margins
 somewhat crenulate.....14. *caerulea*.

Spur shorter than the lower lip of the corolla, obtuse and straight; the upper lip obovate, the lower 3 in. long, slightly more broad, the sides reflexed.....15. *roseo-purpurea*.
 Leaves orbicular or reniform, persistent; calyx-lobes very unequal; seeds glochidiate; corolla with the upper lip small suborbicular emarginate, the lower spreading, 5-lobed.....16. *striatula*.

1. *UTRICULARIA STELLARIS*, Linn. f.; F. B. I. iv. 328; Roxb. Cor. Pl. t. 180; Wt. Ic. t. 1567.
 N. Circars, in standing fresh water; Carnatic, Madras, Tanjore (*vide* Wight).
 A water plant with yellow flowers, only the inflorescence showing above the surface, held up by the floats, which have filiform external pinnules at their apices.
2. *UTRICULARIA FLEXUOSA*, Vahl.; F. B. I. iv. 329. *U. fasciculata*, Roxb.; Wt. Ic. t. 1568.
 N. Circars and Carnatic, chiefly near the coast; W. Coast, in all Districts, in rice-fields, tanks and other fresh-water wet places.
 A water plant with yellow flowers, similar to the former but with longer peduncles, larger flowers and pedicels deflexed after flowering; no floats but occasional inflated upper leaf rhachises; capsules rather large.
3. *UTRICULARIA EXOLETA*, R. Br.; F. B. I. iv. 329. *U. diantha*, Roem. & Sch.; Wt. Ic. t. 1569.
 W. Coast, S. Canara to Malabar, Travancore and Tinnevely, in wet places.
 A small water plant floating in water or sometimes rooting in wet mud, the leaves very small and sparingly lobed, occasionally the whole leaf inflated and linear, especially on mud. Flowers yellow with orange streaks, the spur rather long, the capsules small and globose.
4. *UTRICULARIA ARCUATA*, Wt. Ic. t. 1571, fig. 1; F. B. I. iv. 330.
 Bababudan Hills of Mysore (Law); S. Travancore (Wight).
 A pretty delicate species with bluish-purple flowers and prominently curved slender spur. The roots have small round bladders as have the linear-spathulate leaves.
5. *UTRICULARIA STRICTICAULIS*, Stapf in Herb. Kew. *U. caerulea* var. *stricticaulis*, Koenig. *U. reticulata* var. *uliginosa*, C. B. Clarke; F. B. I. iv. 331. *U. humilis*, Wt. Ic. t. 1572, 2. *not of* Vahl.
 N. Circars, frequent in Ganjam (Gamble); Deccan and Carnatic, Mysore, Madras and Nellore.
 A rather thick-stemmed plant with blue flowers and prominent fruiting calyx, the leaves linear, very narrow, the root bladders very small.
6. *UTRICULARIA ULIGINOSA*, Vahl. *U. affinis*, Wt. Ic. t. 1580, fig. 1; F. B. I. iv. 330. *U. brachypoda*, Wt. Ic. t. 1578, fig. 1.
 W. Ghâts, S. Canara and Mysore to Nilgiris and Travancore, up to 7,000 ft. in the hills in swampy land, more common northwards.
 A small rather obscure species with bluish-purple flowers and conical spur. The linear-oblong obtuse leaves and small bladders are very evanescent.

7. *UTRICULARIA GRAMINIFOLIA*, Vahl. *U. caerulea*, C. B. Clarke; F. B. I. iv. 331, *not* of Linn. *U. pedicellata*, Wt. Ic. t. 1578, fig. 2. *U. uliginoides*, Wt. Ic. t. 1573. *U. conferta*, Wt. Ic. t. 1575.
W. Gháts, in all Districts, especially Nilgiris and Pulneys, in bogs and other wet places at high levels, common.
A slender species with bluish-purple flowers and linear leaves on filiform stolons rooting among grass- and other plant-roots, and provided with small bladders.
 8. *UTRICULARIA SQUAMOSA*, Wt. Ic. t. 1579. *U. caerulea* var. *squamosa*, C. B. Clarke; F. B. I. iv. 331.
Nilgiri Hills, about Sispara at 5,000 ft.; Attapadi Hills of Malabar at 5,300 ft. (Fischer).
A very slender erect plant with blue flowers and linear-spathulate leaves, very evanescent.
 9. *UTRICULARIA SMITHIANA*, Wt. Ic. t. 1577. *U. caerulea* var. *Smithiana*, C. B. Clarke; F. B. I. iv. 331.
W. Gháts, Malabar or Coorg (Wight); Pulneys, at high levels (Bourne).
A slender plant resembling *U. graminifolia* but much larger, also *U. reticulata* but less twining. Flowers blue shaded mauve and lilac, leaves linear-spathulate on filiform rhizomes bearing bladders.
 10. *UTRICULARIA RETICULATA*, Smith Exot. Bot. t. 119; F. B. I. iv. 331; Wt. Ill. t. 143. *U. uliginosa*, Wt. Ic. t. 1574 (*right-hand fig. only*).
W. Coast, in all Districts, in rice-fields, climbing up the stems of the rice.
A striking and interesting species with blue-violet corolla, the palate reticulated with pale blue and white.
 11. *UTRICULARIA SCANDENS*, Oliver; F. B. I. iv. 332.
Carnatic, Madras, Arcot (Shuter); Madura, near the bills (Wight); W. Gháts up to 5,000 ft. in Anamalais (Barber).
A very minute twining plant, often found on other species like *U. Wallichiana*, the flowers blue.
 12. *UTRICULARIA BIFIDA*, Linn.; F. B. I. iv. 332; Bot. Mag. t. 6689.
Deccan and Carnatic, Kambakam Hills of Chingleput (Bourne, etc.), hills of Cuddapah at 2,500 ft.; S. Travancore, in wet places (Bourdillon).
An erect rigid slender herb with yellow flowers, filiform leaves and 2-horned small bladders on threads at their bases.
 13. *UTRICULARIA WALLICHIANA*, Wt. Ic. t. 1572, fig. 1; F. B. I. iv. 332.
Deccan, in hilly country in Salem and Coimbatore above 1,000 ft.; W. Gháts, in all Districts up to 7,000 ft., in bogs and other wet places, common.
A very slender twining plant with yellow flowers and linear evanescent leaves.
- Var. *macrolepis*, Gamble. *U. macrolepis*, Wt. Ic. t. 1580, fig. 2 *excl. seeds*.
Tinnevelly and S. Travancore (Wight).
Scales on the stem comparatively large, ovate, acute.

14. *UTRICULARIA CAERULEA*, Linn.; Wt. Ic. t. 1583. *U. racemosa*, Wall.; F. B. I. iv. 333. *U. nivea*, Vahl; Wt. Ic. t. 1582.
N. Circars, in Ganjam (Gamble); Deccan, Seshachalam Hills of Cuddapah, at 2,500 ft. (Gamble); W. Ghâts, Anamalais, Pulneys and hills of Travancore, up to 7,000 ft.; Shevaroy Hills of Salem; always in swampy places.
A very slender plant with flowers from white to purple, nearly sessile on the scape, the leaves short and spatulate with minute bladders. The very small form with few usually white flowers is var. *filicaulis*, C. B. Clarke.
15. *UTRICULARIA ROSEO-PURPUREA*, Stapf in Herb. Kew. *U. rosea*, C. B. Clarke; F. B. I. iv. 333, *not of* Edgw.
W. Ghâts, Anamalais, Pulneys and hills of Travancore, to 7,000 ft., in swamps.
A slender plant with dark purple (Trimen) or sometimes apparently pinkish flowers, rather large, the leaves rather short and spatulate.
16. *UTRICULARIA STRIATULA*, Sm. *U. orbiculata*, Wall.; F. B. I. iv. 334. *U. glochidiata*, Wt. Ic. t. 1581.
N. Circars, Mahendragiri Hill, Ganjam, 4,000 ft. (Fischer); W. Ghâts, in almost all Districts from S. Canara and Mysore to Tinnevely, above 3,000 ft., on wet rocks; Shevaroy Hills of Salem (Bourne).
A small very pretty slender herb with persistent leaves, filiform stolons bearing many small bladders, and flowers with the upper lip of the corolla white, the lower white with lilac margins and yellow in the throat.

Family CX. GESNERIACEAE.

Herbs or undershrubs, sometimes epiphytic. *Leaves* opposite alternate or solitary, entire or toothed; stipules 0. *Flowers* hermaphrodite, usually irregular, or axillary on terminal peduncles rarely 1-flowered; bracts present; bracteoles usually small. *Calyx* of 5 lobes, valvate or open rarely imbricate. *Corolla* gamopetalous, tubular, more or less 2-labiate; lobes 5. *Stamens* on the corolla-tube, usually didynamous, sometimes 5, often only 2 perfect; anthers 2- or by confluence 1-celled, usually connate in pairs. *Disk* annular or cylindric or 0. *Ovary* 1- or imperfectly 2-celled; ovules numerous on bifid parietal sometimes subconfluent placentas; style linear; stigma capitate or 2-lobed. *Fruit* a 2-valved capsule or a berry; placentas parietal. *Seeds* very many, small, sometimes tipped with long hairs, sometimes with a longish funicle; testa usually reticulate; albumen scanty or 0; embryo straight.

Seeds tipped with one or more hairs from near the hilum, one from the apex; epiphytic undershrubs with fleshy or leathery leaves.....1. *Aeschynanthus*.
Seeds not tipped with hairs:—

Fruit a loculicidal 2-valved capsule; placentas deeply intruded:—

Capsule linear, subfollicular; stamens 2 perfect.....2. *Didymocarpus*.

Capsule ellipsoid or ovoid:—

Erect herbs with blue flowers and leaves with unequal bases:—

Stamens 4 perfect.....3. *Klugia*.

Stamens 2 perfect.....	4. <i>Rhyncoglossum</i> .
Scapigerous herbs with 4 perfect stamens.....	5. <i>Jerdonia</i> .
Fruit a capsule dehiscing circumscissily; succulent herb with flowers in heads.....	6. <i>Epithema</i> .
Fruit a berry with large placentas; undershrub with small flowers and 4 perfect stamens.....	7. <i>Isanthera</i> .

1. *Aeschynanthus*, Jack.

Epiphytic undershrubs, the stems often rooting at the nodes. *Leaves* opposite, fleshy or leathery, usually entire, the nerves obscure but sometimes apparent in dry specimens. *Flowers* often showy, in fascicles on terminal or axillary peduncles, rarely solitary; bracts usually small but sometimes large and coloured, deciduous; bracteoles small. *Calyx* 5-fid or 5-partite. *Corolla* tubular-ventricose, usually large and curved, the limb bilabiate, the upper lip of 2 small, the lower of 3 larger lobes. *Stamens* usually 4 perfect, with sometimes a rudimentary fifth, anthers 2 oblong, usually connate in pairs by their tips. *Disk* annular. *Ovary* superior, oblong or linear, stipitate; placentas naked on the inner face, bearing ovules on the involute margin; stigma dilated. *Fruit* a long linear capsule, loculicidally 2-valved, the valves with placentas recurved at the margins. *Seeds* very many, small, oblong or linear, with 1 or more hairs at the end near the hilum and 1 at the apex; albumen 0; cotyledons very small.

Leaves linear-lanceolate, acuminate at apex, acute or somewhat rounded at base, up to 4.5 in. long, .75 in. broad, the nerves, about 5—6 pairs (apparent when dry), very oblique; calyx-lobes linear, 2—3 in. long; corolla curved, glabrous without except the ciliate lobes, about 1.25 in. long.....1. *Perrottetii*. Leaves elliptic or elliptic-lanceolate, acute, up to 2.5 or even 3 in. long, 1 in. broad, the nerves (when visible) about 5 pairs, spreading and not very oblique; calyx-lobes linear, .5 in. long; corolla slightly curved, pubescent without, the lobes glandular-ciliate, 1.3—1.5 in. long.....2. *planiculmis*.

1. *AESCHYNANTHUS PERROTTETII*, A. DC.; F. B. I. iv. 339.

W. Ghâts, in all Districts, at 4,000—7,000 ft., on trees and rocks in moist forests.

An epiphyte with distant narrow leaves on smooth branches swollen at the nodes and there giving out rootlets. The flowers are handsome, scarlet with purple lines or spots on the lobes and the long papery capsules have seeds with one long hair at each end. *Ae. ceylanica* var. *pinguis*, C. B. Clarke, seems to be only a small form of this with thicker leaves.

2. *AESCHYNANTHUS PLANICULMIS*, Gamble n. comb. *Aeschynanthus Perrottetii*, A. DC., var. *planiculmis* (by error *platyculmis*), C. B. Clarke; F. B. I. iv. 340. *Ae. ceylanica*, Wt. Ic. t. 1347, not of Gardn.

W. Ghâts, hills of Tinnevely above 4,000 ft., in damp forests. An epiphyte with thick flattened stems and close rather broad fleshy leaves, the nodes giving out rootlets. The handsome flowers, larger than those of the former species, are also, apparently, scarlet and spotted, and the capsules and seeds are similar. It is doubtfully distinct.

2. *Didymocarpus*, Wall.

Herbs, rarely undershrubs, erect scapigerous or creeping. *Leaves* opposite alternate or crowded, rarely solitary. *Flowers* axillary, fascicled or pedunculate, cymose subumbellate or racemose with the pedicels in pairs; bracts small. *Calyx* small. 5-fid or 5-partite, the lobes narrow. *Corolla* tubular or campanulate, often ventricose, the mouth often oblique; lobes 5, rounded. *Stamens* included, the 2 anterior perfect, the anthers connate in pairs, the posterior 2 or 3 reduced to staminodes, rarely 4 perfect. *Disk* cylindric or 0. *Ovary* narrow, 1-celled, sessile or stipitate; placentas intruded and then recurved bearing the numerous ovules; style long or short; stigma peltate, emarginate or subcapitate, rarely 2-lobed. *Fruit* a linear rarely lanceolate capsule loculicidally 2-valved or follicular, bearing seeds on the back of the placenta lobes. *Seeds* very many, minute, ellipsoid or subtrigonal, the testa pitted or waved or reticulate.

Very small herb with short stem and only one very thin leaf, ovate-cordate, obtuse, entire, sessile, pilose, the nerves 8—9 pairs chiefly from near the base and prominently arching upwards; flower-pedicels few, fascicled in the leaf-axils; calyx-lobes linear, 1—2 in. long; corolla tubular-funnel-shaped, 3 in. long; capsule 5—7 in. long, pilose.....1. *pygmaea*.
Trailing silvery-pilose herb with stems rooting at intervals, the nodes bearing each one long-petioled orbicular cordate leaf and a rather longer peduncle with a few flowers; the leaf up to about 4 in. in diam. and doubly crenate, the nerves about 6—7 pairs chiefly from the base and arching upwards; calyx-lobes linear, 2 in. long; corolla tubular, curved upwards, 5—75 in. long; capsule slender, 1 in. long, pubescent.....2. *repens*.
Scapigerous herbs, the leaves in a basal rosette:—

All the leaves with simple petioles not winged or broadened:—

Leaves entire, membranous, ovate, subacute, rounded at base, white-pellucid hairy, up to 4 in. long, 2 in. broad, nerves obscure, about 5 pairs, petiole up to 4 in. long; scapes 8—12 in. long, slender, with many flowers in racemes; calyx-lobes linear, 2 in. long; corolla funnel-shaped, 7—1 in. long; capsule slender, 1—1.25 in. long, glabrous.....3. *missionis*.
Leaves regularly shallowly crenate-serrate, elliptic-ovate, obtuse, white-strigose, up to 3 in. long, 2 in. broad, nerves prominent, 8—12 pairs, petiole up to 4 in. long; scapes up to 4 in., umbellately 2—6-flowered; calyx-lobes lanceolate, 2 in. long; corolla tubular ventricose, 75 in. long; capsule slender, 1 in. long, pubescent.....4. *acutifolia*.

Older leaves with elongate petioles, winged and more or less lacerate, the younger and central leaves subsessile, more woolly:—

Petioles up to 6 in. long, ineiso-pinnatifid, the blades membranous, ovate, lobulate, the lobes irregularly crenate, both surfaces softly villous, up to 3 in. long, 2 in. broad, nerves about 5 pairs, much branched; scapes slender, subcorymbose, many-flowered, up to 6 in. long, softly villous; corolla small, tubular-ventricose; capsule 5 in. long, erect, pubescent.....5. *lyrata*.
Petioles up to 5 in. long, narrowly winged, the wings scarcely lacerate, the blades membranous, ovate, obtuse at apex, narrowed at base, prominently crenate, up to 4 in. long, 2.5 in. broad, nerves 5—7 pairs, prominent beneath and branched; scapes slender, up to 10 in. long in fruit; corolla ventricose, 75 in. long; capsule up to 1.5 in. long, oblique, glabrous.....6. *Meeboldii*.
Petioles up to 2 in. long, narrowly winged, the blades ovate, obtuse at apex, rounded or subcordate at base, crenate, up to 3 in. long, 2 in. broad, nerves 4—6 pairs; scapes slender, up to 7 in. long; corolla tubular-ventricose, about 5 in. long; capsule up to 1.5 in. long, oblique, pubescent.....7. *Humboldtiana*.

Older leaves with short petioles, broadened or winged, not lacerate, the younger and central leaves sessile or nearly so:—

Crenatures of the leaves broad and deep, irregular, leaves rather thin, spathu-

late, the blade broadly decurrent on the petiole, bullate and with tufts of white hair, up to 6 in. long, 2·5—3 in. broad:—

Scape-peduncles about 4 in. long, slender, dichotomously branching several times to lax corymbs about 4 in. in diam.; corolla small, oblique at the mouth, 3—4 in. long; capsule slender, 5—8 in. long, very acuminate, villous.....8. *Rotleriana*.

Scape-peduncles up to 10 in. long, stout, once dichotomously branching in few-flowered racemes elongating in fruit; corolla broadly campanulate and slightly ventricose, wide at the mouth, 5 in. long; capsule stout, shortly acute, up to 1·25 in. long, slightly villous.....9. *Fischeri*.

Crenatures of the leaves shallow; leaves thick, the blade ovate or orbicular, broadly decurrent on the short petiole, bullate and thickly tufted with white silky hair, rarely over 3 in. long:—

Petiole about 25 in. broad; crenatures irregular; scapes many stout, the peduncles up to 6 in. long, dichotomously branching in corymbs up to 2 in. in diam.; corolla campanulate, curved, the mouth wide, 5 in. long; capsule 1 in. long, villous.....10. *tomentosa*.

Petiole up to 75 in. broad; crenatures regular; scapes few, the peduncles up to 7 in. long, branching in elongate racemes; corolla up to 4 in. long, campanulate, the mouth very oblique; capsule 75—1 in. long, thickly crispate villous.....11. *lanuginosa*.

Crenatures scarcely any; leaves thick, densely white woolly, obovate-spathulate, up to 2 in. long; scapes under 4 in. long, ending in few-flowered drooping cymes; corolla small, curved, wide at the mouth, scarcely 25 in. long; capsule lanceolate-acuminate, 4 in. long.....12. *Wightii*.

1. *DIDYMOCARPUS PYGMAEA*, C. B. Clarke; F. B. I. iv. 345.

N. Circars, Rampa Hills (V. Narainswami) and Bison Hills (Barber) in Godavari, in crevices of rocks in damp places, usually above 2,000 ft.

A very delicate hyaline-pilose little plant with only one leaf, sessile on a short weak stem up to 3 in. long and up to about 2·5 in. long, 2 in. broad, the corolla apparently pinkish, the seeds somewhat trigonous, the sides with about 5 transverse depressions.

2. *DIDYMOCARPUS REPENS*, Bedd. Ic. t. 120; F. B. I. iv. 354.

W. Gháts, hills of Tinnevely and Travancore, in moist forests at 1,000—3,000 ft. (Beddome, Bourdillon, Barber).

A creeping herb with blue flowers rather wide at the mouth, and dilated filaments, the seeds somewhat trigonous, minutely reticulate.

3. *DIDYMOCARPUS MISSIONIS*, Wall.; F. B. I. iv. 354. *D. membranacea*, Bedd. Ic. t. 176.

W. Gháts, Pachemalai Hills of S. Travancore at 2,000 ft., on moist rocks, rare (Beddome).

A delicate scapigerous stellately white-hairy herb, the flowers pale blue, the seeds angular, scurfy.

4. *DIDYMOCARPUS OVALIFOLIA*, Wt. Ic. t. 1351; F. B. I. iv. 354.

W. Gháts, hills of Tinnevely, about 3,000 ft.

A pretty species with large prominently ventricose flowers, said to be "blue-yellow" (Wt.), probably blue with a yellow throat, the seeds ellipsoid, flattened on one side, minutely scaly.

5. *DIDYMOCARPUS LYRATA*, Wt. Ic. t. 1350; F. B. I. iv. 353.

Tinnevely Hills, about Courtallum, in moist shady places (Wight).

- A softly villous herb with lyrate leaves and small flowers, the seeds oblong, minutely reticulate.
6. *DIDYMOCARPUS MEEBOLDII*, Sm. & Ramas. in Rec. Bot. Surv. Ind. vi. 43.
W. Gháts, hills of Madura and Travancore, about 3,000 ft., at Peermade Ghát (Meebold).
A scapigerous herb with thin leaves, the older white-pilose especially on the nerves, the younger softly rusty-villous, the flowers (probably) pale blue with yellow tube, the seeds subtrigonus minutely pitted.
 7. *DIDYMOCARPUS HUMBOLDTIANA*, Gardn. ; F. B. I. iv. 353.
W. Gháts, Nilgiris, near Coonoor (Bourne, Gamble) and Pulneys (Bourne) at about 6,000 ft., on rocks.
A scapigerous herb with pale lilac flowers.
 8. *DIDYMOCARPUS ROTTLERIANA*, Wall. ; F. B. I. iv. 353.
W. Gháts, hills of Tinnevely and Travancore, at 2,000—3,000 ft.
A large scapigerous herb with many scapes and purple flowers, yellow in the throat, the seeds boat-shaped, rough.
 9. *DIDYMOCARPUS FISCHERI*, Gamble in Kew Bull. 1923, 117.
W. Gháts, Anamalai Hills at 1,700 ft. (Fischer).
A large and handsome species.
 10. *DIDYMOCARPUS TOMENTOSA*, Wt. Ic. t. 1349 ; F. B. I. iv. 353.
Deccan, Veligonda Hills of Nellore (Ramaswami), hills of N. Coimbatore at 4,000 ft. (Fischer) ; Carnatic, Kollimalai Hills of Trichinopoly (Barber) ; W. Gháts, Nilgiris, Anamalais, Pulneys and hills of Madura and Tinnevely, 3,000—6,000 ft., on rocks.
A scapigerous herb with bluish-purple flowers, the seeds subtrigonus, pitted minutely.
 11. *DIDYMOCARPUS LANUGINOSA*, Wt., *not of* Wall. *D. tomentosa* var. *lanuginosa*, C. B. Clarke ; F. B. I. iv. 353.
W. Gháts, hills of Madura and Tinnevely (Wight).
A scapigerous herb with thick cinnamomeous-tomentose leaves.
 12. *DIDYMOCARPUS WIGHTII*, Gamble n. comb. *D. Rottleriana* var. *Wightii*, C. B. Clarke ; F. B. I. iv. 353. *D. Rottleriana*, Wt. Ic. t. 1348, *not of* Wall.
Sivagiri Hills of Tinnevely (Wight), apparently very rare.
A small plant with very white woolly leaves.

3. *Klugia*, Schlecht.

Herbs, the stems rooting near the base, then erect, somewhat succulent. *Leaves* alternate, unequal-sided at base, the lower side cordate, subentire or sinuate, many-nerved. *Flowers* in terminal or leaf-opposed many-flowered racemes ; bracts minute or 0 ; bracteoles very small, linear. *Calyx* campanulate, 5-angled or -winged, one wing often large ; lobes 5. *Corolla*-tube cylindric, limb 2-lipped, the upper very small, the lower broad, rounded or shortly 3-lobed, with 2 hooded depressions at base. *Stamens* 4 perfect, included, inserted above the middle of the tube ; anthers 2-celled, approximate in pairs. *Disk* fleshy, annular or cylindric. *Ovary* ovoid, many-ovuled ; style slender ; stigma obscurely 2-lobed. *Fruit* a loculicidal 2-valved ovoid capsule, the

placentas divided into 2 thick plates, bearing seeds all over. *Seeds* ellipsoid, minute, testa reticulate.

KLUGIA NOTONIANA, A. DC. ; F. B. I. iv. 366 ; Wt. Ic. t. 1353.

W. Gháts, all Districts, above 3,000 ft., in damp places in evergreen forests.

A nearly succulent annual herb reaching 2 ft. in height, with rather large flowers, white in the tube, the large lower lip bright blue with yellow near the cavities at the base; leaves very unequal-sided with many prominent parallel curved nerves, up to 8 in. or more long, 4 in. broad, glabrous or scabrid-pubescent.

4. *Rhyncoglossum*, Blume.

Herbs, usually glabrous. *Leaves* alternate, unequal-sided at base, the lower side cordate, entire or sinuate. *Flowers* in long many-flowered racemes; bracts 0; bracteoles minute. *Calyx* campanulate, 5-lobed. *Corolla*-tube cylindric, contracted at the mouth; limb 2-lipped, the upper short bifid, the lower longer, 3-lobed. *Stamens* 2 perfect included, the anthers 2-celled connivent; the others reduced to staminodes. *Disk* shortly cylindric. *Ovary* ovoid, glabrous, 1-celled; placentas intruded, of 2 thick plates bearing numerous ovules on all sides; style linear; stigma minutely 2-lobed. *Fruit* a membranous loculicidal 2-valved capsule. *Seeds* minute, ellipsoid; testa reticulate.

RHYNCOGLOSSUM OBLIQUUM, Bl. ; F. B. I. iv. 367. Var. *parviflora*, C. B. Clarke.

N. Circars, Mahendragiri Hill, Ganjam, 4,000 ft. (Fischer); W. Coast and W. Gháts from S. Canara to Cochin, up to 3,000 ft., in damp places in evergreen forests.

A succulent herb with blue flowers, similar to *Klugia Notoniana* but usually smaller and with the calyx not winged. Leaves oblong lanceolate acuminate, parallel-nerved, very unequal at base.

5. *Jerdonia*, Wight.

A scapigerous herb, from a thick scarred root-stock. *Leaves* crowded at the base, elliptic, reticulate, long-petioled. *Flowers* in slender few-flowered scapes; bracts small. *Calyx* 5-partite, the lobes lanceolate, long-pilose. *Corolla*-tube elongate, swollen upwards; limb oblique, 2-lipped, upper lip emarginate, lower 3-lobed. *Stamens* 4 perfect; filaments dilated, the lower pair with a descending spur; anthers 2-celled, cohering at their apices. *Disk* cup-shaped. *Ovary* ovoid; placentas 2, each of 2 flat plates bearing ovules on both faces; style linear; stigma peltate. *Fruit* an ovoid, loculicidal, 2-valved villous capsule with 4 many-seeded placentas. *Seeds* funicled, ellipsoid, grooved at the sides.

JERDONIA INDICA, Wt. Ic. t. 1352 ; F. B. I. iv. 368.

W. Gháts, Nilgiri and Anamalai Hills, at about 3,000 ft., in damp evergreen forests; Bolampatti Hills of Coimbatore.

A scapigerous herb with pale lilac corolla marked with red lines, and long petioled rusty-villous leaves up to 2.5 in. long, 2 in. broad, with about 5 pairs of arching nerves and prominent reticulation.

6. *Epithema*, Blume.

Small succulent pubescent herbs; stem simple or branched. *Leaves* few, alternate or opposite. *Flowers* small, in dense pedunculate scorpioid cymes; bract large, solitary, hooded or subspathaceous; bracteoles small, narrow; pedicels very short. *Calyx* campanulate; lobes 5, acute, valvate in bud. *Corolla* small, tubular, 2-lipped, lobes 5, subequal. *Stamens* 4, 2 upper perfect, the anthers 2-celled, cohering, the cells short, soon confluent; 2 lower reduced to staminodes. *Disk* one-sided. *Ovary* ovoid, 1-celled; placentas parietal, stalked, peltate, with ovules on all sides; style filiform; stigma small. *Fruit* a globose membranous capsule included in the calyx and dehiscing circumscissly; placentas T-shaped. *Seeds* very numerous, on slender funicles, oblong, acute at both ends: testa usually spirally striate.

EPITHEMA CARNOSUM, Benth.; F. B. I. iv. 369. Var. *hispida*, C. B. Clarke. *E. ceylanicum*, Wt. Ic. t. 1354, not of Gardn.

W. Ghâts, Nilgiris to Tinnevely Hills, on shaded rocks, at low levels.

A small herb with bluish flowers and leaves of variable size sometimes up to 5 in. in diam. and broadly ovate cordate.

7. *Isanthera*, Nees.

Small undershrubs; almost all parts tawny-silkily woolly. *Leaves* alternate, large, oblanceolate, long-petioled. *Flowers* in axillary peduncled cymes towards the end of the stem; bracts narrow. *Calyx* of 5 narrow lobes extending nearly to the base. *Corolla* small, shortly campanulate, scarcely 2-lipped; lobes 5, ovate. *Stamens* 4 perfect, adnate to the base of the corolla; filaments short; anthers 1-celled, dehiscing marginally, in an arch; staminodes usually absent. *Disk* small, annular. *Ovary* ovoid; placentas 2, recurved and bearing many ovules; style short; stigma small, capitate. *Fruit* an ovoid fleshy indehiscent berry; placentas large, the margin recurved vertically. *Seeds* very small, ellipsoid; testa smooth or slightly wrinkled.

ISANTHERA PERMOLLIS, Nees; F. B. I. iv. 372; Wt. Ic. t. 1355.

W. Ghâts, S. E. Wynaad and Malabar slopes at 2,000–3,000 ft.; hills of Tinnevely, in moist places in evergreen forests.

An erect undershrub with smooth pale brown bark under soft tawny wool, small white flowers and large softly tawny-villous leaves up to 10 in. long, 4 in. broad, long decurrent on a long petiole, the conspicuous parallel nerves about 20 pairs.

Family CXI. BIGNONIACEAE.

Trees or shrubs, sometimes climbing, rarely herbs. *Leaves* opposite, rarely alternate or whorled, 1–3 times odd-pinnate, very rarely simple; leaflets entire or sometimes toothed. *Flowers* hermaphrodite, irregular, in racemes or panicles usually terminal, often large and showy; bracts various. *Calyx* gamosepalous, campanulate or spathaceous; lobes 2–5 or 0, valvate. *Corolla* 2-lipped, tubular-ventricose; lobes 5, subequal, imbricate in bud. *Stamens* 4, didynamous, with often

a 5th usually imperfect, rarely perfect; inserted where the corolla-tube is suddenly swollen; filaments glabrous or hairy at base; anthers 2-celled, the cells parallel or divergent, dehiscing longitudinally. Disk usually thick or annular. Ovary subsessile, 2-celled; ovules numerous, in many rows, anatropous; style long, glabrous; stigma of 2 elliptic lobes. Fruit a usually elongate loculicidally or septicidally 2-valved capsule, the septum enlarging, deciduous with the placentas. Seeds compressed, discoid or trigonous, usually prominently winged, the embryo in an interior membranous testa; albumen 0; cotyledons flattened, sometimes folded.

Perfect stamens 5; a tree with 2—3-pinnate leaves and very large flat capsules

1. *Oroxylum*.

Perfect stamens 4; trees:—

Anther-cells 1 perfect, 1 reduced to a small hook; a tall tree with 2—3-pinnate leaves and very long linear corolla-tube.....2. *Millingtonia*.

Anther-cells 2, both perfect:—

Capsule not winged, cylindric flattened or subquadrangular:—

Calyx spathaceous, split on one side; corolla-tube slender, lobes spreading, crisped on the margins.....3. *Dolichandrone*.

Calyx not spathaceous; corolla-tube ventricose:—

Capsule with a flat or angular septum.....4. *Heterophragma*.

Capsule with a cylindric spongy septum:—

Septum prominently pitted, the seeds trigonous, transversely grooved without, the inner edge fitting into the pit; ovules 2-seriate in each cell

5. *Stereospermum*.

Septum only faintly pitted, the seeds flat; ovules many-seriate in each cell.....6. *Radermachera*.

Capsule winged on both margins, the septum flat; a large tree with large flowers and large pinnate leaves.....7. *Pajanelia*.

1. *Oroxylum*, Vent.

A glabrous tree. Leaves large, opposite, 2—3-pinnate; leaflets entire. Flowers large, in long terminal racemes. Calyx large, leathery, campanulate, the limb truncate or obscurely toothed. Corolla large, fleshy, campanulate; lobes 5, subequal, crisped. Stamens 5 perfect, the posterior one the shortest; filaments inserted near the base of the tube; anthers 2-celled, the cells parallel, oblong. Disk large, cushion-like. Ovary subsessile, contracted at the base, compressed; ovules very many; style slender; stigma 2-lobed. Fruit a very large broadly linear septicfragally 2-valved capsule, compressed parallel to the septum. Seeds very many, flattened, surrounded by a broad hyaline papery wing; cotyledons emarginate.

OROXYLUM INDICUM, Vent.; F. B. I. iv. 378. *Calosanthes indica*, Bl.; Wt. Ic. t. 1337.

Most Forest Districts, chiefly in moist places in deciduous forest; in evergreen forests in Travancore (Bourdillon) up to 2,000 ft.

A small conspicuous but ungainly tree, at once known by the 2—3-pinnate large leaves and the flat capsule, which may reach 3 ft. in length. Bark light brownish-grey, greenish when cut; wood yellowish-white, soft, not used. Vern. Hind. Ullu, Sauna; Ur. Poinponia; Tel. Pampini, Pampana; Tam. Achi, Pana, Pei; Mal. Palaga-paiyani; Kan. Bunepalé.

2. *Millingtonia*, Linn. f.

A tall tree with corky bark. *Leaves* opposite, 2—3-pinnate, the leaflets entire or crenate. *Flowers* in terminal corymbose panicles. *Calyx* small, campanulate, truncate or with 5 short teeth. *Corolla* white; tube long, slender; limb obscurely bilabiate; lobes 5, subequal. *Stamens* 4, didynamous, shortly exsert; anthers 1-celled, the second cell rudimentary, hooked. *Disk* annular. *Ovary* subsessile, cylindric-conical; ovules many 1- or more-seriate; style slender; stigma 2-lobed. *Fruit* an elongate linear capsule compressed parallel to the septum, septicidally 2-valved. *Seeds* very many, flattened, with a broad hyaline wing.

MILLINGTONIA HORTENSIS, Linn. f.; F. B. I. iv. 377; Bedd. Fl. t. 249 (except anthers). *Bignonia suberosa*, Roxb. Cor. Pl. t. 214.

Plains Districts, planted in avenues and gardens and often found run wild. It is said to have come from Burma. Indian Cork Tree.

A tall handsome tree with sweet-scented flowers. Bark thick corky; wood soft, yellowish-white, likely to be useful as a "deal." The tree reproduces well both by seed and by suckers. Vern. *Hind.* Akao-nim'; *Tam.* Kat malli; *Tel.* Kavuki.

3. *Dolichandrone*, Fenzl.

Trees. *Leaves* opposite, pinnate, the leaflets entire or obscurely toothed. *Flowers* few, opening at night, usually white, large or moderate-sized, in terminal corymbs or panicles. *Calyx* spathaceous, cleft to the base on one side. *Corolla*-tube long or short; lobes 5, nearly equal, crisped on the margin. *Stamens* 4, didynamous, included; anthers glabrous, the cells parallel. *Disk* annular. *Ovary* sessile; ovules numerous, many-seriate; style long; stigma 2-lobed. *Fruit* a long subterete or compressed capsule, loculicidally 2-valved; the septum narrow with a transverse false septum, making seemingly 4 cells. *Seeds* much compressed, almost rectangular, with broad wings on each side; cotyledons usually broader than long, emarginate.

Corolla 4—7 in. long, the tube long and slender below, widening after half-way in a funnel, the lobes spreading up to a 4 in. broad mouth; calyx spathe abruptly acuminate at apex; leaves with 5—9 acuminate rhomboid leaflets up to 4 in. long, unequal at base; capsule straight, up to 18 in. long, 1 in. broad, the seeds with corky wings.....1. *spathacea*.

Corolla under 3 in. long, the tube slender below slightly widening, the mouth about 2 in. in diam.; seeds with membranous wings:—

Corolla more than 1.5 in. long, usually 2 in.; calyx-spathe with a recurved point; capsule arcuate with conspicuous speckles, only slightly compressed, 12 in. or more long:—

Glabrous or nearly so, leaflets usually 5 rarely 7, ovate, acuminate, nerves about 5—7 pairs, petiolules 3—6 in. long, that of end-leaflet longer.....2. *atrovirens*.

Pubescent or subfloccose, leaflets usually 5 or 7, sometimes up to 11, ovate or orbicular, obtuse or with a short point, nerves about 5—6 pairs, petiolules 1—3 in. long, that of end leaflet longer.....3. *arcuata*.

Corolla less than 1.5 in. long, calyx-spathe obtuse or emarginate; capsule falcately curved, much flattened, without speckles but minutely striate, up to about 21 in. long, .75 in. broad; leaflets usually 7, orbicular obovate or even obcordate, with a small point, except in var. *Lawii*, grey-pubescent, up to 1.5 in. in diam. but usually much smaller.....4. *falcata*.

1. *DOLICHANDRONE SPATHACEA*, K. Schum.; Sprague in Kew Bull. 1919, 304. *D. Rheedii*, Seem.; F. B. I. iv. 379. *Spathodea Rheedii*, Wall.; Wt. Ic. t. 1339.
W. Coast, S. Canara to Travancore, on the banks of rivers and backwaters.
A moderate-sized deciduous tree with beautiful white flowers which are open at night and then fall off. Wood white, soft. Vern. *Tam.* Vilpadri; *Mal.* Nir pongilium.
2. *DOLICHANDRONE ATROVIRENS*, Sprague in Kew Bull. 1919, 304. *D. crispa*, Seem.; F. B. I. iv. 379.
Deccan, in the Ceded Districts, eastwards to the hills of Nellore, south to Tinnevely and S. Travancore, in dry deciduous forests, up to 3,000 ft.
A moderate-sized tree with pretty white flowers. Bark brown, rough; wood yellowish-brown, useful. Vern. *Tel.* Nironddi; *Tam.* Pumbadri.
3. *DOLICHANDRONE ARCUATA*, C. B. Clarke; F. B. I. iv. 380. *Spathodea arcuata*, Wt. Ic. t. 1340.
Deccan, in Kurnool, Mysore and Coimbatore, in dry deciduous forest, west to Palghat.
A moderate-sized tree, with flowers rather larger than in the last. Bark brown, peeling off in flakes; wood white. Vern. *Tam.* Ran palai.
4. *DOLICHANDRONE FALCATA*, Seem.; F. B. I. iv. 380. *Bignonia spathacea*, Roxb. Cor. Pl. t. 144. *Spathodea falcata*, Wall.; Bedd. Fl. t. 71.
N. Circars, in Vizagapatam and Upper Godavari; Deccan, in Hyderabad, Mysore, and all other Districts; Carnatic, Nellore to S. Arcot, Shevaroy Hills, Sirumalai Hills in Madura, in dry deciduous forests, often on rocky slopes.
A small deciduous tree with white flowers. Bark bluish grey, exfoliating in scales; wood white, hard and close-grained, useful. Vern. *Tel.* Udda, Wodi, Chittivadi; *Tam.* Katuvarsana; *Kan.* Wudige.
Var. *Lawii*, Sprague in Kew Bull. 1919, 308. Nearly or quite glabrous, the leaflets more ovate, with a short point and not emarginate, the nerves 5 pairs.
Dry forest lands in Cuddapah (Gamble).

4. *Heterophragma*, DC.

Trees. *Leaves* large, pinnate. *Flowers* large, in terminal woolly panicles. *Calyx* ovoid and closed when young, afterwards campanulate, irregularly 3—5-lobed. *Corolla* tubular-ventricose, rose white or yellow, glabrous or tomentose without; lobes 5, rounded, subequal. *Stamens* 4, didynamous, included; anthers glabrous, the cells linear-oblong, diverging. *Disk* cushion-shaped. *Ovary* sessile; ovules numerous, many-seriate on each placenta; style long; stigma 2-lobed. *Fruit* an elongate cylindric or more or less compressed, falcate or twisted, loculicidally 2-valved, capsule, the dissepiment flat or 4-angular. *Seeds* compressed, with a membranous wing at each end.

HETEROPHRAGMA ROXBURGHII, DC.; F. B. I. iv. 381. *Bignonia quadrilocularis*, Roxb. Cor. Pl. t. 145.

N. Circars, forests of the Godavari banks at low levels; W. Gháts, hills of S. Canara, in deciduous forest areas.

A large tree with fragrant rose-coloured flowers, densely tomentose calyx, imparipinnate leaves with 7—11 leaflets and narrowly oblong capsules up to 1 ft. long. Wood yellowish-white, hard. Vern. *Tel.* Bondgu; *Tam.* Baro-kala-goru.

H. adenophyllum, Seem., is a Burmese species with large brownish-yellow flowers frequently found in gardens in cultivation.

5. *Stereospermum*, Cham.

Trees. *Leaves* opposite, imparipinnate; leaflets entire or toothed. *Flowers* in large lax terminal panicles. *Calyx* campanulate, truncate or shortly and unequally 5-lobed. *Corolla* tubular-campanulate, curved, 2-lipped, the upper lip 2- the lower 3-lobed; lobes nearly equal, rounded crisped toothed or lacinate. *Stamens* 4 didynamous with a 5th rudimentary, included; anthers glabrous, the cells divergent. *Ovary* sessile, elongate, 2-celled; ovules numerous, biseriate in each cell; style slender; stigmas 2. *Disk* cupular, fleshy. *Fruit* an elongate terete or 4-angled capsule, loculicidally 2-valved; septum thick, corky, cylindrical, pitted in alternating cavities to receive the seeds, the wings of which lie flat along it. *Seeds* trigonous, with a transverse groove without and a prominent ridge within; cotyledons folded, 2-lobed; radicle straight.

Filaments of the stamens with a tuft of woolly hair at the base; leaves and panicles nearly or quite glabrous, the leaflets elliptic, suddenly and long caudate-acuminate at apex; capsule slender, somewhat spirally twisted, 4-angled

1. *tetragonum*.

Filaments of the stamens without a tuft of woolly hair at the base though sometimes villous; leaves and panicles more or less pubescent:—

Petiolules of leaflets very short, scarcely 1 in. long, leaflets broadly elliptic, shortly abruptly acuminate, often serrulate when young, rough; capsule rather stout, nearly terete, lenticellate, usually straight.....2. *suaveolens*.
Petiolules of leaflets longer, up to 4 in. long, leaflets oblong or oblong-lanceolate, acuminate, pubescent beneath even when old; capsule slender, terete, lenticellate, often curved.....3. *angustifolium*.

1. STEREOSPERMUM TETRAGONUM, DC. *S. chelonoides*, C. B. Clarke, F. B. I. iv. 382; Wt. Ic. t. 1341; Bedd. Fl. t. 72, not of DC.

Deccan, Nallamalai Hills, Veligonda Hills of Nellore (Ramawami); W. Gháts, in all Districts, up to about 3,000 ft., chiefly in deciduous forests.

A large tree with yellow flowers veined with red, the capsules up to 2 ft. long. Bark brown; wood hard, greyish brown with darker patches, very little used in S. India. Vern. *Hind.* Padri; *Ur.* Patuli; *Tel.* Pisul, Tagada; *Tam.* Vela-padri, Pombathiri; *Mal.* Karingkura.

2. STEREOSPERMUM SUAVEOLENS, DC.; F. B. I. iv. 382; Wt. Ic. t. 1342.

N. Circars and Deccan, in deciduous forests; W. Gháts, also in deciduous forests, in the hills of Mysore, Malabar and Travancore, scarce.

A large tree with dull crimson flowers, and rather thick straight capsules up to 18 in. long. Bark grey, exfoliating in flat scales;

wood hard, yellowish-brown, useful for many purposes but little used. Vern. *Hind.* Padal; *Tam.* Padri; *Tel.* Kala goru; *Mar.* Parúl; *Kan.* Billa.

3. *STEREOSPERMIUM ANGUSTIFOLIUM*, Haines in Kew Bull. 1922, 121.

N. Circars, near Vizagapatam (Barber); Deccan, Hyderabad Forests (Edwards).
A small tree.

6. *Radermachera*, Zoll. & Moritz.

Trees. *Leaves* opposite, 1—3-pinnate, leaflets petiolulate, entire. *Flowers* large, in terminal racemes, corymbs or panicles. *Calyx* campanulate, truncate or shortly lobed. *Corolla* funnel-shaped or campanulate; tube short; limb sub-bilabiate, the lobes spreading, rounded. *Stamens* 4, didynamous, with a rudimentary fifth, included; filaments slender; anther-cells divaricate. *Ovary* cylindrical, 2-celled; ovules very numerous, in many rows in each cell; style slender; stigma linguiform. *Fruit* an elongate, often twisted capsule; valves 2, woody; septum spongy, faintly pitted and bearing on each side a double row of seeds. *Seeds* small, flat, with a membranous wing at each end; cotyledons flat, not folded; internal testa thin; radicle minute.

RADERMACHERA XYLOCARPA, K. Schum. *Stereospermum xylocarpum*, Benth. & Hook. f.; F. B. I. iv. 383. *Bignonia xylocarpa*, Roxb.; Wt. Ic. tt. 1335, 6; Bedd. Fl. t. 70. *Spathodea xylocarpa*, Brand. For. Fl. t. 43.

N. Circars, hills of Godavari; Deccan, hilly country as at Horsleykonda, Ramandrúg, etc., up to 4,000 ft.; W. Gháts, dry forests in all Districts.

A large deciduous tree with large bipinnate leaves, fragrant flowers in corymbs, a white corolla tinged with yellow or pink, and a long very woody cylindric prominently tubercular capsule sometimes up to 3 ft. long and 1·5 in. in diam. Bark light grey; wood very hard, orange-brown, tough, used for furniture, cart-poles and other purposes. Vern. *Tam.* Vadencarni, Pathiri; *Mar.* Khansing; *Mal.* Vedangkonnai.

7. *Pajanelia*, DC.

A tree. *Leaves* imparipinnate; leaflets numerous, entire, unequal at base. *Flowers* large, in large terminal thyrsoid panicles. *Calyx* large, ovoid, closed in bud, in flower ventricose-campanulate; lobes 5. *Corolla* large, tubular-ventricose; lobes 5, subequal, crisped on the margins. *Stamens* 4, didynamous, with a rudimentary fifth, sub-exsert; filaments slender; anther-cells linear, divergent. *Disk* annular. *Ovary* 2-celled; ovules many-seriate on each placenta; style long; stigma 2-lobed. *Fruit* a large, narrowly oblong, compressed, winged capsule, loculicidally 2-valved, the septum contrary to the valves. *Seeds* compressed, with hyaline wings; cotyledons emarginate.

PAJANELIA RHEEDII, Wt. Ic. tt. 1343, 44; F. B. I. iv. 384.

W. Coast, S. Canara to Travancore, up to 2,000 ft. in the W. Gháts forests (Beddome); much planted as a support for the pepper plant (Bourdillon).

A large deciduous tree in the forests, moderate-sized in plantations, having leaves with 13—15 large leaflets, a large capsule sometimes nearly 2 ft. long with broad wings and corollas 2·5 in. long, white in the tube, crimson-purple on the lobes (Bourd. Trees Trav. 278). Bark pale grey, shining, rough; wood sometimes used for dugout canoes in Travancore. Vern. *Tam. Aranthal*; *Mäl. Arlantha*, Payani.

Several interesting species of this Family, trees or erect or climbing shrubs, have been introduced and cultivated. The most common of these are:

Markhamia stipulata, Seem. (*Dolichandrone stipulata*, Benth. and Hook. f.; F. B. I. iv. 379), a tree from Burma, with yellowish-brown tomentose leaves and inflorescence, the corolla purple inside.

Spathodea campanulata, Beauv., a tree, introduced from Tropical Africa, with large orange-scarlet flowers, the calyx spathaceous.

Kigelia pinnata, DC., a small tree, introduced from Tropical Africa, with pendulous racemes of large red flowers and a long-stalked large gourd-like fruit.

Stenolobium stans, D. Don, a large West Indian shrub with golden-yellow flowers, common in gardens.

Pyrostegia ignea, Presl, a large climbing shrub, native of Brazil, commonly cultivated in gardens, and conspicuous for its showy racemes of orange-red flowers.

Family CXII. PEDALIACEAE.

Herbs, rarely undershrubs. *Leaves* opposite or the upper alternate, entire toothed or lobed; stipules 0. *Flowers* irregular, hermaphrodite, solitary or rarely clustered or racemose, usually axillary; bracts 0 or minute. *Calyx* usually deeply 4—5-lobed. *Corolla* tubular-ventricose; limb 5-lobed, obscurely 2-lipped; lobes imbricate. *Stamens* 4, didynamous, rarely 2. *Disk* hypogynous, fleshy. *Ovary* 2- rarely 1-celled, ovules many or few, superposed; style filiform; stigma 2-lobed. *Fruit* drupaceous or capsular. *Seeds* exalbuminous.

Flowers axillary; stamens 4, didynamous, perfect:—

Fruit indehiscent, with 4 spines on the margin; seeds 2 in each cell

	1. Pedaliium.
Fruit capsular, 2-valved, not spinous; seeds many in each cell.....	2. Sesamum.
Flowers in racemes; stamens 2 only perfect; fruit drupaceous with dehiscent pericarp and hard 2-clawed endocarp.....	Martynia.

1. *Pedaliium*, Linn.

A glabrous annual. *Leaves* opposite or alternate, repand-dentate. *Flowers* axillary, solitary, yellow; pedicels short, 2-glandular at the base. *Calyx* small, 5-partite. *Corolla*-tube slender below, enlarged above; limb sub-bilabiate; lobes 5, round, spreading. *Stamens* 4, didynamous, with a 5th rudimentary; anther-cells ovate, pendulous, opening by short slits. *Disk* large, oblique. *Ovary* 2-celled, ovules 2 in each cell; style slender; stigma 2-lobed, the lower the smaller. *Fruit* hard, indehiscent, 2-celled; the upper part ovoid obtuse above, tetragonous

below with sharp conical spines at the angles. *Seeds* 2 in each cell, superposed, pendulous, oblong; testa membranous, produced; cotyledons oblong.

PEDALIUM MUREX, Linn.; F. B. I. iv. 386; Wt. Ic. t. 1615.

E. Coast from the Chilka Lake southwards, on sandy shores; inland in the Carnatic, Coimbatore (Wight, etc.), Trichinopoly (King).

A branching sub-fleshy herb with minute glands, badly smelling, the leaves glaucous green, ovate, repand, long-petioled, the fruits spinous. The whole plant is used in medicine, and renders water or milk mucilaginous. Vern. *Ur*. Gokara; *Tam*. Anai-nerinji.

2. *Sesamum*, Linn.

Erect or prostrate herbs. *Leaves* opposite below, alternate above, entire toothed lobed or divided. *Flowers* axillary solitary or few and fascicled, shortly pedicelled. *Calyx* small, 5-partite. *Corolla* tubular-ventricose, slightly gibbous at base, 2-lipped, the upper lip usually the smaller, often a ring of hairs at the base inside below the stamens. *Stamens* 4, didynamous, included; anther-cells oblong, parallel. *Disk* annular. *Ovary* 2-celled, with false septa making it 4-celled when mature; ovules many, 1-seriate in each cell; style filiform; stigma 2-lobed. *Fruit* an oblong or ovoid capsule, loculicidally 2-valved, 4-chambered. *Seeds* many, obliquely oblong or obovate, sub-compressed; cotyledons elliptic-oblong.

Erect herbs; leaves large, thin, the lower ones lobed or pedatisect, sparsely hairy, the lobes often serrate, up to 5 in. long; corollas whitish-pink or purplish, with yellow marks, 1—1.25 in. long; capsule oblong, 1 in. long, dehiscent from above to about halfway down.....1. *indicum*.

Prostrate branching herbs; capsule ovoid, .5 in. or more long:—

Leaves variable, from elliptic or orbicular in outline and deeply pinnatifid to spatulate and coarsely lobed, 1—2 in. long, grey-hispid-pubescent; flowers 1—1.5 in. long; capsule .6 in. long, .3 in. broad, obtuse and apiculate.....2. *laciniatum*.

Leaves orbicular or obovate, crenate, densely white tomentose beneath, .3—5 in. in diam.; flowers .75—1 in. long; capsule .5—7 in. long, obtuse, broad at base, then contracted, apiculate.....3. *prostratum*.

1. *SESAMUM INDICUM*, Linn.; F. B. I. iv. 387; Wt. Ill. t. 163.

All districts, in the plains and lower hills, largely cultivated and often found run wild on road sides and waste land. Gingelly. An erect annual up to 2 ft. high, branching from the base, the seeds obovate, smooth, margined, black or white. The seeds give a valuable oil, used for cooking, for lamps and for many other purposes and largely exported. Vern. *Hind*. Til; *Tel*. Nuvvulu; *Tam*. Yellu cheddi.

2. *SESAMUM LACINIATUM*, Klein; F. B. I. iv. 387; Wt. Ic. t. 1345.

Deccan, in Cuddapah and Kurnool; Carnatic, Kambakam Hill in Chingleput, usually on dry rocky ground.

A stout herb with many prostrate branching stems from a stout central rootstock, the flowers dark purple, the seeds black and deeply reticulate.

3. *SESAMUM PROSTRATUM*, Retz; F. B. I. iv. 387; Wt. Ic. t. 1346.

E. Coast from the Kistna southwards, on sandhills near the

sea; inland at Bangalore (Cleghorn) and near Coimbatore (Fischer) on dry sandy lands; Kambakam Hill in Chingleput (Bourne).

A prostrate herb with long trailing branches from a thick tap-root, the flowers purple, the seeds black and reticulate.

Martynia annua, Linn., the Tiger-claw plant, is a coarse clammy pubescent herb with handsome large rose-coloured blotched flowers, large deltoid-ovate cordate leaves and a curious fruit with 2 sharp anterior hooks. It is common on roadsides, rubbish heaps and waste places. It is a native of Mexico.

Family CXIII. ACANTHACEAE.

Herbs or shrubs, rarely trees. *Leaves* opposite, usually entire, usually lineolate with prominent raphides; stipules 0. *Flowers* hermaphrodite, usually irregular, in cymes racemes or spikes rarely solitary; bracts large or small, sometimes 0; bracteoles usually 2. *Calyx* 5- rarely 4-partite (in *Thunbergia* small, often multifid). *Corolla* 2-lipped or subequally 5-lobed; lobes imbricate or twisted in bud. *Stamens* 4 or 2, inserted on the corolla-tube, sometimes a staminode 5th; anthers 2- or 1-celled, the cells sometimes remote. *Disk* often conspicuous. *Ovary* superior, 2-celled; ovules 1 or more in each cell, in one or two series, anatropous; style simple; stigma usually 2-lobed, the lobes often unequal. *Fruit* a loculicidal capsule, the valves often elastically recurved, the septum splitting. *Seeds* usually hard, attached, except in a few genera, to upcurved supports (*retinacula*), ovoid or compressed, the testa smooth or rugose or clothed with appressed hairs which are often elastic and spread out when wetted; albumen none or rarely scanty; cotyledons usually flattened.

Seeds not supported on retinacula; leaves not lineolate:—

Climbers; flowers usually large; ovules 2 in each cell, collateral:—

Calyx minute, annular or 10–15-toothed.....1. *Thunbergia*.

Calyx 5-lobed.....2. *Meyenia*.

Erect or prostrate plants; flowers usually small; ovules more than 2 in each cell:—

Calyx 4-partite; stamens 2:—

Bracts rigid; peduncle of spike covered with alternate scales...3. *Elytraria*.

Bracts herbaceous; peduncle of spike without scales or 0.....4. *Nelsonia*.

Calyx 5-partite; stamens 4.....5. *Staurogyne*.

Seeds supported on retinacula:—

Retinacula minute, straight; lower leaves often toothed or pinnatifid

6. *Cardanthera*.

Retinacula hooked:—

Corolla without an upper lip, the lower lip large, expanded, 3-lobed:—

Lower filaments with an excurrent process.....7. *Blepharis*.

Lower filaments without an excurrent process.....8. *Acanthus*.

Corolla 2-lipped or with 5 subequal lobes:—

Corolla-lobes twisted to the left in bud:—

Ovules more than 2 in each cell; the capsule normally 6- or more seeded:—

Corolla distinctly 2-lipped:—

Inflorescence spinous; capsule 2–8-seeded.....9. *Asteracantha*.

Inflorescence not spinous; capsule 8- or more seeded...10. *Hygrophila*.

Corolla subequally 5-lobed:—

Capsule clavate with a solid base.....11. *Ruellia*.

- Capsule seed-bearing from the base:—
 Flowers capitate or axillary, subsessile.....12. **Hemigraphis**.
 Flowers in clusters in terminal panicles.....13. **Stenosiphonium**.
 Ovules 2 in each cell; the capsule 4- or fewer-seeded:—
 Placentas separating elastically from the base of the ripe capsule:—
 Bracteoles very large, reticulate; corolla large.....14. **Petalidium**.
 Bracteoles none; corolla small.....15. **Micranthus**.
 Placentas not separating elastically from the base of the ripe capsule:—
 Anthers minutely mucronate at base; stamens 4.....16. **Dyschoriste**.
 Anthers not spurred at the base:—
 Corolla subequally 5-lobed:—
 Stamens 2; corolla-tube long and linear.....17. **Eranthemum**.
 Stamens 4 or 2; corolla-tube usually short and cylindric below, ventricose above.....18. **Strobilanthes**.
 Corolla deeply 2-lipped; stamens 4.....19. **Calacanthus**.
 Corolla-lobes imbricate in bud:—
 Ovules 3—10 in each cell; capsule normally 6- or more-seeded:—
 Capsule compressed at right angles to the septum; seeds ovoid hardly compressed:—
 Flowers in panicles often unilateral racemes, without axillary cladodes.....20. **Andrographis**.
 Flowers clustered in the midst of axillary cladodes.....21. **Haplanthus**.
 Capsule subterete; seed much compressed:—
 Corolla-tube slender, the limb shortly 2-lipped.....22. **Gymnostachyum**.
 Corolla-tube short, the limb deeply 2-lipped.....23. **Diotacanthus**.
 Ovules 2 or rarely 1 in each cell:—
 Corolla-lobes 5, subequal:—
 Anthers 1-celled; 2 inner calyx-lobes smaller than the outer.....24. **Crossandra**.
 Anthers 2-celled:—
 Calyx 4-partite, the anterior lobe of the outer pair more or less bifid; 2 stamens only fully perfect.....25. **Barleria**.
 Calyx 2-partite, the upper lip 3- the lower 2-lobed; 4 stamens, one pair perfect the other imperfect.....26. **Neuracanthus**.
 Calyx 5-partite:—
 Stamens 4; corolla-tube cylindric below, inflated above.....27. **Asystasia**.
 Stamens 2; corolla-tube long and slender, limb spreading.....28. **Pseuderanthemum**.
 Corolla distinctly 2-lipped:—
 Stamens 4, anthers 2-celled; bracts conspicuous, often spinous.....29. **Lepidagathis**.
 Stamens 2:—
 Anthers 1-celled; bracts and bracteoles linear-setaceous.....30. **Monothecium**.
 Anthers 2-celled:—
 Placentas separating elastically from the valves, from the base:—
 Bracts in 1-sided spikes, some of the rows barren.....31. **Rungia**.
 Bracts clustered in the leaf-axils or laxly cymose.....32. **Dicliptera**.
 Placentas not separating elastically from the valves:—
 Anther-cells parallel, subequal; bracts large, imbricate.....33. **Ecbolium**.
 Anther-cells one higher up than the other:—
 Anther-cells with a white basal spur-like appendage.....34. **Justicia**.
 Anther-cells not appendaged spur-like at base:—
 Anther-cells minutely apiculate at base; bracts large.....35. **Adhatoda**.
 Anther-cells muticous; capsule at base stalked:—
 Corolla-tube short, limb small.....36. **Dianthera**.
 Corolla-tube long and slender, the upper lip linear-oblong, the lower broad; bracts and bracteoles small; corolla white.....37. **Rhinacanthus**.

Corolla-tube slender, often twisted; bracts larger than bracteoles in opposite pairs; corolla rose or purple
38. *Peristrophe*.

1. *Thunbergia*, Linn. f.

Climbers, rarely erect. *Leaves* opposite, often cordate hastate or angular palminerved. *Flowers* axillary or in racemes, large or moderate-sized; bracts at the base of the pedicels leaf-like; bracteoles large, enclosing the flower buds. *Calyx* small, annular or 10—16-toothed or obscure. *Corolla* conspicuous, the tube cylindric or ventricose, curved, the limb oblique; lobes 5, twisted to the left in bud. *Stamens* 4, didynamous, inserted near the base of the corolla-tube; anthers 2-celled, the cells parallel, sometimes spurred at the base. *Disk* annular or cushion-like. *Ovary* 2-celled; ovules 2 in each cell; style long; stigma funnel-shaped 2-lobed or entire, or style bifid with capitate stigmas. *Fruit* a capsule, globose below, suddenly narrowed to a barren sword-shaped beak. *Seeds* 2 in each cell, globose, the base hollowed or flattened, the funicle minute or conic, no retinacula.

Flowers axillary, solitary or in pairs on long pedicels; calyx 10—16-toothed:—

Flowers white, leaf-petioles not winged:—

Calyx-teeth linear lanceolate, up to .15 in. long; leaves ovate or oblong, cordate or hastate at base, often angularly lobed, from nearly glabrous to softly tomentose; capsule glabrous or puberulous.....1. *fragrans*.

Calyx-teeth filiform, very villous, up to .25 in. long; leaves ovate or ovate-lanceolate, cordate to hastate with spreading lobes at base, tomentose when young afterwards nearly glabrous; capsule villous.....2. *tomentosa*.

Flowers yellow with purple-black brown or claret-coloured throat; leaf-petioles winged; leaves ovate cordate or hastate, villous; calyx-lobes short, villous; capsule villous, the beak slender.....3. *alata*.

Flowers in racemes, the lower ones often axillary; calyx an entire or slightly crenulate ring:—

Flowers bright yellow or orange, the tube purplish, in long pendent racemes; anthers bearded and with a long slender spur to each cell; leaves lanceolate, acuminate, up to 6 in. long, 2 in. broad, sometimes ovate and up to 3 in. broad, slightly dentate, prominently 3-ribbed and coarsely reticulate, glabrous

4. *mysorensis*.

Flowers pale blue:—

Racemes long, pendent, the bracteoles very prominent, orbicular-cordate, mucronate, about 1 in. in diam. and usually 7-ribbed; anthers glabrous with a long spur to each cell; leaves elliptic-ovate, long-acuminate, up to 5 in. long, 4 in. broad, repand-dentate, 5-ribbed and reticulate.....5. *Wightiana*. Racemes stout, rather dense-flowered, with flowers also in upper axils, solitary or in pairs; bracteoles elliptic-falcate about 1.25 in. long; anthers bearded and spurred; leaves deeply cordate, angular, about 5 in. in diam.....*grandiflora*.

1. *THUNBERGIA FRAGRANS*, Roxb. Cor. Pl. t. 67; F. B. I. iv. 390.

All Districts, but especially on the E. side, up to about 4,000 ft., in the hills, both the species and the varieties *laevis* and *vestita*.

A slender twiner with variable leaves, the end branches having them rather narrow and oblong lanceolate, the flowers not fragrant.

Var. *laevis*, C. B. Clarke. Calyx-tube rather long and stiff, nearly glabrous, the teeth short; leaves thin and reticulate; pedicels often much thickened.

Var. *vestita*, C. B. Clarke. Calyx-tube short, teeth linear, very villous; leaves thick, tawny-villous, often tomentose.

Var. *hispida*, Gamble. Stems and leaves hispid, sometimes nearly strigose; leaves broadly ovate, subcordate, apiculate, repand; bracteoles large; calyx teeth villous.

N. Circars, Mahendragiri in Ganjam (Fischer), Vantabla in Vizagapatam (A. W. Lushington), about 4,000 ft.

2. *THUNBERGIA TOMENTOSA*, Wall.; F. B. I. iv. 391.

W. Gháts, Nilgiri Hills, at 5,000—6,500 ft. (Wight and others), at Coonoor (Meebold); Sirumalai Hills of Madura.

A slender climber with prominent large ovate bracteoles, slender cylindric corolla-tube 1.25 in. long and large rounded lobes, the mature leaves reticulately nerved and with long basal auricles.

3. *THUNBERGIA ALATA*, Bojer Ex. Sims Bot. Mag. t. 2591; F. B. I. iv. 391.

Most Districts, cultivated in gardens and apparently run wild in places in the W. Gháts, native of Tropical Africa.

A slender climber.

4. *THUNBERGIA MYSORENSIS*, T. And.; F. B. I. iv. 393. *Hexacentris mysorensis*, Wt. Ic. t. 871.

W. Gháts, S. Canara and Mysore to Travancore and Tinnevely, up to 3,000 ft.

An extensive glabrous climber with long slender branches, the flowers pendent with long open corolla-lip, the bracteoles ovate-oblong, purplish-green.

5. *THUNBERGIA WIGHTIANA*, T. And.; F. B. I. iv. 393. *Schmidia bicolor*, Wt. Ic. t. 1848.

W. Gháts, Nilgiri Hills, W. side, below Sispara, about 5,000 ft.

A large climber with long pendent branches, the conspicuous bracteoles 2-coloured, half red and half green.

Thunbergia grandiflora, Roxb.; F. B. I. iv. 392; Wt. Ic. t. 872 is a large and beautiful blue-flowered climber, native of Eastern Bengal, frequently grown in gardens. *T. erecta*, T. And., is an erect shrub about 6 ft. high with purple or white flowers, a native of Tropical Africa, often grown in gardens.

2. *Meyenia*, Nees.

A climber. *Leaves* opposite, coriaceous. *Flowers* large, usually solitary, axillary, pedicellate; bracteoles large, ovato-oblong. *Calyx* small, obscurely 5-lobed. *Corolla* funnel-shaped, the throat gradually enlarged; lobes 5 spreading, subequal. *Stamens* 4, didynamous; anthers bearded at the apex, those of the longer pair with unequal cells, one long and narrow, the others spurred at the base, those of the shorter with subequal cells, not spurred, pollen-grains crimped on the margins. *Ovary* 2-celled; ovules 2 in each cell; style slender; stigma 2-lobed, each lobe with a fold behind. *Fruit* a capsule, swollen at the base, with a broad conical beak, 4-seeded. *Seeds* subglobose, the funicle in a small cavity, no retinacula; cotyledons unequal.

MEYENIA HAWTAYNEANA, Nees; Wt. Ic. t. 1487. *Thunbergia Hawtayneana*, Wall. Pl. As. Rar. t. 164; F. B. I. iv. 391.

Deccan and Carnatic, in hilly country, up to 4,000 ft.; W. Gháts, from S. Canara to Nilgiris and Pulneys, on E. slopes chiefly, in dry country.

A small climbing shrub with slender branches, beautiful blue-purple flowers and ovate acute sessile reticulate leaves up to 4.5 in. long, 2 in. broad.

3. *Elytraria*, Vahl.

Herbs, nearly stemless. *Leaves* alternate, crowded, subradical. *Flowers* small, in close rigid, simple or branched, spikes, the scapes closely covered by spirally imbricate bracts, the upper ones larger and flower-bearing; bracteoles small. *Calyx* 4-partite, the segments unequal. *Corolla*-tube linear; limb 2-lipped; lobes 5, the lower longest, imbricate in bud. *Stamens* 2 perfect; anthers elliptic, the cells parallel, sometimes with a minute spur. *Disk* small. *Ovary* oblong, 2-celled; ovules 6—10, superposed, in each cell; style slender; stigma shortly 2-lobed. *Fruit* an oblong acute capsule. *Seeds* small, reticulate, not on retinacula; cotyledons small, round.

ELYTRARIA ACAULIS, Lindau. *E. crenata*, Vahl; F. B. I. iv. 394. *Justicia acaulis*, Linn. f.; Roxb. Cor. Pl. t. 127.

N. Circars, Deccan and Carnatic, in dry Districts, in grassy lands and open forest undergrowth.

A scapigerous herb with small white flowers on long bracteate scapes, the leaves obovate, crenate, obtuse, up to 8 in. long, 2.5 in. broad, the bases surrounded by woolly hairs.

4. *Nelsonia*, R. Br.

Diffuse softly villous herbs. *Leaves* opposite, entire, subequal. *Flowers* small, in dense short spikes with many ovate closely imbricate glandular villous bracts; bracteoles 0. *Calyx* small, 4-partite; lobes unequal, lanceolate, the larger often bifid. *Corolla* small; tube slender; limb 2-lipped; lobes spreading, obtuse. *Stamens* 2, attached above the middle of the corolla-tube; anthers 2-celled, the cells ellipsoid, divergent, mucous or minutely spurred. *Ovary* 2-celled; ovules 8—10 in each cell; style slender; stigma shortly 2-lobed. *Fruit* an oblong, acute capsule, the lower part seed-bearing only. *Seeds* small, subglobose, granular, no retinacula.

NELSONIA CAMPESTRIS, R. Br.; F. B. I. iv. 394.

N. Circars, in undergrowth of deciduous fruit; W. Gháts, Mysore, Malabar and Travancore, at low levels.

A soft trailing herb with purplish flowers, the lower leaves large, oblong, up to 9 in. long, 2 in. broad, long-petioled, the upper ones much smaller and often sessile.

5. *Staurogyne*, Wall.

Herbs or small undershrubs. *Leaves* opposite, rarely alternate, usually petioled with smaller leaves in the axils. *Flowers* small, in terminal or also axillary, simple or compound, lax or dense, spikes or racemes; bracts small or large and leafy; bracteoles 2. small. *Calyx*

deeply 5-partite; segments linear or oblong, subequal or one larger than the others. *Corolla-tube* cylindric or funnel-shaped; limb 2-lipped; lobes 5, short, spreading. *Stamens* 4, didynamous, included, with sometimes a minute staminodial fifth; filaments hairy; anthers with 2 ovoid separate muticous cells. *Disk* small. *Ovary* oblong, 2-celled; ovules numerous; style slender; stigma of 2 narrow lobes, one often again 2-lobed. *Fruit* an oblong capsule with many seeds, seed-bearing throughout. *Seeds* many, globose, smooth or pitted, the hilum hollowed, no retinacula.

Stem erect, the branches not trailing, viscous-pubescent; upper leaves or nearly all alternate, spathulate; bract narrow spathulate, bracteoles 2 linear, small; seeds globose, not pitted.....1. *glauca*.

Stem-branches trailing with short erect stems from the nodes, hispid, not viscous; leaves all opposite, elliptic-oblong or obovate; bract broad, obovate, bracteoles 2 linear-lanceolate; seeds pitted.....2. *zeylanica*.

1. STAUROGYNE GLAUCA, O. Kze. *Ebermaiera glauca*, Nees; F. B. I. iv. 395; Wt. Ic. t. 1488. *E. ligulata*, Bedd. Ic. t. 245.

N. Circars, in Ganjam (Gamble); Deccan, in Kurnool, Nallamalai Hills (Beddome); W. Gháts, Coorg to Travancore, in wet places.

An erect viscous herb with purplish flowers, striped rose or yellow.

2. STAUROGYNE ZEYLANICA, O. Kze. *Ebermaiera zeylanica*, Nees; F. B. I. iv. 397.

Deccan, in Mysore; W. Gháts from S. Canara to Travancore, not common.

A herb of wet places in the forests with trailing branches.

6. *Cardanthera*, Buch.-Ham.

Aromatic, often viscid herbs. *Leaves* opposite, often lineolate, the upper toothed, rarely entire, the lower often pinnatifid, or if submerged, pectinate. *Flowers* in spikes or axillary whorls or 1—3 in the leaf-axils; bracts and bracteoles foliaceous, but often suppressed. *Calyx* 5-partite, the lobes narrow, often unequal. *Corolla-tube* straight; limb 2-lipped, the upper erect, 2-lobed, the lower 3-lobed with a transversely plaited palate. *Stamens* 4, didynamous, anthers of the posterior pair often smaller, cells parallel. *Ovary* narrow, 2-celled; ovules many; style slender; stigma linear, bent. *Fruit* a narrow 2-celled capsule, many-seeded throughout. *Seeds* very many, small, ovoid; retinacula minute, conical, straight.

Flowers in terminal spikes with ovate imbricating bracts; calyx-lobes linear; leaves ovate or oblong or spathulate, up 2·5 in. long, 5 in. broad, entire or crenate.....1. *uliginosa*.

Flowers in axillary whorls:—

Glabrous or nearly so; bracts and calyx-lobes linear-lanceolate, acuminate; leaves oblong, crenate-serrate, up to 2 in. long, 4 in. broad, the lower ones sometimes pinnatifid.....2. *balsamica*.

Crispate-villous; bracts and calyx-lobes spathulate, obtuse; leaves elliptic or obovate, up to 1 in. long, 3 in. broad, crenulate.....3. *verticillata*.

Flowers solitary in opposite axils, rarely in loose spikes; bracts obovate; calyx-lobes linear, often toothed; leaves deeply pinnatifid, up to 4 in. long, 1 in. broad.....4. *pinnatifida*.

1. *CARDANTHERA ULIGINOSA*, Buch.-Ham. ; F. B. I. iv. 403.
N. Circars, Ganjam (Gamble), Godavari in sugar-cane gardens (Bourne); Carnatic, near Madras, in drying rice-fields (Wight); W. Gháts, Anamalái Hills, at 800 ft. (Fischer).
An erect or decumbent branching annual herb with purplish (?) flowers.
2. *CARDANTHERA BALSAMICA*, C. B. Clarke ; F. B. I. iv. 404. *Adenosma balsamea*, Spr. ; Wt. Ic. t. 446.
N. Circars, Deccan and Carnatic, in rice-fields, common.
An erect or decumbent branching annual herb with pink or lilac flowers.
3. *CARDANTHERA VERTICILLATA*, C. B. Clarke ; F. B. I. iv. 404. *Adenosma verticillata*, Nees ; Wt. Ic. t. 1524.
Deccan, in Mysore (Wight); S. Canara (Beddome) in rice-fields.
An erect annual herb with purplish flowers, often rooting below.
4. *CARDANTHERA PINNATIFIDA*, C. B. Clarke ; F. B. I. iv. 405. *Adenosma pinnatifida*, T. And. ; Bedd. Ic. t. 246.
S. Canara (Wight), on river banks (Dalzell).
A slender glandular herb with purple flowers and pinnatifid leaves.

7. *Blepharis*, Juss.

Herbs or undershrubs, often spinous. *Leaves* opposite or 4 in a whorl, sometimes unequal, subentire toothed or spinous. *Flowers* small or moderate-sized, in terminal spikes or on suppressed lateral branches; spikes 1- or few-flowered or capitate or strobilate; bracts in several opposite decussate pairs. *Calyx* 4-partite; lobes unequal, in opposite pairs, the inner smaller. *Corolla*-tube horny, upper lip subobsolete, lower spreading, flat, with 3—5 rounded lobes. *Stamens* 4, didynamous; filaments thick, rigid, the anterior ones produced beyond the insertion of the anthers; anthers 1-celled, the margins thickly bearded, the 2nd cell small or obsolete. *Disk* annular. *Ovary* 2-celled; *ovules* 2 in each cell; style linear; stigma shortly 2-fid. *Capsule* oblong or ovoid, 2- or 4-celled. *Seeds* compressed, orbicular, echinate-papillose, on rigid retinacula.

Leaves in opposite pairs, ovate-lanceolate, acute, entire or spinous-dentate, up to 3 in. long, 1.5 in. broad, with scattered bulbous-based hairs; flowers solitary or in few-flowered terminal spikes; bracts 3 pairs, the middle pair 3-toothed; calyx with the outer lobe spatulate, 1 in. long, the opposite one nearly as long, 2-toothed, the inner pairs smaller, lanceolate; corolla lip 1 in. long; capsule oblong, 4-seeded, the seeds shortly softly echinate, on obtuse retinacula.

1. *asperrima*.
Leaves 4 in a whorl; flowers solitary or 2—3 together; bracts 4 pairs, all with glochidiate spinous teeth; capsule ovoid, 2-seeded, the seeds with long processes, on sharp retinacula:—

Leaves petioled, membranous, up to 5 in. long, 2 in. broad, coarsely toothed; calyx with the outer lobe 1 in. long, oblong, the opposite one similar but smaller, the inner pair smaller still; corolla lip up to 1 in. long.

2. *boerhaaviaefolia*.
Leaves subsessile, thick, obovate-oblong, up to 1 in. long, .3 in. broad, entire, with long scattered hairs; calyx with outer lobe .3 in. long, the opposite one similar, 2-toothed, the inner pair linear; corolla-lip .35 in. long.

3. *molluginifolia*.

1. *BLEPHARIS ASPERRIMA*, Nees; F. B. I. iv. 478; Wt. Ic. t. 1534.
W. Gháts, hills of S. Canara, Mysore and Coorg.
A diffuse, erect or prostrate, herbaceous plant with blue flowers, the bracts and calyx white with green veins.
2. *BLEPHARIS BOERHAAVIAEFOLIA*, Pers.; F. B. I. iv. 478; Wt. Ic. t. 458.
N. Circars, Deccan and Carnatic, in dry Districts, but usually in shady places, up to 4,000 ft.
A prostrate wiry undershrub with pale blue or pink flowers, veined darker and with a yellow spot on the lip, the bracts white veined with green.
3. *BLEPHARIS MOLLUGINIFOLIA*, Pers.; F. B. I. iv. 479.
N. Circars, Deccan and Carnatic, on dry stony lands, or sandy places near the sea.
A prostrate wiry undershrub with small blue flowers, the capsules always closely surrounded by the bracts and calyx-lobes.

8. *Acanthus*, Linn.

Erect or twining herbs or shrubs. *Leaves* pinnatifid, toothed, spinous, rarely entire, the petioles sometimes with spines at their bases. *Flowers* in terminal or pseudo-axillary, strobilate or interrupted spikes; bracts ovate, large, spinescent or small, decussate bracteoles large lanceolate, or 0. *Calyx* 4-partite, the outer 2 lobes the larger. *Corolla*-tube short, horny, upper lip obsolete, lower elongate, obovate, shortly obtusely 3-lobed. *Stamens* 4, didynamous, shorter than the lower lip; filaments stout, curved, not produced beyond the anther; anthers 1-celled, oblong, bearded. *Disk* 0. *Ovary* 2-celled; ovules 2 in each cell; style slender; stigma bifid. *Capsule* ellipsoid, compressed, shining. *Seeds* 4, compressed, orbicular; testa lax and often soft and corrugated.

ACANTHUS ILICIFOLIUS, Linn.; F. B. I. iv. 481. *Dilivaria ilicifolia*, Juss.; Wt. Ic. t. 459.

East and West Coasts, in tidal forests. Sea Holly.

A gregarious shrub reaching 5 feet in height with large blue flowers and spinous holly-like leaves, sharp spines also at the bases of the petioles. Vern. *Hind.* Hargoza; *Tel.* Alisi, Alchi; *Mar.* Marandi.

9. *Asteracantha*, Nees.

A stout herb of wet places; stems numerous, with long sharp thorns at the nodes. *Leaves* narrow, lanceolate, lineolate, in whorls of 6, the two outer leaves of each whorl the larger. *Flowers* in sessile axillary whorls, surrounded by the slightly recurved spines; bracts leafy; bracteoles linear-lanceolate. *Calyx* deeply 4-partite, the upper lobe the largest. *Corolla* 2-lipped, the upper lip 2- the lower 3-lobed with 2 crested folds on the palate; tube cylindric below, enlarged above. *Stamens* 4, didynamous; anthers 2-celled, equal, the cells parallel. *Ovary* 2-celled; ovules 4 in each cell; style pubescent; stigma simple. *Fruit* a linear-oblong capsule. *Seeds* 4—8 on hard retinacula, flat and white-hairy when wet.

ASTERACANTHA LONGIFOLIA, Nees; Wt. Ic. t. 449. *Hygrophila spinosa*, T. And.; F. B. I. iv. 408.

All plains Districts, in wet places, rice-fields, the margins of tanks, etc., common.

A tall hispid herb with pale blue-purple flowers and leaves up to 7 in. long, 1 in. broad. Vern. *Hind.* Talmakhana, Kantakalia; *Tam.* Nirmuli.

10. Hygrophila, R. Br.

Herbs, usually found in wet places. *Leaves* opposite, entire, usually lineolate on the upper surface. *Flowers* bluish-purple, sessile, in terminal heads or axillary whorls; bracts elliptic or lanceolate; bracteoles linear or lanceolate. *Calyx* tubular, 5-fid; lobes linear or lanceolate. *Corolla*-tube dilated above; limb 2-lipped, nearly glabrous, lobes twisted to the left in bud. *Stamens* 4, didynamous, the posterior pair sometimes smaller or rudimentary; filaments glabrous; anthers oblong, the cells equal, divaricate or connate at the base. *Ovary* oblong, the tip pubescent; ovules few or many in each cell; style slender, hairy; stigma simple, linear. *Fruit* a narrowly oblong capsule, seed-bearing from the base. *Seeds* numerous, rarely few, ovoid, compressed, hygroscopically hairy; retinacula hard, curved, acute.

Procumbent herbs with flowers in terminal spikes, the leaves small:—

Spikes 1—5 in. long, glabrous or slightly pubescent; fertile stamens 2 only, the posterior pair reduced to slender curved staminodes; leaves usually glabrous, ovate or oblong, obtuse, 5—15 in. long; seeds 20 or more.....1. *polysperma*.
Spikes under 1 in. long, white-strigose; fertile stamens 4, the anthers of the posterior pair smaller; leaves hairy, elliptic or suborbicular, 2.5—5 in. in diam.; seeds 8—10.....2. *Serpyllum*.

Erect herbs with flowers in axillary whorls, the leaves rather large:—

Bracteoles acute, lanceolate, hispid-ciliate; calyx divided halfway down, the lobes acuminate and white hispid-ciliate; leaves linear or linear-lanceolate

3. *angustifolia*.

Bracteoles obtuse, oblong, strigose; calyx divided one-third way down, the lobes long acuminate, strigose but scarcely hispid-ciliate; leaves obovate or elliptic

4. *quadrivalvis*.

1. *HYGROPHILA POLYSPERMA*, T. And.; F. B. I. iv. 406. *Hemiadelphus polysperma*, Nees; Wt. Ic. t. 1492.

N. Circars, in Kimeddy (Beddome).

A branching and rooting small herb of wet places with pale blue flowers.

2. *HYGROPHILA SERPYLLUM*, T. And.; F. B. I. iv. 406. *Physichilus Serpyllum*, Nees; Wt. Ic. t. 1493.

Deccan, in Mysore (J. Campbell).

A small branching herb of variable forms of leaf, from a woody rootstock.

3. *HYGROPHILA ANGUSTIFOLIA*, R. Br. *H. salicifolia*, Nees; F. B. I. iv. 407; Wt. Ic. t. 1490.

N. Circars, in Godavari; W. Gháts, in all Districts from S. Canara and Mysore southwards, up to 4,000 ft.; in swampy places and along streams.

An erect herb up to 3 ft. in height, usually rooting at the lower nodes, the stems more or less quadrangular, the leaves narrow, the flowers pale purplish-blue.

4. *HYGROPHILA QUADRIVALVIS*, Nees; F. B. I. iv. 408. *H. obovata*, Wt. Ic. t. 1489.

W. Coast and W. Gháts, up to 3,000 ft., in swampy places.

An erect herb, very similar to No. 3, and, like it, rooting at the lower nodes and with subquadrangular stems, the leaves obovate or lanceolate glabrate, the flowers pale purplish-blue.

11. *Ruellia*, Linn. (Sect. *Dipteracanthus*, Nees.)

Herbs or undershrubs. *Leaves* opposite, entire or undulate, lineolate. *Flowers* sessile or subsessile, solitary or in clusters or racemes; bracts 0, bracteoles large, usually exceeding the calyx. *Calyx* 5-partite or 5-fid; lobes subequal, narrow, acute. *Corolla* tubular-ventricose, more or less oblique; lobes subequal, rounded, twisted to the left in bud, spreading in flower. *Stamens* 4, didynamous; filaments glabrous except at base; anthers subequal, 2-celled, cells oblong, muticous, glabrous. *Ovary* 2-celled; ovules 3–10 in each cell; style linear; stigma simple. *Fruit* a clavate capsule, solid at the base, seed-bearing upwards. *Seeds* large thin, discoid, margined, hygroscopically hairy, on strong hooked retinacula.

Stems prostrate or straggling; leaves ovate or elliptic, acute, glabrous or slightly hairy, up to 1·5 in. long, 1 in. broad; calyx-lobes linear-subulate, ciliate; capsules slightly pubescent, seeds 16–20.

Stems erect; leaves ovate, obtuse, grey-pubescent, often undulate, up to 1 in. long, 75 in. broad; calyx-lobes lanceolate, acute, pubescent; capsules glabrous, seeds about 12.

1. *RUELLIA PROSTRATA*, Poir.; F. B. I. iv. 411; Bedd Ic. t. 282.

Most dry Districts, in bushy places, on banks, in gardens, etc.

A diffuse undershrub with solitary pale blue or purple flowers.

2. *RUELLIA PATULA*, Jacq.; F. B. I. iv. 412. *Dipteracanthus patulus*, Nees; Wt., Ic. t. 1505.

Deccan and Carnatic to S. Travancore, on waste lands and by road-sides, common.

A hoary small undershrub with purplish blue flowers, solitary or 2–3 together in the leaf-axils.

R. tuberosa, Linn., is a tropical American plant with deep blue flowers frequently found in Madras Gardens.

12. *Hemigraphis*, Nees.

Herbs, undershrubs or shrubs. *Leaves* opposite, toothed or subentire. *Flowers* sessile, in heads or spikes, terminal or pseudo-axillary on shortened branchlets, rarely paniculate or solitary; bracts large, imbricate, each 1-flowered; bracteoles small and narrow or 0. *Calyx* 5-partite; lobes unequal, lanceolate or linear. *Corolla* tubular-ventricose or funnel-shaped; lobes 5, subequal, twisted to the left in bud. *Stamens* 4, didynamous; included or nearly so; anthers oblong, 2-celled, muticous, the bases acute. *Ovary* 2-celled; ovules 2 in each cell; style linear; stigma 2-lobed, one lobe linear, the other short. *Fruit* a linear or linear-oblong capsule, seed-bearing almost from the base. *Seeds* 6 or more compressed, discoid, hygroscopically hairy.

Corolla tubular-ventricose; longer filaments glabrous in the upper half, hairy below:—

Stiff herbs, hispid with jointed hairs; heads large with 4 large hispid reticulate outer bracts, inner bracts oblong or spatulate, bracteoles linear or 0; calyx-lobes linear, 4 in. long; leaves oblong-spathulate, up to 2 in. long, crenulate; capsule linear-oblong, glabrous, grooved, 5 in. long, seeds 6—8.....1. *dura*.

Soft herbs, villous with white hairs:—

Hairs soft; corolla long-cylindric below, upper part funnel-shaped ventricose; bracts elliptic, bracteoles 0; calyx-lobes linear, obtuse, 3—4 in. long; leaves ovate, crenate, up to 1 in. long; capsule linear-obovoid, glabrous except at rip, 3 in. long, about 12-seeded.....2. *hirta*.

Hairs scabrous; corolla short-cylindric below, upper part campanulate-ventricose; bracts obovate, bracteoles 0, calyx-lobes lanceolate, acuminate, 2 in. long; leaves ovate, crenate, up to 2 in. long; capsule not seen.....3. *venosa*.

Corolla funnel-shaped; longer filaments densely bearded in the upper half:—

Bracts of inner flowers short, ovate lanceolate; heads axillary and terminal, with many soft stiff white hairs; calyx-lobes linear, strigose at first then scarious, one longer than the rest; leaves ovate, acuminate, crenate-serrate, up to 3 in. long, 2 in. broad, petioles usually long; capsule pubescent, tetragonous, 25 in. long, 6-seeded.....4. *latebrosa*.

Bracts of inner flowers long, oblong; heads mostly terminal, glandular-hairy, with white hairs; calyx-lobes linear, one longer than the rest; leaves ovate, subobtusely, crenate, up to 1.5 in. long, 1 in. broad, petioles rather short; capsule hispid-pubescent, 3 in. long, 8—10-seeded.....5. *elegans* var. *crenata*.

1. HEMIGRAPHIS DURA, T. And.; F. B. I. iv. 422.

Deccan, Bellary and Kurnool, East to Guntur and Masulipatam, usually on black cotton soil; S. Canara (Hohenacker).

A procumbent hard very hispid herb with flexuose branches and blue flowers in large heads.

2. HEMIGRAPHIS HIRTA, T. And.; F. B. I. iv. 422.

E. Coast, in Chicacole (Gamble).

A softly pubescent herb with creeping flexuose stems and pale blue flowers in small close terminal heads.

3. HEMIGRAPHIS VENOSA, C. B. Clarke; F. B. I. iv. 423.

Deccan or Carnatic (locality doubtful).

A scabrous pubescent herb with creeping and rooting stems.

4. HEMIGRAPHIS LATEBROSA, Nees; F. B. I. iv. 423; Wt. Ic. t. 1504.

N. Circars, Deccan and Carnatic, in undergrowth of deciduous forest, up to 4,000 ft. in hilly country.

A softly pubescent branching and straggling undershrub, with blue flowers, the tube yellowish white.

Var. *Beddomei*, C. B. Clarke. Leaves smaller, ovate, crenate, nearly glabrous, fruiting sepals white scarious.

Deccan, Ramandrúg in Bellary (Beddome).

Var. *incana*, Gamble. Similar but the leaves very softly white-tomentose and thicker.

Deccan, Horsleykonda in Chittoor (Gamble, Fischer), Wt. K. D. 2272 without locality.

5. HEMIGRAPHIS ELEGANS, Nees; F. B. I. iv. 424.

Var. *crenata*, C. B. Clarke.

S. Canara near Malasamudra (Hohenacker); Ramandrúg in Bellary (Beddome).

A viscid pubescent herb, the flowers blue with a pale tube.

13. *Stenosiphonium*, Nees.

Shrubs, often viscous and with glandular-headed hairs. *Leaves* opposite, usually ovate, the lower one long-petioled with decurrent blade, the upper subsessile, all densely lineolate. *Flowers* sessile, in clusters on elongate interrupted spikes, forming leafy panicles; bract ovate or lanceolate; bracteoles 2, linear, similar to the calyx-lobes. *Calyx* subequally 5-fid, the lobes at first connate, later on separating, linear or lanceolate. *Corolla* narrowly tubular below then suddenly bent obliquely and widened to a ventricose limb; lobes 5, subequal, rounded, twisted to the left in bud. *Stamens* either 2 perfect with sometimes 2 small staminodes, or 4 perfect, the posterior shorter and with smaller anthers than the exsert anterior; anthers oblong, mucous. *Ovary* glabrous; style slender; stigma linear. *Fruit* a clavate capsule, seed-bearing nearly from the base, the retinacula hard. *Seeds* 6—8, compressed, discoid, apparently glabrous when dry, densely white hairy all round when wetted.

Stamens 2; leaves ovate, acuminate, up to 3 in. long, 1.5 in. broad, the lower petioled, the upper often sessile and cordate, nerves 5—7 pairs:—

Spikes with dense but interrupted clusters, prominently viscous-pubescent; corolla .75 in. long with lower half tubular narrow, upper broadly ventricose:—

Bracts ovate or obovate, shortly obtusely acute, .25 in. long, bracteoles linear, equal to the calyx; calyx .3—4 in. long, lobes linear, glandular; leaves crenate-serrate.....1. *diandrum*.

Bracts linear-lanceolate, narrow, .3 in. long, bracteoles similar but narrower; calyx .3 in. long, lobes linear, hair-pointed, very glandular; leaves shallowly dentate.....2. *setosum*.

Spikes slender, interrupted, with small clusters, glandular pubescent; corolla under .5 in. long, lower half very narrow, upper ventricose; bracts lanceolate, acuminate, .25 in. long, bracteoles linear; calyx .25 in. long, the lobes linear glabrate but scabrous; leaves dentate.....3. *parviflorum*.

Stamens 4, the 2 anterior longer than the 2 posterior and with anthers twice the size; leaves ovate, acuminate; corolla about .75 in. long, the tube slender:—

Spikes with close clusters especially the upper ones, white villous and viscous-pubescent; bracts obovate, shorter than the calyx; leaves shortly acuminate, shallowly crenate, up to 3 in. long, 2 in. broad, 5—7-nerved, glabrous, the lower petioled, the upper subsessile and subcordate.....4. *confertum*.

Spikes with distant clusters, nearly glabrous when young, very glandular hairy when old; bracts ovate or obovate, obtusely acute, as long as the calyx, 3-ribbed; leaves caudate-acuminate, strongly crenate-serrate, up to 6 in. long, 2—3 in. broad, 7—8-nerved, glabrous above, sometimes white silky beneath, the lower long-petioled, the upper rounded or subcordate at base.....5. *Russellianum*.

1. *STENOSIPHONIUM DIANDRUM*, Wt. Ic. t. 1502; F. B. I. iv. 426.

Hills of Tinnevely, at Courtallum (Wight).

An erect shrub with apparently pale blue flowers.

2. *STENOSIPHONIUM SETOSUM*, T. And.; F. B. I. iv. 427.

Deccan or Carnatic (G. Thomson).

An erect shrub with pale blue flowers and very long hair-like tips to the calyx-lobes, covered with glandular hairs.

3. *STENOSIPHONIUM PARVIFLORUM*, T. And.; F. B. I. iv. 428.

Deccan or Carnatic (G. Thomson); evergreen forests of Travancore (M. Rama Rao).

An erect shrub with small pale blue flowers.

4. *STENOSIPHONIUM CONFERTUM*, Nees; F. B. I. iv. 427; Wt. Ic. t. 873

(note under t. 1503).

Deccan and Carnatic, hills of Kistna and Kurnool, also Chingleput, westwards to Coimbatore and the E. slopes of the Ghâts down to Tinnevely.

An erect shrub with blue flowers.

5. *STENOSIPHONTUM RUSSELLIANUM*, Nees; F. B. I. iv. 427; Wt. Ic. t. 1503.

N. Circars, in Vizagapatam; Deccan, hills of Mysore, Cuddapah and Chittoor; W. Ghâts, on E. slopes, down to Tinnevely.

An erect shrub with blue flowers and long-acuminate leaves.

Var. *subsericeum*, T. And. The young leaves sometimes smaller, but in old plants rather large, densely white-silky beneath, becoming glabrate when older; flowers deep blue.

Deccan, N. Arcot and Chittoor, to 4,000 ft. on Horsleykonda; Carnatic, Kambakam Hills of Chingleput, southwards to the hills of Tinnevely.

14. *Petalidium*, Nees.

Shrubs or undershrubs. *Leaves* opposite, entire or toothed. *Flowers* shortly pedicelled, in contracted axillary cymes or racemes, often crowded on shortened lateral branchlets, sometimes reduced to a single flower; bracts narrow or 0; bracteoles large, ovate, reticulate, ultimately scarious. *Calyx* 5-partite, lobes unequal, narrowly linear-lanceolate. *Corolla* large, ventricose, straight or curved; lobes 5, subequal, twisted to the left in bud. *Stamens* 4, didynamous, anthers subsimilar, 2-celled; cells parallel, spurred or mucicous at the base. *Ovary* 2-celled; ovules 2 in each cell; style long; stigma with 2 unequal lobes. *Fruit* a clavate capsule, compressed parallel to the septum; placentas separating elastically from the bottom and carrying off the seeds. *Seeds* 2 or 4, discoid, hygroscopically hairy, the retinacula rigid.

PETALIDIUM BARLERIOIDES, Nees; F. B. I. iv. 416.

N. Circars, Ganjam to the Kistna, in deciduous forest, common; W. Coast, in S. Canara.

A handsome shrub reaching 5 ft. in height, the leaves up to 6 in. long, 3 in. broad and long-petioled, the large flowers white or pale blue, 1—1.5 in. long with conspicuous pale reticulate bracteoles.

15. *Micranthus*, Wendl.

Perennial glandular hairy herbs. *Leaves* opposite, membranous, linear-lanceolate, entire or obscurely crenate, ovate, petioled. *Flowers* in dense, terminal, 1-sided spikes; bracts orbicular, imbricate, each pair with usually 3 flowers; bracteoles 0. *Calyx* 5-partite, one lobe ovate, bract-like, the others linear-subulate. *Corolla* small; tube slender, cylindric; lobes slightly unequal, rounded, twisted to left in bud. *Stamens* 4, didynamous; anthers subsimilar, 2-celled; cells parallel, oblong, the base minutely mucronate. *Ovary* 2-celled; ovules 2 in each cell; style long, villous; stigma shortly 2-lobed. *Fruit* a clavate capsule, compressed parallel to the septum, 4-seeded; placentas dehiscing with the seeds elastically from the base. *Seeds* compressed, discoid, white-hairy when wetted.

MICRANTHUS OPPOSITIFOLIUS, Wendl. *Phaylopsis parviflora*, Willd.; F. B. I. iv. 417. *Aetheilema reniforme*, Nees; Wt. Ic. t. 1533.

N. Circars, Ganjam to Godavari, in forest undergrowth, common; W. Gháts, S. Canara to Travancore, at low levels; Shevaroy Hills. A much-branched diffuse viscid herb with small white flowers and reniform or orbicular bracts green at first turning white and scarious with age, the leaves in unequal pairs, up to about 4 in. long and long-petioled.

16. *Dyschoriste*, Nees.

Perennial herbs or undershrubs. *Leaves* opposite, often shortly dentate. *Flowers* in axillary clusters or short cymes; bracts and bracteoles small. *Calyx* tubular; lobes 5, lanceolate or subulate, subequal. *Corolla* tubular, mouth obscurely 2-lipped; lobes 5, obtuse, twisted to left in bud. *Stamens* 4, didynamous; anthers similar, cells parallel, minutely mucronate or spurred at base. *Ovary* glabrous, 2-celled; ovules 2 in each cell; style linear, villous; stigma linear, recurved. *Fruit* an oblong capsule, solid at the base. *Seeds* 4, orbicular, compressed, on strong retinacula, densely white-hairy when wetted; cotyledons cordate.

Stiff woody much-branched undershrub with whitish bark; leaves small obovate, grey-canescant, under .5 in. in diam., subsessile; flowers solitary, the calyx appressed hirsute with short acute lobes, the corolla .75 in. long, tubular below, funnel-shaped above; anthers minutely mucronate at base.....1. *littoralis*. Slender undershrub with green branches from a woody rootstock; flowers in clusters or cymes; leaves green:—

Low plant with prostrate stems often rooting at the nodes; flowers in axillary clusters with long-acuminate nearly glabrous calyx-lobes and small funnel-shaped corolla about .25 in. long; anthers minutely mucronate at base; leaves elliptic or obovate, .75—1.5 in. long.....2. *depressa*.

Erect slender plant, subscaudent, the stems often geniculate; flowers in shortly peduncled axillary cymes with long linear glandular hairy calyx-lobes and broadly tubular corolla, .75 in. long; anthers prominently spurred at base; leaves ovate or lanceolate, acute at both ends, up to 2.5 in. long, 1.5 in. broad, long-petioled.....3. *vagans*.

1. *DYSCHORISTE LITTORALIS*, Nees; Wt. Ic. t. 447. *Calophanes littoralis*, T. And.; F. B. I. iv. 410.

Carnatic, chiefly along the coast on dry sand, also inland westwards to the foot of the Gháts on arid spots.

An undershrub with divaricate branches and rather large blue-purple flowers.

2. *DYSCHORISTE DEPRESSA*, Nees. *Calophanes Nagchana*, C. B. Clarke; F. B. I. iv. 410.

Carnatic, near Madras, westwards to Salem and Coimbatore, in dry places, scarce.

A trailing plant with small violet-pink flowers.

3. *DYSCHORISTE VAGANS*, O. Kze. *Calophanes vagans*, Wt. Ic. t. 1526; F. B. I. iv. 411.

N. Circars, in Godavari; Deccan and Carnatic, in the undergrowth of deciduous forest, up to 3,000 ft. on Kambakam Drug, Ramandrúg and other hills.

A slender diffuse plant, straggling among bushes, with blue flowers.

17. *Eranthemum*, Linn.

Perennial herbs or shrubs. *Leaves* opposite, petioled, entire or obscurely crenulate, very much lineolate. *Flowers* in linear, distant or close, spikes or heads; bracts usually large and prominent; bracteoles smaller, linear-lanceolate. *Calyx* 5-lobed, the lobes narrow, often scarious. *Corolla*-tube long and slender, cylindric, widened at the top, or sometimes at the middle; lobes obovate, twisted to the left in bud, spreading in flower. *Stamens* 2 perfect, with usually 2 others reduced to small staminodes, close to the bases of the filaments; anthers oblong, 2-celled, more or less exserted. *Ovary* 2-celled; ovules 2 in each cell; style long and slender, sparsely hairy; stigma simple or slightly 2-lobed. *Fruit* a clavate capsule with solid base. *Seeds* 4, discoid, on sharp retinacula, hairy when wetted.

Bracts white with green nerves; calyx scarious:—

Bracts elliptic-ovate, cuspidate, nearly glabrous; spikes 1—3 in. long, in close panicles; lower leaves ovate, acuminate at both ends, shortly decurrent, usually up to 4 in. long, 2 in. broad, glabrous, upper many, smaller.....1. *nervosum*. Bracts obovate, obtuse, mucronate or shortly apiculate, glandular strigose; spikes 3—6 in. long, subinterrupted, in elongate panicles, often solitary; lower leaves lanceolate or oblong-lanceolate, acuminate, long tapering and decurrent at base, up to 8 in. long, 3 in. broad, glabrous, upper smaller but fewer.....2. *roseum*.

Bracts green, rarely whitish when old:—

Bracts ovate-lanceolate, long acuminate, prominently many-nerved, white-ciliate on the margins; spikes 1—3 in. long, dense, long-peduncled, forming loose panicles; calyx scarious; lower leaves ovate acuminate, rounded at base and then decurrent, up to 8 in. long, 3.5 in. broad, nearly glabrous, but often scurfy on the nerves beneath, upper subsessile, cordate at base.....3. *purpurascens*. Bracts lanceolate to linear, long acuminate, few-nerved, viscidly glandular-hispid; spikes 2—6 in. long, slender, often interrupted, in large very compound terminal panicles; calyx green, glandular; lower leaves elliptic, acuminate, attenuate at base or sometimes rounded, shortly decurrent, up to 5 in. long, 2 in. broad, glabrous, long-petioled, upper gradually smaller and rounded at base, subsessile.....4. *montanum*.

1. *ERANTHEMUM NERVOSUM*, R. Br. *Daedalacanthus nervosus*, T. And.; F. B. I. iv. 418.

Carnatic, in Tinnevely (Wight), perhaps only in cultivation elsewhere in S. India; frequent in gardens.

A pretty shrub reaching 5 ft. in height with bright blue flowers in short bracteate spikes in large terminal panicles.

2. *ERANTHEMUM ROSEUM*, R. Br. *Daedalacanthus roseus*, T. And.; F. B. I. iv. 419.

W. Coast, in S. Canara (Hohenacker, Wight).

A shrub reaching 6 ft. in height with rose-coloured flowers or "blue fading to purple or red" (Cooke) in long spikes forming elongate terminal panicles.

3. *ERANTHEMUM PURPURASCENS*, Nees. *Daedalacanthus purpurascens*, T. And.; F. B. I. iv. 420. *Justicia pulchella* Roxb. Cor. Pl. t. 177. N. Circars, Ganjam to Godavari, in deciduous forest undergrowth, common; Deccan, Nallamalai Hills of Kurnool, hills

of Cuddapah, Ramandrug in Bellary; Shevaroy Hills of Salem. A shrubby plant up to 4 ft. high with blue flowers in close heads.

4. *ERANTHEMUM MONTANUM*, Roxb.; Wt. Ic. t. 466. *Daedalacanthus montanus*, T. And.; F. B. I. iv. 421. *Justicia montana*, Roxb. Cor. Pl. t. 176.

N. Circars, Ganjam to Godavari, in deciduous forest; W. Ghâts, on E. slopes and hills of Coimbatore to S. Travancore.

A small shrub up to about 3 ft. with very pale blue flowers.

Var. *Wightianum*. Bracts very narrow, linear, up to 6 in. long, the spikes very slender, the leaves broader.

Deccan (Russel; Wall. Cat. 2495a).

Var. *concanense*. Bracts much shorter, almost ovate, under 5 in. long, the spikes slender and much interrupted.

Mysore, at Kempkull, 1,000—2,000 ft. (Meebold).

18. *Strobilanthes*, Blume.

Shrubs, undershrubs or herbs, often gregarious and only flowering after a period of years and then dying off. *Leaves* opposite, often unequal, toothed or subentire, usually lineolate with raphides as are the bracts and other green parts. *Flowers* capitate or in strobilate or interrupted bracteate spikes or paniced, sessile or sometimes pedicelled, usually with 1 floral bract and 2 bracteoles. *Calyx* usually deeply 5-partite, the lobes narrow, subequal or one longer, rarely 2-lipped. *Corolla* usually white blue or purple, rather large, straight or curved, the upper part ventricose, the lower cylindric; lobes 5, rounded or ovate, twisted to the left in bud. *Stamens* 2 or, more usually, 4 didynamous; filaments monadelphous, the bases combined in a sheath more or less adherent at the middle to the corolla, the margins free; anthers oblong, muticous, 2-celled. *Disk* small or as a stalk to the ovary. *Ovary* 2-celled, ovules 2 in each cell; style linear; stigma of one linear branch, the other suppressed or a mere point. *Fruit* a 2- or 4-seeded capsule, the placentas sometimes separating elastically. *Seeds* much compressed, glabrous or hairy on strong curved retinacula.

Stamens 2 fertile, hardly monadelphous, though sometimes connected at base:—

Seeds glabrous even when wetted, without basal areole; cylinder base of corolla long, suddenly widening:—

Flowers in elongate linear subinterrupted viscous spikes; filaments glabrous except at base, no infertile stamens or staminodes; bracts lanceolate, acuminate, up to 5 in. long, viscous-glandular; leaves elliptic, acute or acuminate, crenulate, rugose, up to 6 in. long, 2.5 in. broad, main nerves 6—7 pairs, impressed. 1. *humilis*.

Flowers in ovoid densely capitate heads supported by 4 leaves as outer bracts; filaments hirsute, infertile stamens or staminodes 2; bracts lanceolate, 7 in. long, glabrous, 7-ribbed, bracteoles linear; leaves ovate, acuminate, serrulate, up to 5 in. long, 2 in. broad, main nerves about 8 pairs, slightly impressed. 2. *foliosus*.

Seeds densely hairy when wetted, with a basal areole; cylinder base of corolla short, gradually widening:—

Flowers in dense broad spikes, not interrupted, 1—3 in. long, white-villous, supported by 2 leaves as outer bracts; bracts lanceolate, acuminate, 7 in. long; bracteoles linear, like the calyx 3—5 in. long; filaments pilose; leaves elliptic-lanceolate or obovate, acute, serrate, coriaceous, scabrid above, reticulate and

white-villous in the areoles beneath, up to 3 in. long, 1 in. broad, main nerves 8—10 pairs, strong, parallel.....3. *Kunthianus*.

Flowers in narrow spikes:—

Spikes short, usually under 1 in. long, clustered with the leaves in the upper axils, not interrupted, greyish villous; bracts ovate, bracteoles short, like the calyx .25 in. long; filaments villous near the base; leaves ovate, acute, subentire, coriaceous, puberulous beneath and when young white-tomentose, up to 3 in. long, 1.5 in. broad, main nerves 8—9 pairs, curved and parallel.....4. *canarius*.

Spikes more than 1 in. long, usually axillary or lateral, sometimes panicled:—

Spikes from the first more or less glandular hispid, not woolly, more or less interrupted:—

Spikes 1—2 in. long, often panicled, in the axils of present or fallen leaves along the stems; bracts lanceolate; bracteoles small; calyx .5 in. long with linear lobes; corolla .5 in. long; leaves submembranous, ovate, long cuspidate-acuminate, crenulate, the base rounded and decurrent on the long petiole, up to 7 in. long, 4 in. broad, nerves 10—11 pairs.....5. *jeyporensis*.

Spikes 2—3 in. long, peduncled, single or in usually 3-branched very glandular panicles towards the ends of the branches; bracts lanceolate, acuminate, recurved, bracteoles short; calyx .5 in. long, with linear lobes; corolla .75—1 in. long, glabrous or puberulous without; leaves ovate, cuspidate-acuminate, crenulate, the base acute with long petiole, densely white-silky beneath, up to 6 in. long, 2.5 in. broad, main nerves 8—10 pairs, parallel.....6. *cuspidatus*.

Spikes 2—3 in. long, short-peduncled, very slender, single or in panicles axillary or lateral, often nearly quite glabrous; bracts ovate or lanceolate, acuminate, bracteoles linear, short; calyx .2—3 in. long, the lobes slender; corolla .75 in. long, glabrous without; leaves thin, ovate, long-acuminate, dentate, the base decurrent on a long petiole, nearly or quite glabrous, up to 7 in. long, 4 in. broad, main nerves 7—8 pairs, subparallel.....7. *consanguineus*.

Spikes not glandular at any rate at first but with grey or tawny wool:—

Spikes 3—5 in. long, interrupted, covered with the fulvous or greyish appressed wool when in flower, in fruit becoming also glandular hispid, single or in panicles axillary and terminal; bracts ovate-lanceolate, glabrous within, bracteoles small, calyx-lobes acuminate, all enlarging in fruit; leaves ovate-lanceolate, long cuspidate-acuminate, covered beneath with appressed cinnamomeous or grey wool, up to 6 in. long, 2 in. broad, main nerves 9—10 pairs, parallel.....8. *Lawsoni*.

Spikes 2—3 in. long, not interrupted, covered, like the stems and the undersurface of the leaves, with soft spreading floccose tawny wool, single or in panicles; bracts ovate acute, glabrous within, bracteoles small; calyx-lobes linear, .25 in. long; leaves ovate, acuminate with a twisted point, covered beneath with soft tawny wool, up to 5 in. long, 2.5 in. broad, main nerves 10—13 pairs, parallel, impressed.....9. *gossypinus*.

Stamens 4 fertile, usually monadelphous, the filaments combined below in a sheath more or less adherent to the corolla-tube, but the margins usually free:—

Flowers in capitate heads or short spikes:—

Seeds glabrous:—

Stems tetragonous, grooved, winged or not, the bases of the long petioles of the leaves swollen and often auricled; leaves elliptic-lanceolate or oblanceolate, base decurrent, crenate or subentire, glabrous, up to 8 in. long, 4 in. broad, prominently 7—8-nerved; heads very close, 1—2 in. long, enlarged or glandular in fruit; bracts ovate, cuspidate with recurved tips; cylinder base of corolla as long as the campanulate upper part; filament sheath long, ciliate like the stamens, inner pair shorter.....10. *barbatus*.

Stems hardly tetragonous, not winged, the leaf-petioles not auricled:—

Flowers in heads:—

Heads very hairy, short and dense but often elongating in fruit, supported by 2 or more leaf-like involucre bracts:—

Leaves rugose, usually with bulbous-based hairs, scabrous-hispid, sub-coriaceous:—

Corolla with the cylinder base shorter than the urceolate upper part; filaments and their sheaths glabrous:—

Filaments nearly equal, the 2 inner close and rather higher than the 2 divaricate outer; thick low shrubs with lanceolate acute bracts and acuminate calyx-lobes; leaves up to 2 in. long, 1 in. broad, with 6–8 pairs of main nerves impressed above

11. *Wightianus*.

Filaments unequal, the 2 on each side high up separated by a deep depression, sometimes a sterile fifth; slender shrubs with obovate obtuse crenate bracts and linear obtuse calyx-lobes; leaves up to 3 in. long, 2 in. broad, with about 6–7 pairs of main nerves impressed above.....12. *urceolaris*.

Corolla with the cylinder base long and slender, as long as the much curved ventricose part; filaments long white-hairy at base:—

Heads small, flattened, densely white-hairy; bracts leafy, sub-orbicular, with a broad stalk, crenate, bracteoles linear-spathulate, .5 in. long; leaves ovate, acute at both ends, serrate, up to 4.5 in. long, 3 in. broad, main nerves 7 pairs.....13. *pulneyensis*.

Heads large, densely bristly hirsute:—

Bracts oblong, 1–1.5 in. long, bracteoles very long, setaceous bristly; calyx-lobes lanceolate with scarious margins; leaves ovate, acuminate, crenate, rounded at base, up to 6 in. long, 3 in. broad, with 7–8 pairs of main nerves.....14. *neilgherrensis*.

Bracts leafy, obovate, acute, crenate, very silky, bracteoles linear, very white-silky; calyx-lobes narrowly lanceolate, scarious below, silky above; leaves ovate, acute, narrowed at base, up to 4.5 in. long, 2.5 in. broad, with 5 pairs of impressed main nerves

15. *circarensis*.

Leaves stem and inflorescence softly white- or fulvous-glandular hairy, the peduncles flattened; leaves membranous, ovate or lanceolate, long-acuminate, narrowed at base, up to 5 in. long, 2 in. broad; cylinder base of corolla very short, upper part ventricose; filament sheath long, the 2 inner stamens shorter and rather higher up than the outer

16. *anceps*.

Heads softly rufous-hairy, elongate, clavate, on bracteate often deflexed peduncles, with small involucre bracts; cylinder base of corolla short, upper part funnel-shaped; filament sheath elongate, silky straight, truncate at top, the stamens short; bracts membranous, ovate, .75–1 in. long, bracteoles linear; calyx-lobes linear; leaves ovate, acuminate, rounded at base, crenate, up to 4.5 in. long, 3 in. broad, with 5–6 pairs of main nerves.....17. *Perrottetianus*.

Heads erect, very harshly scabrous, with 2 pairs of leafy involucre bracts, floral bracts lanceolate, 1 in. or more long, bracteoles linear also calyx-lobes; corolla large, cylinder base .6 in. long, upper part 1 in., the lobes large; filament sheath short, the inner stamens much shorter than the outer; leaves ovate, acute, shortly cuneate at base, callous-serrate, up to 7 in. long, 4 in. broad, the main nerves 8–9 pairs

18. *papillosus*.

Flowers in spikes, glabrous except sometimes in fruit, bracts not decurrent:—

Spikes erect, oblong:—

Bracts very conspicuous, spreading, leafy, 1–2.5 in. long, glabrous in flower, glandular-hairy in fruit as are the linear-lanceolate calyx-lobes and the small bracteoles; corolla large, cylinder base .5 in. long, upper ventricose part .75 in.; filament sheath short, truncate, the outer stamens the longer; leaves ovate, acuminate, cuneate at base, serrulate, up to 3 in. long, 2 in. broad, with 7–8 pairs main nerves

19. *Zenkerianus*.

Bracts small, not conspicuous, close, glabrous or glandular-hairy, bracteoles small; calyx-lobes .3 in. long, linear; corolla small, .5 in. long, cylinder base as long as the campanulate upper part; filament

sheath short, truncate, villous; leaves lanceolate, acuminate, narrowed and decurrent at base, serrate, up to 6 in. long, 2 in. broad, main nerves 7 pairs raised on upper surface.....20. *Warreensis*.

Spikes deflexed, oblong or clavate, usually glabrous as are the leaves; seeds doubtful but apparently glabrous:—

Spikes .5—7.5 in. long; corolla small, with exsert stamens:—

Heads usually single, glabrous; bracts lanceolate, subcoriaceous; calyx-lobes lanceolate, acuminate; cylinder base of corolla .25 in. long, slender, the upper part campanulate, spreading; filament sheath short, white-fringed; leaves glabrous, lanceolate, acuminate at both ends, serrate, up to 4.5 in. long, 1.5 in. broad, main nerves 5—6 pairs, raised above.....21. *ciliatus*.

Heads in racemes, white hairy; bracts ovate, soft, hairy, subscarious; calyx-lobes spatulate, ciliate; cylinder base of corolla .2 in. long, upper part campanulate, longer; filament sheath long, white-hairy; leaves ovate or ovate-lanceolate, long-acuminate at both ends, crenate, up to 5 in. long, 2 in. broad, main nerves 6 pairs

22. *Meeboldii*.

Spikes .75—1.5 in. long; corolla large with included stamens, cylinder base .25 in. long, upper part funnel-shaped, .75 in. long; filament sheath .2 in. long, sparsely hairy, the inner stamens shorter; leaves narrowly lanceolate, acuminate at both ends, subentire, glabrous, up to 6 in. long, 1—1.25 in. broad, main nerves 6 pairs, faint

23. *adenophorus*.

Flowers in erect or rarely deflexed spikes with 2 small involucre bracts, floral bracts large, membranous, elliptic, decurrent, prominently nerved in fruit; calyx-lobes lanceolate, .3 in. long, subscarious; corolla with cylinder base short, upper part ventricose; filament sheath elongate, .4 in. long, fringed, truncate, the stamens short; leaves lanceolate, acuminate, membranous, up to 7 in. long, 2.5 in. broad, main nerves 10 pairs ..24. *decurrens*.

Flowers in large oblong deflexed spikes elongating in fruit, with 2 pairs of oblong involucre bracts a little below; floral bracts lanceolate, acuminate, .5 in. long; cylinder base of corolla very short, upper part campanulate with short recurved lobes; filament sheath broad, glabrous, the stamens all equal and long-exsert; leaves thin, ovate, acuminate, broad but suddenly decurrent at base, sparsely pubescent, up to 9 in. long, 4.5 in. broad, main nerves 10—11 pairs.....25. *micranthus*.

Seeds hairy:—

Seeds appressed villous, the hairs not elastic when wetted; capsule 2-seeded:—

Seeds oblong with large areoles; flowers in panicles of deflexed lanceolate 2—3-flowered heads about .75 in. long, with 2 pairs involucre bracts; bracts lanceolate, long-acuminate, ciliate, bracteoles 0 or minute; corolla 1 in. long, cylinder base short; leaves elliptic, long-acuminate at both ends, crenate, up to 7 in. long, 2.5 in. broad, main nerves 6 pairs

26. *tristis*.

Seeds elliptic with small areoles; flowers in heads, single or 1—3 together, many-flowered, up to 1 in. long, very villous, with small involucre bracts; bracts linear-oblong, obtuse, 1 in. long or less, bracteoles smaller, narrow; corolla .75—1 in. long, cylinder base short; leaves lanceolate, long-caudate-acuminate, tawny pubescent beneath, up to 6 in. long, 1.25 in. broad, main nerves 10—12 pairs.....27. *caudatus*.

Seeds glabrous on the faces, the ring margin with elastic hairs when wetted:—

Seeds not areolate; stem and leaves scabrous-hirsute; heads short and close, in trichotomous panicles with a pair of spatulate involucre leaves; bracts oblong, .75 in. long, fulvous-hairy, bracteoles nearly as long, linear; calyx-lobes .6 in. long; corolla with cylinder base .4 in. long, ventricose upper part .6 in.; leaves ovate, acuminate, round and suddenly decurrent at base, rugose, serrate, up to 7 in. long, 5 in. broad, main nerves about 8 pairs, impressed.....28. *heteromallus*.

Seeds areolate; stem and leaves slightly hairy; heads somewhat elongate, solitary or in terminal or axillary cymes with 1 or more small leaves on the peduncles; bracts ovate, viscous, scarious in fruit, bracteoles short, spatulate; corolla with cylinder base .2 in. long, ventricose upper part

.5 in.; leaves elliptic-lanceolate, acuminate, cuneate at base, crenate, membranous, up to 6 in. long, 2 in. broad, main nerves 8—10 pairs

29. *ixiocephalus*.

Seeds elastically hairy when wetted, both on face and margin, except the areole; spikes 1—1.5 in. long in flower, 2—3 in. in fruit, in close panicles bracteate at the nodes; bracts ovate, acute, decurrent on a thick stalk, reddish-glandular-hairy; bracteoles linear, .2—3 in.; corolla with cylinder base .3 in. long, ventricose upper part .5 in., hairy without; leaves variable, elliptic, acuminate, decurrent at base, crenate, membranous, with shining white hairs, up to 6 in. long, 3 in. broad, often smaller, long-petioled, main nerves 7—10 pairs.....30. *asper*.

Flowers in strobilate often cymose spikes or heads, the bracts usually rounded and concave:—

Seeds glabrous (those of *S. Andersonii* not known):—

Flowers on the branches, axillary or lateral, the spikes with small bracts in pairs below, the first floral bracts usually flowerless:—

Bracteoles 0; sheath of filaments long, narrow, very hairy, inner stamens shorter:—

Bracts elliptic-obovate, obtuse, softly long-glandular-hairy, reticulate, narrowed at base; calyx-lobes oblong, obtuse or emarginate, scarious, .3 in. long; corolla .75—1 in. long, cylinder base as long as the urceolate upper part; leaves elliptic-ovate, acuminate, slightly decurrent, serrate, rugose, up to 6 in. long, 3 in. broad, main nerves about 9 pairs

31. *lupulinus*.

Bracts not glandular hairy, elliptic or orbicular, obtuse or emarginate, usually white or pink; calyx subscarious, lobes emarginate:—

Bracts not decurrent on the rachis of the spike; filament sheath elongate:—

Leaves thick, broadly elliptic, rugose and often bullate, scabrous with bulbous-based hairs above, white-strigose beneath, up to 5 in. long, 2.5 in. broad; main nerves 8—10 pairs, much impressed as are the subparallel transverse nervules; corolla .75 in. long, cylinder base very short.....32. *asperrimus*.

Leaves thin, ovate or elliptic, acuminate, with a few scattered bulbous-based hairs above and many soft white hairs on both sides, up to 6 in. long, 3 in. broad, main nerves 6—8 pairs, raised, the transverse nervules inconspicuous; spikes in short, usually trichotomous cymes; corolla .75 in. long, without cylinder base

33. *Heyneanus*.

Upper bracts of each spike decurrent on the rachis; filament sheath shorter and curved; leaves ovate, subacute, obtuse or subcordate at base, softly villous, up to 1.5 in. long, 1 in. broad, main nerves 4—5 pairs, not prominent; spikes subglobose, solitary or few together, the small peduncle bracts obovate, deflexed; corolla about .5 in. long, campanulate, no cylinder base.....34. *campanulatus*.

Bracteoles linear-oblong; sheath of filaments short, glabrous; stamens subequal; bracts suborbicular, glabrous; calyx-lobes linear-oblong, acute; corolla 1.25 in. long, the cylinder base very short; leaves ovate, acuminate, rounded or subcordate at base, crenulate, loosely villous, up to 7 in. long, 4 in. broad, main nerves 7—8 pairs.....35. *Andersonii*.

Flowers from the old wood, often from near the ground, sometimes also terminal; stamens equal, united by pairs in a short sheath at the base:—

Bracts large, blackish-purple, orbicular, entire, glabrous or glandular-pubescent, .75 in. in diam., bracteoles ligulate, 1 in. long, scabrous; corolla somewhat bilabiate, the lobes reflexed, cylinder base very short; leaves ovate, caudate-acuminate, crenulate, up to 10 in. long, 5 in. broad, main nerves about 8 pairs.....36. *luridus*.

Bracts large, orbicular, serrate, softly hairy but later glabrate, 1—2 in. in diam., prominently nerved, bracteoles oblong, .75 in. long, ciliate; corolla subcampanulate with broad lobes; leaves ovate, acuminate, serrulate, sparsely glandular-hairy, up to 9 in. long, 4 in. broad, main nerves 9 pairs.....37. *bolampattianus*.

Seeds hairy when wet, except on the areoles; bracteoles 0:—

Spikes cylindric, axillary and terminal, 1—3 in. long; bracts ovate, acute or cuspidate, softly hairy; corolla 1 in. long, the cylinder base .25 in.; filament sheath straight, outer anthers larger than inner; leaves ovate, acute, subcordate at base, crenate, rugose or bullate, very softly glandular-hairy, up to 1.5 in. long, .75—1 in. broad, main nerves 6—7 pairs.....38. *sessilis*. Spikes subtetragonous, lateral and terminal, 2.5 in. long; bracts ovate, obtuse, reddish, viscous, subscarious, decurrent at base, .75 in. long; calyx-lobes scarious; corolla large; leaves ovate, acuminate, subcordate, crenate, bristly-pubescent, up to 5 in. long, 3 in. broad, main nerves 9 pairs.....39. *Dupeni*.

Flowers in lax spikes, cymose or paniced; bracts in pairs at the nodes of the panicle-branches; no floral bracts:—

Bracts early deciduous, .3 in. long, bracteoles smaller, calyx-lobes .5 in. long, linear-oblong, obtuse, all glandular-hairy; spikes in panicles much interrupted; corolla 1—1.5 in. long, of which cylinder base about one-third; leaves ovate, acute, rounded or cordate at base, serrate, scabrous and glandular, up to 2 in. long, main nerves about 5 pairs.....40. *Newii*.

Bracts persistent:—

Spikes axillary, solitary or in cymes, covered with long soft viscid glandular hairs; bracts linear, acuminate, recurved, .5—1 in. long, bracteoles smaller; calyx-lobes linear, unequal, .3—5 in. long, longer in fruit; corolla 1—1.25 in. long, the cylinder base about one-third; filament sheath elongate, villous as are the outer filaments, the inner ones shorter; leaves lanceolate, long acuminate, decurrent on the petiole and then auricled, nearly entire, up to 12 or even more in. long, 3 in. broad, main nerves 6—10 pairs; seeds 2, very shaggy with white hairs.....41. *integrifolius*.

Spikes in terminal more or less leafy panicles; seeds 4, hairy:—

Leaves oblong lanceolate, sessile or petioled with the blade decurrent and ending in an auricle:—

Spikes rather stout, flexuose, with the internodes .5—1 in. long, nodal bracts large, ovate, acute, .5 in. long, bracteoles spatulate; calyx .5 in. long, the lobes linear; corolla 1 in., curved, cylinder tube hardly any; leaves elliptic or lanceolate, long acuminate, serrate, up to 8 in. long, 1.5 in. or more broad, main nerves 8—10 pairs, very oblique

42. *homotropus*.

Spikes slender, flexuose, puberulous, the internodes .25—5 in. long, nodal bracts small, oblong, usually under .25 in. long, bracteoles linear, short, glandular hairy; calyx .25—35 in. long, the lobes linear, glabrous; corolla 1 in. long, curved, the cylinder tube rather short; leaves lanceolate, long acuminate, the petiole broadly winged and auricled, serrate, up to 12 in. long, 3.5 in. broad, main nerves 8—12 pairs, very oblique, regular.....43. *gracilis*.

Leaves ovate, acute, abruptly rounded at base and then shortly decurrent on the long petiole, crenulate, glandular-pubescent, the blade up to 6.5 in. long, 4 in. broad, main nerves 10—15 pairs, spreading and prominent; spikes in glandular-pubescent panicles, the nodal bracts oblong, about .2 in. long, bracteoles linear, more hairy than the obtuse calyx-lobes; corolla 1.25 in. long, urceolate, very retrorsely hairy within, cylinder base small; filament sheath curved at base, the inner stamens short.....44. *violaceus*.

Leaves not auricled and not decurrent on the long petiole:—

Stout and very viscous glandular-hairy, the leaves elliptic or oblanceolate, acuminate at both ends, glabrous, undulate, crenate, long-petioled, up to 7 in. long, 3 in. broad, main nerves 10 pairs, prominent, curved; panicles large and loose, very sticky, nodal bracts small, linear; pedicels slender, bracteoles minute, .1 in. long; calyx very glandular-villous, the lobes linear .5 in., one longer; corolla large, verrucose, no cylinder base, 1—1.5 in. long; capsule glabrous, apiculate.....45. *amabilis*.

Slender and with only a few long white glandular hairs, the leaves lanceolate, caudate-acuminate, nearly glabrous, undulate, petioled, up to 5 in. long, 1.25 in. broad, main nerves 7—9 pairs, curved; panicles much branched, nodal bracts ovate acute, spreading or reflexed; pedicels slender, bracteoles very minute; calyx subglabrous, the lobes linear .25

in., one longer; corolla funnel-shaped, .75–1 in., cylinder base very short; capsule oblanceolate.....46. *rubicundus*.

1. *STROBILANTHES HUMILIS*, Gamble n. comb. *Endopogon viscosus*, var. *humilis*; Wt. Ic. t. 1498.
W. Ghâts, Anamalai Hills, at 4,300 ft. (Beddome, No. 69 in Herb. Calc.), Courtallum, in Tinnevely (Wight).
A low shrub scarcely a foot high (Wight). Beddome's specimen was collected in 1858, Wight's in 1836.
2. *STROBILANTHES FOLIOSUS*, T. And.; F. B. I. iv. 433. *Endopogon foliosus*, Wt. Ic. t. 1501. *E. capitatus*, Wt. Ic. t. 1499.
W. Ghâts, Nilgiri and Pulney Hills, at 4,000–7,000 ft. in Shola Forest, common; Sholas on Kudrainukh, S. Canara (Beddome); Brumagiri Hills (Fischer).
A large, gregarious shrub with pale blue flowers, the stems glabrous or glandular pilose, both often on the same plant, the hairy ones usually in the fruiting season. The leafy outer bracts are often deciduous, when the long linear bracteoles and calyx-lobes are conspicuous. It is often found in flower and perhaps does not die down at intervals.
3. *STROBILANTHES KUNTHIANUS*, T. And.; F. B. I. iv. 434. *Phlebo-phyllum Kunthianum*, Nees; Wt. Ic. t. 448.
W. Ghâts, Nilgiris, Pulneys and hills of Travancore, above 6,000 ft., on grassy downs, common, especially in Nilgiris on the E. side; Shevaroy Hills and hills of N. Coimbatore.
A gregarious bushy shrub with blue flowers, colouring large tracts when in flower, probably at intervals of about 6 years.
4. *STROBILANTHES CANARICUS*, Bedd. Ic. t. 215; F. B. I. iv. 434.
W. Ghâts, hills of S. Canara at Kudrainukh 6,000 ft. (Beddome).
A stiff shrub reaching 3–4 ft. in height, with white flowers, the corolla .5 in. long, villous without.
5. *STROBILANTHES JEYPORENSIS*, Bedd. Ic. t. 214; F. B. I. iv. 436.
N. Circars, hills of Vizagapatam and Godavari, at 1,500–2,500 ft. in forest undergrowth (Beddome, Gamble, Barber). A large shrub with white flowers. It flowered in 1874, 1885 and 1902.
6. *STROBILANTHES CUSPIDATUS*, T. And.; F. B. I. iv. 435; Bedd. Ic. t. 221. *Endopogon versicolor*, Wt. Ic. t. 1497.
N. Circars, hills of Godavari at 3,000 ft. (Gamble); W. Ghâts, in almost all Districts, but most common in Nilgiris on N. and E. slopes about 4,000–7,000 ft.
A large shrub with appressed white-woolly or somewhat tawny young branches and the undersurface of the leaves, mature more glabrous. The flowers are of a very pale blue and the spikes very glandular hairy. It was collected in flower in 1851, 1870, 1877, 1884. Its period seems to be about 7 years.
7. *STROBILANTHES CONSANGUINEUS*, C. B. Clarke; F. B. I. iv. 435.
W. Ghâts on N. and E. slopes of Nilgiris and Pulneys, at low levels.
A large shrub, with pale blue or white flowers, the spikes glandular villous, the bracts rather short. It was collected

in flower in 1884, 1897, 1909, and its period may be about 12 years.

Var. *Amomum*, C. B. Clarke; Bedd. Ic. t. 216. Spikes more slender, more interrupted, nearly glabrous; leaves more prominently toothed; bracts larger, acuminate.

Carnatic, Kainbakam Hills of Chingleput (Fischer); W. Gháts, Mysore and Coimbatore to the Pulneys.

Var. *hypoleucus*, C. B. Clarke. Spikes as in var. *Amomum* but the leaves more or less covered beneath with appressed white tomentum.

Hills of the Deccan, Ramandrug in Bellary (Beddome).

8. *STROBILANTHES LAWSONI*, Gamble in Kew Bull. 1923, 374.

W. Gháts, below Sispara in W. Nilgiris, at 5,000–6,000 ft. (Lawson, Gamble) in sheltered sholas; Tambracheri Ghát, Wynaad (Barber); hills of Travancore, among rocks (Bourdillon). An erect shrub with pale blue flowers. It was collected in flower in 1883. The capsules and seeds are large and the latter very hairy when wetted.

9. *STROBILANTHES COSSYPINUS*, T. And.; F. B. I. iv. 434; Bedd. Ic. t. 198; Bot. Mag. t. 7790.

W. Gháts, above Sispara in W. Nilgiris, at 7,000 ft., on open dry hillsides; Mysore? (Lobb.).

A handsome erect shrub with pale blue flowers. It flowered in 1867 to 1870 and 1883 and its period is supposed to be 6 or 7 years (Beddome).

10. *STROBILANTHES BARBATUS*, Nees; F. B. I. iv. 437; Bedd. Ic. t. 212. *S. tetrapterus*, Dalz.

W. Gháts, Bababudan Hills (Talbot), W. Nilgiris, Anamalais and hills of Travancore, at low levels and up to 3,000 ft.

A gregarious shrub with white flowers, flowering about every 7th year (Beddome).

11. *STROBILANTHES WIGHTIANUS*, Nees; F. B. I. iv. 438; Wt. Ic. t. 1514.

W. Gháts, Nilgiris above 6,000 ft., usually on grassy downs, common.

A very rough rather low gregarious shrub with pale blue flowers marked with darker veins, the tube brownish. It may be found in flower in any year.

12. *STROBILANTHES URCEOLARIS*, Gamble in Kew Bull. 1923, 374.

W. Gháts, Nilgiris about Ootacamund, 7,000–8,000 ft. (Bourne, Gamble). Pulney Hills, head of the Bodinaikanur Ghát (Beddome), in Shola forest, on grass land. An erect shrub with long internodes in the forest, a very low branching one in open places, the flowers apparently pale blue.

13. *STROBILANTHES PULNEYENSIS*, C. B. Clarke; F. B. I. iv. 438.

W. Gháts, Coorg, Nilgiris, Anamalais, Pulneys and hills of Travancore above 5,000 ft.; hills of N. Coimbatore at 5,000 ft. (Fisher), Shevaroy Hills of Salem (Bourne).

A shrub with blue flowers. It seems to have been found in flower at rather long intervals. It flowered at Cairn Hill, Ootacamund, in 1885.

14. *STROBILANTHES NEILGHERRENSIS*, Bedd. Ic. t. 196; F. B. I. iv. 438.
W. Ghâts, Coorg, Wynnaad, Palghât and Pulney Hills, at 3,000—6,000 ft., in evergreen forests.
A large shrub with subtetragonal stems and white flowers. It was found in flower in 1884 (Gamble), 1910 (Fischer), previously by Beddome without date.
15. *STROBILANTHES CIRCARENSIS*, Gamble in Kew Bull. 1923, 373.
N. Circars, hills of Vizagapatam at 2,000—5,000 ft. (Gamble, A. W. Lushington).
An erect shrub with subtetragonous nearly glabrous stems, rather large capsules and glabrous seeds.
16. *STROBILANTHES ANCEPS*, Nees; F. B. I. iv. 442; Bedd. Ic. t. 204.
Var. *microstachya*, C. B. Clarke. *Ruellia?* *punctata*, Nees; Wt. Ic. t. 1563.
W. Ghâts, hills of S. Canara (Beddome); also Carcoor Ghât in Wynnaad; hills of Tinnevely, about Courtallum (Wight) and Naterikal (Hb. Madr.).
A soft slender undershrub with white flowers and glabrous seeds without areoles.
17. *STROBILANTHES PERROTTETIANUS*, Nees; F. B. I. iv. 439; Wt. Ic. t. 1513.
W. Ghâts, Nilgiris, in Shola woods above 6,000 ft., common: Anamalais (Beddome).
A large shrub soft with reddish-purple hairs, the flowers pale blue pink or lilac, the capsule 2-seeded. It was in flower in 1852, again in 1883—1886, since then in 1908 and 1918, but its period is uncertain, it may be 10 years.
18. *STROBILANTHES PAPILLOUS*, T. And.; F. B. I. iv. 445; Bedd. Ic. t. 201.
W. Ghâts, Shola woods of Nilgiris at 7,000—8,000 ft.
A large shrub with large blue flowers, and angular stems which like the leaves and inflorescence are very scabrous with bulbous-based hairs. The close heads have involucre bracts with leafy tips. The seeds are believed to be glabrous and large, without areoles. It flowered at Sispara and on Doddabetta in 1883.
19. *STROBILANTHES ZENKERIANUS*, T. And.; F. B. I. iv. 439; *Endopogon Strobilanthes*, Wt. Ic. t. 1500.
W. Ghâts, Nilgiris, in Shola woods above 6,000 ft., common; Anamalais, at 6,000 ft. (Beddome); Pulney Hills, (Bourne).
A large handsome shrub, with blue flowers and 4-seeded capsule. It was in flower in 1883—85 and again in 1916, but its period, perhaps rather long, is doubtful.
20. *STROBILANTHES WARRFENSIS*, Dalz.; F. B. I. iv. 439. *S. parviflorus*, Bedd. Ic. t. 197.
S. Canara Ghâts (Beddome, Meebold); Coorg, at 3,000 ft. (*vide* Beddome).
An erect shrub 5—6 ft. high with white flowers in slender cottony spikes, capsule 4-seeded.

21. *STROBILANTHES CILIATUS*, Nees; F. B. I. iv. 439; Bedd. Ic. t. 211.
W. Gháts, S. Canara to Travancore, in evergreen forest up to about 4,000 ft.
A slender shrub reaching 4 ft. in height with white or lilac flowers, said to flower yearly.
22. *STROBILANTHES MEEBOLDII*, Craib in Kew Bull. 1910, 278.
Deccan, Kempkull in Mysore, at 1,000 ft. (Meebold).
A small shrub about 3 ft. high, the heads small somewhat strobilate with soft subscarios bracts, the seeds not known but the ovules glabrous.
23. *STROBILANTHES ADENOPHORUS*, Bedd. Ic. t. 225; F. B. I. iv. 440.
W. Gháts, Anamalai Hills, at 4,000–5,000 ft. (Beddome, Fischer), hills of Tinnevelly (Beddome).
A shrub, reaching 3–4 ft. in height, with apparently pale blue flowers and very narrow leaves, probably flowering yearly.
24. *STROBILANTHES DECURRENS*, Nees; F. B. I. iv. 440. *Goldfussia decurrens*, Wt. Ic. t. 1522.
W. Gháts, Coorg (Beddome), Anamalai Hills at 4,500 ft. (Beddome), hills of Tinnevelly (Wight).
A herbaceous (Wight) plant with quadrangular stems. The large decurrent bracts and the very large seeds sometimes nearly 5 in. in diam. are characteristic.
25. *STROBILANTHES MICRANTHUS*, Wt. Ic. t. 1519; F. B. I. iv. 444.
W. Gháts, Nilgiri and Pulney Hills above 6,000 ft., in Shola woods.
An erect almost herbaceous soft shrub with thick branches, large leaves and very distinct corolla (Clarke suggests "reddish") and stamens. It flowered in 1870 and again in 1885 and 1917; the period may possibly be 15 years.
26. *STROBILANTHES TRISTIS*, T. And.; F. B. I. iv. 441. *Goldfussia tristis*, Wt. Ic. t. 1508.
W. Gháts, W. Nilgiris, Anamalais and hills of Tinnevelly, below 6,000 ft. in evergreen forest.
An erect shrub with pale blue flowers.
27. *STROBILANTHES CAUDATUS*, T. And.; F. B. I. iv. 441; Bedd. Ic. t. 213.
W. Gháts, hills of S. Canara, Coorg, Wynaad and Travancore, up to 6,000 ft., in evergreen forest.
An erect shrub, reaching 4–5 ft. high, the flowers white tinged with orange or red. The bracts in the Malabar and Travancore specimens are longer and more spreading than in those from S. Canara.
28. *STROBILANTHES HETEROMALLUS*, T. And.; F. B. I. iv. 437.
W. Gháts, Nilgiri and Pulney Hills, at about 4,000 ft. and above it.
A large shrub, reaching perhaps to 20 ft. high, with pale blue flowers, very scabrous. It was found in flower in 1884–6 (Lawson and Gamble), 1899 (Prain), 1910 (Meebold) in Nilgiris, in 1898 in Pulneys (Bourne). Its period may perhaps be about 14 years.

29. *STROBILANTHES IXIOCEPHALUS*, Benth.; F. B. I. iv. 444; Bedd. Ic. t. 203. *S. Neesianus*, Wt. Ic. t. 1523.
W. Coast and W. Gháts, in S. Canara (Beddome, Hobenacker).
A small straggling shrub with white flowers and very viscid bracts.
30. *STROBILANTHES ASPER*, Wt. Ic. t. 1518; F. B. I. iv. 452.
W. Gháts, Bababudan Hills of Mysore, W. Nilgiris, Anamalais, hills of Malabar, Cochin and Travancore, at 5,000–8,000 ft., margins of Shola woods.
A soft erect shrub about 4–5 ft. high with purplish-white flowers and a strong scent. Its period is possibly quite a short one and perhaps it may not die down at intervals.
31. *STROBILANTHES LUPULINUS*, Nees; F. B. I. iv. 443.
Hills of Mysore, at Aglatti, 3,500 ft. (Meebold); High Wavy Mountain, Madura, 4,000 ft. (Blatter and Hallberg); hills of Travancore and Tinnevely (Wight, Rama Row).
An erect herbaceous undershrub with very glandular-hairy spikes.
32. *STROBILANTHES ASPERRIMUS*, Nees; F. B. I. iv. 443.
W. Gháts, forests of Mysore, North Coimbatore and Wynaad, at about 3,000–5,000 ft.
A rather stout shrub about 3 ft. high, with apparently pale blue corolla and very rough scabrous glandular branches.
33. *STROBILANTHES HEYNEANUS*, Nees; F. B. I. iv. 443. *S. rugosus*, Wt. Ic. t. 1619.
W. Gháts, in all Districts from S. Canara to Tinnevely, at about 3,000–4,000 ft., in evergreen forests; Bababudan Hills of Mysore.
A small gregarious shrub reaching 3 ft. in height but usually less, with pale blue flowers. It seems to remain perennial and is often found in flower. It is most variable but the varieties are very difficult to separate. Clarke's var. *fusca* has large usually solitary spikes; his var. *viridis* has the cymes more elongate, more prominently bracteate and the spikes smaller, but they run into one another and the difference seems to be really only climatic.
34. *STROBILANTHES CAMPANULATUS*, Wt. Ic. t. 1562. *S. Heyneanus* var. *campanulata*, C. B. Clarke; F. B. I. iv. 444.
W. Gháts, in Coorg (Wight).
A very small herbaceous shrub reaching scarcely 10 in. high with small spikes and leaves.
35. *STROBILANTHES ANDERSONII*, Bedd. Ic. t. 208; F. B. I. iv. 450.
W. Gháts, Anamalai Hills, at 6,000 ft. (Beddome), in moist woods.
A very large shrub up to 20 ft. high (Beddome), with pale blue large flowers in strobilate spikes 2–2.5 in. long, the leaves membranous.
36. *STROBILANTHES LURIDUS*, Wt. Ic. t. 1515–6; F. B. I. iv. 450.
W. Gháts, W. Nilgiris from Naduvatam to Sispara at 4,000–6,000 ft., hills of Travancore at 4,000 ft. (Beddome).
A large straggling gregarious shrub with thick stems and branches, the lurid purple (sometimes white) flowers in brac-

teate spikes up to 10 in. long with peduncles deflexed, the spikes erect. Mr. Clarke says it flowers every year and I think this is the case, but Wight says it seems only to flower once in several years.

Var. *Bourneae*, Gamble. Bracts, bracteoles and calyx very glandular hairy, the prominent nerves on the bracts resembling those of the next species.

Pulney Hills, in Periya Shola (Bourne).

37. STROBILANTHES BOLAMPATTIANUS, Bedd. Ic. t. 200; F. B. I. iv. 451.

W. Gháts, Bolampatti Hills of Coimbatore, at 4,500—7,000 ft., in moist forests.

A large shrub up to 15 ft. high with brown flowers in terminal or lateral spikes up to 6 in. long, sometimes paniced. Beddome says it flowers every year.

38. STROBILANTHES SESSILIS, Nees; F. B. I. iv. 452; Wt. Ic. t. 1511.

W. Gháts, downs of W. Nilgiris at 6,000—8,000 ft.

A small erect plant with stems 1—1½ ft. high from a perennial rootstock. The flowers are a bright blue-purple, and the bracts after flowering sometimes change to pale pink. It probably flowers almost every year or at any rate at short intervals, the rootstock remaining.

Var. *sessiloides*, C. B. Clarke; Wt. Ic. t. 1512. Leaves thicker, very rugose or bullate, with prominent nerves; the spikes longer.

Bababudan Hills of Mysore, at 6,000 ft. (Talbot, etc.). Nilgiris (Wight).

39. STROBILANTHES DUPENI, Bedd.; F. B. I. iv. 453.

W. Gháts, Anamalais, top of Neliampatti Ghát (Beddome).

A very little known shrub with well-marked bracts and blue flowers.

40. STROBILANTHES NEWII, Bedd. ex C. B. Clarke; F. B. I. 464. *S. extensus*, Bedd. Ic. t. 202, not of Nees.

W. Gháts, Manjerabad in W. Mysore (New).

A small shrub with quadrangular stems and deep purple flowers, with much inflated corolla, the leaves prominently serrate.

41. STROBILANTHES INTEGRIFOLIUS, O. Kze. *S. perfoliatus*, T. And.; F. B. I. iv. 458. *Leptacanthus alatus*, Wt. Ic. t. 1527.

W. Gháts, hills of S. Canara and Coorg.

A gregarious much-branched shrub up to about 4 ft. high, very viscid, with blue flowers and seeds very hairy when wetted. In the Bombay forests, it is said to flower at intervals of 7 years (Talbot). It flowered in S. Canara in 1866 (Beddome).

42. STROBILANTHES HOMOTROPUS, Nees; F. B. I. iv. 474. *S. sexennis*, Bedd. Ic. t. 206, not of Nees.

W. Gháts, Nilgiris, in Sholas above 7,000 ft.

A large shrub with white flowers. It was in flower in 1883, but its period is probably a long one, as it has only rarely been collected.

43. STROBILANTHES GRACILIS, Bedd. Ic. t. 207; F. B. I. iv. 474.

W. Gháts, Anamalais, Pulneys and hills of Travancore, at 4,000—6,000 ft.

A very large shrub (Beddome), reaching 15 ft. in height (Bourne), the flowers white tinged with lilac; mauve-blue (Bourne).

44. *STROBILANTHES VIOLACEUS*, Bedd. Ic. t. 205; F. B. I. iv. 474.
W. Gháts, about Bangi Tappal and Sispara in the Nilgiris at 6,000–7,500 ft.
A large shrub with beautiful blue-purple flowers. It flowers rarely, probably at long intervals. It was found by Beddome in 1870 and by Lawson and Gamble in 1883, so the period may be 13 years.
45. *STROBILANTHES AMABILIS*, C. B. Clarke; F. B. I. iv. 476. *Leptacanthus Walkeri*, Wt. Ic. t. 1507, not of Nees.
A large very sticky shrub with jointed stems and pink flowers. Recorded flowering years are: 1838 (Gough), 1846 (Wt.), 1847 (Gardner), 1855 (Cleghorn), 1861 (T. Anderson), 1873 (Beddome), 1883 (Lawson, Gamble), 1911 (Fischer); the period has been supposed to be about 10 years.
46. *STROBILANTHES RUBICUNDUS*, T. And.; F. B. I. iv. 475. *S. paniculatus*, Bedd. Ic. t. 199, not of T. And.
W. Gháts, Wynaad to Travancore and Tinnevely Hills, at 2,000–3,000 ft. (Beddome, Lawson, Bourdillon).
A slender delicate shrub with pink flowers. It flowered in Wynaad in 1816 (Heyne), on the Carcoor Ghát in 1864 and 1888, near Peermerd in 1889, in Tinnevely in 1899.

19. *Calacanthus*, T. And.

An erect shrub. *Leaves* large, entire, lineolate. *Flowers* large, solitary and sessile in the axils of bracts, arranged in long spikes, terminal and from the upper axils; bracteoles 2. *Calyx* 5-partite, the lobes unequal, the upper and 2 lower lanceolate, the 2 lateral linear. *Corolla* purple, deeply 2-lipped; upper lip narrow, shortly bifid, lower shortly 3-lobed, the lobes all contorted in bud. *Stamens* 4, didynamous; filaments connate at base in a transverse membrane; anthers subequal, oblong, 2-celled, ciliate. *Ovary* 2-celled; ovules 2 in each cell; style long, filiform, hairy, stigma linear. *Capsule* obovoid, compressed apiculate, pubescent, 2-seeded. *Seeds* compressed, densely hairy, on curved retinacula.

CALACANTHUS DALZELLIANA, T. And.; F. B. I. iv. 479. *Lepidagathis grandiflora*, Dalz.; Bedd. Ic. t. 226.

Hills of S. Canara up to 3,000 ft. (Beddome).

A leafy gregarious shrub up to 6 ft. high, with large elliptic or lanceolate acuminate leaves up to 8 in. long, 3 in. broad, large purple flowers with transversely plicate lower lip and large capsule, the seeds with brown hairs.

20. *Andrographis*, Wall.

Erect or procumbent herbs or undershrubs, the branches often terragonous. *Leaves* entire, often minutely lineolate. *Flowers* in axillary and terminal, lax, often panicled, racemes, sometimes reduced to 1 flower, often unilateral; bracts small; bracteoles minute or 0. *Calyx* 5-partite, the lobes narrow. *Corolla* small, usually pale but blotched and

spotted with brown and purple, tubular at base, then more or less ventricose, prominently 2-lipped, the upper slightly 2-fid, the lower usually deflexed, 3-lobed and coloured. *Stamens* 2; filaments broad, enlarged at base and sometimes in the middle; anthers 2-celled, usually bearded at base with a tuft of white hair. *Ovary* 2-celled, ovules 2—6 in each cell; style slender; stigma minutely bifid. *Fruit* an oblong or elliptic capsule compressed at right angles to the septum, 4—12-seeded, the retinacula acute or rounded. Seeds hard, deeply rugosely pitted, glabrous.

Capsule linear-oblong:—

Flowers in elongate racemes, sometimes subpaniculate but the flowers distant; stem tetragonous; retinacula acute:—

Anthers bearded at the base, the filaments also more or less hirsute; corolla prominently 2-lipped:—

Corolla under .5 in. long; anthers prominently bearded; leaves glabrous:—

Leaves lanceolate, acute at both ends, up to 3 in. long, .75 in. broad; pedicels up to .25 in. long; calyx-lobes glandular-pubescent...1. *paniculata*.

Leaves linear, under 1 in. long; pedicels .15 in. long; calyx-lobes glabrous, lineolate.....2. *stenophylla*.

Corolla about .75 in. long; anthers bearded but not prominently:—

Stems slender as are the racemes; pedicels up to .2 in. long; leaves lanceolate, acuminate, broadest at the rounded base, nearly glabrous, up to 3 in. long, 1 in. broad; calyx-lobes glandular-pubescent and lineolate

3. *Wightiana*.

Stems stouter as are the racemes; pedicels 0—1 in. long; leaves oblong-lanceolate, acute, cuneate at base, slightly pubescent, up to 3.5 in. long, 1 in. broad; calyx-lobes glandular-pubescent4. *macrobotrys*.

Anthers not bearded at the base, the filaments nearly glabrous; corolla not or only obscurely 2-lipped:—

Corolla about .3 in. long:—

Filaments only slightly broadened below; pedicels very short or 0; leaves ovate, acute, rounded and then decurrent at base, up to 4.5 in. long, 2 in. broad; calyx-lobes glandular-pubescent or nearly glabrous5. *elongata*. Filaments with a prominent rounded protuberance; pedicels usually 0; leaves ovate, acute, attenuate or rounded and then long-decurrent at base, up to 4 in. long, 1.5 in. broad; calyx-lobes glandular-pubescent

6. *ovata*.

Corolla .5—1 in. long; filaments flattened; pedicels .1—1 in. long; leaves below ovate, upper linear-oblong, acute at both ends, glabrous but much lineolate, up to 3.5 in. long, 1 in. broad; calyx-lobes long, glandular-hispid

7. *alata*.

Flowers in racemes, paniculate, the flowers not very distant:—

Racemes short, forming terminal subcapitate panicles; corolla ventricose:—

Leaves elliptic, acute at both ends, glabrous except for scattered jointed hairs, drying black, up to 4 in. long, 2.5 in. broad, raphides minute; calyx-lobes linear, .1—1.5 in. long; capsule up to 1 in. long, glandular-strigose

8. *Neesiana*.

Leaves elliptic-lanceolate, narrowed at both ends, strigose above, softly fulvous-tomentose beneath, up to 2.5 in. long, 1 in. broad, raphides 0; calyx-lobes setaceous, .2—1 in. long; capsule about .75 in. long, glandular-strigose

9. *stellulata*.

Racemes long, forming rather large compound terminal panicles:—

Leaves rather thick, subsessile, ovate or ovate-lanceolate, acute, the base obtuse, glabrous, up to 3 in. long, 1 in. broad, raphides minute; calyx-lobes .1—2 in. long, glandular hairy; corolla ventricose; capsule .8 in. long

10. *lineata*.

Leaves submembranous, petioled, lanceolate, acuminate at both ends, up to 4 in. long, 1—1.5 in. broad, lineolate:—

Corolla with a prominent ventricose protuberance; calyx-lobes .15 in. long, glandular; leaves glabrous above.....11. *producta*.

- Corolla only slightly ventricose; calyx-lobes .3 in. long, scaly and glandular; leaves usually strigose above..... 12. *explicata*.
 Leaves thick, very shortly petioled, ovate or ovate-oblong, rounded at base, strigose above, without raphides, up to 2 in. long, .5—.75 in. broad; corolla slightly ventricose; calyx-lobes .2—.25 in. long, glandular hairy...13. *affinis*.
 Racemes short, in short terminal panicles, sometimes single; low branching undershrubs:—
 Leaves ovate or lanceolate, glabrous, narrowed at both ends, submembranous, up to 2 in. long, .75 in. broad, lineolate; panicles rarely 2 in. long; calyx-lobes .15 in. long; corolla very little ventricose.....14. *viscosula*.
 Leaves small, ovate or orbicular; racemes little branched:—
 Anthers very conspicuously white-bearded; corolla pale, not ventricose; calyx-lobes .15—.2 in., glandular; leaves ovate or orbicular, villous, soft, up to .5 in. in diam., the margins not recurved; capsule .6 in. long, .1 in. broad, glandular.....15. *lobelioides*.
 Anthers not at all bearded; corolla dark, slightly ventricose; calyx-lobes .2—.3 in. long, glandular; leaves ovate or elliptic, rounded or cuneate at base, villous only on the margins which are recurved, hard, up to .6 in. long, .3 in. broad; capsule .6 in. long, .1 in. broad, very glandular hirsute.....16. *Lawsoni*.
 Flowers in slender axillary racemes, sometimes bifid; anthers strongly bearded; retinacula spoon-shaped:—
 Racemes long, up to 4 in., slender, spreading, the pedicels distant; calyx-lobes .2 in. long; leaves ovate or orbicular, shortly petioled, villous, up to .7 in. in diam.; capsule .75 in. long, 8-seeded.....17. *Rothii*.
 Racemes short, few-flowered, the pedicels close:—
 Racemes up to 1.5 in. long; calyx-lobes .3 in. long, glandular-pubescent; leaves elliptic or obovate, subsessile, glabrous, up to 3 in. long, 1.5 in. broad; capsule .6 in. long, 8-seeded.....18. *Beddomei*.
 Racemes scarcely 1 in. long; calyx-lobes .15 in. long, glandular; leaves elliptic or ovate, subsessile, villous, up to 1 in. long, .3 in. broad; capsule .5 in. long, 4-seeded.....19. *glandulosa*.
 Capsule elliptic:—
 Capsule hairy, .35 in. long, .15 in. broad, 4-seeded; seeds large, dark, deeply pitted, retinacula spine-like; anthers slightly bearded; flowers erect, in slender axillary unilateral racemes, which are sometimes 2-branched and as long as or shorter than the leaves; calyx-lobes very slender, .25—.5 in. long; leaves oblong or elliptic, subobtus, up to 3.5 in. long, 1 in. broad.....20. *echioides*.
 Capsule, acute at both ends, glabrous, .4 in. long, .2 in. broad, 8-seeded; seeds small, pale, deeply rugose, retinacula spoon-shaped; anthers much bearded; flowers solitary axillary or in few-flowered racemes in upper axils; calyx-lobes very slender, .25—.4 in. long; leaves orbicular or subreniform, sessile, villous, up to 1 in. in diam.....21. *serpyllifolia*.
1. *ANDROGRAPHIS PANICULATA*, Nees; F. B. I. iv. 501; Wt. Ic. t. 518.
A. subspathulata, C. B. Clarke; F. B. I. iv. 502.
 N. Circars, Deccan and Carnatic to S. Travancore in dry forest undergrowth.
 An erect herb with pink corolla, darker on the lower lip, the capsule usually 12-seeded. A bitter plant, used in medicine.
 2. *ANDROGRAPHIS STENOPHYLLA*, C. B. Clarke; F. B. I. iv. 503.
 Deccan, about Coimbatore (Wight).
 An erect glabrous undershrub with very narrow leaves and stems from a stout rootstock, the corolla pale with dark red stripes.
 3. *ANDROGRAPHIS WIGHTIANA*, Arn. ex Nees; F. B. I. iv. 503; Wt. Ic. t. 1558.
 W. Ghâts, Anamalais and hills of Travancore and Tinnevely, up to 2,500 ft., in evergreen forests.

A very slender nearly glabrous herb, the corolla pink with red-purple lower lip.

4. *ANDROGRAPHIS MACROBOTRYS*, Nees ; F. B. I. iv. 503.
W. Gháts, S. Canara (Hohenacker), Anamalais, Pulneys and hills of Travancore, up to 2,500 ft., in evergreen forests.
A stouter somewhat pubescent herb with pink corolla and dark purple-red blotches on the lower lip, as in the last.
5. *ANDROGRAPHIS ELONGATA*, T. And. ; F. B. I. iv. 502.
W. Gháts, hills of Tinnevely, in evergreen forests, at low levels.
An erect plant with divaricate branches and inflorescence, the corolla apparently pink.
6. *ANDROGRAPHIS OVATA*, Benth. ; F. B. I. iv. 502. *Gymnostachyum ovatum*, T. And. ; Bedd. Ic. t. 250.
N. Circars, Mahendragiri Hill in Ganjam, 4,000 ft. (Gamble, Fischer and Gage), Rampa Hills of Godavari, 2,000—3,000 ft. (Gamble, V. Narayanswami) ; Déccan, Ananthapura in Mysore, 2,000—3,000 ft. (Meebold).
An erect rather tall herb with glandular-pubescent stem and pink corolla.
7. *ANDROGRAPHIS ALATA*, Nees ; F. B. I. iv. 502.
W. Gháts, E. base of slopes in Nilgiris, Coimbatore and Walayar, up to 3,000 ft. in the Gundal Valley (Fischer).
An erect herb reaching 4 ft. in height with very divaricate long branches and white corolla spotted with pink. The upper branchlets have the angles so sharp as to be slightly winged.
8. *ANDROGRAPHIS NEESIANA*, Wt. Ic. t. 1561 ; F. B. I. iv. 504.
W. Gháts, Anamalais, Pulneys and hills of Tinnevely, about 7,000 ft., on grass downs at the margins of sholas and on the banks of streams.
An erect handsome plant about 2—3 ft. high with brownish purple flowers. The heads are usually close, but the racemes elongate later on.
9. *ANDROGRAPHIS STELLULATA*, C. B. Clarke ; F. B. I. iv. 504.
W. Gháts, Nilgiris about 6,000 ft. (Hohenacker, Clarke).
An erect herb with prominent calyx-lobes, the corolla pale pink with purple spots.
10. *ANDROGRAPHIS LINEATA*, Nees ; F. B. I. iv. 504.
Deccan, hills of Cuddapah at 3,000 ft. (Gamble) ; Mysore and N. Coimbatore to the N. slopes of Nilgiris, 3,000—5,500 ft. ; Carnatic, Sirumalai Hills of Madura.
An erect herb, the panicle branches very long and almost spicate in fruit, the corolla pale with purple blotches. Clarke's var. *Lawii*, seems quite a distinct plant but the material is very insufficient.
11. *ANDROGRAPHIS PRODUCTA*, Gamble n. comb. *A. Neesiana* var. *producta*, C. B. Clarke ; F. B. I. iv. 504.
W. Gháts, Malabar, Travancore and Tinnevely, up to 6,000 ft. on W. Nilgiris.
An erect herb.

12. *ANDROGRAPHIS EXPLICATA*, Gamble n. comb. *A. viscosula* var. *explicata*, C. B. Clarke; F. B. I. iv. 504. *A. ceylanica*, Wt. Ic. t. 1560, not of Nees.
W. Gháts, hills of Tinnevely and Travancore, up to 5,000 ft.
An erect herb.
13. *ANDROGRAPHIS AFFINIS*, Nees. *A. Neesiana* var. *affinis*, T. And.; F. B. I. iv. 504.
W. Gháts, Nilgiris and Pulneys at 5,000—7,000 ft.
A slender, many-stemmed undershrub with pale corolla streaked with purple, the inflorescence bracts prominent.
14. *ANDROGRAPHIS VISCOSULA*, Nees; F. B. I. iv. 504; Wt. Ic. t. 1559.
Hills of Tinnevely, about Courtallum (Wight, etc.).
A many-branched woody undershrub reaching scarcely more than 1—1½ ft. high, the corolla apparently lilac with a few dark streaks.
15. *ANDROGRAPHIS LOBELIOIDES*, Wt. Spic. Nilg. t. 181, Ic. t. 1557; F. B. I. iv. 505.
W. Gháts, Nilgiris, on the downs among grass, at 6,000—8,000 ft.
A low much-branched procumbent herb from a woody rootstock, the corolla white streaked with red.
16. *ANDROGRAPHIS LAWSONI*, Gamble in Kew Bull. 1923, 375.
W. Gháts, Kundahs in Nilgiris about Avalanché and Sispara, 7,000—8,000 ft., in grass.
A low undershrub with erect branches and rather long often paniculate racemes, the flowers apparently dark brownish-purple.
17. *ANDROGRAPHIS ROTHII*, C. B. Clarke; F. B. I. iv. 506.
S. Carnatic, plains of Tinnevely (Beddome), lower hills (Fischer).
A straggling undershrub from a woody rootstock, the flowers pale yellow with large purple blotches on the deeply cut lobes of the lower lip.
18. *ANDROGRAPHIS BEDDOMEI*, C. B. Clarke; F. B. I. iv. 506.
Deccan, Nallamalai Hills of Kurnool, 2,000 ft. (Beddome, *vide* F. B. I.); Lankamalai Hills of Cuddapah, up to 1,000 ft. (Fischer).
A many-branched nearly glabrous undershrub, the flowers white with purple spots on the lower lip.
19. *ANDROGRAPHIS GLANDULOSA*, Nees; F. B. I. iv. 505.
Deccan, in Mysore, hills of Cuddapah at 3,000 ft. (Gamble), on rocks.
A straggling small grey-pubescent undershrub, the flowers nearly white with a pale purple tinge on the lower lip.
20. *ANDROGRAPHIS ECHIOIDES*, Nees; F. B. I. iv. 505; Wt. Ic. t. 467.
N. Circars, Deccan and Carnatic, in all dry Districts, common.
An erect herb, villous with whitish hairs, the corolla pink or white with purple blotches on the lower lip.
21. *ANDROGRAPHIS SERPYLLIFOLIA*, Wt. Ic. t. 517; F. B. I. iv. 506.
Deccan and Carnatic, on dry soil, laterite and trap, up to 3,000 ft.
A trailing and rooting procumbent herb from a stout rootstock, the flowers pale with purple blotches on the lower lip.

21. *Haplanthus*, Nees.

Erect herbs. *Leaves* entire, petioled. *Flowers* axillary, in false whorls, surrounded by numerous abortive branchlets reduced to cladodes and ending in spinous points (reduced leaves); bracts and bracteoles small. *Calyx* 5-partite, lobes linear-lanceolate. *Corolla* small, tubular, the tube slightly enlarged above, 2-lipped, the upper lip 2-fid, the lower 3-lobed. *Stamens* 2, shorter than the corolla and inserted below the throat; filaments flattened; anthers 2-celled, connivent; cells ovate, somewhat unequal, mucous, one cell with the connective bearded. *Disk* thick, prominent. *Ovary* 2-celled; ovules 3—8 in each cell; style slender; stigma linear. *Fruit* a linear-oblong capsule, compressed at right angles to the septum, 6—16-seeded. *Seeds* ellipsoid, densely hairy when wetted, retinacula obtuse.

Cladodes stout, quadrangular, .75—1.25 in. long, ending usually in 2 spinous teeth, villous and glandular-hairy; capsule glabrous, .4 in. long; leaves ovate, rounded at base and decurrent on the long petiole, up to 4 in. long, 2 in. broad

1. *verticillaris*.
Cladodes very slender, subquadrangular, .5 in. long, ending in 2 or more teeth, villous with long soft hairs; capsule pubescent, .2 in. long; leaves ovate, rounded at base and decurrent on the long petiole, up to 5 in. long, 2.5 in. broad

2. *neilgherryensis*.

1. *HAPLANTHUS VERTICILLARIS*, Nees; F. B. I. iv. 506.

Dcccan, Ramandrug Hills of Bellary (Beddome).

A herbaceous plant, up to 3 ft. high, the corolla dark lilac with darker lines.

2. *HAPLANTHUS NEILGHERYENSIS*; Wt. Ic. t. 1556. *H. tentaculatus* var. *neilgherrensis*, C. B. Clarke; F. B. I. iv. 507.

W. Ghats, Hills of Mysore, Coorg, S. Canara and Malabar, up to 3,000 ft.

An erect herbaceous plant, with the flowers and cladodes collected in conspicuous soft terminal spikes, the corolla bright blue (Hb. Madr.).

22. *Gymnostachyum*, Nees.

Herbs or undershrubs. *Leaves* cauline or subradical, entire or toothed. *Flowers* subsessile or shortly pedicellate, in axillary cymes or in a terminal spicate or racemose panicle: bracts and bracteoles very small. *Calyx* 5-partite, the lobes linear-lanceolate. *Corolla*-tube slender; limb short, 2-lipped, the lobes subequal, imbricate. *Stamens* 2, included or slightly exserted, filaments slender, usually villous near the base; anthers 2-celled, the cells subequal, oblong or ovate, glabrous or hairy. *Ovary* 2-celled; ovules, numerous in each cell; style slender; stigma subentire. *Fruit* a linear capsule, 16—24-seeded. *Seeds* ovoid, compressed, with soft hairs when wetted.

Inflorescence terminal; leaves chiefly at the base of the stem:—

Corolla large, 1—1.5 in. long, glabrous; leaf-blade ovate, rounded at base and then long-decurrent on the petiole, about 6 in. long; anthers bearded

1. *febrifugum*.

Corolla moderate-sized, .7 in. long, puberulous; leaf-blade ovate, rounded or cordate at base, not decurrent, up to 3 in. long; anthers glabrous

2. *polyanthum*.

Inflorescence axillary, sometimes also terminal:—

Corolla small, up to .7 in. long, pubescent; leaves ovate, acute and slightly decurrent at base, serrulate, 8 in. long or longer; anthers puberulous

Corolla large, 1 in. long, nearly glabrous; leaves broadly ovate, rounded or truncate at base, not usually decurrent, entire, up to 9 in. long; anthers glabrous but the connective rough.....^{3. *canescens*.}
.....^{4. *latifolium*.}

1. *GYMNOSTACHYUM FEBRIFUGUM*, Benth.; F. B. I. iv. 508. *G. alatum*, Wt. Ic. t. 1525.

W. Coast and W. Gháts, S. Canara, Malabar and Travancore.

A small nearly stemless and scapigerous herb with apparently blue flowers, the large usually long-petioled leaves lineolate and undulate crenulate.

2. *GYMNOSTACHYUM POLYANTHUM*, Wt. Ic. t. 1494; F. B. I. iv. 508.

W. Gháts, in Coorg (Jerdon).

A scapigerous herb with a long inflorescence of small opposite cymes in a raceme, the leaves not lineolate though minutely punctate.

3. *GYMNOSTACHYUM CANESCENS*, T. And.; F. B. I. iv. 509. *G. serrulatum*, T. And.; Bedd. Ic. t. 254. *Cryptophragmium canescens*, Nees; Wt. Ic. t. 1495.

W. Gháts, in Malabar, Nilgiris, Anamalais, Travancore and Tinnevely, up to 4,000 ft., in evergreen forests.

A shrubby glandular-hairy plant with small flowers green and yellow (Meebold), the leaves large, lineolate and parallel-nerved, white-pubescent beneath when young.

4. *GYMNOSTACHYUM LATIFOLIUM*, T. And.; F. B. I. iv. 509; Bedd. Ic. t. 253. *Phlogacanthus latifolius*, Wt. Ic. t. 1537.

W. Gháts, in S. Canara, Coorg and Malabar; Bababudan Hills of Mysore, up to 4,000 ft.

A glabrous undershrub up to 3 ft. high with greenish yellow flowers, the very long-petioled leaves not lineolate, parallel-nerved, the lower nerves close together.

Var. *decurrens*, Gamble. Leaves acuminate at base and decurrent on the long petiole, the nerves equally spaced, the calyx-lobes rather shorter.

W. Gháts at Manantoddy, Wynaad (Lawson).

23. *Diotacanthus*, Benth.

Shrubs. Leaves large, membranous, entire or obscurely crenate, not or obscurely lineolate. Flowers in lax cymes, axillary or in terminal trichotomous panicles; bracts small, narrow; bracteoles minute. Calyx 5-partite, the lobes linear-subulate, subequal. Corolla-tube short; limb deeply 2-lipped, ventricose, the upper lip erect, emarginate or shortly 2-lobed, the lower spreading, 3-lobed, the bases shortly auricled. Stamens 2, about as long as the corolla; filaments thickened; anthers oblong, 2-celled, dorsifixed. Disk cupular, thick. Ovary 2-celled; ovules many in each cell; style filiform; stigma small, capitate. Fruit a linear terete capsule, 2-cleft from the base. Seeds many, about 24, compressed, hairy, especially when wet.

Flowers in terminal panicles axillary to upper leaves often 18 in. long; corolla crimson; leaves lanceolate or oblanceolate, acuminate, glabrous, up to 12 in. long, 3.5 in. broad, main nerves about 18 pairs; capsule 1.25 in. long.....1. *grandis*.
 Flowers in axillary cymes about 3 in. long; corolla white; leaves lanceolate, acute or acuminate, nearly glabrous, up to 5 in. long, 2 in. broad, main nerves 7—8 pairs; capsule 1.5 in. long.....2. *albiflorus*.

1. DIOTACANTHUS GRANDIS, Benth.; F. B. I. iv. 515. *Phlogacanthus grandis*, Bedd. Ic. t. 179.
 W. Ghâts, hills of Tinnevely and Travancore, up to 4,000 ft., in dense moist forests.
 A large shrub, reaching 12 ft. in height.
2. DIOTACANTHUS ALBIFLORUS, Benth.; F. B. I. iv. 515. *Phlogacanthus albiflorus*, Bedd. Ic. t. 180.
 W. Ghâts, hills of Tinnevely and Travancore, up to 5,000 ft., in evergreen forest.
 A shrub reaching 7—10 ft. in height.

24. Crossandra, Salisb.

Undershrubs. *Leaves* opposite or whorled, entire or undulate, sometimes slightly toothed. *Flowers* sessile, yellow, in linear-oblong spikes; bracts rather large, imbricate; bracteoles linear or lanceolate. *Calyx* 5-partite to the base, upper 2-lobed, 2-nerved, 2 lower oblong, sometimes connate, 2 inner small, lanceolate. *Corolla*-tube long, linear, incurved; limb unilateral, forming a lip of 5 subequal lobes. *Stamens* 4, didynamous, included in the tube, anthers 1-celled. *Ovary* 2-celled, ovules 2 in each cell; style linear; stigma 2-lobed. *Fruit* an oblong acute capsule. *Seeds* 4, compressed, clothed with appressed fringed scales formed of many connate hairs.

CROSSANDRA UNDULAEFOLIA, Salisb.; F. B. I. iv. 492. *C. axillaris*, Nees; Wt. Ic. t. 460.

Deccan, from the Godavari southwards, west to the Ghâts, in open forest land, commonly planted in gardens and about temples.

A pretty undershrub up to 3 ft. high with orange-yellow flowers and whorled leaves, lanceolate, acute, decurrent at base, up to 6 in. long, 2 in. broad.

25. Barleria, Linn.

Small shrubs or undershrubs, spinous or unarmed. *Leaves* opposite, entire, usually lineolate with cystoliths. *Flowers* showy, solitary or in lax or dense spikes or racemes or helicoid cymes often crowded towards the ends of the branches; bracts 1 fertile, 1 sterile, sometimes reduced to spines; bracteoles 0. *Calyx* deeply 4-partite, the lobes in opposite pairs, the outer pair the larger with the anterior lobe more or less bifid and apparently of 2 connate lobes. *Corolla* large, the tube more or less cylindric at base, funnel-shaped above; lobes 5, subequal, imbricate in bud. *Stamens* 2 long and fertile with oblong 2-celled anthers, 2 small and rudimentary with anthers having sometimes a little pollen, often a fifth quite rudimentary. *Disk* large, cupular, half embracing the ovary. *Ovary* 2-celled; ovules 2 in each cell; style long; stigma bifid or

subentire. *Fruit* an ovoid or oblong capsule 2- or 4-seeded below the middle. *Seeds* compressed, usually clothed with wavy silky appressed hairs, rarely glabrous.

Shrubs or undershrubs with sharp intrapetiolar spines, usually white;

Capsule ovoid, with a solid beak, 2-seeded close to the base:—

Flowers sessile, solitary in lower axils, spicate above; inflorescence bracts foliaceous, oblong, sharply mucronate, floral bracts linear-subulate; leaves elliptic, acuminate, bristly mucronate, glabrous above, often pubescent beneath, up to 7 in. long, 2.5 in. broad, petioled.....1. *Prionitis*.

Flowers subsessile, mostly solitary axillary; inflorescence bracts lanceolate, mucronate, floral bracts 0 or mere bristles; leaves oblong-lanceolate, acute, bristly mucronate, glabrous, pale beneath, up to 2.5 in. long, .5 in. broad, subsessile.....2. *cuspidata*.

Capsule oblong or ellipsoid, the beak not solid, 4-seeded; flowers solitary, no bracts except the spines:—

Outer calyx-lobes oblong or obovate at first, about .3—6 in. long, longer and reticulate in fruit, sometimes emarginate, sometimes with 1—2 spinous teeth, inner small; corolla-tube up to 1 in. long; leaves orbicular or ovate, spinous-mucronate, .5—7.5 in. in diam.....3. *buxifolia*.

Outer calyx-lobes broadly ovate, spinous-toothed, about .75 in. long, softly hairy, scarious, nerved and reticulate in fruit, inner very small; corolla-tube up to 1.5 in. long; leaves elliptic or obovate, obtuse, mucronate, tomentose, .5—1 in. in diam.....4. *mysorensis*.

Outer calyx-lobes ovate, spinous-toothed, about .75 in. long, prominently white-scarious, nerved and reticulate in fruit, inner lanceolate, .4 in. long; leaves oblong or obovate, obtuse or acute, mucronate, .75—1 in. long.....5. *noctiflora*.

Shrubs or undershrubs without spines:—

Flowers in loose many-branched leafy panicles of solitary flowers or somewhat scorpioid cymes; bracts linear; leaves rather small, hairy; capsule 4-seeded, the seeds with appressed hairs:—

Outer calyx-lobes entire, not spinescent-toothed:—

Outer calyx-lobes ovate, obtuse at base, pale and scarious in fruit and prominently reticulate with spreading nerves, .75—1 in. long; corolla-tube very slender, cylindric to near the top, up to 6 in. long, lobes ovate, .5 in. long; leaves ovate-deltoid, acute, closely softly grey-tomentose, up to 1.75 in. long, 1 in. broad.....6. *longiflora*.

Outer calyx-lobes oblong or spatulate, acute, sometimes bifid, pale and scarious in fruit, .5—7.5 in. long:—

Corolla cylindric below, then funnel-shaped, the tube 2 in. long, lobes elliptic-ovate, .75 in. long; leaves elliptic or ovate, acuminate at both ends, yellowish-hirsute with spreading hairs, up to 3 in. long, 1.5 in. broad.....7. *tomentosa*.

Corolla-tube cylindric, scarcely enlarged above, .75—1.5 in. long, lobes orbicular, .3 in. in diam.; leaves ovate, acute, obtuse at base, softly and shortly appressed-tomentose, pale beneath, up to 2 in. long, 1.5 in. broad.....8. *acuminata*.

Outer calyx-lobes ovate-orbicular, reticulate and about 5—7-nerved, with spinescent teeth, .5 in. in diam.; corolla-tube slender, gradually enlarging upwards, about 1 in. long, lobes obovate, about .6 in. long; leaves thin, ovate-acuminate, softly villous, up to 4 in. long, .2 in. broad, long-petioled.....9. *pilosa*.

Flowers large, in a panicle of terminal and axillary helicoid racemes at the ends of the branches; bracts linear; leaves large and glabrescent; capsule 4-seeded, the large seeds appressed-hairy:—

Corolla-tube at first cylindric, soon widening and funnel-shaped, expanding in obovate lobes 3—3.5 in. long in all; outer calyx-lobes oblong, 1 in. long, tawny-pubescent, inner .5 in. long; leaves elliptic, acuminate at both ends, sparsely pubescent, up to 12 in. long, 3 in. broad.....10. *involuta* var. *elata*.

Corolla-tube cylindric, funnel-shaped at top, the lobes suborbicular, emarginate, 2.5—3 in. long in all; outer calyx-lobes lanceolate, one deeply bifid, .5—7 in. long, inner ovate, long-apiculate, .4 in. long; leaves membranous, elliptic, long-acuminate at both ends, pilose, up to 6 in. long, 2 in. broad.....11. *paniculata*.

Flowers medium-sized or large, in axillary and terminal spikes or racemes or sometimes solitary, closer and less leafy upwards:—

Outer calyx-lobes not spinous-ciliate:—

Flowers in tawny-pubescent racemes with very short pedicels; bracts linear-oblong, .4—7 in. long, glandular; outer calyx-lobes elliptic-ovate, nervose, one acuminate, the other shortly bilobed, 1 in. long, inner lanceolate, .3 in. long; corolla long- and narrowly-funnel-shaped, pubescent, veined, 3—3.5 in. long; leaves lanceolate, acuminate at both ends, up to 4 in. long, 2 in. broad.....12. *Lawii*.

Flowers in glandular-hairy tawny spikes; bracts linear, .3 in. long; outer calyx-lobes ovate or ovate-lanceolate, nervose, one slightly bifid at apex, .75—1 in. long; corolla with short cylindric tube, then funnel-shaped, glabrous, lobes obovate, 1.5—2.5 in. long in all; leaves lanceolate or elliptic, acuminate at both ends, glabrous, up to 6 in. long, 3 in. broad.....13. *courtallica*.

Outer calyx-lobes spinous-ciliate, ovate-lanceolate, hairy, mucronate or one sometimes bimucronate, prominently nerved and reticulate, at length white, about .75 in. long, inner smaller; flowers in dense strigosely hairy spikes; bracts linear, usually reflexed, spinous-ciliate, .5 in. long; corolla-tube cylindric then funnel-shaped, lobes ovate, 1—2 in. long in all; leaves variable, ovate or lanceolate or linear-oblong, up to 4 in. long, 1.5 in. broad.....14. *cristata*.

Flowers large, solitary in upper leaf-axils and gradually passing into terminal spikes:—

Seeds densely silky:—

Outer calyx-lobes 1 in. long, prominently ciliate with long hairs, one lanceolate 3-nerved, the other bifid to the middle each side 2-nerved, inner pair linear, .75 in. long; bracts oblong, longer than the calyx; corolla-tube cylindric below funnel-shaped above, lobes obovate emarginate, in all 2 in. long; leaves ovate, sessile, nearly glabrous, up to 2 in. long, 1 in. broad.....15. *Stocksii*.

Outer calyx-lobes 1.5 in. long, nearly glabrous, ovate, .75 in. broad, one sometimes slightly bifid, inner pair linear, .75 in. long; bracts linear-spathulate, shorter than the calyx; corolla tube funnel-shaped, lobes obovate, 2—2.5 in. in all; leaves ovate-lanceolate, acuminate at both ends, glabrous, petioled, up to 5 in. long, 2 in. broad.....16. *montana*.

Seeds glabrous, black; outer calyx-lobes elliptic, acute, 1.25 in. long, .5—75 in. broad, glabrous; bracts subulate, .5 in. long; corolla-tube broadly funnel-shaped, lobes obovate, up to 2.5 in. long in all; leaves ovate or lanceolate, glaucous beneath, up to 7 in. long, 3 in. broad.....17. *Gibsoni*.

Flowers in dense unilateral spikes at the ends of the branchlets; outer calyx-lobes with 9—11 nerves radiating from the base, scarious in fruit; corolla cylindric below, funnel-shaped above, 1.5—2 in. long; capsule 4-seeded:—

Leaves large, ovate, acuminate, long-decurrent on the petiole, glabrate, up to 9 in. long, 4.5 in. broad, main nerves 6—8 pairs; bracts ovate or lanceolate, shorter than the calyx; outer calyx-lobes subequal but one sometimes shortly bifid, ovate, ciliate-denticulate, minutely strigose, 1 in. long, .75 in. broad, inner linear-lanceolate, white-hirsute, .5 in. long.....18. *strigosa*.

Leaves small, ovate, acute, shortly decurrent, strigose beneath, up to 2 in. long, 1 in. broad, main nerves 5 pairs; bracts ovate, 5-ribbed, short; outer calyx-lobes unequal, subspinously denticulate on the margins, outside with long stiff hairs, up to 1.25 in. long, .75 in. broad, inner linear, strigose, .4 in. long.....19. *nitida*.

1. *BARLERIA PRIONITIS*, Linn.; F. B. I. iv. 482; Wt. Ic. t. 452.

All plains Districts, especially the Deccan and Carnatic, chiefly on waste lands and roadsides, sometimes planted in hedges.

A prickly very variable shrub with yellow, or sometimes whitish, flowers. Vern. *Hind. Katsareya*; Tel. *Mulu govinda*.

2. *BARLERIA CUSPIDATA*, Heyne; F. B. I. iv. 483; Wt. Ic. t. 451.

Dry Districts of the Circars, Deccan and Carnatic.

- A very prickly small shrub with white yellow or fawn-coloured flowers and very long straight thorns.
3. *BARLERIA BUXIFOLIA*, Linn.; F. B. I. iv. 483; Wt. Ic. t. 870.
Dry Districts of the Deccan and Carnatic, up to 4,000 ft., chiefly on roadsides and waste lands.
A small very prickly hairy shrub with pink or white flowers, sometimes with long pedicels, but more often nearly sessile. The calyx-lobes enlarge and become scarious in fruit.
 4. *BARLERIA MYSORENSIS*, Roth; F. B. I. iv. 484.
W. Deccan, in Coimbatore, dry places in Malabar and Travancore.
A small prickly shrub with blue or purple flowers, the spines usually long.
 5. *BARLERIA NOCTIFLORA*, Linn. f.; F. B. I. iv. 484.
Deccan and Carnatic, chiefly in somewhat hilly country, on dry waste lands.
A small very prickly shrub, colour of flowers not recorded. The spines are sometimes leafy-margined, showing their bracteate character.
 6. *BARLERIA LONGIFLORA*, Linn. f.; F. B. I. iv. 485.
N. Circars, Deccan and Carnatic, especially on dry rocky hills.
A shrub with very white appearance and very long white flowers, sometimes reaching even 6 inches, usually solitary with a small branchlet opposite.
 7. *BARLERIA TOMENTOSA*, Roth; F. B. I. iv. 485.
Deccan and Carnatic, from the Kistna river southwards, westwards to the drier E. slopes of the W. Gháts up to 4,000 ft.
A low shrub with rose-coloured (?) flowers and obovoid capsules.
 8. *BARLERIA ACUMINATA*, Wt. Ic. t. 450. *B. tomentosa*, Roth. var. *acuminata*, C. B. Clarke; F. B. I. iv. 485.
Deccan, Carnatic and E. side of W. Gháts, up to 5,000 ft.
A low shrub with apparently blue flowers. It is near to the last but is quite distinct in its flowers and indumentum and in the shape of the leaves. The capsules are narrower.
 9. *BARLERIA PILOSA*, Wall.; F. B. I. iv. 486; Bedd. Ic. t. 256.
W. Gháts, hills of Tinnevely up to 1,500 ft.
A small softly pilose undershrub with sky-blue flowers, solitary in the leaf-axils.
 10. *BARLERIA INVOLUCRATA*, Nees; F. B. I. iv. 486; Wt. Ill. t. 164.
Var. *elata*, C. B. Clarke.
W. Gháts, in all Districts, in Shola forests at 3,000—6,000 ft.
A handsome shrub reaching 6 ft. in height, the large flowers blue.
 11. *BARLERIA PANICULATA*, Wall.: *B. tomentosa*, Roth; F. B. I. iv. 485 in part.
Foot of the W. Gháts, in Malabar, Cochin and Travancore, often on rocky river banks (Bourne).
A pretty shrub with rose pink flowers.
 12. *BARLERIA LAWII*, T. And.; F. B. I. iv. 486. *B. Beddomei*, T. And. ex Bedd. Ic. t. 258.

- Bababudan Hills of Mysore (Law *vide* T. And.).
A shrub with long white flowers, prominently veined when dry.
13. *BARLERIA COURTALLICA*, Nees; F. B. I. iv. 489; Wt. Ic. t. 1529.
N. Circars, Rampa Hills of Godavari, at 2,000 ft. (Gamble); W. Gháts, in all Districts, in open places in evergreen forests at low elevations.
A shrub reaching 3—4 ft. high with large blue flowers, yellow in the tube.
14. *BARLERIA CRISTATA*, Linn.; F. B. I. iv. 488; Wt. Ic. t. 453.
All dry plains Districts, in deciduous forest or bushy places, up to about 3,000 ft., sometimes cultivated in gardens.
A nearly herbaceous hairy undershrub with usually blue but sometimes pink or even white flowers, very variable in the leaves and calyx-lobes. The Circar specimens show usually narrow leaves, the W. Coast ones rounded leaves.
15. *BARLERIA STOCKII*, T. And.; F. B. I. iv. 489.
Bababudan Hills of Mysore (Stocks), Kottakota and Gootoor Hills of Anantapur at 2,000 ft. (Gamble).
A small undershrub with pink (?) flowers and a beaked capsule with floccosely woolly seeds.
16. *BARLERIA MONTANA*, Nees; F. B. I. iv. 487.
N. Circars, Godavari valley (Gamble); Kambakam Hill in Chingleput (Cleghorn); hills of Coimbatore and Madura (Fischer); Cochin, at Trichoor (Wight).
A subherbaceous undershrub with blue flowers and an acuminate capsule with wavily silky seeds.
17. *BARLERIA GIBSONI*, Dalz.; F. B. I. iv. 487. *B. montana*, Bedd. Ic. t. 257.
Deccan, Nallamalai Hills of Kurnool, Ramandrúg in Bellary; W. Gháts, Coorg, Malabar, Anamalais (Beddome, etc.).
A glabrous undershrub with pink flowers and black flat glabrous seeds.
18. *BARLERIA STRIGOSA*, Willd.; F. B. I. iv. 489.
N. Circars, in all Forest undergrowth, up to 4,000 ft., common; Deccan, in the forests of the Kurnool Nallamalais and Ramandrúg in Bellary, scarce.
A shrub reaching 4 ft. high with large blue flowers, the seeds very shaggy with long white hairs when wet.
19. *BARLERIA NITIDA*, Nees; F. B. I. iv. 490; Wt. Ic. t. 454.
W. Gháts, hills of Tinnevely.
A small shrub with blue flowers, the seeds with appressed brown hairs.

26. *Neuracanthus*, Nees.

Herbs or undershrubs. *Leaves* opposite, entire. *Flowers* small, spicate, the spikes axillary or terminal, elongate, strobilate or capitate; bracts ovate, imbricate, strongly nerved; bracteoles 0 or minute. *Calyx* 2-partite, the posterior lip 3-, the anterior 2-lobed. *Corolla* tubular below, funnel-shaped above; limb plicate, entire or subbilabiate. *Stamens* 4, didynamous, included, inserted on the middle of the tube;

anterior anthers perfectly 2-celled, posterior with 1 perfect, 1 imperfect cell. *Disk* inconspicuous. *Ovary* 2-celled; ovules usually 2 in each cell; style short; stigma of one oblong lobe. *Fruit* an oblong glabrous capsule, 4-seeded. *Seeds* much compressed, ovoid or suborbicular, silky.

NEURACANTHUS NEESIANUS, C. B. Clarke; F. B. I. iv. 491.

Carnatic, Polur in N. Arcot, on black cotton soil (Wight).

A procumbent hoary-tomentose undershrub with thick leaves about 2 in. long, 1 in. broad, the flowers very small in dense terminal bracteate spikes.

27. *Asystasia*, Blume.

Herbs or undershrubs. *Leaves* opposite, entire or rarely wide-toothed; usually lineolate. *Flowers* in lax or dense, usually 1-sided, simple or compound, spikes or racemes; bracts opposite, usually very small, bracteoles usually minute. *Calyx* deeply 5-partite, the lobes equal, linear or lanceolate. *Corolla-tube* cylindric below, inflated above, ventricose or funnel-shaped; lobes 5 subequal, imbricate in bud. *Stamens* 4, didynamous, perfect; filaments connate at the base in pairs; anthers oblong, the cells parallel, approximate, minutely spurred at the base or mucicous. *Ovary* 2-celled; ovules 2 in each cell; style linear; stigma 2-fid or subcapitate. *Fruit* an elliptic capsule with a contracted solid base, opening widely in a reflexed curve. *Seeds* 4, compressed, orbicular or angular, glabrous, rugose or tuberculate.

Bracts very small; inflorescence secund, of lax racemes of rather distant flowers:—
Branches and leaves grey-puberulous; leaves ovate, acute, usually rounded or subcordate or suddenly narrowed at base, 1—2.5 in. long, 1—1.5 in. broad; calyx-lobes linear, .3 in. long, hirsute; corolla with short cylindric base, the upper part ventricose, much longer, in all 1—1.25 in. long.....1. *gangetica*.
Branches and leaves green, glabrous or slightly pubescent:—

Leaves entire on the margins:—

Leaves elliptic, ovate or narrowly lanceolate, glabrous, the base always narrowed; inflorescence paniculate; corolla white or pale purple, about .75 in. long or less.....2. *chelonoides* var. *quadrangularis*.

Leaves ovate, more or less pubescent, the base in upper branches usually rounded and then decurrent on the petiole, in the lower ones narrowed, the petioles long; inflorescence of solitary or twin terminal racemes; corolla blue, 1—1.5 in. long.....3. *violacea*.

Leaves linear-lanceolate, elongate, often pubescent, the base cuneate; inflorescence of few subpanicled racemes; corolla violet, 1.25—1.5 in. long.....4. *travancorica*.

Leaves crenulate or crispate on the margins, elliptic or ovate, often obtuse at base; inflorescence of usually solitary or twin terminal racemes; corolla white with rose or purple spots.....5. *crispata*.

Bracts and bracteoles large, membranous, oblong-lanceolate; inflorescence erect, of close spikes; corolla small, .5—1 in. long, white; leaves elliptic, acute at both ends, sparsely hairy.....6. *lawiana*.

1. *ASYSTASIA GANGETICA*, T. And. *A. coromandeliana*, Nees; F. B. I. iv. 493.

N. Circars, Deccan and Carnatic, especially near the sea, westwards to the E. slopes of the Ghâts; often cultivated in gardens.

A straggling, often somewhat climbing, perennial herb with smallish leaves and variable flowers, white blue purple or yellow.

2. *ASYSTASIA CHELONOIDES*, Nees; F. B. I. iv. 493.

Var. *quadrangularis*, C. B. Clarke.

W. Gháts, Nilgiris, Anamalais, Pulneys and hills of Tinnevely and Travancore, 2,000—5,000 ft.

A straggling herb with membranous leaves, sparingly strigosely hairy, up to 9 in. long, 3 in. broad.

3. *ASYSTASIA VIOLACEA*, Dalz. ; F. B. I. iv. 494.

W. Gháts, from S. Canara southwards, at low levels.

An erect herb with membranous nearly glabrous leaves.

4. *ASYSTASIA TRAVANCORICA*, Bedd. Ic. t. 178 ; F. B. I. iv. 494.

W. Gháts, Anamalai Hills (Barber) at 3,000 ft. ; hills of Tinnevely and Travancore, especially in the south.

A large shrub with narrow leaves reaching 5 in. in length and at most, though rarely, 1 in. in diam. It grows to 8 ft. in height and is the handsomest species of the genus (Beddome).

5. *ASYSTASIA CRISPATA*, Benth. ; F. B. I. iv. 494. *A. coromandeliana*, Wt. Ic. t. 1506, not of Nees.

W. Gháts, Nilgiri and Pulney Hills, at 4,000—8,000 ft., in Shola forests.

A branching herbaceous undershrub with crispate or sometimes entire leaves variable in size but often up to 5 in. long, 2 in. broad.

6. *ASYSTASIA LAWIANA*, Dalz. ; F. B. I. iv. 496.

W. Deccan, in Mysore and Coorg.

An erect herbaceous plant reaching 3 ft. in height, the leaves up to 3 in. long, 1.5 in. broad, the flowers white.

28. *Pseuderanthemum*, Radlkf.

Glabrous shrubs or undershrubs. *Leaves* opposite, usually lineolate. *Flowers* subsessile, solitary or 1—3 together in the axils of opposite bracts arranged in terminal dense or interrupted simple or branched spikes ; bracteoles small, narrow. *Calyx* 5-fid or 5-partite, the lobes narrow subequal. *Corolla-tube* elongate, cylindric, narrow, rarely widened at the throat ; limb 5-partite, the lobes elliptic, spreading, flat, unequal. *Stamens* 2 fertile with usually 2 upper small clavate staminodes ; anthers 2-celled, the cells oblong, equal, parallel, the connective widened. *Disk* annular or cupular. *Ovary* 2-celled, usually glabrous ; ovules 2 in each cell ; style filiform ; stigma entire or shortly 2-lobed. *Fruit* an oblong capsule with contracted solid stalk, 4-seeded. *Seeds* compressed, orbicular, smooth or rugose, on acute retinacula.

PSEUDERANTHEMUM MALABARICUM, Gamble n. comb. *Eranthemum malabaricum*, C. B. Clarke ; F. B. I. iv. 497.

N. Circars, Palkonda Hills of Vizagapatam (Gamble) ; Deccan, in Mysore and N. Arcot ; W. Gháts from S. Canara to Travancore, in evergreen forest.

An undershrub with white flowers, the leaves ovate or elliptic, acuminate, up to about 5 in. long, 2 in. broad, the capsule valves springing back, the seeds wavy-rugose.

29. *Lepidagathis*, Willd.

Herbs or undershrubs. *Leaves* entire or crenate-serrate, usually lineolate. *Flowers* sessile, usually capitate, sometimes opposite and solitary, the heads terminal or axillary, sometimes densely crowded at the base of the plant; bracts usually conspicuous, bracteoles smaller. *Calyx* deeply 5-lobed, the upper lobe large, the 2 lower opposite it and usually more or less joined, the 2 inner smaller and narrower. *Corolla*-tube cylindric below, above suddenly expanded and 2-lipped, the upper lip erect 2-fid, the lower 3-lobed, usually spotted. *Stamens* 4, didynamous; anthers 2-celled, the cells oblong, opposite or one above the other. *Disk* annular. *Ovary* 2-celled; ovules 2, rarely 1, in each cell; style slender; stigma capitate, shortly 2-lobed or entire. *Fruit* a compressed conoid or oblong capsule. *Seeds* 2 or 4, flattened, hairy.

Capsule 2-seeded, 2-valved from the subsolid tip:—

Spikes aggregated at the base of the stem in globose cushions:—

Bracts and calyx-lobes with dense soft silky hairs, no stiff ones:—

Bracts and calyx-lobes long spinous-mucronate, the bracts broadly ovate; lower calyx-lobes joined to about half-way up; leaves linear-oblong, lineolate, nearly glabrous, up to 1.25 in. long, .25 in. broad.....1. *cristata*.

Bracts and calyx-lobes shortly spinous-mucronate, the bracts broad, obtuse; lower calyx-lobes joined to near the top; leaves oblong or obovate, scabrous on the 5—6 pairs of nerves beneath, ciliate, up to 1.5 in. long, .4 in. broad.....2. *mitis*.

Bracts and calyx-lobes glabrescent but ciliate with long stiff white hairs, all long-spinous mucronate:—

Bracts ovate, suddenly long spinous-acuminate; lower calyx-lobes joined to about 3/4ths the way up; leaves ovate or obovate-oblong, obtuse, up to 1.5 in. long, .6 in. broad, prominently 5—6-nerved, scabrous on the nerves beneath.....3. *subarmata*.

Bracts lanceolate, long spinous-acuminate; lower calyx-lobes joined to half-way up; leaves linear or narrowly oblong, scabrous on the nerves beneath, ciliate on the margins, up to 4 in. long, .4 in. broad, nerves 5—7 pairs, distant.....4. *Hamiltoniana*.

Spikes ovoid, not aggregated at the base of the stem but axillary on the branches:—

Leaves spinous-mucronate, coriaceous:—

One spine usually only at the tip of the small obovate obtuse leaf scarcely .5 in. long; lower calyx-lobes not joined; heads ovoid, .5—75 in. long, the bracts and calyx-lobes all long, spreading or recurved spinous-acuminate.....5. *spinosa*.

Margins of the leaves spinous-serrate as well as the tip:—

Leaves ovate with about 3—4 sharp spinous-mucronate teeth on either side, up to .75 in. long, .5 in. broad; lower calyx-lobes joined to about one-third of the way up; heads broadly ovoid, about .5 in. long, the spreading bracts and the calyx-lobes long spinous-mucronate, very woolly with soft silky hairs inside.....6. *pungens*.

Leaves ovate-oblong with about 3 short spinous teeth on either side, up to .75 in. long, .25 in. broad; lower calyx-lobes joined to about one-half of the way up; heads ovoid, about .5 in. long, the closely adpressed bracts and calyx-lobes shortly spinous-mucronate and with soft hairs.....7. *Barberi*.

Leaves not spinous-mucronate or coriaceous, linear or elliptic, nearly glabrous, up to 1.25 in. long, .1—3 in. broad; lower calyx-lobes joined to about one-fourth the way up; heads ovoid, .5—75 in. long, usually axillary but sometimes also aggregated at the base of the stem, the bracts and calyx-lobes long-acuminate, mucronate, softly and long hairy.....8. *diffusa*.

Capsule 4-seeded, 2-valved, the tip not subsolid:—

Leaves entire or undulate:—

Flowers in elongate villous spikes, the bracts coriaceous, 3-ribbed, sharply

mucronate; lower calyx-lobes joined about $\frac{1}{4}$ way up, 3-ribbed as is the larger upper lobe; corolla-tube short, slightly villous within; anther-cells at rather different levels; leaves of the main stem lanceolate, acuminate, long-decurrent at base, up to 6 in. long, 2 in. broad, upper leaves smaller, sometimes almost linear.....9. *cuspidata*.

Flowers in congested heads, the bracts scarious, mucronate:—

Heads terminal ovoid, the bracts obovate, many-ribbed, lower calyx-lobes joined about $\frac{1}{4}$ way up, 3-ribbed, upper larger, 7-ribbed; corolla-tube short, villous at the middle within; anther-cells equal and opposite, filaments long and slender; leaves ovate, tawny-pubescent beneath, long-petioled, up to 1.5 in. long, 1 in. broad.....10. *scariosa*.

Heads axillary and terminal, often clustered, small or large, the bracts hyaline, 1-nerved, ciliate; lower calyx-lobes very narrow, 1-nerved, joined to half way up, upper slightly larger; corolla-tube long, glabrous; anther-cells small, one a little above the other; filaments short; leaves variable, lanceolate, acuminate, decurrent at base, up to 6 in. long, 2.5 in. broad.....11. *hyalina*.

Leaves crenate-serrate, ovate or lanceolate, acuminate, obtuse and then acuminate-decurrent at base, up to 4.5 in. long, 2 in. broad; flowers in small soft heads in axillary or terminal leafy cymes, the bracts 3-ribbed, ovate; lower calyx-lobes narrow, only joined at base, 1-nerved; corolla-tube rather long; anther-cells separated; capsule very thin, pubescent.....12. *fasciculata*.

1. LEPIDAGATHIS CRISTATA, Willd.; F. B. I. iv. 516; Wt. Ic. t. 455.

N. Circars and Carnatic, in dry places and on rocks.

A stiff undershrub, the branches procumbent from a hard central rootstock, sometimes with occasional globose small heads of flowers in the axils; corolla white, spotted with brown and purple.

2. LEPIDAGATHIS MITIS, Dalz.; F. B. I. iv. 516.

Deccan and Carnatic, in dry sandy places, especially in Nellore, Cuddapah and N. Arcot; plains of S. Canara.

A stiff undershrub, similar to the last but the globose flower heads denser and hardly spinous and more woolly; corolla white or pale pink, spotted with brown and purple.

3. LEPIDAGATHIS SUBARNATA, Gamble n. comb. *L. mitis* var. *subarnata*, C. B. Clarke; F. B. I. iv. 516. *L. rupestris*, Bedd. Ic. t. 229.

Deccan, Cuddapah and Kurnool to Coimbatore, chiefly on black cotton soil.

A stiff undershrub, the globose flower heads smaller.

4. LEPIDAGATHIS HAMILTONIANA, Wall.; F. B. I. iv. 516.

N. Circars, open places in the Ganjam Sál forests (Gamble).

A stiff undershrub, the branches sometimes bearing heads smaller than those at the base of the stem.

5. LEPIDAGATHIS SPINOSA, Wt. ex Nees; F. B. I. iv. 517.

S. Carnatic, plains of Tinnevely.

A stiff prostrate much-branched spinous shrub.

6. LEPIDAGATHIS PUNGENS, Nees; F. B. I. iv. 517.

S. Carnatic, near Palamcottah in Tinnevely.

A stiff much-branched small spinous shrub.

7. LEPIDAGATHIS BARBERI, Gamble n. comb. *L. pungens*, Wt. Ic. t. 456, not of Nees.

W. and S. Carnatic, plains of Coimbatore, Madura and Tinnevely (Barber, Beddome, Fischer).

A much-branched small shrub with white stems, usually erect.

8. *LEPIDAGATHIS DIFFUSA*, C. B. Clarke ; F. B. I. iv. 518.
Deccan and W. Carnatic, Mysore, Bellary and Coimbatore.
A low straggling shrublet from a woody rootstock.
9. *LEPIDAGATHIS CUSPIDATA*, Nees ; F. B. I. iv. 519 ; Bedd. Ic. t. 227.
N. Circars and Deccan, up to about 6,000 ft. in the hills, Coorg.
An erect undershrub, up to about 3 ft. high, the corolla white with purplish spots.
10. *LEPIDAGATHIS SCARIOSA*, Nees ; F. B. I. iv. 520 ; Wt. Ic. t. 457.
Carnatic and E. slopes of the W. Gháts, from Coimbatore southwards.
A small undershrub, the corolla apparently white or pale yellow.
11. *LEPIDAGATHIS HYALINA*, Nees ; F. B. I. iv. 521.
All Districts, by roadsides and in dry forest undergrowth.
A small perennial herb with a woody rootstock, very variable in its leaves and the size of the flower spikes. All the S. Indian specimens seem, as the F. B. I. says, to be var. *mucronata*, C. B. Clarke, except a few which are var. *lophostachyoides*, but it is difficult to separate the vars. The corolla is white with brown spots on the palate.
12. *LEPIDAGATHIS FASCICULATA*, Nees ; F. B. I. iv. 522 ; Bedd. Ic. t. 228.
N. Circars, Ganjam to Godavari, up to 4,000 ft. in the hills ; S. Canara and Mysore, in forest undergrowth and in rocky places.
A herbaceous, soft, villous plant, the corolla white with purple spots.

30. *Monothecium*, Hochst.

Diffuse herbs. *Leaves* entire, lineolate. *Flowers* in small sessile dense, ovate or oblong, unilateral spikes ; bracts and bracteoles linear-setaceous. *Calyx* 5-lobed, lobes equal, linear-setaceous. *Corolla* small, tube short, limb deeply 2-lipped. *Stamens* 2 ; anthers 1-celled, muticous. *Ovary* 2-celled, hairy ; style slender ; stigma minutely bifid. *Fruit* a small oblong capsule, the base solid. *Seeds* 4, compressed, truncate above, testa rugosely furrowed, retinacula obtuse.

MONOTHECIUM ARISTATUM, T. And. ; F. B. I. iv. 524 ; Bedd. Ic. t. 269.
W. Gháts, hills of S. Coimbatore at 1,200 ft. (Fischer), hills of Tinnevely and Travancore, in dry open forests (Beddome, Venkoba Rao).

A branching procumbent often rooting small undershrub, the corolla white with spots on the lower lip, the leaves ovate, pubescent, up to 1.5 in. long.

31. *Rungia*, Nees.

Erect or diffuse herbs or undershrubs. *Leaves* entire, usually and prominently lineolate. *Flowers* in dense terminal or axillary one-sided spikes ; bracts in 2 or 4 rows, 2 of the rows usually without flowers, sometimes similar to but often different from the flowering bracts which usually have scarious hyaline margins ; bracteoles narrower than the flowering bracts. *Calyx* 5-partite, lobes linear-lanceolate. *Corolla* small, blue or white ; limb 2-lipped, the upper lip acute or emarginate, the lower longer 3-lobed. *Stamens* 2 ; anthers 2-celled, the cells usually

superposed, the lower cell often with a white basal appendage. *Ovary* 2-celled; ovules 2 in each cell; style filiform; stigma minutely bifid. *Fruit* an ovoid or oblong capsule, the placentas and retinacula elastically separating from the base after dehiscence. *Seeds* 4, compressed, orbicular, minutely tuberculate or concentrically ridged.

Barren bracts and flowering bracts similar or very nearly so; upper lip of corolla broad, emarginate:—

Spikes narrow and slender, quite 1-sided, on filiform peduncles; bracts lanceolate, mucronate, very narrowly scarious-margined; leaves lanceolate, acute, glabrous or puberulous, up to 1·5 in. long, ·5 in. broad, main nerves 3—5 pairs

1. *linifolia*.

Spikes slender, secund, one-sided, the peduncles short; bracts lanceolate, long-mucronate, narrowly scarious-margined, minutely pubescent; leaves variable, ovate or lanceolate or even linear, acute or acuminate, puberulous, up to 3·5 in. long, 1 in. broad, main nerves about 6 pairs.....2. *apiculata*.

Spikes broad and close with conspicuous broadly scarious-margined nearly orbicular bracts regularly imbricating, ciliate and apiculate, the bracteoles lanceolate, much smaller; leaves linear-oblong to lanceolate, acute or subobtusely, nearly glabrous, up to 3 in. long, ·75 in. broad, main nerves 3—6 pairs.....3. *repens*.

Barren bracts and flowering bracts more or less different; upper lip of corolla acute:—

Both kinds of bracts prominently white-scarious-margined, sub-similar, the barren ones usually narrower:—

Spikes elongate, often 2—3 in. long, in panicles; leaves large and thin, lanceolate, acuminate at both ends, up to 7 in. long, 2 in. broad, main nerves 8—12 pairs.....4. *Wightiana*.

Spikes short, rarely 1 in. long, in small clusters; leaves rather small and thick, ovate-lanceolate, acuminate, rounded at base, up to 3 in. long, 1 in. broad, main nerves 6—8 pairs.....5. *latior*.

Bracts rather large, scarious-margined, and usually coloured, prominently nerved:—

Barren bracts broadly attached at base to the rhachis of the spike and decurrent, imbricate in 2 series, one sided, flowering bracts not broadly attached, all shining, not mucronate, bracteoles small; leaves large, thin, oblong-lanceolate, acuminate at both ends, up to 6 in. long, 1·75 in. broad, the main nerves about 6—8 pairs.....6. *sispænsis*.

Barren bracts and flowering bracts thin and chaffy, attached at a point, the latter broader and broader-margined, both ciliate and long-mucronate, not markedly 1-sided, bracteoles lanceolate, small; leaves ovate, acute, rounded at base and then decurrent, up to 5 in. long, 2 in. broad, main nerves 7—9 pairs

7. *laeta*.

Barren and flowering bracts very different, the former in 2 rows on one side of the spike, thick, elliptic, mucronate, narrowly margined, the latter with the flowers on the other side conspicuously hyaline-margined, obovate or orbicular, ciliate, variously clothed; leaves various, ovate or lanceolate or even linear-spathulate.....8. *parviflora*.

1. *RUNGIA LINIFOLIA*, Nees; F. B. I. iv. 548. *Rostellularia gracilis*, Wt. Ic. t. 1541.

Mysore, at Aglati, 3,500 ft. (Meebold in Hb. Calc.).

A very slender herb, erect but often rooting from lower nodes, the anthers not appendaged at base, the flowers said to be pale purple.

2. *RUNGIA APICULATA*, Bedd. Ic. t. 247; F. B. I. iv. 548.

W. Ghâts, hills of Madura and Tinnevely, at 2,000—5,000 ft., in the beds of streams.

A slender undershrub, rooting at lower nodes, then erect, the corollas white with lilac spots, the seeds minutely tuberculate.

3. *RUNGIA REPENS*, Nees ; F. B. I. iv. 549 ; Wt. Ic. t. 465.
N. Circars, in Godavari and Kistna ; Deccan and N. Carnatic, in all Districts, west to the foot of the Gháts.
A decumbent or erect, often rooting, herb with angular zigzag stems and conspicuous spikes often 4 in. long, the bract-margins hyaline ; flowers white, blue or pink ; seeds concentrically ridged.
4. *RUNGIA WIGHTIANA*, Nees ; F. B. I. iv. 546 ; Wt. Ic. t. 1549. *R. Arnothiana*, Wt. Ic. t. 1550.
W. Gháts, Anamalais and hills of Tinnevely and Travancore, 2,000—5,000 ft.
An erect undershrub with white flowers, the lower lip veined with lilac, the seeds minutely tuberculate.
5. *RUNGIA LATIOR*, Nees ; F. B. I. iv. 546 ; Wt. Ic. t. 548. *R. longifolia* var. *latifolia*, C. B. Clarke ; F. B. I. iv. 547.
W. Gháts, Nilgiris, Anamalais and hills of Travancore, at about 3,000—6,000 ft.
A stout erect herb with white or pale blue flowers, the leaves reticulately nerved.
6. *RUNGIA SISPAESENSIS*, T. And. ; F. B. I. iv. 546.
W. Gháts, Nilgiris, Anamalais and hills of Coimbatore and Malabar, at 3,000—4,000 ft.
A shrubby nearly glabrous plant with one-sided spikes and purplish bracts, the seeds minutely tuberculate in concentric lines.
7. *RUNGIA LAETA*, C. B. Clarke ; F. B. I. iv. 546.
W. Gháts, Pulney Hills and hills of Madura and Travancore, at 5,000—7,000 ft.
A shrubby plant with stout terete zigzag stems and white flowers with purple spots, the seeds minutely tuberculate in concentric lines.
8. *RUNGIA PARVIFLORA*, Nees ; F. B. I. iv. 550. *R. longifolia*, Bedd. Ic. t. 266, *not of* Nees.
W. Coast and lower parts of W. Gháts in Madura, Tinnevely and Travancore, in dry forests in the low country.
A small soft herb with membranous leaves and small spikes of blue flowers, the fertile bracts glabrous except the ciliate margins. The small plant from Ceylon (Bedd. Ic. t. 266) with linear spathulate leaves has been found at Kolatoor in Travancore (Bourdillon).
Var. *pectinata*, C. B. Clarke *l.c.* *R. pectinata*, Nees ; Wt. Ic. t. 1547. Larger and with larger and broader spikes and larger leaves, the floral bracts villous, the barren bracts prominently pectinately arranged.
All Districts, in fairly moist places, along streams and in forest undergrowth and grassy pasture lands, up to 4,000 ft. in the hills.
Var. *muralis*, C. B. Clarke *l.c.* Much smaller, many branched, with very small ovate or orbicular leaves and rather long dense-flowered secund strobiliform spikes, the barren bracts scarcely longer than the almost woolly fertile ones.
W. Coast, S. Canara to Travancore, on dry fields and on walls.
Var. *monticola*, Gamble. Erect, almost an undershrub, with strigosely villous stems and leaves, the latter ovate up to about 1 in.

long; spikes short, about .5 in. long, barren bracts long-mucronate, longer than the very white woolly fertile ones; flowers bright blue.

N. Circars, top of Mahendragiri at 4,500 ft. (Gamble, Fischer and Gage); Karimalai and Ayinalai hills of Malabar, at 4,000—5,000 ft. (Fischer), on rocks and among grass.

32. *Dicliptera*, Juss.

Erect or diffuse herbs. *Leaves* entire or undulate, lineolate. *Flowers* sessile or subsessile, in axillary or terminal clusters or panicles of cymes, often with imperfect flowers or flowerless bracts added, one or more enclosed within a pair of opposite inflorescence bracts; flowering bracts smaller and in often unequal pairs; bracteoles linear, about equalling the similar *calyx*-lobes. *Corolla* white, pink or red, purple-spotted; tube slender, limb 2-lipped, the upper lip narrow, entire or emarginate, the lower 3-lobed recurved. *Stamens* 2; anthers 2-celled, the cells superposed, muticous. *Ovary* 2-celled; 2 ovules in each cell; style filiform; stigma bifid. *Fruit* a clavate capsule with a solid stalk; placentas separating elastically from the base after dehiscence. *Seeds* ovoid or orbicular, compressed, verrucose or glandular-papillose, the papillæ sometimes glochidiate.

Flowers in slender divaricately branched panicles, the inflorescence bracts lanceolate but gradually reduced in size to minutely linear; flowering bracts and bracteoles minute, like the calyx-lobes, .05—1 in. long; leaves ovate, acuminate, membranous, nearly glabrous, up to 5 in. long, 2—3 in. broad, long-petioled

1. *parvibracteata*.

Flowers in lax panicles with white-hairy branches, the inflorescence bracts linear oblong, mucronate, ciliate, gradually reduced to linear, flowering bracts spatulate, bracteoles linear lanceolate as are the rather smaller calyx-lobes; leaves ovate, acuminate, minutely pubescent, up to 5.5 in. long, 3.25 in. broad, long-petioled

2. *Beddomei*.

Flowers in clusters in few-flowered axillary umbels, bracts at the base of the umbel small, linear or spatulate, those below the clusters broadly ovate or subcordate, mucronate, reticulate, glabrous or pubescent, about .5 in. in diam., bracteoles linear, shorter than the scarious ciliate calyx-lobes; leaves ovate or lanceolate, acuminate at both ends, membranous, up to 5 in. long, 2.5 in. broad, long-petioled.

3. *zeylanica*.

Flowers in subcapitate peduncled clusters, one or more together in the leaf-axils, bracts of the clusters small, linear, those of the flowers obovate-oblong, up to .6 in. long, bracteoles linear like the calyx-lobes; leaves ovate or elliptic, acuminate, acute or rounded at base, glabrous, up to 3.5 in. long, 1.5 in. broad, long-petioled.

4. *cuneata*.

Flowers in dense terminal and axillary sessile or subsessile capitate cymes, the bracts obovate or oblanceolate, glandular-pubescent, unequal; leaves rhomboid- or elliptic-lanceolate, acuminate at both ends, undulate, membranous, up to 4.5 in. long, 2 in. broad, long-petioled.

5. *bupleuroides*.

1. *DICLIPTERA PARVIBRACTEATA*, Nees; F. B. I. iv. 551.

N. Circars, in Jaipur Hills (Beddome), Rampa Hills of Godavari, at 2,000 ft. (Gamble).

A tall slender herb with elongate trichotomous cymes of apparently pink flowers.

2. *DICLIPTERA BEDDOMEI*, C. B. Clarke; F. B. I. iv. 551.

Deccan, Nallamalai Hills of Kurnool (Beddome).

A slender herb with flowers in rather short trichotomous cymes.

3. *DICLIPTERA ZEYLANICA*, Nees ; F. B. I. iv. 552. *D. bivalvis*, Nees ; Wt. Ic. t. 1551.
W. Gháts, S. Canara to Travancore, in evergreen forests, at 2,000—3,000 ft.
A well-marked subscandent (Cooke) herb with conspicuous bracts and deep rose-coloured flowers, the seeds minutely glochidiate-papillose. The stems vary in pubescence from glabrous to densely white-woolly.
4. *DICLIPTERA CUNEATA*, Nees ; F. B. I. iv. 552 ; Wt. Ic. t. 1552.
Deccan, Horsleykonda in Chittoor, at 4,000 ft. (Fischer), hills of N. Coimbatore ; Carnatic, hills of Salem, Trichinopoly and Madura to S. Travancore ; W. Gháts in Wynaad, about 3,000 ft.
A branching herb with, apparently, pink flowers, the seeds glochidiate-papillose.
5. *DICLIPTERA BUPLEUROIDES*, Nees. *D. Roxburghiana* var. *bupleuroides*, C. B. Clarke ; F. B. I. iv. 554.
N. Circars, hill forests of Ganjam, about 1,500 ft. (Gamble, Barber).
An erect or tufted herbaceous plant with white flowers spotted with purple.

33. *Ecbolium*, Kurz.

Shrubs, nearly glabrous. *Leaves* entire. *Flowers* in dense terminal spikes ; bracts large, leafy, imbricate, sometimes toothed ; bracteoles small, narrow. *Calyx* 5-partite, connate below ; lobes linear. *Corolla*-tube very long and slender ; limb 2-lipped, the upper lip narrow, shortly 2-fid, the lower 3-lobed with broad pendent lobes. *Stamens* 2, attached near the top of the tube ; anthers 2-celled, linear, parallel, muticous. *Ovary* 2-celled ; ovules 2 in each cell ; style filiform ; stigma shortly 2-fid. *Fruit* an ovoid compressed capsule narrowed into a solid stalk. *Seeds* 4 or, more often, 2, large, compressed, tuberculate and scabrous, the retinacula long and curved.

ECBOLIUM LINNEANUM, Kurz ; F. B. I. iv. 544 ; Wt. Ic. t. 463. Deccan and Carnatic, inland to Coimbatore, otherwise chiefly from Madras southwards.

A low shrub with bluish-green corolla, the bracts obtuse or slightly acute, the spikes short and leaves small and pubescent. The leaves are used in medicine. Vern. *Hind.* Udu jati.

Var. *rotundifolium*, C. B. Clarke l.c. Leaves small sessile, ovate ; bracts shortly aristate.

Deccan, about Coimbatore (Wight).

Var. *laetevirens*, C. B. Clarke l.c. Leaves glabrescent, longer and larger and more acuminate, more prominently nerved ; spikes long, up to 8 in., bracts broadly lanceolate, aristate.

W. Gháts, in all Districts, at low levels, common.

Var. *dentatum*, C. B. Clarke l.c. Leaves glabrous, larger still and much attenuate at base, spikes long, bracts ovate acuminate, dentate. N. Circars, Ganjam to Godavari, in forest areas chiefly.

34. *Justicia*, Linn.

Herbs, undershrubs or shrubs. *Leaves* entire, usually lincolate with often very many raphides. *Flowers* sessile or subsessile, in spikes or panicles, rarely solitary; bracts various, bracteoles usually narrow, sometimes 0. *Calyx* 5- or 4-partite, the lobes narrow. *Corolla*-tube as long as or shorter than the limb; limb 2-lipped, the upper lip 2-lobed or sub-entire, the lower 3-lobed, the lobes imbricate in bud. *Stamens* 2; filaments often dilated; anthers 2-celled, the cells round or oblong usually more or less separate, the lower always with a white basal appendage. *Ovary* 2-celled; ovules 2 in each cell; style filiform; stigma shortly 2-fid. *Fruit* an ovoid or obovoid capsule, solid at base or not, often papery. *Seeds* 4, ovoid or suborbicular, more or less compressed, tuberculate rugose or echinate, not hygroscopically hairy.

Calyx-lobes 5, equal or nearly so:—

Erect shrubs; flowers large, in opposite clusters in elongate, often paniculate, spikes or racemes; capsule clavate, 4-seeded near the top, about 1 in. long; leaves oblong-lanceolate, obtusely acuminate at apex, acuminate at base, glabrous, up to 10 in. long, 3.5 in. broad, main nerves about 10 pairs.....1. *montana*.
Shrubs or herbs; flowers middle-sized, in continuous spikes with conspicuous imbricate bracts:—

Bracts white with green nerves, bracteoles similar:—

Flower spikes large and conspicuous, terminal, often panicled; bracts .5—75 in. long:—

Tall shrub, sometimes branching and decumbent; leaves petioled, ovate or lanceolate, acuminate, shortly attenuate at base, glabrous or villous beneath, entire or crenate-dentate, up to 6 in. long, 3 in. broad; capsule .3—5 in. long, clavate, pubescent, the seeds small, spinulose when wetted.....2. *Betonica*.

Low procumbent much-branched undershrub; leaves sessile, oblong, obtuse or emarginate, nearly glabrous, entire, up to 2 in. long, .2—5 in. broad; capsule .75 in. long, clavate, puberulous, the seeds large, echinate when wetted.....3. *nilgherrensis*.

Flower spikes small and slender; bracts about .25 in. long, narrow; leaves ovate or oblong, sometimes linear, up to 1.5 in. long, .4 in. broad; capsule .5 in. long, pubescent, the seeds small, softly tuberculate when wet.....4. *trinervia*.

Bracts green; bracteoles different, often 0; the seeds softly echinate when wet:—

Stiff undershrubs with white bark and small leaves:—

Branches softly white-hairy; bracts elliptic, acute, about .1—2 in. long, bracteoles more oblong, usually longer, both minutely puberulous; spikes few-flowered; leaves oblong or spatulate, obtuse, .5—75 in. long; capsule .5 in. long, softly pubescent.....5. *salsoloides*.

Branches glabrous except sometimes the uppermost branchlets; bracts orbicular or obcordate, short-apiculate, pubescent, .15—25 in. in diam., bracteoles linear or slightly elliptic, shorter; spikes short or elongate, many-flowered; leaves obovate or orbiculate, pubescent, up to 1 in. in diam.; capsule .3 in. long, glabrous.....6. *tranquebariensis*.

Erect or diffuse herb with purplish bark and puberulous stems; leaves ovate or orbicular, obtuse or acute, petioled, up to 3 in. long, 2 in. broad; bracts orbicular-spatulate, bracteoles small linear, sometimes absent; spikes sometimes short, usually long and many-flowered; capsules obovoid, glabrous except at tip, .25 in. long.....7. *glauca*.

Erect undershrubs with small or middle-sized flowers in axillary or terminal branched often paniculate spikes, the bracts inconspicuous and narrow:—

Flowers clustered in the spikes; bracts linear, very small, bracteoles 0; leaves short-petioled, narrowly lanceolate, glabrous, up to 5 in. long, 1 in. broad, main nerves about 7 pairs, not conspicuous; capsule glabrous, .5 in. long, seeds unknown.....8. *Gendarussa*.

Flowers opposite in the spikes; bracts linear-lanceolate, bracteoles linear, small; leaves long-petioled, elliptic, acuminate at both ends, glabrous or pubescent, up to 8 in. long, 3 in. broad, main nerves 8—10 pairs, prominent; capsule 4-sided, clavate, very villous, .7 in. long, seeds softly round-tuberculate.

9. *wynadensis*.

Herbaceous plant with flowers in lax axillary and terminal cymes, the bracts and bracteoles very small, linear; leaves broadly ovate, acute, obtuse or even subcordate at base and then acute into the long petiole, glabrous, minutely lineolate, up to 4 in. long, 3 in. broad, main nerves about 6—7 pairs; capsule 4-sided, clavate, villous, the seeds very villous, on jointed retinacula...

10. *glabra*.

Calyx-lobes 4; herbs and undershrubs with small flowers in terminal and axillary cylindric or linear spikes:—

Spikes cylindric, hairy; bracts and bracteoles as long as or longer than the calyx-lobes:—

Bracts and bracteoles very slender and long, with distant spreading long bulbous-based white hairs; calyx-lobes similar or only apiculate, their margins scarious; spikes up to 1.5 in. long, .4 in. broad; leaves thin, ovate or elliptic, up to 2 in. long, the raphides irregular in the middle, transverse at the margins.....

11. *micrantha*.

Bracts and bracteoles linear, green, pectinately white-ciliate and scabrous-hirsute; calyx-lobes narrowly lanceolate, the margins only scarious, the raphides concentrically transverse and curved:—

Spikes scarcely 1 in. long, .25 in. broad, usually pale; leaves elliptic lanceolate or linear, up to 2.5 in. long; white hairs of the bracts and bracteoles short and close.....

12. *procumbens*.

Spikes up to 2 in. long, .2 in. broad; leaves very small, orbicular, under .7 in. in diam., the white jointed hairs long and spreading.....

13. *serpyllifolia*.

Bracts elliptic-ovate or lanceolate, the bracteoles narrower though similar; leaf raphides concentrically transverse:—

Erect, simple-stemmed, the leaves sessile, oblong, subobtus; spikes up to 2.5 in. long, .4 in. broad; bracts, bracteoles and calyx-lobes pectinately white-setulose.....

14. *Notha*.

Diffuse and branching, the branches often angled or zigzag:—

Bracts more than 1 in. broad, lineolate, bracteoles and similar calyx-lobes narrower, all scarious-margined and with soft whitish jointed hairs; leaves ovate or oblong even sometimes almost linear, up to about 1 in. long, main nerves about 6 pairs; plant pale when dry.....

15. *simplex*.

Bracts less than 1 in. broad, but broader than the bracteoles and calyx-lobes, more or less pectinately ciliate; leaves ovate or elliptic, up to 2 in. long, 1 in. broad, main nerves about 4 pairs; nearly black when dry.

16. *latispica*.

Spikes linear; bracts and bracteoles usually shorter than the calyx-lobes, all with a green midrib and scarious margins:—

Bracts, bracteoles and calyx-lobes obtuse at apex; leaves elliptic-oblong or lanceolate, obtuse at apex, attenuate at base into the petiole, the raphides scattered, straight, parallel to the 4—5 main nerves; spikes slender, often very long, the whorls distant.....

17. *quinqueangularis*.

Bracts, bracteoles and calyx-lobes acute at apex:—

Bracts and bracteoles lanceolate nearly 1 in. long but much shorter than the calyx-lobes, more or less scabrous:—

Prostrate and rooting many-branched herbs, sometimes becoming woody; spikes short; the leaves very small, orbicular or ovate, rarely over .5 in. long, the raphides scattered ascending.....

18. *prostrata*.

Erect tall slender branching herbs; spikes long and pale; leaves narrowly linear or lanceolate, up to 3 in. long, .5 in. broad, the lower ones sometimes ovate, the raphides numerous ascending.....

19. *Vahl.*

Bracts and bracteoles usually very small and ovate, scarcely .05 in. long, and with the calyx-lobes generally glabrous; spikes very slender up to 2 in. long; leaves usually thin, ovate, obtuse or acute, up to 2.5 in. long, 1.25 in. broad, the raphides irregular.....

20. *diffusa*.

Bracts and bracteoles lanceolate, hirsute, a little shorter than the calyx-lobes, all with cuspidate long-ciliate tips and narrow scarious margins; leaves

ovate or orbicular, obtuse, with strigose hairs above, villous beneath, up to nearly 2 in. long, 1 in. broad, the raphides irregular.....21. *orbiculata*.

1. *JUSTICIA MONTANA*, Wall.; F. B. I. iv. 525. *Hemichoriste montana*, Nees; Wt. Ic. t. 1538.

W. Gháts, Mysore, Coorg, Wynaad, to the Anamalais and hills of Travancore, at low levels in evergreen forest.

An erect bush with thick stem, the corolla white with purple spots in the throat, the seed-testa corrugately wrinkled.

2. *JUSTICIA BETONICA*, Linn.; F. B. I. iv. 525.

All Districts, except very dry ones, on waste lands and in hedges.

An erect shrub, up to 4 ft. high, the corolla white, spotted with pink.

Var. *villosa*, C. B. Clarke. Stem and leaves beneath villous, bracts large.

N. Circars, Ganjam to Godavari, up to 4,500 ft. on Mahendragiri.

3. *JUSTICIA NILGHERRENSIS*, Wall.; F. B. I. iv. 526. *Adhatoda nilgherrensis*, Nees; Wt. Ic. t. 1544.

Carnatic, Melpat, S. Arcot, at 2,500 ft. (Barber); W. Gháts, Nilgiris, in grass lands on the downs above 6,000 ft.

A low herb branching from a stout rootstock, the corolla whitish, spotted with red.

4. *JUSTICIA TRINERVIA*, Vahl; F. B. I. iv. 526.

W. Coast, S. Canara and Malabar; Deccan, in Mysore.

A low procumbent herb, branching from a woody root-stock, the bracts and bracteoles often scarcely white, the corolla small.

5. *JUSTICIA SALSOLOIDES*, T. And.; F. B. I. iv. 530.

Carnatic, on very dry lands (Wight, G. Thomson).

A woody undershrub, the corolla densely pubescent without.

6. *JUSTICIA TRANQUEBARIENSIS*, Linn. f.; F. B. I. iv. 530.

Deccan and Carnatic, from Mysore southwards, on dry lands, up to 3,000 ft. in hilly country.

A woody undershrub with many stiff branches, the corolla slightly villous without, yellowish with purple spots.

7. *JUSTICIA GLAUCA*, Rottl.; F. B. I. iv. 529. *Gendarussa tranquebariensis*, Wt. Ic. t. 462, *not of* Nees.

All Districts, on waste lands and in dry forests, up to 2,000 ft.

A very variable herb, with pubescent branches, the corolla whitish with purple spots.

8. *JUSTICIA GENDARUSSA*, Linn. f.; F. B. I. iv. 532. *Gendarussa vulgaris*, Nees; Wt. Ic. t. 468.

W. Gháts, valleys in the hills of Madura, cultivated and frequently found run wild.

An erect undershrub, the corolla white or rose with purple spots. The plant is used in garden hedges, and the leaves are much used medicinally. Vern. *Tel.* Nalla vavili; *Tam.* Karu nochi.

9. *JUSTICIA WYNAADENSIS*, Heyne; F. B. I. iv. 533. *Adhatoda wynaadensis* Nees; Wt. Ic. t. 1545.

W. Gháts, from S. Canara and Coorg to Wynaad, E. Nilgiris

and S. Malabar Hills, up to 3,000 ft., in evergreen forests and on waste lands.

An erect undershrub, the corolla with pink upper and brown-purple lower lip, the spikes long and slender with flowers in distant pairs.

10. *JUSTICIA GLABRA*, Koen.; F. B. I. iv. 535. *Rhaphidospora glabra*, Nees; Wt. Ic. t. 1554.

N. Circars, in Godavari; Deccan, in Kurnool and the Sandur Hills of Bellary, hills of Coimbatore and Salem; Carnatic, in Tinnevely, in hedges and open forest.

An erect herb with slender divaricately branched inflorescence, the corolla pale yellow with purple spots.

11. *JUSTICIA MICRANTHA*, Wall.; F. B. I. iv. 536.

Deccan, in Bellary and Cuddapah to Chingleput.

An erect herb with trichotomous pale zigzag-branching stems and small rose-purple flowers, the small capsule pubescent.

12. *JUSTICIA PROCUMBENS*, Linn.; F. B. I. iv. 539.

W. Ghâts, from the slopes of the Pulneys southwards, W. Coast to Travancore.

A diffuse slender herb with many branches often rooting at the nodes, the flowers pale purple, the capsule pubescent at tip.

13. *JUSTICIA SERPYLLIFOLIA*, Gamble n. comb. *J. simplex* var. *serpyllifolia*, C. B. Clarke; F. B. I. iv. 539.

W. Coast, S. Canara and Malabar.

A small prostrate or straggling diffuse herb often rooting at the nodes, with slender zigzag branches, the spikes close and cylindrical.

14. *JUSTICIA NOTHA*, C. B. Clarke; F. B. I. iv. 537. *Rostellularia simplex*, Wt. Ic. t. 1542.

"Station not known (Wt.)." Clarke thinks it may be Malayan, but it is not recorded by Miquel.

15. *JUSTICIA SIMPLEX*, D. Don; F. B. I. iv. 539.

Deccan, Carnatic and W. Ghâts, usually in hilly country and even up to 7,000 ft., common.

A pale softly hairy herbaceous branching plant, the flowers pale pink or lilac, the capsules papery, villous at apex.

16. *JUSTICIA LATISPICA*, Gamble n. comb. *J. procumbens* var. *latispica*, C. B. Clarke; F. B. I. iv. 539. *Rostellularia procumbens*, Wt. Ic. t. 1539.

W. Ghâts, Nilgiri Hills above 5,000 ft., less common in Anamalais and Pulneys.

Almost an undershrub somewhat woody below, turning nearly black when dry, covered with scattered stiff strigose hairs, the flowers apparently pale lilac spotted white, the capsules papery, glabrous.

17. *JUSTICIA QUINQUEANGULARIS*, Koen.; F. B. I. iv. 536.

N. Circars, Biccavol in Godavari (Bourne).

A herbaceous undershrub with curving angular stems rooting at the nodes and giving erect branches, the flowers small, the

capsules obovoid glabrous, the seeds with wavy subconcentric ridges.

18. *JUSTICIA PROSTRATA*, Gamble n. comb.; *J. diffusa*, Willd.; var. *prostrata*, C. B. Clarke, F. B. I. iv. 538.

Circars and Carnatic, from Ganjam southwards to S. Travancore, usually in sandy places near the coast, but sometimes inland to Salem, Trichinopoly and Coimbatore. A small pale prostrate plant, the branches long and diffusely spreading from a stout rootstock sometimes almost woody, the flowers pale pink, the capsules small and minutely puberulous, the seeds minutely tuberculate. The leaves are small and usually orbicular or ovate, sometimes slightly lanceolate.

19. *JUSTICIA VAHLII*, Roth. *J. diffusa* var. *VahlII*, C. B. Clarke; F. B. I. iv. 538.

Circars and Deccan, westwards to Bellary, up to 4,000 ft. in the hills.

A tall straggling narrow-leaved plant from a stout rootstock, the branches with long internodes angular and scabrous, the flowers pale with a reddish lip, the capsule pubescent, the seeds papillose.

20. *JUSTICIA DIFFUSA*, Willd.; F. B. I. iv. 538.

Circars, Deccan and Carnatic, also, but more scarce, W. Gháts, up to 7,000 ft. in places.

A slender but sometimes in old plants quite woody branching herb, with pale flower spikes and leaves, the glabrous capsules small and pointed.

Var. *hedyotidifolia*, C. B. Clarke; F. B. I. iv. 538. *Rostellularia hedyotidifolia*, Nees; Wt. Ic. t. 1540. Leaves thicker and like other parts turning nearly black in drying; spikes broader and denser.

Deccan, on Horsleykonda, 4,500 ft. (Gamble); W. Gháts, Nilgiris, Pulneys and hills of Travancore, about 3,000—5,000 ft.

21. *JUSTICIA ORBICULATA*, Wall. *J. diffusa* var. *orbiculata*, C. B. Clarke, F. B. I. iv. 538.

W. Gháts, Nilgiri and Pulney Hills, probably above 5,000 ft.; Shevaroy Hills of Salem (Bourne).

Almost an undershrub, soft and compact, with spreading dichotomous branches, the capsules nearly or quite glabrous, the seeds with lines of papillae.

35. *Adhatoda*, Nees.

Shrubs. Leaves entire. Flowers subsessile in the axils of opposite bracts in dense axillary and terminal often thyrsiform spikes; bracts herbaceous, bracteoles similar but usually narrower. Calyx 5-partite, the lobes imbricate, the 2 lowest often subconnate. Corolla-tube short; limb 2-lipped, the upper lip galeate subentire, the lower spreading, 3-lobed. Stamens 2, near the top of the corolla-tube; anthers 2-celled, the cells minutely apiculate at base. Disk cup-shaped. Ovary 2-celled; ovules 2 in each cell; style filiform; stigma entire. Fruit a clavate capsule with a long solid base. Seeds 1 or 2, suborbicular, compressed, rugose.

Branches grey-pubescent; spikes stout, about 3 in. long; bracts elliptic, up to 1 in. long, about 7-ribbed; leaves lanceolate, acuminate at both ends, minutely puberulous, up to 8 in. long, 3 in. broad, main nerves about 15 pairs, rather close.....1. *Vasica*.
Branches glabrous; heads short, up to 1 in. diam.; bracts ovate, up to .5 in. long, obscurely 5-ribbed; leaves oblong-lanceolate, attenuate at both ends, minutely puberulous on the nerves, up to 6 in. long, 1.5 in. broad, main nerves about 8 pairs, rather distant.....2. *Beddomei*.

1. *ADHATODA VASICA*, Nees; F. B. I. iv. 540.

All plains Districts, perhaps wild in the N. Circars, elsewhere cultivated as a hedge-plant and run wild near villages.

A dense shrub with a foetid scent, the flowers white with the throat barred with red or yellow. The leaves are used in native medicine, and an infusion of them is used as an insecticide. Vern. *Hind.* Arusha; *Ur.* Basung; *Tel.* Addasaram; *Tam.* Adatodai.

2. *ADHATODA BEDDOMEI*, C. B. Clarke; F. B. I. iv. 540.

Hills of S. Travancore, at 3,000 ft. (Beddome).

A very large shrub, with rather small flowers in short heads; turns black in drying.

36. *Dianthera*, Linn.

Diffuse herbs or undershrubs. *Leaves* petioled, ovate or oblong. *Flowers* in terminal and sometimes axillary spikes or panicles; bracts and bracteoles small. *Calyx* 5-partite, the lobes narrow. *Corolla* small or middle-sized, the tube short; limb 2-lipped, the upper lip suberect, emarginate, the lower 3-lobed, pendent. *Stamens* 2; anther-cells 2, ellipsoid, subopposite or superposed, muticous. *Ovary* 2-celled, 2 ovules in each cell; style minutely hairy below, nearly bifid at tip. *Fruit* a clavate capsule with subcylindric solid base. *Seeds* 4, compressed, scabrous verrucose or subhispid.

DIANTHERA WALLICHII, Benth. in Gen. Pl. ii. 1114. *D. leptostachya*, C. B. Clarke; F. B. I. iv. 542. *Leptostachya Wallichii*, Nees; Wt. Ic. t. 1543.

W. Ghâts, hills of Tinnevely.

An erect herb with slender divaricately branched panicles of small flowers, the leaves membranous, elliptic-oblong or lanceolate, acuminate at both ends, up to 7 in. long, 2.5 in. broad.

37. *Rhinacanthus*, Nees.

Shrubs, sometimes subscandent. *Leaves* entire. *Flowers* solitary or in small cymes in dense or divaricate panicles; bracts and bracteoles small, linear-lanceolate, shorter than the calyx. *Calyx* 5-lobed, the lobes narrow. *Corolla*-tube long, very slender, scarcely enlarged above; limb 2-lipped, the upper lip linear-oblong, entire or shortly 2-lobed, twisted or recurved, the lower broad, 3-lobed. *Stamens* 2, adnate near the top of the corolla-tube; anthers 2-celled, the cells superposed, muticous. *Disk* cupular. *Ovary* 2-celled; ovules 2 in each cell; style filiform; stigma minutely 2-fid. *Fruit* a clavate capsule, contracted below in a long solid stalk. *Seeds* 1 or 2, orbicular, compressed, rugose.

RHINACANTHUS COMMUNIS, Nees; F. B. I. iv. 541; Wt. Ic. t. 464.

Almost all Districts, wild or cultivated, common on roadsides; also in forest glades especially in N. Circars, on the hills to 4,500 ft. as on Mahendragiri.

A shrubby plant reaching 5 ft. in height, with leaves sometimes reaching 8 in. long, 4 in. broad, the flowers white.

Var. *montana*, C. B. Clarke. Leaves ovate, very softly pubescent beneath and rounded at base.

Nilgiri Hills, near Coonoor (Wight).

38. *Peristrophe*, Nees.

Erect herbs. *Leaves* entire, lineolate. *Flowers* in terminal or axillary clusters, which are often in spreading lax panicles; bracts 1—4 together, decussate, longer than the calyces or the similar bracteoles. *Calyx* 5-partite; lobes linear-lanceolate. *Corolla*-tube slender, often twisted; limb 2-lipped, the upper lip subentire, the lower shortly 3-lobed. *Stamens* 2; filaments pubescent below; anthers 2-celled, cells linear or ovoid, one higher than the other, muticous. *Ovary* 2-celled; ovules 2 in each cell; style filiform; stigma shortly bifid. *Fruit* an ellipsoid stalked capsule, usually 4-seeded, the placentas not separating elastically. *Seeds* discoid, compressed, papillose.

A laxly paniculate spreading herb with angular hispid stems, the leaves chiefly near the base, ovate, acuminate, up to 2 in. long, pubescent; cymes trichotomous; bracts 2, unequal, opposite, linear or linear-spathulate, up to .5 in. long; corolla pink, villous without, up to .5 in. long; anther-cells short; seeds glochidiatopapillose.....1. *bicalyculata*.

An erect herb or undershrub with nearly terete stems, the leaves chiefly near the top, elliptic, long-acuminate, subglabrous, up to 7 in. long, 2.5 in. broad, the flower-clusters in axillary or terminal 3—5-branched cymes; bracts 2, conspicuous, elliptic, glabrous or slightly villous, nerved, up to .75 in. long; corolla pink, villous without, 2—2.5 in. long; anther-cells linear; seeds granular-papillose...2. *montana*.

1. *PERISTROPHE BICALYCULATA*, Nees; F. B. I. iv. 554.

All Districts, common in forest undergrowth, in hedges and on waste land, even as a weed in gardens.

A hispid herb 3—6 ft. high with unattractive very spreading flower panicles and rather small leaves.

2. *PERISTROPHE MONTANA*, Nees; F. B. I. iv. 556; Wt. Ic. t. 1553.

W. Gháts, Wynaad, Anamalais, hills of Travancore and Tinnevely, in evergreen forests at low levels up to 3,000 ft.

A handsome erect undershrub with large leaves and flowers, the bracts often also coloured.

Graptophyllum hortense, Nees, is a glabrous shrub with crimson flowers and leaves mottled with white patches. It is largely cultivated in gardens and has occasionally run wild.

Family CXIV. VERBENACEAE.

Herbs, shrubs or trees. *Leaves* opposite or whorled, simple digitate or pinnate; stipules 0. *Inflorescence* cymose racemose or spicate, often paniculate; bracts usually small; flowers hermaphrodite, rarely polygamous, generally irregular, often brightly coloured, sometimes with coloured calyx or enlarged coloured involucre. *Calyx* inferior,

gamosepalous, 5—4- rarely more-lobed, persistent. *Corolla* gamopetalous; tube usually cylindric or dilated above, often curved; limb 2-lipped or subequally lobed, lobes 5—4, rarely more. *Stamens* usually 4 didynamous, rarely 2, rarely more, inserted on the corolla-tube; filaments free; anthers 2-celled. *Ovary* superior, sessile, 2—4-celled, entire or 4-lobed; ovules variously attached, 2, sometimes 1 in each cell; style terminal; stigma entire or bifid. *Fruit* drupaceous with bony pyrenes, or capsular, 1—4-celled; mesocarp usually fleshy; endocarp usually bony. *Seeds* erect or pendulous, separate in distinct cells; albumen usually 0, embryo straight, radicle inferior.

Inflorescence spicate, centripetal (the lowest flowers opening first):—

Fruit with 2 or 1 1-seeded pyrenes:—

Spikes capitate ovoid or cylindric, calyx small; stamens 4.

Calyx truncate or obscurely lobed; fruit drupaceous, succulent...1. *Lantana*.

Calyx 2—4-lobed; fruit dry, hard.....2. *Lippia*.

Spikes long, slender; calyx long, tubular:—

Stamens 4 didynamous.....3. *Bouchea*.

Stamens 2.....4. *Stachytarpheta*.

Fruit with 2 2-seeded pyrenes.....5. *Priva*.

Fruit with 4 1-seeded pyrenes; calyx tubular.....*Verbena*.

Inflorescence cymose, centrifugal (the end flower opening first):—

Cymes paniculate, drupes fleshy:—

Leaves simple:—

Corolla regular, stamens equal:—

Flowers 4-merous; drupe with 4 pyrenes.....6. *Callicarpa*.

Flowers 4—6-merous; drupe with 4-celled endocarp.....7. *Tectona*.

Corolla 2-lipped; stamens 4 didynamous:—

Drupe with 1 pyrene, normally 4-celled:—

Flowers small.....8. *Premna*.

Flowers large.....9. *Gmelina*.

Drupe with 4 pyrenes, 1—3 often suppressed.....10. *Clerodendron*.

Leaves digitate; pyrene 1.....11. *Vitex*.

Cymes capitate, bracts of the heads forming an involucre:—

Corolla 6—16- or more-merous; stamens long-exsert.....12. *Symphorema*.

Corolla 5—6-merous; stamens included or shortly exsert.....13. *Sphenodesme*.

Inflorescence capitate or shortly spicate, centripetal; calyx 5-partite, the lobes concave, imbricate, fruit capsular.....14. *Avicennia*.

1. *Lantana*, Linn.

Erect or subscandent, often rambling, often strong-smelling, pubescent or scabrous shrubs; branches 4-angled, sometimes prickly. *Leaves* simple, opposite or ternate, crenate, often rugose. *Flowers* in pedunculate capitate ovoid or cylindric spikes; bracts conspicuous, persistent, bracteoles 0. *Calyx* small, membranous, truncate or obscurely toothed. *Corolla*-tube cylindric, slender; limb salver-shaped; lobes 4 or 5, spreading. *Stamens* 4, didynamous, included in the corolla-tube and inserted at its middle; anthers oblong, the cells parallel. *Ovary* 2-celled; ovules 1 in each cell; style short; stigma oblique, subcapitate. *Fruit* a drupe with more or less fleshy mesocarp; endocarp hard, separating into 2 1-celled, 1-seeded pyrenes. *Seeds* exalbuminous; testa reticulate.

Erect shrubs, the stems not prickly:—

Leaves usually opposite, sometimes ternate:—

Lower bracts of the spike broadly ovate, usually abruptly acuminate, villous, 7-ribbed; spikes 5—75 in. long in flower, elongating in fruit; corolla-tube

.3 in. long; leaves ovate, acute, rounded and then cuneate at base, crenate, rugose above, usually white-pubescent beneath, up to 3 in. long, 1.5 in. broad

1. *indica*.

Lower bracts of the spike leafy, ovate, gradually acute, 5—7-ribbed, softly villous; spikes small, about .5 in. long or less, in fruit up to 1 in.; corolla-tube short, .15 in. long; leaves small, ovate or orbicular, obtuse or obtusely acute, crenulate, often very white villous or tomentose, up to 1.5 in. long, but usually much less.....2. *Wightiana*.

Lower bracts of the spike lanceolate, 3-ribbed; spikes short, subumbellate, .25 in. long in fruit, up to .5 in.; corolla-tube long; leaves ovate-lanceolate, acuminate, rounded and then cuneate at base, scabrous above, crenulate, up to 3.5 in. long, 1.5 in. broad, the petiole long and slender.....3. *crenulata*.

Leaves usually ternate, sometimes only opposite, lanceolate, acute, cuneate at base, crenate, hispid-pubescent, up to 4 in. long, 1.5 in. broad; lower bracts of the spike ovate, cuspidate-acuminate; spikes .5—1.5 in. long, elongate in fruit; corolla-tube very white-villous.....4. *trifolia*.

Straggling or climbing shrubs, the stems with many recurved prickles; bracts of the spike lanceolate 3—5-ribbed; spikes short, subumbellate, corolla-tube slender; scabrous-pubescent; leaves ovate or ovate-oblong, acute, cuneate rounded or cordate at base, crenate, rugose and scabrous, up to 4 in. long.....5. *aculeata*.

1. LANTANA INDICA, Roxb.; F. B. I. iv. 562; Wt. Ic. t. 1464.

Deccan, Carnatic and W. Gháts, in hilly country up to 4,000 ft., often planted in gardens.

An erect shrub reaching 3—8 ft. high, the flowers pink or purplish with a yellowish tube.

2. LANTANA WIGHTIANA, Wall. *L. indica*, Roxb., var. *albiflora*, Wt.; F. B. I. iv. 562.

Carnatic and E. slopes of W. Gháts, in or near the hills.

A woody shrub with very pale branches, small leaves and long slender peduncles, the flowers white.

3. LANTANA CRENULATA, Otto & Dietr.; F. B. I. iv. 563.

Coast of the Carnatic, Pulicat (Wight), Madras (Barber), perhaps introduced only.

An erect shrub with yellow and orange flowers, the leaves with long slender petioles, the peduncles up to 3.5 in. long.

4. LANTANA TRIFOLIA, Linn.; F. B. I. iv. 563.

Travancore (Heyne); Bangalore (Cleghorn), an introduced plant.

An erect hispid shrub resembling *L. indica*, the rather large ternate leaves subsessile.

5. LANTANA ACULEATA, Linn. *L. Camara*, Linn.; F. B. I. iv. 562.

W. Deccan and lower hills of W. Gháts, up to perhaps 6,000 ft., especially common in Coorg and Wynaad, introduced from tropical America and run wild. The Lantana. A very aromatic plant with the scent of black currants, the corollas normally orange, but plants found in gardens have them of various hues, from white to dark red. The plant is most troublesome and measures for its destruction are often necessary though difficult (see Troup, 'Sylv. Ind. Trees,' ii, 780).

2. Lippia, Linn.

Shrubs or undershrubs, rarely herbs. *Leaves* opposite or ternate, rarely alternate, often aromatic, entire or toothed. *Flowers* small, in elongate or cylindric or capitate spikes; bracts small, imbricate,

bracteoles 0. *Calyx* small, membranous, 2—4-lobed, ultimately 2-valved. *Corolla* small, salver-shaped, tube cylindric, straight or curved; limb oblique, 2-lipped, the upper lip bifid or emarginate, the lower 3-lobed. *Stamens* 4, didynamous, included at the middle of the corolla-tube; anthers ovate with parallel cells. *Ovary* 2-celled, ovules in each cell solitary; style short; stigma oblique, subcapitate. *Fruit* small, with a dry epicarp enclosed in the calyx valves; mesocarp granular; endocarp hard and bony, separating into 2 1-seeded pyrenes. *Seed* exalbuminous.

Prostrate, widely creeping and rooting, minutely hairy; leaves cuneate-spathulate, serrate towards the apex, up to 2 in. long; spikes dense, globose at first, afterwards elongating, peduncles usually single; bracts broadly obovate, apiculate...1. *nodiflora*. Erect and shrubby, softly white-strigose; leaves ovate, subobtusate, obtuse at base and somewhat decurrent, rugose, crenulate, up to 2 in. long .75—1 in. broad; spikes dense, cylindric, elongating to 1 in. long, peduncles in one or two pairs; bracts ovate, apiculate, white-villous.....2. *geminata*.

1. *LIPPIA NODIFLORA*, Mich.; F. B. I. iv. 563; Wt. Ic. t. 1463.

All Districts, a weed of wet ground and grassy pastures, common.

A prostrate herb with small white flowers.

2. *LIPPIA GEMINATA*, H. B. & K.; F. B. I. iv. 563.

Nilgiris, on Sigūr Ghāt, at 3,000 ft. (Lawson, Gamble); Anamalais (Beddome). Wild Sage.

A strongly aromatic shrub of wet places, the flowers pink.

Lippia citriodora, H.B. & K. is the Lemon-scented Verbena, commonly planted in gardens, especially in the hills, where it sometimes grows to a considerable size. It is a native of S. America, and has very fragrant lanceolate leaves and small lilac flowers in terminal panicles.

3. *BOUCHEA*, Cham.

Herbs or undershrubs. *Leaves* opposite or subopposite, petioled, toothed. *Flowers* sessile or shortly pedicelled in terminal spikes or racemes; bracts small; bracteoles minute or 0. *Calyx* narrowly tubular, prominently 5-ribbed and 5-toothed, at length splitting longitudinally to the base between the 2 longer teeth. *Corolla*-tube slender, cylindric below, gradually widening; limb spreading, oblique, 5-lobed. *Stamens* 4, didynamous, included in the upper part of the tube; anthers oblong, the cells parallel. *Ovary* 2-celled; cells 1—2-ovuled; style slender; stigma oblique, subbilobed. *Fruit* enclosed in the calyx, of 2 elongate 1-seeded pyrenes, each with an interior basal hollow. *Seed* cylindric; testa thin; cotyledons oblong.

BOUCHEA HYDERABADENSIS, Walp.; F. B. I. iv. 564; Wt. Ic. t. 1462.

Deccan and Carnatic, in hilly country from Cuddapah to Tinnevely.

A tall subsrubby plant with pink-purple flowers in long narrow spikes reaching 1 foot or more, ovate-lanceolate leaves deeply serrate in the upper three-fourths, cuneate and entire at the base, up to nearly 6 in. long, 2 in. broad, the hard pyrenes flattened on the inner face.

4. *Stachytarpheta*, Vahl.

Herbs or shrubs. *Leaves* usually opposite, toothed. *Flowers* in terminal spikes in the axils of bracts often closing an excavation of the rhachis in which they lie; bracts usually lanceolate, bracteoles 0. *Calyx* narrowly cylindric, shortly 4—5-lobed, often slit at the back when in fruit. *Corolla* salver-shaped; tube slender, cylindric, usually curved; limb spreading, 5-lobed, the lobes rounded. *Stamens* 2 perfect, included, with 2 or no staminodes; filaments short; anthers with divaricate cells. *Ovary* 2-celled; ovule solitary in each cell, attached laterally near its base; style filiform; stigma capitate. *Fruit* cylindric, enclosed in the calyx-tube, separating into 2 hard 1-seeded usually plano-convex pyrenes. *Seeds* oblong; testa membranous; cotyledons fleshy.

Spikes slender, about 1—15 in. in diam., glabrous, the flowers blue; bracts lanceolate, acuminate, appressed; leaves elliptic-ovate, obtuse or acute, cuneate and decurrent at base, serrate or crenate-dentate except at base, up to 4 in. long, 1.5 in. broad, nearly glabrous.....1. *indica*.
Spikes stout, about 2—25 in. in diam., very villous, the flowers pink; bracts lanceolate, long-acuminate and spreading; leaves ovate, acute, decurrent at base, crenate except at base, up to 5 in. long, 2.5 in. broad, softly tomentose beneath
2. *mutabilis*.

1. *STACHYTARPHETA INDICA*, Vahl; F. B. I. iv. 564. *S. urticæfolia*, Dalz. & Gibs. Bot. Mag. t. 1848.

Hills of the Carnatic, Shevaroy (Perrottet, Bourne), introduced probably.

A tall herb with long slender spikes of blue flowers, the leaves serrate.

- Var. *jamaicensis*, Trimen. *S. jamaicensis*, Vahl; Bot. Mag. t. 1860.

All plains Districts, on roadsides, and in wet places, common and probably only naturalized.

A tall herb with very long slender spikes, the blue flowers in excavations of the rhachis, the leaves coarsely crenate-serrate.

2. *STACHYTARPHETA MUTABILIS*, Vahl.

Hills of the Deccan, Carnatic and W. Gháts, in places, introduced to gardens from tropical America and run wild.

A tall herb, shrubby, with very long stout spikes and pink flowers (scarlet and rose, *Haines*).

5. *Priva*, Adans.

Erect herbs. *Leaves* opposite, thin, toothed. *Flowers* solitary, in simple terminal or axillary spikes or racemes; bracts small, narrow; bracteoles 0. *Calyx* tubular, becoming-inflated in fruit, 5-ribbed, the ribs ending in short teeth. *Corolla*-tube cylindric, straight or curved; limb 5-lobed, spreading, slightly 2-lipped; base of tube with spiral lines. *Stamens* 4 didynamous, included; anther-cells parallel or slightly divergent; staminode minute or 0. *Ovary* 2-celled; ovules 2 in each cell; style long, filiform; stigma oblique, subclavate. *Fruit* enclosed in the loose dilated calyx-tube, separating when ripe into 2 2-seeded pyrenes, usually hollowed out on the inner side. *Seed* smooth; testa thin.

PRIVA LEPTOSTACHYA, Juss. ; F. B. I. iv. 565. *Streptium asperum*, Roxb. Cor. Pl. t. 146.

Deccan and Carnatic, from the Kistna southwards and up to 3,000 ft., W. to E. slopes of the Gháts, on old walls, rocks, etc. An erect herb with quadrangular stem, ovate obtuse long-petioled soft leaves truncate or subcordate at base, 3 in. long, and white flowers in very long racemes covered with hooked hairs, the pyrenes echinate.

6. *Callicarpa*, Linn.

Trees or shrubs, the young branches more or less densely stellately hairy. *Leaves* opposite, rarely ternate, entire or toothed. *Flowers* small, in axillary sessile or pedunculate many-flowered cymes; bracts linear, inconspicuous. *Calyx* small, campanulate, truncate or minutely 4-lobed, not enlarged in fruit. *Corolla* small, campanulate, purple or red; lobes 4; spreading. *Stamens* 4 equal, exserted; anthers oblong, glandular on the back, the cells parallel. *Ovary* imperfectly 2-celled, 2 ovules in each cell; style linear; stigma dilated, obscurely bifid. *Fruit* a small globose drupe, supported by the persistent calyx, containing 4 pyrenes with bony endocarp, each 1-seeded. *Seed* shortly oblong; albumen 0.

Under-surface of leaves with close hard finely stellate pale tomentum; leaves ovate to oblong, acuminate, acute or cuneate at base, entire or slightly denticulate, up to 10 in. long, 6 in. broad, calyx subtruncate.....1. *arborea*.
Under-surface of leaves with dense soft stellate grey or fulvous tomentum; leaves ovate or elliptic, acuminate, truncate or rounded, or cuneate at base, entire or serrate, up to 12 in. long, 8 in. broad; calyx shortly 4-lobed.....2. *lanata*.

1. *CALLICARPA ARBorea*, Roxb. ; F. B. I. iv. 567.

N. Circars, forests of the Eastern Gháts, Ganjam to Godavari, in rather open spots.

A moderate-sized tree with lilac purple flowers and small black drupes. Bark brownish, rough; wood light brownish-white, even-grained. Vern. *Ur*. Boropatri.

2. *CALLICARPA LANATA*, Linn. ; F. B. I. iv. 567. *C. Wallichiana* Walp. ; Wt. Ic. t. 1480.

W. Gháts, in all Districts, at 2,000—4,000 ft., especially at the edges of clearings.

A small tree or large shrub reaching 25 ft. high, the flowers purple, the small drupes black. Bark brown, rough; wood pale brown, smooth, moderately hard, used for carving and the legs of cots. Vern. *Tam*. Vettilai patta; *Mal*. Thin perivelam.

7. *Tectona*, Linn. f.

Trees, stellately tomentose. *Leaves* large, opposite or whorled, entire, petioled. *Flowers* numerous, in dichotomous cymes in large terminal panicles; bracts small, narrow. *Calyx* campanulate, shortly 5-6-lobed, enlarged and bladder-like in fruit. *Corolla* small, white; tube short; limb with 5-6 short subequal spreading imbricate lobes. *Stamens* 5-6, inserted near the base of the corolla, equal, exserted; anthers ovate or oblong with distinct parallel cells. *Ovary* fleshy,

4-celled, each cell 1-ovuled; style linear; stigma shortly bifid. *Fruit* a drupe enclosed in the enlarged calyx; exocarp spongy or nearly dry; endocarp bony thick, 4-celled. *Seeds* erect, oblong; testa membranous; albumen 0; cotyledons fleshy and oily; radicle short.

TECTONA GRANDIS, Linn. f.; F. B. I. iv. 570; Roxb. Cor. Pl. t. 6; Bedd. Fl. t. 250; Brand. For. Fl. t. 44.

N. Circars, forests on both sides of the Godavari; Deccan and Carnatic in Hill forests in all forest Districts, but in scattered localities; W. Ghâts, in all Districts, but most especially in the Wynaad, the Anamalais and in dry forests at low levels in Cochin and Travancore. It has been much planted, the most notable plantation being that of Nilambur in Malabar. *Teak*.

A very large deciduous tree with quadrangular stems, covered, like the inflorescence and under-surface of the leaves, with tawny stellate tomentum. The leaves are very large as are the flower panicles. Bark light brown or grey; wood moderately hard, golden yellow, darkening on exposure, very valuable and in great demand as the principal timber of India, both for local use and for export. Vern. *Hind.* Sagun; *Ur.* Singuru; *Tel.* Teku; *Tam.* and *Mal.* Thekku; *Kan.* Tadi.

8. *Premna*, Linn.

Trees or shrubs, sometimes climbing, rarely herbaceous under-shrubs. *Leaves* opposite or sometimes whorled, entire or toothed. *Flowers* in corymbose paniced or thyrsoid terminal cymes; bracts small, narrow, bracteoles 0. *Calyx* small, campanulate, truncate 2-lipped or shortly 2-5-lobed, somewhat enlarged in fruit. *Corolla* small; tube short, often villous within; limb 2-lipped, 5- or subsequently 4-lobed. *Stamens* 4, didynamous, inserted below the throat of the corolla-tube, rarely exerted; anthers ovate or rounded, the cells parallel or divergent. *Ovary* 2- or 4-celled, 4-ovuled; style linear; stigma shortly bifid. *Fruit* a small drupe, seated on the calyx, globose or obovoid, mesocarp thin, fleshy, endocarp of 1 pyrene, rugose or verrucose, often with a central cavity. *Seeds* oblong, testa thin, albumen 0, cotyledons flat.

Climbing shrubs:—

Leaves coriaceous, glabrous, ovate or ovate-oblong, abruptly cuspidate-acuminate at apex, rounded or cordate at base, entire or shortly serrate, prominently 4-7-nerved, the nerves and reticulations raised beneath, up to 8 in. long, 4 in. broad; corymbs large and spreading, often 8 in. in diam.; calyx truncate, scarcely lipped.....1. *coriacea*.

Leaves membranous:—

Leaves densely softly villous beneath, puberulous above, ovate, acute or shortly acuminate at apex, truncate or cordate at base, entire, 6-8-nerved, the nerves slightly raised beneath, up to 7 in. long, 4.5 in. broad; corymbs up to 4 in. in diam.; calyx truncate or very slightly waved.....2. *villosa*.

Leaves merely villous along the nerves beneath, otherwise glabrous, ovate-oblong, abruptly acuminate, rounded at base, entire, about 3-5-nerved, up to (when young) scarcely 4 in. long; corymbs about 2 in. in diam.....3. *paucinervis*.

Erect trees or shrubs:—

Cymes in panicles:—

Calyx deeply 2-lipped, enlarged and prominent in fruit, the upper lip sometimes minutely 3-lobed; panicles small, under 1 in. broad, dense; leaves

ovate, acuminate, truncate or subcordate at base, nearly glabrous, entire, 4-nerved, up to 4 in. long, 2 in. broad, petiole .5—1 in. long; drupe obovoid

4. *corymbosa*.

Calyx shortly 5-lobed, somewhat enlarged and widened in fruit; panicles pyramidal, up to 4 in. broad; leaves ovate, acuminate, obtuse or cordate at base, densely (like the branches and inflorescence) tawny-yellow stellately tomentose, up to 8 in. long, 5 in. broad, petiole 1—2 in. long; drupe subglobose

5. *tomentosa*.

Cymes in corymbs:—

Corymbs terminal to main branches only, broad; calyx obscurely 2-lipped, one lip 2-lobed, the other 3-lobed or subentire, in fruit saucer-shaped:—

Leaves oblong-elliptic or oblanceolate, abruptly acuminate at apex, somewhat rounded at base, glabrous, entire or slightly serrate, 5—8-nerved, the nerves looped and, with the transverse nervules, prominent beneath, up to 9 in. long, 4.5 in. broad, petiole .6 in.; drupe globose.....6. *glaberrima*.

Leaves ovate, acuminate, rounded at base, pubescent (especially beneath) and gland-dotted, entire or undulate, 6—8-nerved and with subparallel transverse nervules, up to 8 in. long, 4.5 in. broad, petiole 1—4 in.; drupe globose

7. *flavescens*.

Leaves broadly elliptic-ovate, obtuse at apex with a very short point, rounded at base, glabrous or slightly villous beneath, entire or dentate towards the apex, 4—5-nerved, up to 4 in. long, 2.5 in. broad, petiole about .5 in.; drupe globose or obovoid.....8. *serratifolia*.

Corymbs terminal to side branchlets as well as main branches, small; calyx 2-lipped, the upper lip 2-, the lower 3-lobed; leaves ovate, shortly acuminate at apex, obtuse and then cuneate at base, glabrous or pubescent, entire, about 4-nerved, up to 3 in. long, 2 in. broad, petiole .5—1.5 in.; drupe globose

9. *latifolia*.

Corymbs lateral on old wood or sometimes terminal on side branchlets; calyx campanulate but very shallow in fruit; leaves ovate-lanceolate, acuminate, cordate or truncate at base, serrate, up to 3.5 in. long, 1.5 in. broad; drupe obovoid.....10. *procumbens*.

Cymes in thyrsoid panicles, terminal; calyx obscurely 2-lipped, upper lip 2-, lower 3-lobed; leaves ovate, acuminate, obtuse at base, entire or serrate in the upper half, glabrous or slightly pubescent, 4—5-nerved, up to 3.5 in. long, 2 in. broad, petiole slender, .5—1 in. long, grooved; drupe obovoid, verrucose-tubercular

11. *Wightiana*.

Small herbaceous plant from a woody rootstock, the flowers in small corymbs; calyx obscurely 2-lipped, the upper lip 2-, the lower 3-lobed; leaves sessile obovate, coarsely crenate or serrate in the upper half, pubescent on the nerves, up to 4.5 or more in. long, 3 in. broad; drupe globose.....12. *herbacea*.

1. PREMNA CORIACEA, C. B. Clarke; F. B. I. iv. 573.

W. Ghâts, from Mysore and Canara to Cochin and Travancore, at low levels, up to 3,000 ft.

A large climber with pale brown bark with corky lenticels, the corymbs purplish, the flowers white. The petioles have a cup-shaped scar at their base.

2. PREMNA VILLOSA, C. B. Clarke; F. B. I. iv. 573.

Deccan, Sandur Hills of Bellary, at 2,000 ft. (Brougham, Gamble); W. Ghâts, Coorg and Wynaad, at 3,000 ft. (G. Thomson, Beddome).

A large climber with pale brown smooth bark, white flowers and hairy leaves with long petioles.

3. PREMNA PAUCINERVIS, Gamble, *n. comb.* *P. purpurascens*, Thw., var. *paucinervis*, C. B. Clarke; F. B. I. iv. 574.

W. Ghâts, Anamalais at 3,000 ft. (Beddome).

A gigantic climber and epiphyte (Beddome), the flowers supposed to be red. A very little known species.

4. PREMNA CORYMBOSA, Rottl. & Willd.; F. B. I. iv. 573. *P. cordifolia*, Wt. Ic. t. 1483, not of Roxb.
Deccan, forests about Kodúr in Cuddapah; Carnatic, Nellore, Chingleput and Madras to the Javadis, in hedges and among bushes.
A shrub from 3 to 6 ft. high with slender branches and yellowish flowers. Vern. *Tel.* Pomanti, Pedda narva.
5. PREMNA TOMENTOSA, Willd.; F. B. I. iv. 576; Wt. Ic. t. 1468; Bedd. Fl. t. 251.
N. Circars, Deccan and Carnatic down to S. Travancore in deciduous forest, up to about 4,000 ft., common.
A moderate-sized deciduous tree with greenish-yellow flowers. Bark light greyish-brown; wood light brown smooth and close-grained, of good quality but little used. Vern. *Tel.* Nagal, Narvu; *Tam.* Kolakatta; *Kan.* Ije.
6. PREMNA GLABERRIMA, Wt. Ic. t. 1484; F. B. I. iv. 577 (*by error integerrima*).
W. Gháts, hills of Tinnevelly (Wight).
A shrub, 6—8 ft. high, quite glabrous and with characteristic distantly nerved leaves, the branchlets pale brown.
7. PREMNA FLAVESCENS, Ham.; F. B. I. iv. 578.
N. Circars, Rampa Hills of Godavari (V. Narayanswami).
A large tree with large soft leaves and large spreading corymbs of whitish flowers.
8. PREMNA SERRATIFOLIA, Linn. *P. integrifolia*, Linn.; F. B. I. iv. 574; Wt. Ic. t. 1469.
Plains of S. Carnatic, near the coast.
A small tree or shrub with the trunk and older branches with opposite spines, the greenish-yellow flowers unpleasantly scented. Bark thin, pale; wood light brown, scented. Vern. *Tam.* Pay minnay.
9. PREMNA LATIFOLIA, Roxb.; F. B. I. iv. 577; Wt. Ic. t. 869.
N. Circars and Carnatic to Tinnevelly, near the coast, in dry forest areas.
A small tree reaching 25 ft. in height, the leaves usually drying blue or black, the flowers greenish-white. Vern. *Tel.* Pedda nella kura.
Var. *mollissima*, C. B. Clarke. Leaves softly pubescent beneath usually smaller as are the corymbs.
Deccan, in deciduous forest.
Var. *viburnoides*, C. B. Clarke. Leaves ovate, rhomboid at base, glabrate, drying green.
Carnatic, Madras and S. Arcot to Tinnevelly; W. Coast at Cochin.
10. PREMNA PROCUMBENS, Moon; F. B. I. iv. 580.
Tinnevelly, at Mundanthorai, 675 ft. (Fischer).
A small undershrub with yellowish terete branches and flowers in small usually lateral corymbs.
11. PREMNA WIGHTIANA, Schauer, F. B. I. iv. 578. *P. thyrsoides*, Wt. Ic. t. 1485; F. B. I. iv. 579.

W. Gháts, Pulneys and hills of Tinnevely and Travancore, at low levels.

A small tree or large shrub with yellowish-brown branches and white flowers very long-hairy in the throat. Vern. *Tam.* Pinja.

12. *PREMNA HERBACEA*, Roxb.; F. B. I. iv. 581.

N. Circars, forests of Ganjam (Barber), hills of Vizagapatam at 2,500 ft. (A. W. Lushington); W. Gháts, Mudumalai in S. E. Wynaad (Beddome), usually on clay in open ground, especially where fires have been.

A small plant, a few inches high only, with the leaves pressed close to the ground, the flowers small and white.

9. *Gmelina*, Linn.

Trees or shrubs, unarmed or armed with axillary divaricate spines (abortive branchlets). *Leaves* opposite, entire toothed or lobed. *Flowers* large, yellow or brownish-yellow, often tomentose, in dense or lax sessile or pedunculate racemes along the branches of a terminal panicle; bracts usually small, sometimes large and leafy. *Calyx* campanulate, shortly 4—5-lobed or subentire, persistent. *Corolla* obliquely campanulate or funnel-shaped; limb oblique spreading 4—5-lobed. *Stamens* 4, didynamous, inserted below the throat, included; anthers pendulous, with oblong subseparate cells. *Ovary* 4-celled, the cells 1-ovuled; style slender; stigma shortly bifid. *Fruit* a succulent drupe, the endocarp bony, 2—4-celled, usually with a conical hollow in the middle open on one side. *Seeds* oblong; testa thin; albumen 0; cotyledons fleshy.

An unarmed tree; leaves large, deltoid-ovate, acuminate, cordate and then slightly decurrent at base, fulvous-tomentose beneath, up to 9 in. long, 8 in. broad, long-petioled; calyx-lobes 5; corolla brownish-yellow densely pubescent without, tube stout.....1. *arborea*.

Shrub, often spinous from divaricate abortive branchlets; leaves small, ovate, often irregularly lobed, glabrous but glaucescent beneath with minute round glands, up to 1.5 in. long, 1 in. broad, short-petioled; calyx-lobes 4; tube with large glands; corolla bright yellow, pubescent without, tube slender.....2. *asiatica*.

1. *Gmelina ARBOREA*, Roxb. Cor. Pl. t. 246; F. B. I. iv. 581; Wt. Ic. t. 1470; Bedd. Fl. t. 253.

All Districts, in deciduous forests and up to 5,000 ft. in the hills though sporadic and not abundant; often planted in avenues and gardens.

A large or moderate-sized deciduous tree with handsome panicles of brownish-yellow flowers and a large yellow fleshy drupe. Bark smooth, white or whitish-grey; wood greyish-white, glossy, smooth and even grained, useful for planking, furniture and many other purposes and not liable to warp or contract. Vern. *Hind.* Gumhar; *Ur.* Gambari; *Tel.* Gumar tek; *Tam.* Gumadi, Umi; *Kan.* Shivani; *Mal.* Kumbil.

2. *Gmelina ASIATICA*, Linn.; F. B. I. iv. 582; Wt. Ill. t. 174. *G. parvifolia*, Roxb. Cor. Pl. t. 162.

N. Circars, E. Deccan and Carnatic in scrub forest, sometimes planted.

A large straggling shrub, sometimes climbing, spinescent. On poor land, it is often with very small leaves. Bark brownish-

white, thin; wood hard, grey, used for fuel and fencing. Vern. *Tel.* Gumadi; *Tam.* Kumil.

G. Hystrix, Schult., is a thorny shrub, frequently met with in gardens, a native of Tenasserim Siam and Malaya. It has large yellow flowers and conspicuous large coloured bracts.

10. *Clerodendron*, Linn.

Trees and shrubs, sometimes straggling or climbing. *Leaves* opposite, rarely verticillate, simple, entire or toothed or lobed. *Flowers* small or large, in axillary cymes or terminal panicles, often leafy below; bracts conspicuous or small; bracteoles 0 or very small. *Calyx* campanulate, rarely tubular, truncate 5-lobed or almost 5-partite, persistent often accrescent, often coloured in fruit. *Corolla* salver-shaped or funnel-shaped; tube usually long and slender, limb more or less oblique with 5 spreading lobes. *Stamens* 4, didynamous, long-exserted; filaments filiform, involute in bud; anthers ovate or oblong, the cells parallel. *Ovary* imperfectly 4-celled, 1-ovuled; style filiform; stigma shortly bifid. *Fruit* a globose drupe, succulent or rarely dry, 4-grooved, separating into 4 pyrenes of which 1—3 sometimes suppressed; endocarp bony or crustaceous. *Seeds* oblong or pyriform, albumen 0; cotyledons fleshy.

Corolla irregularly salver-shaped, 1·5 in. long or less:—

Panicles axillary, occasionally also terminal; flowers white:—

Calyx minutely toothed, in fruit enlarged, subtruncate, at the base of the spongy drupe:—

Leaves obovate or elliptic, even orbicular, obtuse or emarginate, opposite or rarely ternate, up to 2 in. long, 1·5 in. broad.....1. *inerme*.

Leaves elliptic, acute or acuminate, frequently ternate, up to 3 in. long.....2. *neriifolium*.

Calyx lobed about half-way down, the lobes caudate-acuminate, in fruit enlarged and rigid; leaves ovate-deltoid, sinuate or serrate, up to 3 in. long, and broad, puberulous beneath.....2. *Phlomidis*.

Panicles terminal:—

Calyx subtruncate, the lobes very short; corolla blue to white; 5—1·5 in. long, obovate to lanceolate, often coloured; leaves elliptic or oblong, acuminate, coarsely serrate, up to 12 in. long, 6 in. broad, but usually smaller....3. *serratum*.

Calyx deeply 5-lobed, the lobes lanceolate, acute; corolla pinkish white; bracts small; leaves ovate or almost orbicular, acuminate, cordate or obtuse at base, entire denticulate or serrate, villous or tomentose, up to 10 in. long, 8 in. broad.....4. *infortunatum*.

Calyx small, with subulate lobes; panicle dense, corymbose; corolla white to purple, usually double; leaves ovate, acute, subcordate, up to 6 in. in diam.5. *fragrans*.

Corolla narrowly funnel-shaped, 3 in. or more long; calyx 5 in. long, lobes lanceolate, acute; panicle lax, terminal, much elongate; leaves narrowly lanceolate, subsessile, subentire, up to 9 in. long, 1·5 in. broad.....5. *Siphonanthus*.

1. CLERODENDRON INERME, Gaertn.; F. B. I. iv. 589.

Sea-coasts on both sides, in tidal forests, often planted in gardens, and so perhaps run wild inland.

A straggling shrub, with corolla-tube usually 1—1·5 in. long and a dry brown drupe. Vern. *Hind.* Batraj; *Tel.* Pisung; *Tam.* Pinchil, Sangam.

2. CLERODENDRON PHLOMIDIS, Linn. f. *C. phlomoides*, Willd.; F. B. I. iv. 590; Wt. Ic. t. 1473.

N. Circars, Deccan and Carnatic, usually in hedges and near villages.

A large often rambling shrub with hoary pubescence on the branchlets, the flowers sometimes pink, the corolla-tube .75—1 in. long, the drupe obovoid nearly dry. Bark of the branches nearly white with brown lenticels. Frequently used in medicine. Vern. *Hind.* Urni ; *Tel.* Telaki ; *Tam.* Taludala.

3. *CLERODENDRON SERRATUM*, Spreng. ; F. B. I. iv. 592 ; Wt.-Ic. t. 1472. All Forest Districts, up to 5,000 ft. in the hills, chiefly in rather damp places.

A shrub, usually herbaceous but occasionally woody, with 4-angled stems, pretty blue flowers in a long cylindrical thyrsus and a 4-lobed purple drupe, the corolla-tube short. Often used in medicine. Vern. *Hind.* Barangi ; *Tam.* Chiru dekku.

4. *CLERODENDRON INFORTUNATUM*, Linn. ; F. B. I. iv. 594 ; Wt. Ic. t. 1471.

All Districts, especially the moister ones and up to 6,000 ft. in the hills ; common in forest undergrowth, in mango and other topes and near villages.

A large tawny-villous shrub, occasionally a small tree up to 30 ft. high (Bourdillon) with 4-angled branches and large terminal panicles of pedunculate cymes. In the Southern Districts the leaves are cordate tomentose and entire, proceeding northwards they become less cordate, less tomentose and gradually serrate. It reproduces well by suckers. It is frequently used in medicine. The drupe is black, in an enlarged pink calyx. Vern. *Hind.* Bhánt ; *Ur.* Bania ; *Tel.* Bockada ; *Tam.* Perugilai ; *Mal.* Paragu, Vatta perivelam.

5. *CLERODENDRON SIPHONANTHUS*, R. Br. ; F. B. I. iv. 595 ; Wt. Ill. t. 173.

Deccan and Carnatic, in grass lands and near streams ; W. Coast Districts.

A tall shrub with erect hollow stems up to 6 ft. high or more, conspicuous for its very long-tubed flowers and blue drupes in a persistent red enlarged calyx. Vern. *Hind.* Barangi.

C. nerioifolium, Wall., is a Malay coast shrub, occasionally found in cultivation and run wild. *C. fragrans*, R. Br., is a Chinese shrub with sweet-scented double flowers and bad-smelling leaves, often met with in gardens and run wild in topes and on roadsides. Some other species are also to be found in gardens, the most conspicuous of which is the climbing *C. Thomsonae*, Balf., an African plant with a white calyx and crimson corolla.

11. *Vitex*, Linn.

Trees or shrubs. Leaves opposite, digitately 3—7-foliolate, sometimes 1-foliolate ; leaflets usually entire sometimes dentate. Flowers in sessile or pedunculate cymes forming terminal and axillary or wholly axillary panicles or corymbs ; bracts small, often caducous. Calyx campanulate or tubular-funnel-shaped, truncate or shortly 5-lobed. Corolla small, 2-lipped ; tube usually short ; upper lip of 2, lower of 3 lobes.

the midlobe much the longest. *Stamens* 4, didynamous, usually exerted; anther-cells at first parallel and pendulous afterwards divaricate, always attached at the tip only. *Ovary* 2—4-celled, 4-ovuled; style filiform; stigma bifid. *Fruit* a globose ovoid or obovoid drupe supported by the somewhat enlarged calyx; mesocarp fleshy; endocarp a bony pyrene, normally 4-celled and 4-seeded but often with some cells suppressed, the centre and base sometimes hallowed. *Seeds* ovate or oblong; testa rather thick; albumen 0; cotyledons fleshy.

Inflorescence terminal, with occasional additional branches in upper leaf-axils:—

Shrubs or small trees; leaves membranous, white- or grey-pubescent beneath, entire or sometimes toothed:—

Leaves 1—3-foliolate, the leaflets sessile, obovate-oblong, the middle one cuneate at base, usually subobtusate but sometimes acute at apex; panicles 1—5 in. long; calyx-teeth very short.....1. *trifolia*.

Leaves 3—5-foliolate, the leaflets lanceolate, all with petiolules, the middle one long; panicles up to 12 in. long; calyx-teeth triangular.....2. *Negundo*.

Trees; leaves chartaceous or coriaceous, not grey-pubescent beneath:—

Leaves 3-, occasionally 5-foliolate, the leaflets sessile or subsessile, the side ones lanceolate the middle one lanceolate or oblanceolate, acuminate, all nearly glabrous above, thinly pubescent beneath, up to 6 in. long; petiole angular or winged with an auricled base; panicles with racemose branches of small grey-pubescent cymes, bracts small and caducous; corolla very small, scarcely 2 in. long; drupes small, 2 in. in diam.....3. *altissima*.

Leaves 3-, sometimes 4- or 5-foliolate, the leaflets sessile, ovate or elliptic, abruptly acuminate, rounded at base, broad, glabrate above, fulvous pubescent beneath, up to 9 in. long; petiole not winged; panicles pyramidal, fulvous, with short racemose branches, bracts foliaceous, conspicuous and persistent; corolla 4—5 in. long; drupe shining, about 4 in. in diam.....4. *pubescens*.

Inflorescence axillary:—

Flowers in slender lax panicles of dichasia, often 8 in. long; leaves submembranous, 3-foliolate, the leaflets petioluled, elliptic or lanceolate, acuminate, nearly glabrous, but yellow-gland-dotted beneath, entire or (when young) coarsely serrate, petiole in young trees frequently winged; corolla 3 in. long, puberulous and glandular; drupe obovoid about 3—4 in. long.....5. *peduncularis*.

Flowers in divaricate corymbose dichasia about 4 in. long; leaves coriaceous, 3—5-foliolate, the leaflets long-petioluled, elliptic or lanceolate, obtuse or acuminate, glabrous except along the midrib beneath, entire or sometimes shortly dentate near the tip, petiole not winged; corolla with large lower lip, long-villous on the palate; drupe ellipsoid, 75 in. long, succulent, the pyrene with large basal cavity and usually 1-seeded.....6. *Leucoxydon*.

1. *VITEX TRIFOLIA*, Linn. f.; F. B. I. iv. 583.

Coast Districts, especially the West in S. Canara and Malabar.

A shrub, rarely more, sometimes quite small, the flowers pale purple, the leaves often with only 1 leaflet which may then be ovate or orbicular, up to 2 in. long, 1.5 in. broad. Vern. *Tam. Nir nocchi*; *Tel. Vavili*.

2. *VITEX NEGUNDO*, Linn.; F. B. I. iv. 583; Wt. Ic. t. 519.

All Districts, in the dry region, up to 5,000 ft. in the hills, on waste lands round villages, on roadsides and the banks of streams, common.

A large shrub, rarely a small tree, with bluish-purple flowers and narrow long-acuminate leaflets. Bark thin, grey; wood greyish-white, hard. The plant is used in medicine. Vern. *Hind. Nisinda*, *Shambalu*; *Ur. Beyguna*; *Tel. Vavili*; *Tam., Mal. Nocchi*.

3. *VITEX ALTISSIMA*, Linn. f.; F. B. I. iv. 584; Wt. Ic. t. 1466; Bedd. Fl. t. 252. *V. alata*, Heyne; F. B. I. iv. 584.
All Forest Districts, in deciduous and dry forests of the Deccan and Carnatic, also on W. coast, sometimes but scarce in evergreen forests, up to 4,000 ft. in hilly country. A large and lofty tree with white flowers tinged with blue or violet. Bark yellowish-grey; wood grey to yellowish-brown, hard and close-grained, valuable for building, furniture, carts, etc. The winged petioles are most conspicuous in young plants and coppice shoots. Vern. Tel. Nemili adaga; Tam. Maila; Kan. Myrole; Mal. Mayilai.
4. *VITEX PUBESCENS*, Vahl; F. B. I. iv. 585. *V. arborea*, Roxb.; Wt. Ic. t. 1465.
N. Circars, in deciduous forest, common; Deccan and Carnatic to S. Travancore, less so, up to 3,000 ft. in hilly country, often on the banks of streams.
A large tree with 4-angled branchlets and blue or purple flowers. Bark greyish; wood reddish- or olive-brown, very hard, close-grained, durable and useful for building and other purposes. Vern. Ur. Dhalasingha; Tel. Nowli eragu; Tam. Myladi; Mal. Atta mayila.
5. *VITEX PEDUNCULARIS*, Wall.; F. B. I. iv. 587.
N. Circars in deciduous forest, in the hills up to 3,000 ft., usually near streams, fairly common in Ganjam with Sál. A small or moderate-sized tree, the flowers white with a yellow palate. Bark thick; wood reddish-grey, hard and close-grained.
6. *VITEX LEUCOXYLON*, Linn. f.; F. B. I. iv. 587. *Wallrothia leucoxylon*, Roxb.; Wt. Ic. t. 1467.
All Forest Districts at low levels, on the banks of streams.
A deciduous tree with spreading head and white rather large flowers with purple hairs on the long palate, the drupe large and dark purple. Bark grey, smooth; wood light greyish-brown, moderately hard and useful for furniture and carts. Vern. Tel. Luki; Tam. Nir nocchi; Kan. Sengeni; Mal. Atta nocchi.

12. *Symphorema*, Roxb.

Rambling or climbing shrubs. *Leaves* opposite, entire or toothed. *Flowers* in pedunculate, capitate, usually 7-flowered cymes, with an involucre of 6 oblong or obovate foliaceous bracts accrescent in fruit. *Calyx* obovoid, 4—8-lobed, somewhat accrescent in fruit. *Corolla* with cylindric tube, the limb with 6—16 or more subequal narrowly oblong lobes. *Stamens* as many as the corolla-lobes, exserted; anthers ovate with parallel cells. *Ovary* 2- or imperfectly 4-celled, 4-ovuled, the ovules pendulous. *Fruit* nearly dry, included in the calyx, 1-seeded. *Seed* erect; cotyledons fleshy, concave, enclosing a cavity.

Corolla (tube and lobes) .25 in. long, lobes 6—8; bracts in flower .25—75 in. long, in fruit 1—1.25 in., spatulate, papery, thinly pubescent; leaves ovate or elliptic, subacute, crenate-dentate, stellate-pubescent beneath, up to 6 in. long, 4 in. broad.....1. *involucratum*.
Corolla (tubes and lobes) .5—75 in. long, lobes 12—16 or more; bracts in flower 1 in. long, in fruit 1.5 in., obovate, soft, tomentose; leaves ovate or suborbicular,

acute, crenate-dentate, stellate-tomentose on both surfaces, up to 6 in. long, 4 in. broad.....2. *polyandrum*.

1. SYMPHOREMA INVOLUCRATUM, Roxb. Cor. Pl. t. 186; F. B. I. iv. 599; Wt. Ic. t. 362.

N. Circars, Deccan and E. slopes of W. Gháts.

A deciduous climbing shrub with white flowers.

2. SYMPHOREMA POLYANDRUM, Wt. Ic. t. 363; F. B. I. iv. 599.

Deccan, Nallamalai Hills of Cuddapah and Kurnool (Beddome, Gamble); Kambakam Hill in Chingleput (Hb. Madr.).

A climbing shrub with densely fulvous-tomentose branches and young leaves, the flowers white.

13. *Sphenodesme*, Jack.

Climbing shrubs. *Leaves* opposite, entire, shortly petioled. *Flowers* in capitate 3- or about 7-flowered cymes in an involucre of 6 foliaceous bracts, the cymes in pairs on the branches of large terminal or axillary thyrsoid panicles, leaves at the panicle nodes small and bract-like. *Calyx* ovoid or campanulate, lobes 4—5 short. *Corolla* funnel or slaver-shaped, lobes 4—6, oblong or lanceolate. *Stamens* as many as the corolla-lobes, inserted on the corolla-tube, included or exserted; anthers small, ovate or reniform, the cells parallel or divergent. *Ovary* 2-celled, the cells 2-ovuled, the ovules pendulous from an axile placenta; style filiform; stigma 2-lobed. *Fruit* a globose or obovoid drupe, included in the calyx, 1-seeded. *Seed* globose, included in the calyx; cotyledons fleshy.

SPHENODESME PANICULATA, C. B. Clarke; F. B. I. iv. 600.

W. Gháts, evergreen forests of Cochin and Travancore; Coorg (Rottler); Shevaroy Hill (Perrottet).

A large climber, the branches and inflorescence covered with a golden-brown tomentum, the leaves ovate or elliptic, acute, up to about 5 in. long, 3 in. broad, the main nerves 4—5 pairs. Bracts spatulate, obtuse or emarginate in fruit.

14. *Avicennia*, Linn.

Shrubs or small trees with long creeping roots which give out at intervals narrow conical leafless suckers (pneumatophores). *Leaves* opposite, coriaceous, entire. *Flowers* small, yellow, sessile in capitate peduncled heads of close cymes, sometimes forming terminal trichotomous panicles; bracts small. *Calyx* short, 5-partite; lobes ovate, concave, imbricate. *Corolla*-tube short, cylindric; lobes 4, subequal, or the posterior slightly the larger. *Stamens* 4, adnate to the corolla-throat; filaments short; anther-cells ellipsoid, parallel. *Ovary* imperfectly 4-celled, the central axis 4-winged; ovules 4, pendulous between the axial wings; style tapering; stigma bifid. *Fruit* a compressed capsule, dehiscing by 2 leathery valves. *Seed* solitary, erect; albumen 0; cotyledons large, longitudinally plicate; radicle villous; seed often germinating on the plant.

Leaves obtuse at apex, elliptic-oblong or obovate, attenuate at base, glabrous and shining above, minutely and closely brownish-pubescent beneath, up to 4 in. long, 2 in. broad; anthers exserted; style elongate, tapering; capsule ovoid, 1—1.5 in. long.....1. *officinalis*.

Leaves acute at apex; anthers included; style very short, conical:—

Leaves ovate or lanceolate, cuneate at base, glabrous and shining above, minutely and closely tawny-pubescent beneath, up to 3 in. long, 1·5 in. broad; capsule ovoid, about ·75—1 in. long.....2. *marina*.
Leaves lanceolate, very acute or acuminate, attenuate and decurrent at base, glabrous and shining above, closely whitish-pubescent beneath, up to 4·5 in. long, 1·5 in. broad; capsule when young conical and beaked, when old ovoid, ·75 in. long.....3. *alba*.

1. *AVICENNIA OFFICINALIS*, Linn.; F. B. I. iv. 604. *A. tomentosa*, Jacq.; Wt. Ic. t. 1481.

W. Coast, in S. Canara, Malabar, Cochin and Travancore, along the coast, in creeks and tidal marshes, E. Coast, in the Godavari Delta (Homfray, Foulkes); White Mangrove.

A small tree. Bark greyish-brown, thin; wood brown or grey, hard, of peculiar structure and used only for fuel when other and better kinds are not available. Vern. *Tel. Mada*; *Tam. Upattha*; *Mal. Orei*.

2. *AVICENNIA MARINA*, Vierh. in Denkschr. Akad. Wien, lxxi, 435. *Sceura marina*, Forsk. Fl. Æg.-Ar. Cent. i. 37.

E. Coast, from the Kistna southwards, along the coast in tidal waters and salt swamps.

A large shrub, the wood of similar peculiar structure and used for fuel. Vern. *Tel. Mada*; *Tam. Venkandan*.

3. *AVICENNIA ALBA*, Bl.; Wt. Ic. t. 1482. *A. officinalis*, var. *alba*, C. B. Clarke; F. B. I. iv. 604.

E. Coast, delta of the Kistna river (A. W. Lushington, Foulkes). Tummalapenta in Nellore (Fischer).

A shrub, apparently scarce. Vern. *Tel. Gundu Mada*.

Verbena venosa, Gill and Hook., and *V. bonariensis*, Linn., are S. American plants with purple flowers, cultivated sometimes in gardens and sometimes found run wild, especially in Nilgiris. The garden *Verbenas* of various colours are believed to be hybrids of the S. American *V. chamædrifolia*, Jun.

Duranta Plumieri, Jacq., is a pretty blue-flowered shrub of the W. Indies commonly found in gardens in the plains.

Petrea volubilis, Linn., is a beautiful climbing shrub of tropical America with pendulous racemes of violet flowers in a large purplish persistent calyx, commonly grown in gardens.

Congea tomentosa, Roxb., var. *azurea*, is another beautiful climbing shrub of Burma and Siam, conspicuous by its large pink or lilac bracts.

Holmskioldia sanguinea, Retz, is a straggling shrub of N. India with a large scarlet calyx and corolla often found in Madras Gardens.

Family CXV. LABIATAE.

Herbs or undershrubs rarely shrubs, usually with aromatic oil-glands; branches opposite or verticillate, usually 4-angled. *Leaves* opposite or whorled, simple or rarely pinnatisect; stipules 0. *Flowers* hermaphrodite, more or less zygomorphic, solitary or in pairs or fasciated and axillary, or in centrifugal cymes which by union in pairs

form false whorls; bracts and bracteoles usually small. *Calyx* inferior, persistent, more or less tubular, 4—5-lobed, the lobes often forming 2 lips. *Corolla* hypogynous, tubular at base, the limb 4—5-lobed or 2-lipped, the lobes imbricate in bud. *Stamens* inserted in the corolla-tube, 4 didynamous or only 2 perfect; anther-cells connate separate or confluent, dehiscing longitudinally. *Disk* prominent. *Ovary* deeply 4-lobed; ovules solitary anatropous in each lobe; style simple, from the centre of the ovary between the lobes, slender, 2-fid, sometimes unequally. *Fruit* of 4 dry (rarely fleshy) 1-seeded nutlets, sometimes 1 or more suppressed, scarred at the base. *Seed* small, erect; albumen scanty or 0; radicle inferior.

Ovary 4-partite; nutlets with small scar, basilar or slightly oblique:—

Nutlets dry:—

Stamens 4, all perfect and declinate; anther-cells at length confluent:—

Attachment of nutlets basilar:—

Lower lip of corolla declinate, flat or slightly concave, generally narrower, but hardly longer than the 3—4-lobed upper lip:—

Calyx deflexed in fruit; upper lobe widest, large, ovate, recurved, the margins decurrent on the tube:—

Corolla-tube short; lower lip flat; stigma 2-fid1. *Ocimum*.

Corolla-tube usually long, lower lip concave; stigma entire

2. *Orthosiphon*.

Calyx suberect or declinate in fruit; upper lobe widest, the margins not decurrent on the tube:—

Whorls crowded in globose or ovoid heads; calyx sub-erect

3. *Acrocephalus*.

Whorls racemose or spicate; calyx usually declinate:—

Racemes simple:—

Bracts conspicuous; lower lip of calyx not inflexed

4. *Geniosporum*.

Bracts small; lower lip of calyx inflexed.....5. *Platystoma*.

Racemes paniculate.....6. *Moschosma*.

Lower lip of corolla deflexed, concave boat-shaped or saccate, much longer than the upper lip:—

Upper lip of corolla very short, obtusely 3—4-toothed, lower lip elongate, boat-shaped:—

Calyx equally 5-toothed or somewhat 2-lipped, the upper 3-, the lower 2-toothed, or with upper lip large rounded reflexed, the others narrow, subulate:—

Filaments free.....7. *Plectranthus*.

Filaments connate in a sheath at their bases, round the style

8. *Coleus*.

Calyx very oblique, 2-lipped, the upper lip large entire and nearly or quite closing the mouth, the lower truncate, obscurely 4-toothed; or

calyx 1-lipped, 5-toothed, not quite closing the mouth...9. *Anisochilus*.

Corolla obscurely 2-lipped, the 2 upper lobes flat, the lower lip deflexed, saccate; calyx-teeth subequal.....10. *Hyptis*.

Attachment of nutlets slightly oblique to the outer side; calyx-lobes subequal; corolla 2-lipped; stamens included in the tube.....11. *Lavandula*.

Stamens erect or spreading or ascending:—

Stamens 4 perfect:—

Corolla-lobes 4; stamens equal or subequal:—

Calyx 5-toothed; stamens exerted:—

Corolla-lobes unequal; whorls in glomerate or paniculate or solitary interrupted spikes; filaments bearded or naked.....12. *Pogostemon*.

Corolla-lobes equal; whorls in slender continuous spikes; filaments bearded.13. *Dysophylla*.

Calyx 5-partite, the lobes plumose; filaments naked, included

14. *Colebrookea*.

- Corolla lobes 5, 2-lipped; stamens didynamous:—
 Anterior pair of stamens the longer:—
 Calyx 13-nerved; anthers 2-celled, the cells short:—
 Calyx equally 5-toothed.....15. *Micromeria*.
 Calyx distinctly 2-lipped.....16. *Calamintha*.
 Calyx 5—10-nerved; anthers 2-celled, the cells linear:—
 Upper lip of corolla short, nearly flat; stamens exserted, the cells of
 the upper pair dimidiate, of the lower transverse.....17. *Anisomelea*.
 Upper lip of corolla hooded:—
 Upper lip of corolla not woolly:—
 Calyx 2-lipped with a broad plate or pouch at the back, the
 mouth closed after flowering.....18. *Scutellaria*.
 Calyx tubular, upper lip 3-, lower 2-toothed.....19. *Brunella*.
 Upper lip of corolla densely woolly:—
 Calyx 5-toothed, the teeth spinescent; stamens more or less
 exserted; anther-cells parallel.....20. *Leonurus*.
 Calyx 6—10-toothed; stamens included; anther-cells diver-
 gent:—
 Lower lip of corolla longer than the hood.....21. *Leucas*.
 Lower lip of corolla shorter than the hood.....22. *Leonotis*.
 Posterior pair of stamens the longer; calyx tubular, 15-ribbed,
 5-toothed; stamens not exserted.....*Nepeta*.
 Stamens 2, anterior pair only perfect; anther-cells linear, separated by an
 elongated connective or one cell abortive; calyx 2-lipped:—
 Corolla 4-lobed; anthers 2-celled, the cells pendulous from a long
 connective.....*Meriandra*.
 Corolla 2-lipped, the upper lip entire or emarginate, concave, the lower
 spreading, 3-fid; anther-cells very unequal or solitary, on a long trans-
 verse connective.....23. *Salvia*.
 Nutlets succulent; corolla 2-lipped, the upper lip hooded; anther-cells parallel,
 the anterior pair of stamens the longer.....24. *Gomphostemma*.
 Ovary 4-lobed; nutlets with a large oblique or lateral scar on the inner side;
 stamens 4 perfect, erect, exserted from the fissure of the upper lip:—
 Corolla apparently 1-lipped, the 2 small upper lobes and the lateral pair
 springing from the contracted base of the large lower lobe.....25. *Teucrium*.
 Corolla distinctly 2-lipped, the upper lip short, 2-lobed, notched, the lateral
 pair of lobes very small, springing from the sides of the large lower
 lobe.....26. *Ajuga*.

1. *Ocimum*, Linn.

Herbs, undershrubs or shrubs, strongly aromatic from oil-glands. *Leaves* opposite or whorled, usually toothed, petioled; floral leaves small, bract-like, usually caducous. *Flowers* small, in whorls of 6—10 on the axis of elongate spikes or racemes which are sometimes paniced; pedicels with recurved tips; bracts small, caducous. *Calyx* ovoid or campanulate, deflexed in fruit and then usually enlarged and hardened, 2-lipped; upper lip broad, flat, decurrent, lower lip with 4 mucronate teeth, the 2 middle ones usually the longest. *Corolla* 2-lipped; tube short, not annulate within; upper lip subequally 4-lobed, lower lip hardly longer than the upper, declinate, entire. *Stamens* 4 didynamous, declinate, exserted; filaments free or the lower connate below, the upper often with a tooth or hairy below; anthers 1-celled, later on flattened out. *Disk* entire or 3—4-lobed. Ovary 4-partite; style slender, bifid at apex. *Fruit* of 4 dry, smooth or subrugose, nutlets, often mucilaginous when wetted.

Shrubs; leaves membranous, ovate, acute, cuneate and decurrent at base, coarsely crenate-serrate, nearly glabrous except on the nerves, long-petioled, up to 4 in. long.

2 in. broad; racemes often 6 in. long, the whorls close and about .3 in. apart; upper calyx-lip longer than the lower, rounded and curved upwards in fruit, teeth of the lower short; nutlets large, not mucilaginous when wetted.....1. *gratissimum*.
Herbs or slightly woody undershrubs:—

Racemes elongate, the whorls close; two lower teeth of the calyx longest:—

Fruiting calyx large, hairy or glabrous, the upper lip often .25 in. in diam. and saucer-shaped; racemes long and closely whorled, or shorter and much paniced, the floral leaves conspicuous till they fall; leaves variable, ovate or lanceolate, acute, cuneate at base, entire or denate, usually glabrous, up to 3 in. long, 1.5 in. broad, but usually smaller; nutlets large, pitted, very mucilaginous when wetted.....2. *basilicum*.

Fruiting calyx small, villous and pilose without, the upper lip recurved often to nearly erect, middle teeth of lower lip long and curved:—

Fruiting calyx villous within, the pedicel shorter and erect except at tip; leaves elliptic-lanceolate, entire or slightly serrate, long-petioled, pubescent, up to 1.5 in. long, .5 in. broad; nutlets small, pitted, mucilaginous when wetted.....3. *canum*.

Fruiting calyx glabrous within, the pedicel as long or longer, spreading; leaves elliptic-oblong, obtuse or acute, entire serrate or dentate, pubescent, petioled, up to 2 in. long, 1 in. broad; nutlets small, nearly smooth, not mucilaginous when wetted.....4. *sanctum*.

Racemes lax, the whorls distant, often .5–1 in.; fruiting calyx papery, the upper lip obovate, mucronate, the lower as long, the two lower teeth long, the side ones very short, bimucronate, all nearly glabrous within and without; leaves ovate, obtuse, entire or repand, cuneate at base, up to 1 in. long, .75 in. broad; nutlets orbicular, compressed, mucilaginous when wetted.....5. *adscendens*.

1. *OCIMUM GRATISSIMUM*, Linn.; F. B. I. iv. 608.

Deccan and Carnatic, in low country, cultivated and probably introduced only, chiefly found on waste land and near villages. Shrubby Basil.

A shrub reaching 4–6 ft. in height, much branched, the flowers pale greenish-yellow, the leaves strongly aromatic and used in medicine. Vern. *Hind.* Ram tulsi; *Tel.* Rama tulasi.

2. *OCIMUM BASILICUM*, Linn.; F. B. I. iv. 608.

Carnatic, cultivated. Sweet Basil.

A large herbaceous plant with large leaves and long close racemes of white or pale purple whorled flowers. Vern. *Hind.* Babui tulsi, Kali tulsi.

Var. *thyrsiflorum*, Benth.; Wt. Ic. t. 868.

Deccan, probably cultivated only.

A stout, nearly glabrous, herbaceous plant with the racemes short and collected in terminal thyrsoid panicles, the flowers pink.

Var. *purpurascens*, Benth.

Carnatic, introduced.

A slender herb with nearly single racemes, narrow lanceolate leaves and a generally purple colour.

Var. *pilosum*, Benth.

Deccan and Carnatic, cultivated and run wild.

A slender hispid-pubescent herb with small leaves and narrower racemes, the fruiting calyces much smaller.

3. *OCIMUM CANUM*, Sims.; F. B. I. iv. 607.

Most plains Districts, near villages and on waste lands, probably introduced; also in Nilgiris. Hoary Basil.

An erect much-branched herb, with white, pink or purplish flowers, used in medicine. Vern. *Tel.* Kukka tulasi.

4. *OCIMUM SANCTUM*, Linn.; F. B. I. iv. 609.

All plains Districts, cultivated in pots or on pedestals at all Hindu houses and in temples and frequently found run wild. Sacred Basil.

An erect much-branched softly pubescent undershrub with red or purple small flowers. As the most sacred of plants to Hindus it is carefully looked after, and when large enough to form wood, it is made into beads for rosaries. It is also used medicinally. Vern. *Hind.* Tulsi; *Tam., Tel.* Tulasi.

5. *OCIMUM ADSCENDENS*, Willd.; F. B. I. iv. 609.

N. Circars, Deccan and Carnatic from the Godavari to Tinnevely and S. Travancore, in sandy places and up to 3000 ft. in hilly country.

An annual (?) herb, erect or prostrate with ascending branches, the flowers pale rose, the fruiting calyx yellow and papery.

2. *Orthosiphon*, Benth.

Shrubs, undershrubs or herbs with a woody rootstock, the roots sometimes tuberous. *Leaves* opposite, floral leaves bract-like, usually short and reflexed, sometimes large and coloured. *Flowers* usually in whorls of 6 or less, in terminal racemes. *Calyx* ovoid campanulate or tubular, deflexed in fruit, 5-lobed, the upper lobe broad, membranous, with decurrent margins, the lateral and lower lobes distinct or shortly connate, subulate or aristate. *Corolla* 2-lipped; tube as long as or longer than the calyx, sometimes very long, often slender, straight or incurved; upper lip subequally 4-lobed, lower declinate, entire, concave. *Stamens* 4, didynamous, declinate; filaments free, without appendages at the base; anther-cells confluent. *Disk* usually gibbous. *Ovary* 4-partite; style slender, with a capitate or clavate stigma. *Fruit* of 4 dry ovoid globose or ellipsoid nutlets, usually smooth, the basal scar small.

Stamens included in the corolla-tube:—

Calyx-throat villous within; corolla-tube rather longer than the calyx; leaves ovate or elliptic, obtuse, rounded or cuneate at base, crenate, viscidly tomentose on both surfaces, up to .75 in. long, petiole to .5 in.1. *diffusum*.

Calyx-throat not villous within:—

Corolla-tube about equal to the calyx; leaves ovate, obtuse or acute, cuneate and entire at base, crenate or serrate above, nearly glabrous, glandular, up to 1.5 in. long, 1 in. broad, petiole to .5 in.2. *pallidum*.

Corolla-tube longer than the calyx, in all .25—.75 in. long:—

Leaf-petioles up to 2.5 in. long, leaves broadly ovate, acute obtuse or subcordate or often shortly cuneate at base, coarsely crenate or serrate, nearly glabrous, up to 3.5 in. long, 2 in. broad; corolla .25—.5 in. long, slender, pubescent without.3. *glaberrimum*.

Leaf-petioles only up to .75 in. long, leaves ovate, subobtusate, rounded or cordate at base, crenate, viscidly pubescent and glandular-punctate, up to 3 in. long, 2 in. broad; corolla .5—.7 in. long, puberulous without.4. *viscosum*.

Lower leaves petioled, upper sessile, ovate-oblong, obtuse, long-cuneate at base, nearly glabrous and sometimes glaucous, coarsely serrate-dentate, up to 4.5 in. long, 2 in. broad; corolla .3—.5 in. long.5. *rubicundum*.

Stamens exerted from the long and slender corolla-tube:—

Stamens shorter than the spreading corolla-lobes; corolla-tube 1.25 in. long, villous; fruiting calyx .5 in. long, tubular, hispid and glandular, the upper lip

orbicular, the 4 lower teeth subulate, equal; leaves sessile, oblong or obovate, obtuse, crenulate, up to 2.5 in. long, 1 in. broad, rugose and tomentose, strongly nerved.....6. *comosus*.

Stamens much longer than the corolla-lobes; corolla-tube .5 in. long puberulous; fruiting calyx .3 in. long, campanulate, the upper lip spreading, the 4 lower teeth aristate, the 2 lowest longest and curved; leaves petioled, ovate, acuminate, cuneate at base, coarsely toothed, up to 4 in. long, 2 in. broad, glabrous except on the nerves.....7. *stamineus*.

1. *ORTHOSIPHON DIFFUSUS*, Benth.; F. B. I. iv. 613.

Deccan, hilly country of N. Arcot and Cuddapah, up to 3,000 ft., most usually in rocky places; W. Gháts, N. and E. slopes of Nilgiris and Pulneys in similar localities.

A diffuse undershrub with many branches from a stout woody rootstock, short and with short racemes in very dry places, longer and with more slender racemes and larger leaves (var. *hispidus*, Hook. f.) in better soils.

2. *ORTHOSIPHON PALLIDUS*, Royle; F. B. I. iv. 613.

N. Circars, in Godavari and Kistna; Carnatic, about Madras, in wet places near streams and in rice-fields; Nilgiris to 4,000 ft. (Clarke).

A low diffuse undershrub with many branches from a woody rootstock, the flowers white or pale lilac.

3. *ORTHOSIPHON GLABRATUS*, Benth. *O. tomentosus* var. *glabratus*, Hook. f.; F. B. I. iv. 614.

N. Circars, in Godavari; W. Deccan, in Mysore, Bellary and Salem; hills of the Carnatic and E. slopes of the Gháts to S. Travancore, up to 3,000 ft., chiefly in dry open forests.

An erect herb, reaching about 2 ft. in height, with pale purple flowers of medium size.

Var. *parviflorus*, Benth. Corolla small and narrow, .25 in. long; leaves ovate, coarsely serrate, under 1 in. long, petioles slender, .75 in. W. Gháts, Nilgiris to hills of Tinnevely, scarce.

4. *ORTHOSIPHON VISCOSUS*, Benth. *O. tomentosus* var. *viscosus*, Hook. f.; F. B. I. iv. 614.

Deccan, Nagar Hills of N. Arcot; W. Gháts, in all Districts at low levels, in forest glades.

An erect glandular pubescent herb with, apparently, pale purple flowers, the corolla usually large. Var. *rubiginosus* seems to differ only by being less pubescent and having rather longer petioles to the leaves.

5. *ORTHOSIPHON RUBICUNDUS*, Benth.; F. B. I. iv. 614.

N. Circars, Ganjam to Godavari, in deciduous forest undergrowth, but in somewhat open places; Deccan, in the hills of the Ceded Districts, westwards to Coimbatore; W. Gháts, N. and E. slopes of the Nilgiris up to 6,000 ft.

An erect much branching herb from a stout rootstock, the root often furnished with fusiform root-tubers. The flowers may be white lilac or rose, and the racemes 6 in. long or more, usually with distant whorls of flowers.

Var. *Hohenackeri*, Hook. f. A smaller plant with many branches from a stout rootstock and with smaller leaves and flowers, the calyx-tube very hispid.

Nilgiri Hills, at about 6,000 ft. (Hohenacker, Gamble).

6. *ORTHOSIPHON COMOSUS*, Wt. ex Benth.; F. B. I. iv. 615. *O. bracteatus*, Wt. Ic. t. 1428.

W. Ghâts, hills of Tinnevely and Travancore, about 2,000—3,000 ft.

A striking and handsome shrubby plant conspicuous for the comose tuft of mauve-coloured floral leaves at the ends of the racemes. The upper lip of the corolla has 2 end and 2 side lobes, the lower is oblong. The ellipsoid nutlets are smooth and shining.

7. *ORTHOSIPHON STAMINEUS*, Benth.; F. B. I. iv. 615.

W. Ghâts, Anamalai Hills, at 2,000—3,000 ft.

An erect herb with white or lilac flowers, conspicuous for the very long filiform stamens. The broad upper lip of the corolla is 4-lobed, the lower lip linear-oblong, entire; the floral leaves are small and persistent. The nutlets are ellipsoid, marked with labyrinthiform wavy lines.

3. *Acrocephalus*, Benth.

Herbs. *Leaves* small, opposite or whorled, petioled. *Flowers* very small, in dense whorls collected in terminal or axillary, globose or ovoid, heads with a pair of floral leaves and imbricate bracts. *Calyx* in flower ovoid, in fruit tubular, gibbous at base, 2-lipped, the upper lip flat, entire, the lower entire emarginate or 4-toothed, throat naked. *Corolla* small, somewhat 2-lipped, the upper lip subequally 4-lobed, the lower entire, scarcely longer. *Stamens* 4, didynamous, declinate; filaments free, filiform, not appendiculate at base; anthers 1-celled. *Disk* small. *Ovary* 4-partite; styles slender, shortly bifid at apex. *Fruit* of 4 smooth dry nutlets.

ACROCEPHALUS INDICUS, Briq. *A. capitatus*, Benth.; F. B. I. iv. 611.

N. Circars, forests from Ganjam to Godavari, in damp places;

W. Ghâts and W. Coast in damp grassy places up to 3,000 ft.

An annual erect herb, sometimes quite small, but in places reaching 2 ft. in height, the flowers pale purple, the leaves ovate or lanceolate, acute, cuneate at base to the petiole, serrate, up to 1·5 in. long, ·5 in. broad, the heads ·25—·75 in. long.

4. *Geniosporum*, Wall.

Herbs, erect or procumbent. *Leaves* opposite or whorled, toothed, floral leaves bract-like, often coloured. *Flowers* small, many, in whorls in long terminal lax or stiff spikes or racemes; bracts small, caducous. *Calyx* in flower ovoid, in fruit tubular, the tube constricted above, 10-nerved and often with transverse bars; lobes 5, subbilabiate, the uppermost larger, not decurrent. *Corolla* small, 2-lipped; tube short; upper lip 4-lobed; lower lip entire, declinate. *Stamens* 4, didynamous, declinate; filaments free, often flattened, not appendiculate; anthers

1-celled, later flattened out. *Disk* swollen, gibbous. *Ovary* 4-partite; style slender, bifid at apex, the lobes usually flattened. *Fruit* of 4 dry, ovoid or oblong, smooth or slightly punctate nutlets, not or very slightly mucilaginous when wetted.

Prostrate herbs with many branches from a woody rootstock, glabrous or hispid with soft deflexed hairs; racemes slender, up to 6 in. long with many pedicelled flowers in whorls usually closely packed; fruiting calyx with the uppermost lobe ovate-reniform, mucronate, the rest triangular, the 2 lowest slightly longer, tube .075 in. with a ring of hairs within; floral leaves broadly ovate acuminate, reflexed; leaves ovate or oblong or linear, spatulate, up to 1 in. long, serrate.....1. *prostratum*. Erect herbs, usually unbranched, slightly hispid-pubescent; racemes almost spicate, up to 5 in. long, the whorls closely packed; fruiting calyx ovate, the uppermost lobe large, erect and broadly rounded, the side lobes triangular, the 2 lowest longer and narrow, tube prominently 10-nerved with transverse base, hispid; floral leaves large, reflexed, white and persistent; leaves linear-oblong, up to 2 in. long, scarcely .25 in. broad, distantly serrate.....2. *indicum*.

1. GENIOSPORUM PROSTRATUM, Benth.; F. B. I. iv. 610.

Carnatic, on sandy ground, especially near the sea, common near Madras.

A many-branched herb, very variable in pubescence, also in the shape of the leaves, which, in the prostrate more glabrous forms are small and ovate, in the more erect and hispid ones (*ocimoides*) elongate, up to 1 in. long, .4 in. broad. Flowers red.

Var. *gracile*, Thw. Nearly quite glabrous, the racemes panicle, the leaves very narrow .1 in. broad and up to 1.5 in. long, the side calyx-lobes broader, ovate like the upper one, the 2 lowest small. Coast of the Carnatic.

2. GENIOSPORUM INDICUM, Briq. *G. elongatum*, Benth.; F. B. I. iv. 610.

N. Circars, Jeypore Hills of Vizagapatam (Beddome).

A very slender plant, chiefly found in Ceylon.

5. Platystoma, Beauv.

Small annual herbs. *Leaves* opposite, petioled, serrate. *Flowers* minute, in many-flowered whorls in slender racemes terminal to the stem and branches with a pair of floral leaves at the base; bracts broad, caducous. *Calyx* campanulate, deflexed in fruit, 2-lipped, the upper lip ovate, not decurrent, with a tooth at each side near the base; lower lip ovate, obtuse, slightly concave. *Corolla*-tube very short, widely campanulate at the mouth; upper lip broad, 4-lobed, lower entire, scarcely longer. *Stamens* 4 declinate; filaments free; anthers 1-celled, at length flattened. *Disk* swollen, gibbous. *Ovary* 4-partite; style shortly bifid at apex. *Fruit* of 4 ovoid, smooth nutlets.

PLATYSTOMA FLACCIDUM, Benth.; F. B. I. iv. 611.

Mysore, at Sagar, 2,000 ft. (Meebold).

An erect herb up to 12 in. high with pale lilac flowers, the leaves ovate, acute, narrowed at base into the petiole, serrate, up to 1.5 in. long, .75 in. broad, nearly glabrous.

6. Moschosma, Reichb.

Herbs. *Leaves* opposite, crenate or dentate, petioled. *Flowers* very small, in whorls of 6—10, pedicelled, in slender axillary and terminal

racemes; bracts small. *Calyx* ovoid or campanulate, 2-lipped, the upper lobe or 3 upper lobes larger than the 4 or 2 lower, not decurrent, throat naked. *Corolla* 2-lipped, the upper lip 4-lobed, the lobes subequal or the 2 middle ones rather longer, the lower entire, longer than the upper. *Stamens* 4, didynamous, declinate; filaments filiform, not appendiculate; anther-cells confluent. *Disk* uniform. *Ovary* 4-partite; style 2-fid at tip. *Fruit* of 4 compressed smooth nutlets: basal scar small.

MOSCHOSMA POLYSTACHYUM, Benth.; F. B. 1. iv. 612.

Carnatic, from Nellore southwards to S. Travancore, common, more scarce inland.

A slender erect annual herb with sharply quadrangular stems, pale pink or flesh-coloured very small flowers, ovate deltoid acuminate leaves, entire at the truncate base, crenate above, and very slender racemes about 2 in. long.

7. *Plectranthus*, L'Hér.

Herbs, undershrubs or shrubs, the stems usually more or less 4-angled, sometimes succulent. *Leaves* opposite or ternate. *Flowers* usually small, in paniced or racemed 6—8 flowered cymes or whorls, with pairs of floral leaves; bracts usually small but sometimes large and caducous. *Calyx* usually 2-lipped, enlarged in fruit; lobes 5, subequal or the uppermost widest and sometimes decurrent. *Corolla* 2-lipped; tube exserted, straight or decurved, the throat equal or obliquely swollen, the upper lip short, 4-fid, recurved, the lower entire, boat-shaped, narrow or stipitate at the base. *Stamens* 4, didynamous, declinate; filaments free; anther-cells usually confluent. *Disk* usually enlarged in front. *Ovary* 4-partite; style slender, 2-fid at tip. *Fruit* of 4 orbicular ovoid or oblong nutlets, smooth or punctate.

Fruiting calyx decurved, more or less 2-lipped, the upper lip 3-, the lower 2-lobed, sometimes subequally 5-lobed; slender herbs, never succulent:—

Lips of the fruiting calyx prominent, ribs also prominent:—

Leaves narrowly linear-lanceolate, shallowly serrate in the upper half only, the lower half entire and attenuate to a short petiole, up to 3 in. long, .4 in. broad, nearly or quite glabrous; corolla short, .15 in. long, the lobes short

1. *Walkeri*.

Leaves lanceolate, acute, strongly crenate in the upper two-thirds, the lower part entire, cuneate, the petiole long and slender, blade 2.5 in. long, nearly 1 in. wide, nearly glabrous; corolla short, .15 in. long.....2. *rivularis*.

Leaves ovate, acute, crenate-serrate almost to the base, glandular-pubescent, up to 1.75 in. long, 1 in. broad, petiole short; corolla-tube funnel-shaped, .2 in. long, the lower lip .1 in.; fruiting calyx .2 in. with scattered glands

3. *nigrescens*.

Lips of the fruiting calyx not prominent, ribs prominent, with glands between:—

Fruiting calyx slightly curved, minutely scabrous, the teeth usually acute, .2 in. long; corolla-tube campanulate, the lower lip long, concave; leaves broadly ovate, acute, cordate or rounded at base, crenate or dentate, pubescent or glabrate, up to 5 in. long, 3 in. broad, petioled.....4. *Wightii*.

Fruiting calyx much curved, slightly scabrous, the teeth rounded, .15 in. long; corolla-tube straight, lower lip short; leaves ovate, obtuse, truncate and then slightly cuneate at base, deeply crenate-dentate, membranous and nearly glabrous, up to 1.5 in. long and broad, petioled.....5. *Stocksii*.

Fruiting calyx gibbous at base and slightly curved, densely woolly, the short teeth rounded, .15 in. long; corolla-tube cylindric, lobes hispid-ciliate, short

and spreading; leaves broadly ovate, acute, cordate at base, crenate, thick, rugose and densely tawny-pubescent or tomentose, up to 5 in. long, 3 in. broad, the lower ones petioled, the upper sessile.....6. *nilgherriensis*.
Fruiting calyx subequally 5-lobed, small and curved, declinate; corolla-tube short, curved, upper lip reflexed, 4-lobed, lower entire, concave; leaves ovate, acute, obtuse at base but shortly cuneate and decurrent, crenate, tomentose, white beneath, up to 4 in. long, 2 in. broad.....7. *Coetsa*.

Fruiting calyx 2-lipped, the upper lip entire, the lower 4-lobed; stout plants, often succulent or fleshy:—

Fruiting calyx nearly .5 in. long, the lower lip longer than the small round upper, the teeth incurved and aristate; corolla .3 in. long, the lower lip obtuse; leaves broadly ovate, cordate, deeply and usually doubly crenate, pale, nearly glabrous above, puberulous beneath and villous on the nerves, up to about 6 in. in diam.

8. *incanus*.

Fruiting calyx about .25 in. long, the upper and lower lips nearly equal:—

Inflorescence of elongate panicles of racemes with whorls of about 6 flowers on slender pedicels; corolla very small, about .15 in. long, villous, the lower lip obtuse; leaves broadly ovate or orbicular, cordate, lobulate, the lobules crenate, about 4 in. in diam., flaccid and glabrous; petiole very long.....9. *subincisus*.

Inflorescence paniced, of racemes about 1 in. or more long in elongate thyrsi:—

Corolla .5 in. long, the lower lip elongate, acute, ciliate; leaves broadly ovate or orbicular-ovate, acute, cordate, glandular-pubescent, crenate, up to 4 in. in diam., fleshy; petiole long.....10. *coleoides*.

Corolla .3—.5 in. long, the lower lip acute, glabrous; leaves large, broadly ovate, acuminate, rounded at base, deeply lobulate, the lobules crenate, glabrous, up to 6 in. in diam., petiole very thick, 2—3 in. long

11. *urticifolius*.

Fruiting calyx under .2 in. long; inflorescence paniced, of racemes about 1 in. long or more in elongate thyrsi; more or less fleshy undershrubs:—

Leaves large, broadly ovate, obtuse, cordate or rounded at base, villous on the nerves above, densely tawny tomentose beneath, margins lobulate, the lobules often crenate, up to 10 in. in diam., petioles long; fruiting calyx thick and glandular; corolla elongate, .75 in., the lower lip acute; flowers close, in racemes 1—2 in. long.....12. *fruticosus*.

Leaves rather small, not over 3 in. long, petioled:—

Leaves orbicular, 1—1.5 in. in diam., obtuse, base slightly cuneate and not toothed, upper part crenate, tawny-pubescent; thyrsoid panicles up to 10 in. long, the racemes 1—1.5 in. long, the flowers close; fruiting calyx nearly .2 in. long, tawny villous; corolla .5—.75 in., the lower lip acute

13. *Bourneae*.

Leaves ovate, up to 3 in. long, 2 in. broad, acute, base rounded or slightly cuneate, not toothed, upper part crenate, minutely puberulous; thyrsoid panicles up to 10 in. long, the racemes very slender, single or in pairs on a peduncle, up to 3 in. long, the flowers distant; fruiting calyx scarcely .125 in. long, villous at base; corolla .6 in. long, the lower lip subobtusate

14. *Bishopianus*.

1. *PLECTRANTHUS WALKERI*, Arn.; F. B. I. iv. 617.

W. Ghâts, hills of Tinnevely at 4,000 ft., on the banks of streams.

A herb, decumbent at base, then erect, the flowers pink (Trimen), the narrow leaves very characteristic.

2. *PLECTRANTHUS RIVULARIS*, Wt.; F. B. I. iv. 617.

W. Ghâts, Nilgiris and Anamalais, about 6,000 ft., in wet places; Atrimalai Hills, 3,000—4,000 ft. (Beddome).

A tall herb, with long racemes of many-flowered short cymes in distant whorls.

3. *PLECTRANTHUS NIGRESCENS*, Benth. ; F. B. I. iv. 617.
W. Gháts, hills of Mysore (Talbot, Meebold) ; Shembaganur in Pulneys at 6,000 ft. (L. Anglade).
A slender herb with many-branched slender panicles of white flowers spotted with red, long-pedicelled in dichasioid cymes.
4. *PLECTRANTHUS WIGHTII*, Benth. ; F. B. I. iv. 619 ; Wt. Ill. t. 194 ; Wt. Ic. t. 1429. *P. pulneyensis*, Hook. f. ; F. B. I. iv. 617. *P. nepetaefolius*, Benth. ; F. B. I. iv. 619.
W. Gháts, Nilgiris, Anamalais and Pulneys up to 8,000 ft. and chiefly at higher levels, common ; Shevaroy Hills of Salem.
A tall herb with white flowers speckled with red points and large panicles of prominently small-bracted cymes. The leaves are normally cordate at base, but many Pulney specimens (chiefly *P. pulneyensis*, Hook. f.) have them straight or slightly cuneate. Fyson ('Hill. Flora,' i. 322) seems to be right in considering the three as one variable species. In the form *nepetaefolius* the corollas are usually longer and narrower and the panicles more slender.
5. *PLECTRANTHUS STOCKSI*, Hook. f. ; F. B. I. iv. 618.
Bababudan Hills of Mysore, at 6,000 ft. (Heyne, *fide* 'F. B. I.' Meebold).
A slender annual, decumbent and rooting at base, the stems thin, erect, the corollas white with purple spots.
6. *PLECTRANTHUS NILGHERRICUS*, Benth. ; F. B. I. iv. 619.
W. Gháts, Nilgiris, from Wynaad upwards, 4,000—7,000 ft.
A tall herb, reaching 3 ft. high or more from a large rootstock, the whole plant tawny villous and the large panicles very (especially the calyces) yellowish woolly. The corollas are apparently white with red spots and the whole plant is usually covered with red glands.
7. *PLECTRANTHUS COETSA*, Buch.-Ham. *ex* D. Don ; F. B. I. iv. 619. *P. menthoides*, Benth. ; F. B. I. iv. 620.
W. Gháts, Nilgiris and Pulneys, at 5,000—8,000 ft., edges of Shola Forest ; N. Circars, Mahendragiri Hill in Ganjam, at 4,500 ft. (Gamble).
A tall herb with more or less tomentose leaves white beneath and lavender-blue flowers.
Var. *Macraei*, Hook. f. in Herb. Kew. *P. Macraei*, Benth. ; Wt. Ic. t. 1430. Leaves rounded at base, smaller, especially on the branches, softly tomentose, cymes denser and more closely-flowered, but in many cases running into the type.
W. Gháts, Nilgiris and Pulneys, at 5,000—8,000 ft., in moist places and on the banks of ditches (Wight).
8. *PLECTRANTHUS INCANUS*, Link ; F. B. I. iv. 621.
Deccan, Carnatic and W. Gháts, in hilly country, at about 3,000—6,000 ft.
An erect herb, reaching 2·5 ft. high with pale leaves and fleshy stem and branches, the racemes up to 9 in. long, the flowers pale lilac or light blue, the nutlets spotted.

9. *PLECTRANTHUS SUBINCISUS*, Benth. ; F. B. I. iv. 621.
Hills of Tinnevelly and Travancore, scarce.
A small erect flaccid herb, the racemes reaching 10 in. long, the nutlets pitted.
10. *PLECTRANTHUS COLEOIDES*, Benth. ; F. B. I. iv. 622. *Coleus Wightii*, Benth. ; Wt. Ic. t. 1433.
W. Gháts, Nilgiris, Anamalais and hills of Travancore, at 4,000—7,000 ft., in wet places.
A succulent herbaceous plant reaching 3 ft. in height, the stems purple, the panicles reaching 12 in. long and up to 8 in. in diam., the flowers lilac, the nutlets black and shining. When young the upper parts of the racemes have conspicuous large rounded bracts which are very early deciduous.
11. *PLECTRANTHUS URTICIFOLIUS*, Hook. f. ; F. B. I. iv. 622.
W. Gháts, hills of Tinnevelly, at about 4,500 ft.
A succulent herb with short stem and large panicles, the flowers apparently purple, the nutlets brown and shining.
12. *PLECTRANTHUS FRUTICOSUS*, Hook. f. ; F. B. I. iv. 623.
W. Gháts, Nilgiri and Pulney Hills, about 7,000 ft., banks of lakes and streams.
A large succulent undershrub with thick spongy stem, the flowers mauve, the inflorescence often 12 in. long and very dense. Lady Bourne says that it is planted for hedges in the Pulneys.
13. *PLECTRANTHUS BOURNEAE*, Gamble in Kew Bull., 1924, ined.
W. Gháts, Pulney Hills, about 6,000—7,000 ft., near Kodaikanal, along streams, especially in rocky places (Bourne) ; Coonoor, in Nilgiris 6,500 ft. (Gamble).
A large succulent undershrub with thick stem, the flowers lilac, the leaves whitish or tawny tomentose.
14. *PLECTRANTHUS BISHOPIANUS*, Gamble in Kew Bull., 1924, ined.
W. Gháts, Pulney Hills, near Pillar Rocks, Kodaikanal, about 7,000 ft. (Bourne), drawing in Hb. Kew by Mrs. Bishop.
A large erect slightly fleshy undershrub with lilac flowers, the lower leaves often rather large and more rounded and purplish, the branches of the inflorescence very slender.

8. *Coleus*, Lour.

Herbs or undershrubs, usually aromatic, often fleshy. *Leaves* opposite. *Flowers* in close or lax paniculate or racemose cymes, with pairs of very caducous floral leaves ; bracts also very caducous. *Calyx* 2-lipped, the tube usually decurved, the throat often oblique ; upper lip broad, the lower of 4 usually acuminate lobes. *Corolla* 2-lipped ; tube exserted, decurved ; upper lip short and slightly 4-lobed, recurved ; lower lip long, entire, boat-shaped, narrow or stipitate at base. *Stamens* 4, didynamous, connate below in a sheath around the style ; anther-cells confluent. *Disk* enlarged in front. *Ovary* 4-partite ; style slender, 2-fid at tip. *Fruit* of 4 orbicular or ovoid nutlets, smooth, the basal scar small.

Calyx-throat villous with a ring of white hairs:—

Fruiting calyx with upper lip broad, very obtuse, shorter than the lower; floral leaves ovate, acute; whorls of flowers densely packed; leaves subsessile, glabrous, very fleshy, obovate, obtuse, entire or crenate, up to 2 in. long, 1 in. broad; nutlets black.....1. *spicatus*.
Fruiting calyx with upper lip ovate acuminate, a little longer than the lower; floral leaves broadly ovate, long acuminate; whorls of flowers close at first afterwards up to 1 in. distant; leaves petioled, villous, not fleshy, ovate, obtuse, crenate, up to 5 in. long, 1.5 in. broad; nutlets brown.....2. *barbatus*.

Calyx-throat glabrous within:—

Flowers shortly pedicelled, in dense whorls at distant intervals in a long rather slender raceme; leaves petioled, thick and fleshy, very villous, broadly ovate, crenate, up to 3 in. long, 2 in. broad; calyx hispid, small, the upper lip ovate acute, the lower of 4 acuminate lobes.....3. *amboinicus*.
Flowers in short cymes in pairs or whorls at distant intervals in long racemes often paniculate; leaves long-petioled, membranous, glabrous, ovate, acute cordate rounded or slightly acute at base, up to 7 in. long, 5 in. broad; calyx glabrous, fruiting large, the upper lip rounded and reflexed, the lower of 4 acuminate sharp lobes.....4. *malabaricus*.

1. *COLEUS SPICATUS*, Benth.; F. B. I. iv. 624; Wt. Ic. t. 1431.

Deccan, especially in Salem and Coimbatore, in arid places on rocky ground among bushes.

A perennial fleshy herb with subquadrangular softly hairy stems ascending from a procumbent base and with a strong scent. Flowers pale lilac.

2. *COLEUS BARBATUS*, Benth.; F. B. I. iv. 625; Wt. Ic. t. 1432.

Deccan and Carnatic, in hilly country; W. Gháts, Nilgiris and Pulneys up to 7,000 ft.; often cultivated in gardens.

A perennial aromatic herb with branches from a thick root-stock, very softly-generally white-hairy, the flowers blue.

3. *COLEUS AMBOINICUS*, Lour. *C. aromaticus*, Benth.; F. B. I. iv. 625; Wt. Ill. t. 175.

Circars, Deccan and Carnatic, a Malay species cultivated and found run wild.

A rather large succulent very aromatic herb with small pale purple flowers, said to be known as Indian Borage and used for flavouring drinks and in medicine. Vern. *Hind.* Pathor chur.

4. *COLEUS MALABARICUS*, Benth.; F. B. I. iv. 626.

W. Gháts, Nilgiris, Pulneys and hills of Travancore and Tinnevely up to 6,000 ft.

A large erect herbaceous plant reaching 3 ft., with often purple stems and leaves, the flowers pale lilac with dark blue upper lip.

Coleus parviflorus, Benth., F. B. I. iv. 625, is a species sometimes cultivated in Southern Districts for its edible tubers. *C. Blumei*, Benth., is a beautiful species with the leaves mottled with deep purple or sanguineous stains (see 'Bot. Mag.' t. 4754), which is commonly cultivated in gardens.

9. *Anisochilus*, Wall.

Herbs or undershrubs, often fleshy. Leaves opposite or whorled. Flowers small, in dense tetragonal or cylindrical or slender whorled spikes, the floral leaves and bracts often caducous, red glands often covering especially the corollas. Calyx suberect, inflated below the mid-

dle, 2-lipped or 5-lobed, rarely 1-lipped, the upper lip often entire and much deflexed, the lower short, truncate or minutely lobed. *Corolla* 2-lipped, the tube slender below, inflated above and decurved; upper lip entire or 3—4-lobed, lower elongate, concave. *Stamens* 4, didynamous, declinate, filaments free. *Disk* lobed. *Ovary* 4-partite; style bifid at apex. *Fruit* of 4 ovoid dry nutlets, basal scar small.

Upper lip of fruiting calyx entire, deflexed, concealing the mouth, lower lip truncate obscurely toothed:—

Upper lip large and conspicuous in the spikes; spikes .5 in. in diam., usually 1—2 in. long in fruit:—

Upper lip ovate, acute at apex, .1 in. long, tube swollen and curved, .2 in. long:—

Calyx-tube pubescent without, not silky-villous at the mouth; leaves broadly ovate, obtuse, cordate or rounded at base, deeply crenate, glabrous or villous above, puberulous beneath, up to 3.5 in. long, 2 in. broad, petiole up to 2 in. long.....1. *carnosus*.

Calyx-tube densely white silky-villous at the mouth, glabrous towards the base; leaves thick, orbicular-ovate, obtuse, cordate, shallowly crenate, glandular puberulous, up to 2 in. long, 1.5 in. broad, but usually smaller, petiole under 1 in. long.....2. *eriocephalus*.

Upper lip obtuse and broad glabrous, prominently reticulate, ciliate, tube not much curved, very villous, .2 in. long; leaves thick, ovate, obtuse rounded or attenuate at base, crenulate, densely softly hoary tomentose, up to nearly 2 in. long, 1 in. broad, petiole .5—1 in. long.....3. *scaber*.

Upper lip small and inconspicuous in the spike; spikes .25—5 in. in diam.:—

Upper lip obtuse, ciliate; spikes short, in many-branched trichotomous panicles; leaves thick, ovate or orbicular, obtuse, cordate or rounded at base, crenulate, hoary-tomentose, up to 2.5 in. long, 1.5 in. broad; petiole .5 in. long.....4. *paniculatus*.

Upper lip acute, white-puberulous; spikes long and narrow, 3—6 only in a very long-peduncled panicle; leaves ovate, obtuse, cuneate at base, crenate, hoary-tomentose, up to 2 in. long, 1.5 in. broad, petiole short.....5. *Wightii*.

Upper lip of fruiting calyx short, entire or notched, not concealing the mouth, lower lip truncate:—

Spikes solitary, terminal on the branches:—

Spikes shortly peduncled (1—1.5 in.), very slender, .1—1.5 in. in diam., 2—3 in. long; leaves obovate, obtuse, sessile, slightly crenate, .75 in. long, with 3—4 pairs of very oblique impressed main nerves, collected close under the spikes; corollas much curved.....6. *plantagineus*.

Spikes long-peduncled in fruit:—

Spikes 2—4 in. long, .3—4 in. in diam.; cylindrical, densely white villous on the bracts and calyces; leaves opposite or whorled, sessile, oblanceolate, acute, entire, almost parallel-nerved, densely silvery- or tawny-tomentose, up to .75 in. long, .25 in. broad; corollas very small, short.....7. *argenteus*.

Spikes 3—9 in. long, up to .5 in. in diam., cylindrical, with inconspicuous lanceolate bracts; leaves in whorls, sessile, oblong lanceolate or oblanceolate, acute, entire or crenulate, with 5—6 pairs of oblique main nerves, silky-villous, up to 3 in. long, .5 in. broad; corolla large, the tube much enlarged above, the lips spreading.....8. *verticillatus*.

Spikes short-peduncled, terminal and axillary on the branches of a leafy panicle:—

Spikes 1—3 in. long, .2—3 in. in diam., cylindrical, the bracts inconspicuous; leaves subsessile, opposite, obovate, obtuse, entire or obscurely crenate, fulvous-tomentose, with 3—4 pairs of very oblique main nerves, up to 2 in. long, .5 in. broad; corolla very minute, the lips spreading.....9. *dysophylloides*.

Spikes 1—3 in. long, .1—2 in. in diam., slender, the bracts imbricating; leaves sessile, whorled, oblong or obovate, entire or slightly crenate, densely white- or fulvous-silky tomentose, with 3—4 pairs of nearly parallel main nerves, up to 2 in. long, .6 in. broad; corolla very minute, the upper lip incurved.....10. *sericeus*.

Spikes in terminal long-peduncled racemes on stout branches covered with broad scars; leaves short-petioled, ovate-lanceolate, subacute, entire, tomentose, prominently closely nerved beneath, 1—1.5 in. long, .5 in. broad; corolla-tube long and much deflexed.....11. *suffruticosus*.
 Upper lip of fruiting calyx erect or recurved or deflexed, entire or emarginate, not quite concealing the mouth, lower reflexed, bifid, tube ventricose, very red-glandular; spikes very long and slender in terminal panicles, the flowers in whorls; corolla-tube bent in the middle and broad above, the upper lip incurved, the lower deflexed; leaves petioled, very large, ovate, acute, rounded at base, crenulate, but lower ones sometimes deeply crenate, 12—15-nerved, tomentose beneath, up to 15 in. long, 8 in. broad.....12. *robustus*.

1. *ANISOCHILUS CARNOSUS*, Wall.; F. B. I. iv. 627.
 N. Circars, Deccan and Carnatic, in rocky places on the hills, up to 3,000 ft. or more, less common on W. Coast.
 An erect herb with tetragonous stems, and flowers in long-peduncled spikes, small in flower but large and strobilate in fruit, and covered with red glands. Corolla pale purple, nutlets orbicular, compressed, shining, brown.
2. *ANISOCHILUS ERIOCEPHALUS*, Benth.; F. B. I. iv. 627.
 Deccan, in Cuddapah, N. Arcot and Chittoor, up to 4,000 ft. on Horsleykonda (Gamble), Bellary fort (Wight); Mysore or Canara (Law).
 An erect herb similar to the last but with smaller heads and more slender peduncles.
3. *ANISOCHILUS SCABER*, Benth.; F. B. I. iv. 627.
 W. Ghâts, hills of Tinnevely and Travancore.
 A herb with woody stems, rooting at the nodes, the branches ascending, usually with only single heads, sometimes reaching 3 in. long and purplish when dry, the corolla with long boat-shaped lower lip.
4. *ANISOCHILUS PANICULATUS*, Benth.; F. B. I. iv. 628. Trimen, Fl. Ceyl. t. 75.
 Deccan, in Mysore? (G. Thomson); W. Ghâts, Eachadi Hills in S. Travancore (K. Venkoba Row), in dry forests.
 An erect herb with stout stem and pale nearly white flowers.
5. *ANISOCHILUS WIGHTII*, Hook. f.; F. B. I. iv. 628.
 W. Ghâts, Anamalai Hills (Wight, Barber).
 An erect herb with narrow spikes, a small calyx and much bent, apparently pale, corolla.
6. *ANISOCHILUS PLANTAGINEUS*, Hook. f.; F. B. I. iv. 628.
 Bababudan Hills of Mysore (Law).
 A dwarf undershrub with a very thick rootstock and decumbent stems giving out short erect flower-bearing spikes, the fruiting calyx minute, villous.
7. *ANISOCHILUS ARGENTEUS*, Gamble in Kew Bull. 1924, ined.
 W. Ghâts, Kodaikanal Ghât new road in the Pulneys (Bourne).
 A rather stout undershrub with erect silvery branches and long spikes, the fruiting calyx minute, very tomentose, with rounded upper lip and incurved lower lip.
8. *ANISOCHILUS VERTICILLATUS*, Hook. f.; F. B. I. iv. 629.
 Hyderabad, Golconda Hills (Beddome); Gairsoppa Falls, Mysore, 2,000—3,000 ft. (Meebold).

An erect herb, reaching 3 ft. in height, with deeply grooved stems and pale blue flowers, the fruiting calyx very small, truncate.

9. *ANISOCHILUS DYSOPHYLLOIDES*, Benth.; F. B. I. iv. 628; Wt. Ic. t. 1434. *A. albidus*, Wt. Ic. t. 1436.

W. Ghâts, about Coonoor, 6,000 ft. in Nilgiris.

A thick undershrub with decumbent tomentose stems sending up short erect branchlets bearing spikes of usually white flowers.

- Var. *purpureus*, Gamble. *A. purpureus*, Wt. Ic. t. 1435; Spic. Neilg. t. 195.

Leaves shorter and rather broader, often orbicular, the spikes stouter and more silky, the flowers white streaked with pink.

About Coonoor, on rocks (Wight), Pykara (Bourne).

10. *ANISOCHILUS SERICEUS*, Benth.; F. B. I. iv. 629.

W. Ghâts, Pulney Hills and hills of Tinnevely.

A stout undershrub with long erect stems and slender conspicuously bracteate spikes. It is very near to the last species, but is evidently a much larger plant and the young shoots have dense rather large leaves.

11. *ANISOCHILUS SUFFRUTICOSUS*, Wt. Ic. t. 1437; F. B. I. iv. 628.

W. Ghâts, Nilgiri Hills, at Sispara, on rocky cliffs among grass, about 7,000 ft. (Wight, Gardner).

An erect thick woody undershrub reaching 3 ft. in height, the corollas whitish with pale lilac at the ends of both lips (Wt. Spic. Neilg., t. 196).

12. *ANISOCHILUS ROBUSTUS*, Hook. f.; F. B. I. iv. 629.

W. Ghâts, hills of Tinnevely, apparently about 6,000 ft. (Wight, Beddome, etc.).

A tall stout plant, perhaps shrubby, the stems subtetragonous, the leaves soft and thick, a very distinct species.

10. *Hyptis*, Jacq.

Herbs or shrubs. *Leaves* opposite. *Flowers* small or medium-sized, variously arranged, often capitate. *Calyx* ovoid campanulate or tubular, subequally 5-lobed, often accrescent. *Corolla*-tube cylindric; lobes 5, the lower lobe or lip deflexed and saccate, the others erect and spreading, flat. *Stamens* 4, didynamous, declinate; filaments free; anther-cells confluent. *Disk* entire or glandular. *Ovary* 4-partite; style with a subentire or shortly bifid stigma. *Fruit* of 4 dry ovoid or oblong nutlets, smooth or rugulose; basal scar small.

HYPTIS SUAVEOLENS, Poit.; F. B. I. iv. 630.

Most plains Districts, on roadsides and waste ground, introduced from Tropical America and run wild.

A tall sweet-smelling herb with tetragonal hispid stems, ovate, cordate, denticulate leaves reaching 4·5 in. long and small blue flowers, the fruiting calyx campanulate and ribbed with 5 aristate teeth. Vern. *Hind.* Wilayati tulsi.

11. *Lavandula*, Linn.

Herbs or shrubs, often aromatic. *Leaves* opposite or whorled, entire dentate or pinnatisect. *Flowers* in 2–10-flowered whorls collected in simple or paniced spikes; bracts persistent. *Calyx* erect, tubular, 10–15-ribbed, shortly and equally 5-toothed. *Corolla* oblique, 2-lipped, the upper lip 2-fid, the lower 3-partite, the lobes all spreading. *Stamens* 4, didynamous, declinate, included; filaments free, anther-cells confluent. *Disk* with 4 lobes, opposite the ovary lobes. *Ovary* 4-partite; style 2-fid, the lobes flattened. *Fruit* of 4 dry smooth nutlets, the basal scar somewhat oblique, the back marked by a large white areole.

Leaves petioled, pinnatisect, the lobes broad, oblong; bracts ovate-lanceolate not awned, ribbed; fruiting calyx tubular, 2–3 in. long, villous with long hairs; corolla 2.5 in. long.....1. *Gibsoni*.
Leaves sessile or nearly so, pinnatipartite, the lobes linear; bracts shortly ovate with a long capillary awn; fruiting calyx 2 in. long, hoary-pubescent; corolla up to 5 in. long.....2. *bipinnata*.

1. *LAVANDULA GIBSONI*, Grah.; F. B. I. iv. 631. *L. Lawii*, Wt. Ic. t. 1439.

Nilgiri Hills (Perrottet).

A tall undershrub with flowers in compact woolly spikes.

2. *LAVANDULA BIPINNATA*, O. Kze. *L. Burmanni*, Benth.; F. B. I. iv. 621; Wt. Ic. t. 1438.

Deccan, in Canara, Mysore and Coorg; Ramandrug Hills in Bellary.

A slender erect herb with blue or white flowers in solitary or paniced spikes.

12. *Pogostemon*, Desf.

Herbs, undershrubs or shrubs, often aromatic. *Leaves* opposite, rarely ternate. *Flowers* small, in clusters or racemes in whorls on usually elongate spikes or racemes; the lower whorls often with floral leaves, the upper with bracts and bracteoles, the latter usually very small. *Calyx* more or less tubular, equally 5-lobed, the tube naked within, often enlarged in fruit. *Corolla-tube* included or exerted, 2-lipped, the upper lip 3-lobed, the lower narrower and longer. *Stamens* 4, exerted, subequal; filaments usually bearded; anther-cells confluent. *Disk* subentire. *Ovary* 4-partite; style slender, 2-fid with slender stigmatic lobes. *Fruit* of 4 smooth, ovoid or ellipsoid, dry nutlets, one face often angled.

Spikes or racemes of clusters terminal and axillary, forming a paniced inflorescence:—

Clusters interrupted in the spikes, except sometimes at the top:—

Clusters one-sided in the spikes with a pair of unequal small floral leaves, the rachis usually elongate (even to 1 in. long), secund and curved, with many pairs of obliquely ovate imbricating ciliate bracts, enclosing the flowers and their narrower bracteoles; leaves in unequal pairs, membranous, ovate, acuminate, irregularly inciso-serrate, cuneate at base, appressed-pubescent, up to 5 in. long, 3 in. broad.....1. *paniculatus*.

Clusters not one-sided, globose, small, single or in pairs with small floral leaves, the rachis not elongate, the bracts ovate or lanceolate, ciliate; leaves in usually equal pairs, membranous, glabrescent, ovate, acute or obtuse, simply or doubly crenate-serrate, cuneate at base, up to 4 in. long, 3 in. broad

2. *Heyneanus*.

Clusters close, interrupted towards the base of the not very paniculate spikes but continuous and regular and close above, the floral leaves reflexed; bracts ovate lanceolate, slightly falcate, ciliate, .2 in. long, shorter than the calyx; calyx teeth about equal to the tube; leaves membranous, ovate or ovate-lanceolate, cuneate at base, inciso-serrate, softly hairy, up to about 5 in. long, 2 in. broad

3. *purpurascens*.

Clusters usually close but occasionally interrupted especially in the terminal spikes of the panicle, the floral leaves mostly reflexed; bracts oblong-lanceolate, membranous, ciliate, .2 in. long, usually longer than the calyx; calyx-teeth much shorter than the tube; leaves membranous, ovate, acuminate, cuneate at base, inciso-crenate, softly pubescent, up to 3 in. long, 1.5 in. broad.....4. *Gardneri*. Clusters close and densely packed on the branches of large panicles; leaves chartaceous, long-petioled, often doubly crenate, but scarcely incised:—

Stems and leaves nearly glabrous, also the floral leaves; imbricating short bracts slightly longer than the calyx; calyx-teeth much shorter than the tube; leaves ovate or ovate-lanceolate, acuminate, rounded or slightly cuneate at base, singly or doubly crenate-serrate, up to 3.5 in. long, 1.5 in. broad

5. *pubescens*.

Stems hoary-puberulous, leaves also on the under-surface; floral leaves and imbricating large and prominent bracts softly white- or tawny-pubescent; calyx-teeth much shorter than the rather slender tube; leaves ovate or ovate-lanceolate, acute, rounded or slightly cuneate at base, singly or doubly crenate, up to 6 in. long, 3 in. broad.....6. *plectranthoides*.

Spikes or racemes of clusters terminal or axillary, solitary, not panicked:—

Filaments of the stamens bearded:—

Leaves thin, coarsely crenate or serrate, the petioles long; herbaceous plants with slender branches:—

Leaves ovate, crenate, rounded or slightly cuneate at base, nearly glabrous as are the branchlets, about 2 in. long, 1.5 in. broad, racemes up to 4.5 in. long, .3 in. in breadth, with distant whorls of clusters; fruiting calyx tubular, narrow, villous, deflexed, .1 in. long, the lobes short; bracts and bracteoles minute.....7. *paludosus*.

Leaves ovate, acute, singly or doubly crenate or incised, rounded or broadly cuneate at base, hispid as are the branchlets with long cellular hairs, up to 2 in. long, 1.5 in. broad; racemes up to 6 in. long, .5 in. broad, the whorls of clusters close above, sometimes interrupted below, especially the lowest when the floral leaves are large; fruiting calyx nearly glabrous, inflated, contracted at the much ciliate mouth, sometimes with straggling hairs, .15 in. long, the lobes short; bracts and bracteoles linear.....8. *Wightii*.

Leaves orbicular, obtuse, doubly crenate, rounded or cordate at base, villous with scattered hairs, 2 in. in diam.; racemes up to 4 in. long, .75 in. broad, the whorls of clusters slightly interrupted; fruiting calyx tubular, villous, .25 in. long, the lobes lanceolate; bracts and bracteoles linear-subulate

9. *rotundatus*.

Leaves ovate, subacute, crenate, rounded at base, very long tawny-villous or tomentose with shining hairs, up to 2 in. long, 1.25 in. broad; racemes 3—4 in. long, .5 in. broad, the whorls of clusters close; fruiting calyx tubular, villous like the leaves, the lobes acuminate; bracts lanceolate, bracteoles linear.....10. *nilagiricus*.

Leaves thick and tomentose, shortly crenate, the petioles short; undershrubs, woody at base and with short branches; bracts and bracteoles linear:—

Tomentum on the branchlets, leaves and racemes dark tawny; leaves ovate or orbicular, obtuse, rounded or shortly cuneate at base, crenate, .5—1 in. rarely to 1.5 in. long; racemes up to 7 in. long, .4 in. in diam., the whorls of clusters or short racemules usually crowded; fruiting calyx tubular, villous, .15 in. long, the lobes short.....11. *mollis*.

Tomentum on the leaves and racemes pale tawny to nearly white, the branches with much soft woolly hair; leaves ovate, obtuse, truncate or cordate at base, crenate, rugose and impressed above, up to 1.5 in. long, 1 in. broad; racemes up to 3 in. long, .75 in. in diam., the whorls of racemules rather crowded; fruiting calyx tubular, very tomentose, .25 in. long, the lobes sharp.....12. *vestitus*.

Filaments of the stamens not bearded, but usually slightly villous at base:—

Calyx very densely villous, tubular, .25 in. long, lobes short; corolla-tube slender, exserted; racemes up to 8 in. long, nearly 1 in. in diam., the whorls of racemules very crowded except one or two lower, spreading or reflexed; leaves ovate, acute, cuneate often unequally at base, doubly crenate, dark velvety on both sides, long-petioled, up to 4 in. long, 2 in. broad

13. *atropurpureus*.

Calyx glabrescent or with scattered long strigose hairs, .25 in. long, lobes long-setaceous; corolla-tube slender, not exserted; racemes up to 6 in. long, .75 in. in diam., the whorls of racemules crowded except sometimes in the axils of separate large floral leaves below; leaves broadly ovate, acute, cordate at base, doubly crenate, sparsely hairy, long-petioled, up to 4 in. long, 3 in. broad

14. *speciosus*.

Calyx glabrous, terete, .2 in. long, the lobes triangular; corolla-tube funnel-shaped, exserted; racemes up to 6 in. long, the flowers reflexed on slender pedicels with minute bracts; leaves ovate, acute, rounded or slightly cuneate at base, doubly serrate, nearly glabrous, long-petioled, up to 5 in. long, 2 in. broad.....15. *travancoricus*.

1. *POGOSTEMON PANICULATUS*, Benth.; F. B. I. iv. 631.

W. Coast, from S. Canara to Travancore, up to about 3,000 ft. on the Gháts.

An erect herb reaching 4 ft. in height, the flowers apparently white and small, the clusters sometimes, especially in young flowers, quite small and round, but in older plants much elongate and curved almost to a circle.

2. *POGOSTEMON HEYNEANUS*, Benth.; Wt. Ic. t. 1440. *P. Patchouli*, Hook. f. in F. B. I. iv. 653, *not* of Pelletier.

W. Gháts, S. Canara southwards, in open forest land, often cultivated and then run wild; about Kotagiri in Nilgiris, 6,000 ft. (Wight).

A strongly aromatic herb with small flower clusters. The dried leaves are used to keep off insects.

3. *POGOSTEMON PURPURASCENS*, Dalz.; F. B. I. iv. 632.

W. Coast and W. Gháts, S. Canara, Bahabudan Hills of Mysore (Law).

An erect herb, the stems and branches covered with very soft spreading hairs, the leaves also soft and often in unequal pairs, sometimes tinged with purple, the corollas with purple upper lip and white lower lip.

4. *POGOSTEMON GARDNERI*, Hook. f.; F. B. I. iv. 632.

W. Gháts, Wynaad (Gardner), Sispara in Nilgiris at about 5,000 ft. (Wight), Mankulam in Travancore Hills, 2,500 ft. (Venkoba Row).

A soft branching herb with reddish stems, all parts very villous.

5. *POGOSTEMON PUBESCENS*, Benth. *P. parviflorus*, Benth.; F. B. I. iv. 632 *in part*.

W. Gháts, Nilgiris, Anamalais and hills of Travancore, at about 3,000—5,000 ft.; Kollimalai Hills of Trichinopoly.

A stout erect nearly glabrous herb. The corollas have the upper lip "white, shot with purple, the lower white, the filaments purple with purple hairs (T. Cooke)."

6. *POGOSTEMON PLECTRANTHOIDES*, Desf. ; F. B. I. iv. 632.
N. Circars, Ganjam to Godavari, up to 3,000 ft. on Mahendragiri, in open places in deciduous forests; Deccan, Nallamalai Hills of Kurnool; W. Gháts, S. Canara to Wynaad.
A large erect branching aromatic shrub, with conspicuous flower panicles and long-petioled leaves, the corollas pink or white, the filaments bearded with lilac moniliform hairs. The leaves have the scent of black currants.
7. *POGOSTEMON PALUDOSUS*, Benth. ; F. B. I. iv. 635.
W. Gháts, Nilgiris, in wet places near Ootacamund, 7,000 ft. (Wight), at Sispara, 6,000 ft. (Lawson).
A slender erect herb with nearly black stems, leaves also turning black when dry.
8. *POGOSTEMON WIGHTII*, Benth. ; F. B. I. iv. 635. *P. hirsutus*, Wt. Ic. t. 1442, *not good and not of* Benth.
W. Gháts, Nilgiris, Pulneys and Anamalai Hills, about 7,000 ft., in wet places.
An erect herb about 2 ft. high with reddish branches, the leaves black when dry. Flowers apparently white, with purple tufts of hair on the filaments.
9. *POGOSTEMON ROTUNDATUS*, Benth. ; F. B. I. iv. 636.
Deccan (Heyne), locality not known.
A herb with erect branches from a procumbent base, two branches villous with white cottony hair, the leaves greenish-brown when dry.
10. *POGOSTEMON NILAGIRICUS*, Gamble n. comb. *P. rotundatus*, Wt. Ic. t. 1441, Spic. Nilgh. t. 197, *not of* Benth.
Nilgiris, on the downs at Ootacamund, 7,000 ft. (Bourne),
A soft herbaceous plant with white woolly hair on the stems.
11. *POGOSTEMON MOLLIS*, Benth. ; F. B. I. iv. 635.
W. Gháts, Nilgiri Hills, on the plateau above 6,000 ft., in rough places and the edges of shola forests, Pulney Hills and hills of Tinnevelley; Shevaroy Hills of Salem (Bourne).
A much branched low woody undershrub with white flowers.
12. *POGOSTEMON VESTITUS*, Benth. ; F. B. I. iv. 636.
Deccan (Heyne), locality not known; W. Gháts, Palghat (Wight).
A densely woolly undershrub with ascending branches up to about 18 in. long, the flowers lilac.
13. *POGOSTEMON ATROPURPUREUS*, Benth. ; F. B. I. iv. 636.
W. Gháts, Sispara Ghát in Nilgiris, at 6,000 ft., in moist forest.
An erect shrubby plant with velvety tawny branches having the hair reflexed, the flowers dark purple, the leaves and inflorescence dark rusty black when dry.
14. *POGOSTEMON SPECIOSUS*, Benth. ; F. B. I. iv. 637; Wt. Ic. t. 1443.
W. Gháts, Nilgiris and Anamalais, at 6,000—8,000 ft., on the edges of Shola forest.
A shrub, reaching 3 ft. in height with pilose-hispid brown branches, white flowers tinged with pink and leaves and inflorescence nearly black when dry. The very long stamens give a bottle-brush appearance to the racemes.

15. *POGOSTEMON TRAVANCORICUS*, Bedd. Ic. t. 159; F. B. I. iv. 637.
 W. Ghâts, Atraimalai Ghât, Travancore, at 3,500 ft., Mankulam,
 2,500 ft. (K. Venkoba Rao).
 A subshrubby plant reaching 2 ft. in height, the branches
 smooth, the leaves and inflorescence black when dry.

13. *Dysophylla*, Blume.

Herbs. *Leaves* opposite or whorled. *Flowers* minute, in dense long spikes or racemes of many whorled cymes; bracts and bracteoles many, usually small. *Calyx* ovoid or campanulate, equally 5-lobed, the throat naked within. *Corolla* very small, equally 4-lobed, the tube exserted or included. *Stamens* 4, exserted, straight or subdeclinate; filaments long, bearded; anther-cells confluent. *Disk* equal, subentire. *Ovary* 4-partite; style slender, 2-fid, the stigmatic lobes subulate. *Fruit* of 4 ovoid or oblong, smooth or rough, dry nutlets, the basal scar small.

Leaves opposite:—

Stems and leaves clothed with long soft tawny hair; leaves sessile or shortly petioled, elliptic-oblong or ovate-lanceolate, acute or obtuse, rounded at base, serrate, up to 3 in. long, nearly 1 in. broad; racemes spicate, 2—4 in. long, 3—5 in. broad, the flowers with slender pedicels and lanceolate or spatulate long-ciliate bracts; calyx minute, turbinate; corolla-tube exserted...1. *auricularia*.

Stems and leaves closely pale-tawny or white silky tomentose:—

Spikes very slender, 1·5—4 in. long, about 2 in. broad, the flowers minute with linear bracts; calyx very small, the lobes triangular; corolla-tube included; leaves subsessile, thick, linear-oblong, denticulate in the upper half, up to 1·5 in. long, 3 in. broad.....2. *myosuroides*.
 Spikes about 2 in. long, 25 in. broad, the flowers minute with oblong small bracts; calyx 0·5 in. long, turbinate, gland-dotted, the teeth triangular, ciliate; corolla-tube included; leaves sub-sessile, linear-oblong, obtuse, crenate or subentire, up to 1·25 in. long, 4 in. broad, fulvous-pubescent.....3. *rugosa*.

Leaves in whorls, plants of wet places:—

Erect plants, not floating:—

Racemes single or in leafy panicles, dense, more or less closely grey-pubescent, up to 6 in. long, 3 in. in diam.; leaves linear-oblong or linear-lanceolate, shortly petiolate, serrate, the nerves oblique, up to 4 in. long, 5 in. broad
 4. *quadrifolia*.

Racemes single, very dense, up to about 4 in. long, 4 in. in diam. with a pair of short floral leaves at the base; leaves in distant whorls, linear or narrowly linear-lanceolate usually entire, the margins revolute, strigosely hispid especially beneath, up to 2 in. long.....5. *cruciata*.

Water plants, often floating:—

Stems decumbent at base, glabrous, often geniculate; leaves 4—5 in a whorl, sometimes more, soft and glabrous, linear, usually entire, up to 3 in. long, 2 in. broad; spikes very dense and villous, up to 2·5 in. long, 2 in. in diam., the calyx tube 5-angled, glabrous, with incurved villous lobes.....6. *Griffithii*.

Stems creeping at base, then with many stiff erect branches with very short internodes; leaves many in a whorl, very short, narrowly linear, entire, puberulous, up to 5 in. long, 1 in. broad; spikes very dense and villous, up to 2·5 in. long, 2 in. in diam., the calyx campanulate.....7. *stellata*.

1. *DYSOPHYLLA AURICULARIA*, Blume; F. B. I. iv. 638; Wt. Ic. t. 1445.
 Deccan, hills of Mysore and Bellary; Carnatic, Kollimalai Hills of Trichinopoly; W. Ghâts, Nilgiris and Pulneys at 3,000—6,000 ft.
 An erect annual with pale lilac flowers.

2. *DYSOPHYLLA MYOSUROIDES*, Benth.; F. B. I. iv. 638.
Deccan, Ramandrúg in Sandur Hills, Bellary, at 3,500 ft.; Bababudan Hills of Mysore; Carnatic, base of Kambakam Hill, Chingleput.
A much-branched perennial herb with a woody rootstock, the flowers red; the main nerves of the leaves slender, very oblique.
3. *DYSOPHYLLA RUGOSA*, Hook. f.; F. B. I. iv. 638.
Carnatic, hills near Pallamcottah, Tinnevely (Heyne).
An erect perennial herb similar to the last and perhaps scarcely distinct, the main nerves of the leaves more distant and less oblique.
4. *DYSOPHYLLA QUADRIFOLIA*, Benth.; F. B. I. iv. 639.
N. Circars, hills of Godavari, up to 3,500 ft., in rocky places near streams and in grass savannahs; W. Gháts, and W. Coast, S. Canara and Malabar to the Anamalais.
An erect aromatic undershrub reaching 4 ft. in height with rose-coloured flowers. There are two forms, one with long leaves drying nearly black and subglabrous, the other grey pubescent when dry with the leaves shorter. Vern. Tel. Konda-jajain.
5. *DYSOPHYLLA CRUCIATA*, Benth.; F. B. I. iv. 639. *D. tetraphylla*, Wt. lc. t. 1444.
W. Coast, perhaps Malabar (Wight), in wet places.
A pretty erect herb with lilac or pale purple flowers, easily recognized by the regularly spaced whorls of usually 4 leaves with revolute margins. The stamens are bearded with pink or purple.
6. *DYSOPHYLLA GRIFFITHII*, Hook. f.; F. B. I. iv. 641.
N. Circars, wet places at Bamunpodor in Ganjam (Gamble).
An aquatic herb, rooting in mud or floating in water, the many spikes at the ends of the branches erect, the flowers pink.
7. *DYSOPHYLLA STELLATA*, Benth.; F. B. I. iv. 640.
W. Coast, S. Canara to Travancore, in rice-fields.
A pretty water plant with minute pink flowers and the stamens bearded with purple hairs.
Var. *gracilis*, T. Cooke. *D. gracilis*, Dalz.; F. B. I. iv. 641, taller and with rather more distant whorls or leaves, the stem also thicker with prominent nodal scars.
Canara and Mysore (Law).

14. *Colebrookea*, Smith.

A shrub, densely hoary or woolly. *Leaves* opposite or ternate, petioled, elliptic-oblong or -lanceolate, crenulate. *Flowers* small, functionally dioecious, in bracteate clusters on elongate spikes arranged in panicles. *Calyx*-tube very short; teeth subulate, in fruit elongate, capillary and feathery. *Corolla* small, tube very short, lobes 4, subequal. *Stamens* 4, exserted in ♂ flowers, included in ♀; filaments naked; anthers orbicular, the cells confluent. *Disk* uniform. *Ovary* 4-partite; style bifid, the lobes subulate. *Fruit* of 1—4 obovoid dry nutlets with hairy tips, the basal scar small.

COLEBROOKEA OPPOSITIFOLIA, Sm.; F. B. I. iv. 642. *C. ternifolia*, Roxb. Cor. Pl. t. 245.

N. Circars, common in hilly forests up to 3,500 ft., chiefly in ravines; Deccan, in hill forests in Mysore; W. Gháts, S. Canara to Travancore in dry forest localities.

An erect much-branched very white-tomentose shrub up to 10 ft. high, the flowers white, the fruiting panicles long-plumose, the leaves up to 8 in. long, 3 in. broad, variable in pubescence.

Bark grey, rather corky; wood greyish-white, close-grained.

15. *Micromeria*, Benth.

Herbs or undershrubs. *Leaves* usually small, entire or toothed. *Flowers* small, in axillary few-flowered cymes or in whorls sessile or peduncled on a terminal sometimes paniced raceme; bracts small. *Calyx* 10—13-nerved, 5-lobed or 2-lipped. *Corolla* 2-lipped, the tube straight, annulate within, the upper lip entire or emarginate, the lower spreading, 3-lobed. *Stamens* 4 didynamous, the lower pair the longer, ascending, incurved; anther-cells distinct, parallel, at length divergent, the connective usually thickened. *Disk* cup-shaped. *Ovary* 4-partite; style slender, 2-lobed at apex, the stigmatic lobes equal or the upper short and lower recurved, flattened. *Fruit* of 4 smooth, dry-ovoid or oblong nutlets, the basal scar small.

Stems short, dense, leafy, glabrous or slightly pubescent; leaves very small, ovate, nearly sessile, gland-dotted, 15—25 in. long; cymes, 2—4-flowered, axillary, with slender pedicels.....1. *biflora*.
Stems tall, slender, pubescent; leaves shortly petioled, ovate or oblong, obtuse, serrate, 5—1 in. long, 5 in. broad; whorls dense-flowered, lower ones often peduncled, in long terminal racemes or spikes, tawny-villous.....2. *capitellata*.

1. MICROMERIA BIFLORA, Benth.; F. B. I. iv. 650; Wt. Ic. t. 1446.

N. Circars, hills of Vizagapatam, 3,500 ft. (A. W. Lushington); W. Gháts, Nilgiris and Pulneys above 6,000 ft. common.

An aromatic herb with a very stout rootstock and many tufted ascending wiry stems, the flowers pink.

2. MICROMERIA CAPITELLATA, Benth.; F. B. I. iv. 649.

N. Circars, hills of Ganjam (Barber); W. Gháts, Nilgiri Hills at 5,000—6,000 ft.

A very aromatic herb with long slender stems and small purplish flowers in very dense villous whorls.

16. *Calamintha*, Moench.

Herbs or shrubs. *Leaves* entire or toothed. *Flowers* small, in whorls, the whorls dense and axillary or loose and paniced or spicate; bracts small. *Calyx* ribbed, ribs usually 13, 2-lipped, the upper lip 3-, the lower 2-lobed and with narrower teeth; throat naked or villous. *Corolla* 2-lipped, the tube straight, the throat villous, the upper lip erect, entire or emarginate, the lower spreading, 3-lobed. *Stamens* 4, didynamous, the lower pair longer, ascending under the upper lip; anther-cells distinct, parallel or diverging. *Ovary* 4-celled, style slender, 2-fid, the stigmatic lobes equal or the lower larger. *Fruit* of 4 minute subglobose dry smooth nutlets; basal scar small.

CALAMINTHA UMBROSA, Benth.; F. B. I. iv. 650. *Melissa umbrosa*, Bieb.; Wt. Ic. t. 1447.

W. Gháts, Nilgiri and Pulney Hills, on the downs and in moist woods at high levels.

A slender straggling laxly hairy herb procumbent at base, then ascending, with purplish or sometimes white flowers in axillary whorls, the leaves ovate, serrate, up to 1·5 in. long.

17. Anisomeles, R. Br.

Erect, branching coarse herbs, often very aromatic, the stems usually tetraginous. *Leaves* opposite, the floral leaves sub-similar. *Flowers* in axillary whorls of short spikes usually elongating in fruit, or of lax branching cymes, the whole often paniced; bracts linear, 2 to each flower. *Calyx* ovoid or tubular, straight, equally 5-lobed. *Corolla* 2-lipped, the tube short, annulate within; upper lip short, erect, entire; lower broad, spreading, 3-lobed, the midlobe large, bifid or emarginate. *Stamens* 4, didynamous, exserted, the lower pair longer; anthers of upper pair 2-celled, of lower 1-celled, the cells transverse and parallel. *Disk* equal. *Ovary* 4-partite; style slender, 2-fid, the stigmatic lobes equal, subulate. *Fruit* of 4 smooth dry lenticular nutlets, the basal scar small.

Stem and branches acutely tetraginous; fruiting calyx prominently reticulate; filaments bearded:—

Cymes in the whorls pedunculate, in fruit elongate and unilateral; fruiting calyx scabrous and with scattered bulbous-based hairs, the lobes acuminate; leaves ovate, acuminate, cuneate at base, crenate-serrate, glabrous or sparsely hairy, up to 3 in. long, 1·5 in. broad.....1. *Heyneana*. Cymes in the whorls sessile, shortly elongate in fruit; fruiting calyx hispid, the lobes caudate; leaves ovate, acute or acuminate, rounded or slightly cuneate at base, crenate, tomentose, up to 6 in. long, 3 in. broad.....2. *indica*. Stem and branches obtusely tetraginous and softly white-tomentose as are the under-surfaces of the leaves; cymes in the whorls dense, shortly but sometimes much (up to 2 in.) elongate in fruit; fruiting calyx softly villous with shining hairs, the lobes narrowly lanceolate; leaves thick, lanceolate, acute, rounded at base, crenate-serrate, tomentose, up to 5 in. long, 2 in. broad.....3. *malabarica*.

1. ANISOMELES HEYNEANA, Benth.; F. B. I. iv. 672.

W. Gháts, Nilgiri Hills (Wight), probably from Wynaad. A tall erect herb reaching 5 ft. in height (*Cooke*), the corolla white or greenish-white.

2. ANISOMELES INDICA, O. Kze. *A. ovata*, R. Br.; F. B. I. iv. 672; Wt. Ic. t. 865.

All Districts, except very dry ones, in open forests, on waste land and by roadsides, up to about 5,000 ft., common. An almost shrubby herb reaching 6 ft. in height and smelling strongly of camphor. The corollas have a pale upper lip and purple lower lip and the stems and leaves vary from softly pubescent to velvety tomentose (var. *mollissima*, Benth.) and nearly white beneath. It is used in medicine.

3. ANISOMELES MALABARICA, R. Br.; F. B. I. iv. 673; Wt. Ic. t. 864.

S. Carnatic from Madras southwards to S. Travancore, West to the E. foot of the Gháts, in low country.

An almost shrubby herb reaching 6 ft. in height, densely white woolly and with pale purple flowers. It is used in medicine. Vern. Tel. Moga-bira; Tam. Peyameratti.

18. *Scutellaria*, Linn.

Herbs or undershrubs. *Leaves* opposite; floral leaves usually small and bract-like. *Inflorescence* various, but often in pairs or whorls in a terminal raceme. *Calyx* campanulate, 2-lipped, the lips closed in fruit, the upper lip then deciduous, furnished on the back with a large shield or pouch, the lower lip persistent. *Corolla* 2-lipped, the tube usually sharply recurved above the calyx and then ascending, dilated at the throat, not annulate within; upper lip galeate, entire or notched, lower broad, 3-lobed. *Stamens* 4, didynamous, the lower pair longest; anthers connivent, those of upper pair 2-celled, of lower 1-celled. *Disk* elongate. *Ovary* 4-partite, oblique, on a curved gynophore; style slender, 2-fid, one stigmatic lobe very short. *Nutlets* 4, subglobose, smooth granular or tubercular.

Leaves chiefly radical, with sometimes a few distant pairs on the stem, elliptic, obtuse, rounded or cordate at base, crenate, pubescent, sometimes purple beneath, up to 4 in. long, 2.5 in. or more broad; petioles 1—3 in. long; racemes elongate, solitary or panicled, the floral leaves very small; nutlets minutely tuberculate

1. *discolor*.

Leaves cauline, the floral leaves much smaller and bracteate:—

Erect, stiff plants, pubescent or hispid; leaves ovate, acute, cordate or rounded at base, crenate-serrate, hispid, often purplish beneath, up to 2 in. long, 1—1.5 in. broad, petiole slender, up to about 1 in. long; floral leaves ovate; racemes erect, up to 6 in. long; nutlets granulate.....2. *Wightiana*.

Straggling weak plants, glabrous or minutely pubescent:—

Slender branching flaccid flexuous herbs; leaves ovate, subacute, rounded or cordate at base, membranous, broadly crenate, up to 3.5 in. long, 2.5 in. broad, petiole 1—3 in., floral leaves lanceolate; racemes lax, up to 6 in. long; nutlets spinulose.....3. *violacea*.

Many-branched soft thinly pubescent herbs; leaves deltoid, acute, truncate or cordate at base, rather thick, repand-crenate, minutely tomentose, 1—1.25 in. long and nearly as much broad, petiole .5—7.5 in.; floral leaves very small, ovate; racemes elongate, up to 6 in. long; nutlets minutely tuberculate

4. *Colebrookiana*.

Leaves cauline gradually smaller upwards as they pass into floral leaves, the lower shortly petioled, the upper sessile, ovate or lanceolate, obtuse, cordate or rounded at base, entire or slightly crenate, up to 1 in. long, .5 in. broad; pedicels very short; nutlets granulate.....5. *rivularis*.

1. *SCUTELLARIA DISCOLOR*, Coleb.; F. B. I. iv. 667.

Bababudan Hills of Mysore (Law); Marnhalli, 2,000 ft. (Meebold).

An annual herb, the stems rooting at the base, the flowers with pale blue corolla about .5 in. long, the pouch of the upper fruiting calyx-lip short and broad.

2. *SCUTELLARIA WIGHTIANA*, Benth. *S. violacea*, Heyne, var. *hispidior*, Benth.; F. B. I. iv. 668; Wt. Ic. t. 1449.

W. Gháts, Nilgiri Hills, at about 5,000—7,000 ft.

A stiff-branched but erect herb, the stems rooting at base, the corollas white or rose (Wight), .5 in. long, the pouch of the upper fruiting calyx-lip deep and hooded.

3. *SCUTELLARIA VIOLACEA*, Heyne; F. B. I. iv. 668 in part; Bot. Mag. t. 8320.

N. Circars, hills of Vizagapatam at 2,500 ft. (Beddome, A. W. Lushington), Rampa Hills of Godavari, at 4,000 ft. (V. Narayanswami); W. Gháts, Nilgiris, Pulneys and hills of Travancore, up to 7,000 ft.

A flaccid straggling herb, the pouch of the upper fruiting calyx-lip concave without, the corolla-tube long, blue with white patches on the lip.

4. SCUTELLARIA COLEBROOKIANA, Benth. *S. violacea* var. *Colebrookiana*, Hook. f.; F. B. I. iv. 668.

W. Gháts, Pulney Hills and hills of Tinnevely, apparently at low levels.

A straggling herb of characteristic aspect and soft thick deltoid leaves, the pouch of the upper fruiting calyx-lip usually concave without, the corolla large, especially the broad lower lip.

5. SCUTELLARIA RIVULARIS, Benth.; F. B. I. iv. 670; Wt. Ic. t. 1450.

W. Gháts, Nilgiris, in wet places near streams at about 7,000 ft., Pykara (Wight), Cairn Hill Swamp (Gamble).

A nearly glabrous tufted herb with many branches, the lower one rooting below, the corolla lilac or blue and short, the pouch of the upper lip of the fruiting calyx broad and curved forward.

19. *Brunella*, Linn.

Perennial herbs. *Leaves* opposite; floral leaves bract-like. *Flowers* in whorls of 6, closely packed in terminal cylindric heads. *Calyx* reticulate, white-strigose, 2-lipped, above a short tube closed in fruit; upper lip broad, 3-toothed, lower 2-lobed, the lobes lanceolate, aristate. *Corolla* ascending, tube annulate at the base within; upper lip erect, galeate; lower lip spreading, the side lobes oblong deflexed, the middle lobe rounded, concave, crenulate. *Stamens* 4, didynamous, exserted; filaments bifid, especially the upper, at apex, the lower arm anther-bearing; anthers conniving, 2-celled, the cells divaricate. *Disk* erect. *Ovary* 4-partite, on a gynophore; style slender, 2-lobed, the stigmatic lobes subulate. *Fruit* of 4 smooth oblong nutlets.

BRUNELLA VULGARIS, Linn.: F. B. I. iv. 670. Var. *hispida*, Benth.; Wt. Ic. t. 1448.

W. Gháts, Nilgiris, Pulneys and hills of Travancore, above 5,000 ft., in grass, on the downs.

A herb with creeping rootstock, the stems and ovate obtuse leaves hispidly hairy, the corollas deep purple-blue or sometimes white, the bracts broadly ovate-cordate, apiculate, often purple on the margins.

20. *Leonurus*, Linn.

Erect stout herbs. *Leaves* opposite, lobed, floral leaves similar. *Flowers* in dense axillary whorls; bracts subulate. *Calyx*-tube turbinate, 5-nerved; teeth 5, spreading, spinescent. *Corolla* 2-lipped; tube cylindric, annulate within; upper lip erect, entire, lower 3-lobed, the midlobe obcordate. *Stamens* 4, didynamous, the lower pair the

longest; anthers conniving, the cells transverse. *Disk* uniform. *Ovary* 4-partite; style 2-fid, the stigmatic lobes obtuse or subulate. *Fruit* of 4—3-quetrous truncate, smooth nutlets, the basal scar small.

LEONURUS SIBIRICUS, Linn.; F. B. I. iv. 678.

Coorg, Nilgiri Hills and other localities, in waste places.

An annual weed with 4-gonous stems and long-petioled pinnatifid leaves having linear-lanceolate segments. The flowers are red.

21. *Leuca*, R. Br.

Herbs, undershrubs or shrubs, nearly always pubescent or villous; branches usually 4-gonous. *Leaves* opposite or whorled; floral leaves usually similar. *Flowers* usually white, in axillary few- or many-flowered whorls, rarely quite terminal; bracts usually many, linear or lanceolate, frequently enclosing the base of the whorls. *Calyx* tubular, 10-ribbed, the mouth straight or oblique, equally or unequally 6—10-toothed, often with a ring of hairs within the teeth, fruiting calyx often elongated. *Corolla* 2-lipped; tube included, annulate or naked within; upper lip erect concave externally, often densely and white- or tawny-villous, lower lip spreading, 3-lobed, the midlobe very large. *Stamens* 4, didynamous, the lower pair the longer; filaments ascending under the upper lip; anthers connivent, the cells divaricate, at length confluent. *Disk* entire or lobed, equal or glandular in front. *Ovary* 4-partite; style subulate at the apex, the upper lobe obsolete. *Fruit* of 4 ovoid triquetrous obtuse dry nutlets, the basal scar small.

Mouth of the calyx oblique:—

Longer side of the calyx-mouth anterior, tube prominently ribbed, reticulate and curved; bracts linear-lanceolate, ciliate; corolla-tube slender, .2 in. long, the upper lip .05, the lower .1 in.; whorls up to 1 in. in diam. in most axils; leaves thin, ovate, acute, rounded or slightly cuneate at base, more or less pubescent, coarsely crenate-serrate, up to 2.5 in. long, 1.5 in. broad, petiole to 1 in.

1. *urticaefolia*.

Longer side of the calyx-mouth posterior:—

Calyx-tube bent in the middle to curve outwards or downwards, the teeth long and slender:—

Calyx-tube sigmoidly curved, pubescent, ribbed and reticulate, the uppermost tooth nearly twice as long as the rest; bracts linear-lanceolate, villous, spinous-awned; corolla-lips nearly equal, short; whorls in most axils about 1 in. in diam.; leaves ovate or lanceolate, acuminate, cuneate at base, coarsely crenate-serrate, pubescent, up to 3.5 in. long, 1.5 in. broad, petiole to .75 in. 2. *martinicensis*.

Calyx-tube abruptly deflexed, villous, strongly ribbed, the teeth subequal; bracts thin, foliaceous, lanceolate, ciliate, .2—3 in. long; corolla with lower lip longer than upper; whorls in upper axils about .75 in. in diam.; leaves oblong-lanceolate, obtuse, shallowly serrate, hispid, up to 2 in. long, .5 in. broad, petiole very short. 3. *nutans*.

Calyx-tube erect, not bent in the middle:—

Mouth of the calyx-tube very oblique, the upper tooth long, the rest smaller:—

Bracts linear, finely pubescent, .2—3 in. long, not long-ciliate; calyx-tube with upper and lower halves similar, glabrous or short-pubescent, .25 in. long; corolla with lower lip long and broad; whorls terminal and few at the ends of the branches, .5—1 in. broad; leaves linear or narrowly linear-lanceolate, obtuse, entire or slightly serrate, pubescent, up to 3.5 in. long, .4 in. broad, petiole very short. 4. *linifolia*.

Bracts linear, villous and long-ciliate:—

Calyx-tube uniform:—

Calyx prominently nerved and hispid, .25 in. long, the teeth all sharp; corolla very small, the upper and lower lips nearly equal; whorls close together in the uppermost axils, scarcely .5 in. in diam.; leaves sessile, linear, obtuse, entire or very distantly obscurely serrate, up to 2.5 in. long, .25 in. broad.....5. *Wightiana*.

Calyx not prominently nerved, hispid, .25 in. long, the teeth small; corolla large, the lower lip much longer than the upper, the midlobe broad; whorls terminal with one or more in adjacent axils as well, .5—75 in. in diam., leaves subsessile, linear or linear-lanceolate, entire or distantly obscurely serrate, up to 4 in. long, .75 in. broad

6. *zeylanica*.

Calyx-tube glabrous and membranous in the lower half, ribbed and hispid and with long bulbous-based hairs in the upper; corolla large, the lower lip twice as long as the upper, the midlobe obovate; whorls terminal and also sometimes in upper axils, dense, up to 1 in. in diam.; leaves linear- or oblong-lanceolate, obtuse, entire or crenate, pubescent, up to 3 in. long, .5 in. broad, petiole short.....7. *aspera*.

Mouth of the calyx-tube slightly oblique, the teeth subequal:—

Whorls very large, terminal, globose, 1—2 in. in diam.; bracts foliaceous, imbricate, lanceolate, green, membranous, ciliate, .5—75 in. long; calyx tubular, .75 in. long, glabrous below, villous above; leaves ovate or ovate-lanceolate, obtuse, membranous, crenate, pubescent, up to 4 in. long, 1.5 in. broad, petiole to .5 in.....8. *Cephalotes*.

Whorls small, under 1 in. in diam., mostly terminal; bracts stiff, linear, hispid and with few but prominent long bulbous-based bristles as on the calyx-tube:—

Calyx-teeth about .1 in. long or longer, subulate, the tube white-villous, ribbed and bristly near the mouth, often nearly glabrous below; leaves variable, linear or oblong, obtuse, hispid, up to 2 in. long, .5 or sometimes .75 in. broad, petiole very short.....9. *stricta*.

Calyx-teeth about .025 in. long, triangular, the tube curved, ribbed, hispid and bristly; leaves linear or linear-oblong, obtuse, up to 1.5 in. long, .3 in. broad, sessile.....10. *diffusa*.

Mouth of the calyx straight:—

Calyx-teeth erect, rarely spreading, throat naked; whorls axillary:—

Whorls few-flowered, usually about 1—4 at any rate on each side; bracts setaceous:—

Calyx-teeth very short, .05 in. long, triangular, tube obconical, ribbed, .3 in. long, villous; leaves orbicular-ovate, obtuse, coarsely crenate, pubescent, 1 in. long, petiole to .5 in., slender.....11. *nepetaefolia*.

Calyx-teeth subulate, .1 in. long, ciliate, tube campanulate, ribbed, .2—25 in. long, villous, leaves variable, ovate or elliptic, obtuse or acute, rounded or cuneate at base, crenate-serrate, rarely over 1 in. long, .5 in. broad, the petiole short.....12. *biflora*.

Whorls about 6- many-flowered, fewer on the branches than on main stems:—

Hairs on the branches erect or spreading, not deflexed, whole plant densely white-silky tomentose except the upper surface of the mature leaves usually softly villous only; calyx-teeth very short, about .05 in., the tube .25—35 in.; leaves subsessile, thick, ovate or suborbicular, rounded at base, crenate-serrate, up to 2.5 in. long, 1.5 in. broad.....13. *lanata*.

Hairs on the branches deflexed:—

Calyx-teeth short, under .1 in. long; bracts minute, linear.

Calyx-teeth subulate, about .05 in. long, the tube campanulate, ribbed, softly white villous, slightly curved, .25—35 in. long:—

Leaves thick, ovate, obtuse, rounded at base, crenate, nearly glabrous above, densely white velvety tomentose beneath, up to 1.5 in. long, 1 in. broad, petiole very short.....14. *montana*.

Leaves rather thin, ovate or ovate-lanceolate, acute, cuneate at base, serrate, somewhat strigosely villous above, hoary-tomentose beneath, up to 4 in. long, 2 in. broad, petiole sometimes to nearly 1 in.

15. *mollissima*.

Calyx-teeth triangular, spreading, the tip spinulose, the tube funnel-shaped, ribbed, densely softly white-silky with a few long hairs, .3—.5 in. long; leaves broadly ovate, acute or obtuse, cuneate at base, crenate or dentate, softly pubescent or tomentose, up to 2.5 in. long, 1.5 in. broad, petiole slender, .25—1.25 in.16. *chinensis*.

Calyx-teeth usually over .1 in. long, but unequal, so some shorter, all slender and subulate:—

Bracts subulate, .25 in. long, shortly hispid; calyx-tube cylindric, hispid on the ribs, the teeth unequal, up to .15 in. long; leaves triangular-ovate or lanceolate, thin, acute, truncate rounded or almost cordate at base, coarsely crenate or serrate, pubescent, up to 3 in. long, 1.5 in. broad

17. *angularis*.

Bracts narrowly lanceolate or spatulate, acuminate, .4 in. long, long-ciliate; calyx-tube campanulate, hispid on the ribs, the teeth subequal, up to .1 in. long; leaves ovate or orbicular, thin, usually obtuse, truncate at base, coarsely crenate, pubescent, 1—1.5 in. in diam., petiole to .5 in.

18. *pubescens*.

Bracts filiform with long soft silky hairs, .5 in. long; calyx tubular, softly silky, the teeth unequal, up to .15 in. long, filiform; leaves thick, often tawny and rugose or bullate beneath when old, thinner and white-tomentose when younger, rounded or cordate at base, crenate, up to 2 in. long, 1.5 in. broad, petiole slender, .25—.5 in. long.19. *marruboides*.

Calyx-teeth erect and usually stellately spreading, throat villous; whorls chiefly terminal, but sometimes also in upper axils:—

Leaves quite entire:—

Leaves at most 1—1.5 in. long, narrow, obtuse, coriaceous, with revolute margins:—

Branches fulvous, calyx fulvous- or white-tomentose:—

Leaves linear, .5—1 in. long, .1—2 in. broad, white-tomentose beneath:—

Stems and leaves scaly and hispid with erect or spreading hairs; whorls 1—2 at the top of scapiform branches 6—10 in. long; bracts setaceous, villous, .125 in. long; calyx-teeth minute, about .025 in. long, the throat ring of hairs as long.20. *suffruticosa*.

Stems and leaves closely appressed-villous; whorls usually 2 at the ends of slender subterminal internodes 1—2 in. long; bracts subulate, .1 in. long; calyx-teeth minute, .025 in. long, the throat ring of hairs as long.21. *ternifolia*.

Leaves linear-oblong, 1—2 in. long, .2—4 in. broad, white or tawny beneath; above fulvous-villous like the stems, with erect hairs; whorls many, crowded at the ends of the branches; bracts subulate, .25 in. long; calyx-teeth minute, .025 in. long, the throat ring of hairs long and dense.22. *helianthemifolia*.

Branches greenish-grey, strigose with erect hairs; leaves linear, obtuse, 1—2 in. long, .1—1.5 in. broad, grey-villous beneath; whorls usually single, terminal or axillary on short peduncles; bracts linear-oblong, strigose, .2—3 in. long; calyx-teeth triangular, .04 in. long, shorter than the prominent throat ring of hairs.23. *rosmarinifolia*.

Leaves up to 4 in. long, 1 in. broad, soft, chartaceous, lanceolate, scaberulous above, white-tomentose beneath, the margins very slightly revolute; whorls about 1 in. in diam., axillary to the 3—5 uppermost nodes; bracts linear, thick, .4 in. long; calyx-teeth very small but longer than the ring of hairs

24. *lanceaefolia*.

Leaves more or less serrate or crenate:—

Upper lip of corolla densely bearded with rufous hairs, villi of the calyx-throat white; whorls usually 1 or 2 terminal, large; bracts linear:—

Leaves lanceolate, acute, narrowed at base, crenate-serrate, tawny-villous, up to 4 in. long, 1.5 in. broad, petiole short; calyx-teeth short.25. *vestita*.

Leaves membranous, ovate, acute, narrowed at base, coarsely serrate, pubescent or glabrate, up to 5 in. long, 2.5 in. broad, petiole to 1 in.; calyx-teeth slender, spreading, ciliate, .1 in. long or longer.26. *ciliata*.

Upper lip of corolla densely bearded with white hairs; hairs of the stem and branches usually stiff, spreading or reflexed:—

Leaves thick, 3—5 in. long, ovate, acute, rounded or cordate at base,

crenate, tawny-villous above, softly whitish-tomentose beneath, 1·5—2·5 in. broad; whorls large, usually 1—2 terminal, 1 in. in diam.; bracts linear-lanceolate, 4 in. long; calyx-teeth slender, 0·75 in. long, spreading

27. *lamiifolia*.

Leaves narrow, usually under 1 in. broad, subobtusate, distantly and shallowly crenate, the nerves few, very oblique:—

Leaves rather thick, oblong, tawny-pubescent, 1—3 in. long, shortly petioled; whorls 1—2 terminal, 75—1 in. in diam.; calyx-teeth subulate, spreading, about 0·5 in. long; bracts linear-lanceolate.....28. *hirta*.

Leaves thick, linear-oblong or lanceolate up to 4 in. long, 1 in. broad, crenate, the 5—7 pairs of main nerves very oblique, impressed above, brown-hispid-pubescent, the hairs spreading; whorls many, in upper axils, up to 1 in. in diam.; calyx-teeth short, subulate, the villi conspicuous; bracts linear, pectinately ciliate.....29. *eristoma*.

Leaves thin, linear-oblong, nearly glabrous, up to 4 in. long, shortly petioled; whorls several in upper axils, 75 in. in diam.; calyx-teeth recurved, very short, about 0·25 in. long; the tube much constricted in the middle; bracts filiform.....30. *stelligera*.

Leaves small, ovate, obtuse, rounded at base, crenate, tawny-hispid-pubescent, up to 1 in. long, 5 in. broad, the nerves about 4—5 pairs, not oblique, petiole to 3 in.; whorls single, terminal, 75 in. in diam.; bracts subulate, 3 in. long, ciliate; calyx-teeth stiff and with stiff hairs, 1 in. long, as long as the dense villi; the tube 25 in. long.....31. *prostrata*.

1. *LEUCAS URTICAEFOLIA*, R. Br.; F. B. I. iv. 680; Wt. lc. t. 1451.
Deccan and Carnatic, on dry waste lands, often on black-cotton soil, common about Coimbatore, also about Tadpatri in Anantapur.
A soft annual herb with white flowers, the nutlets trigonous with the truncate top glandular.
2. *LEUCAS MARTINICENSIS*, R. Br.; F. B. I. iv. 688.
Deccan and Carnatic, Horsleykonda at 4,000 ft., Ramandrug in Bellary at 3,000 ft., hills of Salem and Coimbatore Districts, doubtfully indigenous.
A large herb with angular stems and white flowers, the nutlets trigonous with rounded back.
3. *LEUCAS NUTANS*, Spreng.; F. B. I. iv. 688.
N. Circars, in Ganjam (Barker); Deccan, in Cuddapah (Gamble).
A dwarf trailing herb, diffusely branched, with angular stems and white flowers.
4. *LEUCAS LINIFOLIA*, Spreng.; F. B. I. iv. 690.
N. Circars, Deccan and Carnatic, in pastures, waste lands and fallow fields, common.
An erect herb with rather large white flowers.
5. *LEUCAS WIGHTIANA*, Benth.; F. B. I. iv. 690.
Carnatic and S. Travancore, at Cape Comorin (Lawson).
A small erect scabrid herb.
6. *LEUCAS ZEYLANICA*, R. Br.; F. B. I. iv. 689; Wt. Ill. t. 176.
W. Ghats, Nilgiris, Pulneys and hills of Travancore 3,000—7,000 ft.; Shevaroy Hills of Salem.
A large erect pubescent or hispid herb with white flowers.
7. *LEUCAS ASPERA*, Spreng.; F. B. I. iv. 690.
Most plains Districts, and up to 3,000 ft., in fields and on waste land and roadsides, common.

A coarse erect diffusely branched annual herb with white flowers, the stems hispid or scabrid.

8. *LEUCAS CEPHALOTES*, Spreng.; F. B. I. iv. 689; Wt. Ic. t. 337 (not good).

All plains Districts; a weed of cultivated land.

A stout coarse herb with large terminal many-bracted conspicuous heads of white flowers, the corollas with the lower lip not much longer than the white-bearded upper. Vern. *Hind.* Dhurpi Ság.

9. *LEUCAS STRICTA*, Benth.; F. B. I. iv. 688.

N. Circars, Ganjam to Godavari, near the coast; Deccan, in the Ceded Districts, Mysore and Salem.

A small herb with 4-angled hispid slender stems and white flowers, the corollas with large obovate lower lip, much longer than the white-bearded upper.

10. *LEUCAS DIFFUSA*, Benth.; F. B. I. iv. 689.

E. Coast Districts, from the Godavari southwards, usually on sandy pastures near the sea; Shevaroy Hills (Perrottet). A small diffuse herb with trailing branches and rather large white flowers.

11. *LEUCAS NEPETAEFOLIA*, Benth.; F. B. I. iv. 681.

Deccan, Hyderabad journey (Heyne); Guntur District, at Bellamkonda (Cleghorn).

A shrubby plant with hoary branchlets, the flowers white, the lower lip of the corolla hardly longer than the white-bearded upper.

12. *LEUCAS BIFLORA*, R. Br.; F. B. I. iv. 683; Wt. Ic. t. 866.

Deccan and Carnatic and the lower E. slopes of the Gháts, southwards to S. Travancore; dry places on the W. Coast.

A slender procumbent softly pubescent herb, often straggling up and apparently climbing, the branches long, 4-angled, the flowers usually in pairs, corollas white.

Var. *procumbens*. *L. procumbens*, Desf.; F. B. I. iv. 683. Glabrous and with usually narrower leaves, shorter calyx-teeth and longer pedicels, but scarcely separable from the species.

Hills of S. Canara and Mysore.

13. *LEUCAS LANATA*, Benth.; F. B. I. iv. 681.

Hills of the Deccan and Carnatic, in dry places at low levels. N. slopes of Nilgiris, up to 3,000 ft.

An erect plant with many silky branches from a stout root-stock, the corollas rather large, white, with broad lower lip, longer than the white-bearded upper.

14. *LEUCAS MONTANA*, Spreng.; F. B. I. iv. 682.

N. Circars, on Mahendragiri, 4,500 ft. (Gamble), hills of Vizagapatam; Deccan, Kambakam Drúg, Ramandrúg in Bellary, at 3,000 ft.; N. side of Nilgiris at 3,000 ft.

A straggling undershrub with white flowers.

Var. *Wightii*, Hook. f. Calyx funnel-shaped, nearly 5 in. long, upper surface of leaves strigose, whorls many-flowered. Locality doubtful (Hb. Wight).

15. *LEUCAS MOLLISSIMA*, Wall.; F. B. I. iv. 682.
 Var. *scaberula*, Hook. f.
 N. Circars, forests of Ganjam and Vizagapatam; Rampa and Bison Hills of Godavari, to 2,000 ft.; hills of Mysore (Meebold).
 A straggling slenderly branched herb, sometimes climbing among bushes, the flowers white. Young leaves are often very silky, but the tomentum disappears as they get older and larger.
16. *LEUCAS CHINENSIS*, R. Br.; F. B. I. iv. 681.
 W. Gháts, hills of Malabar, Anamalai and Pulney Hills, at 3,000—4,000 ft. or higher.
 A somewhat shrubby straggling plant very variable in thickness of leaf and clothing, probably according to light and shade, the corollas white with the lower lip rather longer than the upper. The calyx-tube is villous on the upper half within but is not fringed at the mouth.
17. *LEUCAS ANGULARIS*, Benth.; F. B. I. iv. 684. *L. marrubiioides*, var. *pulneyensis*, Hook. f.; F. B. I. iv. 684.
 W. Gháts, Nilgiris, Pulneys and hills of Travancore, in evergreen forests at 3,000—5,000 ft. and perhaps higher.
 A herbaceous plant with long straggling branches and rather large white flowers.
18. *LEUCAS PUBESCENS*, Benth.; F. B. I. iv. 684.
 Without locality (Wight); Nilgiris, at 5,000 ft. (Clarke)?
 An erect herb with characteristic round broadly crenate leaves and white flowers.
19. *LEUCAS MARRUBIODES*, Desf.; F. B. I. iv. 683.
 W. Gháts, hills of Mysore and N. Coimbatore, Nilgiris, at 3,000—7,000 ft., less common in Pulneys (Wight).
 A stout straggling herb, the flowers white and large in very white-silky whorls with rather long internodes, the old leaves with the nerves impressed.
20. *LEUCAS SUFFRUTICOSA*, Benth.; F. B. I. iv. 685; Wt. Ic. t. 1454.
 W. Gháts, Nilgiri Hills, on the downs at and about 7,000 ft.
 A low undershrub with many slender stems from a thick woody rootstock, the corolla white, the upper lip prominently white-bearded.
21. *LEUCAS TERNIFOLIA*, Desf. *L. helianthemifolia*, Hook. f.; F. B. I. iv. 685 *in part*.
 W. Ghats, Anamalais, Pulneys and hills of Travancore, at high levels, above 6,000 ft.
 An undershrub with conspicuous smooth golden pubescence, having many slender branches from a stout rootstock. The whorls resemble those of the last species but they have not the long peduncle-like internodes.
22. *LEUCAS HELIANTHEMIFOLIA*, Desf.; F. B. I. iv. 685 *in part*. *L. ternifolia*, Wt. Ic. t. 1453, *not of* Desf.
 W. Gháts, Nilgiri Hills, at 5,000—7,000 ft., Pulneys scarce.
 A small shrub, with very white or tawny wool on the inflorescence, only the upper surface of the leaves green. The corollas are white and the white wool of the upper lip very thick. The

leaves are usually ternate or, as Wight says, ternate below, opposite above.

23. *LEUCAS ROSMARINIFOLIA*, Benth.; F. B. I. iv. 685; Wt. Ic. t. 1455.
W. Gháts, Nilgiri Hills, above 6,000 ft., often on roadsides.
A grey-green rather compact small shrub with the narrow leaves fascicled, many together, at the nodes. Flowers white in very silky whorls with rather large bracts.
24. *LEUCAS LANCEAEFOLIA*, Desf.; F. B. I. iv. 685; Wt. Ic. t. 1452.
W. Gháts, Nilgiri and Pulney Hills, above 6,000 ft., more or less gregarious on the margins of Shola woods.
A shrub, reaching 6—8 ft., and very bushy. Flowers white, rather small. Bark thin, grey; wood light brown. Some of the Pulney specimens show very faint shallow crenatures to the leaves.
25. *LEUCAS VESTITA*, Benth.; F. B. I. iv. 686; Wt. Ic. t. 338.
S. E. Wynaad (Lawson); Pulney Hills and hills of Tinnevely and Travancore, at low levels.
A tall tawny-villous soft herb with white lower lip to the corolla, the rufous upper lip characteristic.
26. *LEUCAS CILIATA*, Benth.; F. B. I. iv. 687.
W. Gháts, hills of S. Canara, Coorg, Mysore, to the S. E. Wynaad at 3,000 ft.
A straggling aromatic loosely branched herb, the corolla with upper lip clothed with yellowish-brown hairs (Cooke), the whorls very scabrous hispid.
27. *LEUCAS LAMIFOLIA*, Desf.; F. B. I. iv. 686.
W. Gháts, Nilgiris, at 6,000 ft.; common in "Old Forest," Coonoor.
A large straggling herb with tawny villous stem and leaves.
28. *LEUCAS HIRTA*, Spr.; F. B. I. iv. 687.
Deccan, in hilly country, up to 4,000 ft. on Horsleykonda; W. Gháts, in all Districts from S. Canara to Tinnevely.
A sub-shrubby branching herb from a stout rootstock, the leaves and stems variable in pubescence.
Var. *Beddomei*, Hook. f. Softly villous with spreading hairs the whorls more numerous, the villi of the calyx-mouth fewer and shorter. The hairs on the corolla upper lip seem to have a brown tinge.
Hills of S. Canara and Wynaad at 5,000—6,000 ft. (Beddome).
29. *LEUCAS ERIOSTOMA*, Hook. f.; F. B. I. iv. 686.
W. Gháts, in S. Canara (Barber), Wynaad (Heyne, de Monrhodon), Brumagiri Hills, 4,000—5,000 ft. (Fischer).
An undershrub with long narrow leaves, probably not very distinct from *L. hirta*, Spr.
Var. *latifolia*, Hook. f. Stout and with many and larger whorls, the leaves broader. Nilgiri or Coorg (G. Thomson).
Var. *lanata*, Hook. f. Branches and inflorescence clothed with long soft white spreading hairs, the whorls smaller.
Bababudan Hills of Mysore, also Nilgiris (Wight, Meebold).
30. *LEUCAS STELLIGERA*, Wall.; F. B. I. iv. 686. *L. eriostoma*, var. *longifolia*, Hook. f.; F. B. I. iv. 686.

W. Ghâts, hills of S. Canara and Mysore to Nilgiris, up to 3,000 ft.

An erect branching herb with usually simply pubescent stems, sometimes with long spreading hairs.

31. *LEUCAS PROSTRATA*, Gamble n. comb. *L. hirta*, Spr., var. *prostrata*, Hook. f.; F. B. I. iv. 687.

W. Ghâts, Nilgiris, above 5,000 ft., Anamalais (Beddome); Shevaroy Hills.

A low herb, with many hispid prostrate branches from a knotty rootstock, often rooting at the nodes, the scapes sometimes long and slender.

22. *Leonotis*, R. Br.

Herbs or shrubs, stems 4-gonous. *Leaves* opposite; floral leaves similar but smaller. *Flowers* large, scarlet or yellow, in axillary dense many-flowered whorls; bracts numerous, slender. *Calyx* 10-ribbed, tubular, the tube often incurved; mouth oblique with 8–10 rigid teeth, the upper tooth the largest. *Corolla* 2-lipped, the upper lip long, concave, with a villous crown, the lower lip small, 3-lobed, the mid-lobe largest. *Stamens* 4, didynamous, the lower pair longer, ascending; anthers connivent, the cells divaricate. *Disk* equal. *Ovary* 4-partite; style subulate, the upper lobe very short. *Fruit* of 4 oblong ovoid or obovoid, triquetrous, obtuse or truncate, dry nutlets, the basal scar small.

Calyx 1 in. long in all, the tube curved, the teeth very unequal and tipped with slender spines, the uppermost much the largest; *corolla* 1 in. long, the upper lip 5 in.; leaves broadly ovate, long-petioled, up to 8 in. long, 5 in. broad, coarsely serrate.....*L. nepetaefolia*.
Calyx 5–75 in. long, the tube straight, the teeth very small subequal; *corolla* 2 in. long or more, the upper lip nearly 1 in.; leaves oblong-lanceolate, short-petioled, obtuse and shortly serrate.....*Leonurus*.

LEONOTIS NEPETAEFOLIA, R. Br.; F. B. I. iv. 691; Wt. Ic. t. 867.

Most plains Districts, on roadsides and in waste places, chiefly near villages, often cultivated, doubtfully indigenous. A tall herb reaching 6 ft. high with obtusely 4-angled stems, long internodes and spinous whorls of orange-scarlet flowers, the upper lip densely woolly.

L. Leonurus, R. Br., is sometimes found in gardens and is easily recognized by the very long orange-scarlet handsome corolla. It is native of S. Africa.

23. *Salvia*, Linn.

Herbs or shrubs of various habits. *Flowers* small or large and showy, whorls usually racemose or spicate; bracts small or large and often coloured. *Calyx* tubular or campanulate, 2-lipped, throat naked; upper lip entire or 3-lobed, lower 2-fid. *Corolla* 2-lipped; tube naked or with a ring of hairs inside; upper lip erect, entire; lower 3-lobed, the lateral lobes spreading. *Stamens* 2 (the lower pair) perfect, the upper pair reduced to staminodes or obsolete; filaments short, articulate with the slender connective, sometimes produced

beyond the joint; anthers dimidiate, connective linear, transverse, the posterior arm ascending and bearing a linear fertile cell, the anterior arm straight or deflexed, with a fertile or empty cell or naked. *Disk* usually enlarged in front. *Ovary* 4-partite; style shortly bifid, the lobes equal or the anterior longer. *Fruit* of 4 ovoid-triangular dry smooth nutlets, the basal scar small.

SALVIA PLEBEIA, R. Br.; F. B. I. iv. 655.

Most plains Districts, a weed of roadsides and waste land.

An erect pubescent herb with very small lilac or white flowers in whorls in panicles of slender racemes especially in fruit when the calyx is much enlarged. Leaves petioled, oblong-lanceolate or -spathulate, crenate, 2—5 in. long. Nutlets mucilaginous when wetted.

Salvia officinalis, Linn., is the Sage plant occasionally cultivated in gardens. Several species are also cultivated in gardens for their showy flowers.

24. *Gomphostemma*, Wall.

Herbs or undershrubs, stellately pubescent or tomentose, the roots often bearing tubers. Leaves opposite, large, entire or dentate or crenate, floral leaves similar or bract-like. Flowers rather large, usually yellow, in short cymes forming whorls which are axillary or in dense terminal spikes; bracts many, usually linear. Calyx campanulate, equally 5-lobed, 10-ribbed. Corolla 2-lipped; tube slender, the throat more or less dilated; upper lip hooded, lower broadly 3-lobed, the lobes spreading. Stamens 4, didynamous, ascending, the lower pair the longer; anthers approximate in pairs, 2-celled, the cells parallel. Disk uniform or slightly swollen. Ovary 4-partite, style slender, 2-fid, the lobes subulate, nearly equal. Fruit of 4, or, by reduction, 3—4 glabrous or pubescent, corky or fleshy nutlets, the basal scar broad.

Whorls combined in terminal spikes, sometimes with others axillary in upper nodes as well; floral leaves elliptic-ovate, cordate; calyx lobes lanceolate, acuminate, .5 in. long; corolla-tube .4 in. long, slender, lower lip as long, broad; leaves elliptic ovate, subacute, rounded and then abruptly and acuminate decurrent on the petiole, closely serrate, shortly hirsute above, densely tomentose beneath, up to 9 in. long, 5 in. broad.....1. *Heyneanum*.

Whorls axillary; calyx-teeth slender, corolla-tube elongate:—

Cymes of the whorls pedunculate; calyx-teeth subulate, very grey stellate hairy, .2 in. long; corolla 1 in. long, glabrate; floral leaves lanceolate; bracts linear; leaves elliptic to oblanceolate, acuminate, distantly shallowly crenate, up to 9 in. long, 4.5 in. broad.....2. *parviflorum*.

Cymes of the whorls sessile; calyx-teeth very slender, .15—.25 in. long, subglabrous; corolla 1 in. long, villous without; floral leaves ovate; bracts lanceolate; leaves elliptic-oblong or lanceolate, acute, sharply dentate, up to 6 in. long, 2 in. broad.....3. *eriocarpon*.

1. *GOMPHOSTEMMA HEYNEANUM*, Wall.; Wt. Ic. t. 1456;

Prain, Ann. Calc. iii. t. 79. *G. strobilinum*, Wall., var. *Heyneana*, Hook. f.; F. B. I. iv. 696.

W. Gháts, S. E. Wynaad at 3,000 ft. (Lawson), Anamalai Hills at 3,000 ft. (Gamble), evergreen forests of Travancore (K. Venkoba Row), hills of Tinnevely.

A tall shrubby herbaceous plant, covered with stellate hairs, the flowers yellow (Lawson, Gamble), blue with purple tinge (Wight), the nutlets glabrous.

Var. *Rottleri*, Prain, Ann. Calc. iii. t. 80. Leaves crenate, the upper surface less hirsute, the stems furrowed.

W. Gháts, Mudumalai forest at 2,000 ft. (Gamble), Anamalai Hills (Barber), hills of Travancore and Tinnevely (Rottler, Wight).

2. *GOMPHOSTEMMA PARVIFLORUM*, Wall. ; F. B. I. iv. 697 ;

Prain, Ann. Calc. iii. t. 87 (var. *farinosa*).

N. Circars, hills of Ganjam at 3,000 ft. (Barber), Rangalu in Vizagapatam at 3,400 ft. (A. W. Lushington).

An erect large herb, softly stellate tomentose, the flowers yellow.

3. *GOMPHOSTEMMA ERIOCARPON*, Benth. ; F. B. I. iv. 698 ;

Prain, Ann. Calc. iii. t. 90. *G. oblongum*, Wt. Ic. t. 1457, not of Wall.

W. Gháts, Anamalai Hills and hills of Travancore and Tinnevely, at about 2,000 ft., in evergreen forests.

A slender erect herbaceous plant with simple or stellate hairs, the flowers yellow, the nutlets tomentose.

25. *Teucrium*, Linn.

Herbs or shrubs. *Leaves* opposite, entire serrate or lobed, floral leaves often bract-like. *Flowers* usually small, in whorls of 2—6, in axillary or terminal spikes, racemes or heads. *Calyx* 2-lipped, 10-ribbed ; teeth 5, the uppermost usually largest. *Corolla*-tube not annulate ; limb 1-lipped, the 2 upper and the lateral lobes short or even obsolete, the end lobe large. *Stamens* 4, didynamous, the lower pair longest, all exserted ; anthers reniform, the cells short, at length confluent. *Disk* equal. *Ovary* 4-lobed ; style bifid, the lobes subequal. *Fruit* of 4 obovoid rugosely reticulate nutlets, the scar oblique or lateral, large.

Inflorescence densely villous with tawny often glandular hairs, the racemes in close panicles ; bracts lanceolate ; upper and side lobes of corolla-lip short and rounded :—

Leaves thin, ovate, acute, truncate or cuneate and entire at base, rest serrate or crenate, often doubly, sparsely pubescent above, more so beneath, up to 3 in. long, 2 in. broad, petiole slender, .5—1.5 in. long.....1. *tomentosum*.

Leaves thick, ovate, obtuse, rounded or cordate at base, crenulate, rugose and strigosely hairy on both surfaces, up to 1.5 in. long, 1 in. broad, petiole stout, .25—5 in. long.....2. *Wightii*.

Inflorescence with few glandular hairs, glabrescent, the racemes in slender leafy panicles ; bracts linear-lanceolate ; upper lobes of corolla lip curved acuminate, side lobes acute ; leaves thin, ovate, acute, rounded or cordate at base and then often acutely decurrent, sharply serrate, nearly glabrous above, minutely puberulous beneath, up to 2 in. long, 1.5 in. broad, petiole slender, .5—75 in. long

3. *plectranthoides*.

1. *TEUCRIUM TOMENTOSUM*, Heyne ; F. B. I. iv. 700.

W. Gháts, Nilgiris, Pulneys and hills of Tinnevely and Travancore, up to about 5,000 ft. ; Bababudan Hills of Mysore ; Kollimalai Hills of Trichinopoly.

An erect copiously flowering herb reaching 3 ft. in height, the flowers apparently yellowish (Benth.), the nutlets globose, granulate.

2. *TEUCRIUM WIGHTII*, Hook. f.; F. B. I. iv. 701. *T. tomentosum*, Wt. Ic. t. 1458, not of Heyne.

W. Gháts, Nilgiri Hills about Doddabetta at 7,000—8,000 ft., in dry rocky places.

A thick stout herb with short branches and pale purple flowers (Fyson).

3. *TEUCRIUM PLECTRANTHOIDES*, Gamble in Kew Bull., 1924, ined.

W. Gháts, near Sengalteri, Tinnevely (Hb. Madr.).

A slender erect herb with 4-angled stems, almost glabrous and with the flowers in spreading panicles of open racemes, the corolla rather large.

26. *Ajuga*, Linn.

Herbs, often decumbent or stoloniferous. *Leaves* opposite, usually coarsely toothed, floral leaves subsimilar. *Flowers* sessile in 2- or more-flowered whorls, axillary or in terminal leafy spikes. *Calyx* 5-lobed, lobes subequal. *Corolla* 2-lipped; tube often annulate within, straight or dilated and curved; upper lip short, 2-fid, lower lip spreading, the mid-lobe largest. *Stamens* 4, didynamous, ascending, the lower pair longest, exserted or included; anthers 2-celled, the cells divaricate, at length confluent. *Disk* uniform or swollen behind. *Ovary* 4-lobed; style slender, 2-fid, the stigmatic lobes nearly equal. *Fruit* of 4 obovoid rugosely reticulate nutlets, the scar lateral, large.

AJUGA MACROSPERMA, Wall.; F. B. I. iv. 704.

N. Circars, in Ganjam, up to 4,500 ft. on Mahendragiri (Beddome, Gamble, Barber).

A decumbent villous herb with blue flowers, the leaves soft, ovate or ovate-oblong, coarsely dentate, up to 4 in. long, 2 in. broad.

Nepeta ruderalis, Ham., is an aromatic herb believed to be occasionally found on roadside and waste lands in Northern Districts, though actual Madras specimens have not been examined.

Meriandra bengalensis, Benth., is the Bengal Sage, a pretty though straggling shrub with leaves like those of the cultivated sage (*Salvia officinalis*, Linn.) but strongly smelling of camphor. It is often cultivated and frequently found run wild. Its home is Abyssinia.

Family CXVI. PLANTAGINACEAE.

Scapigerous herbs. *Leaves* usually radical. *Flowers* small, greenish, spicate, often dimorphic, bracteate. *Sepals* 4, imbricate in bud, persistent. *Corolla* hypogynous, scarious, salver-shaped; lobes 4, short, imbricate in bud. *Stamens* 4, inserted on the corolla-tube; filaments capillary, persistent; anthers large, pendulous, versatile. *Ovary* superior, 1—4-celled; ovules 1 or more in each cell; style filiform with 2 lines of stigmatic hairs. *Fruit* a small membranous capsule, 1—4-celled.

dehiscence circumscissile. *Seeds* usually peltate, attached by the centre; testa thin, mucilaginous; albumen fleshy; embryo cylindric, transverse; radicle inferior.

Plantago, Linn.

Characters of the Family.

PLANTAGO ASIATICA, Linn.; Wt. Ill. t. 177. *P. major*, Hook. f.; F. B. I. iv. 705 *in part*.

Nilgiri and Pulney Hills, at high levels, in waste places and by roadsides. Plantain.

A perennial herb with erect stout rootstock and radical leaves, these are ovate, entire or more usual coarsely dentate or lobed, 3—5-ribbed, long-petioled, the flowers in long spikes with rather large bracts, the capsules many-seeded. It differs somewhat from the common European weed *P. major*, Linn.

P. lanceolata, Linn., the Ribwort Plantain, is occasionally found in the Nilgiris, probably introduced, as suggested by Trimen for Ceylon, with British grass-seed.

FLORA
OF THE
PRESIDENCY OF MADRAS

BY
J. S. GAMBLE, C.I.E., M.A., F.R.S., F.L.S.
LATE OF THE INDIAN FOREST DEPARTMENT

PART VII
NYCTAGINACEAE TO EUPHORBIACEAE.

PUBLISHED UNDER THE AUTHORITY
OF THE GOVERNMENT OF INDIA

CALCUTTA

1956

INTRODUCTION TO PART VII.

SINCE the issue of Part VI supplementary notes on Parts I, III, V and VI have appeared as No. V of "Notes on the Flora of Madras" in the 'Kew Bulletin' for 1924, p. 235.

It is with great regret that I have to record the death of Mr. J. S. Gamble on October 16th. Mr. Gamble had corrected all the proofs and had seen the final revises of all but the last two sheets through the press before his death.

ARTHUR W. HILL.

ROYAL BOTANIC GARDENS, KEW ;
November, 1925.

FLORA OF MADRAS.

IV. MONOCHLAMYDEAE.

Sepals distinct, herbaceous, rarely petaloid, imbricate or valvate, or connate in a tube with imbricate or valvate lobes. *Petals* usually 0, very rarely 1-seriate and like the *sepals*, more rarely 1-seriate and truly coralline, inserted on the disk or adnate to the ovary. *Torus* small, or raised and stalk-like. *Stamens* few, rarely numerous, inserted on the torus or rarely on the base of the perianth. *Carpels* 1 or more, free or connate.

Family CXVII. NYCTAGINACEAE.

Herbs, shrubs or trees. *Leaves* usually opposite, entire; stipules 0. *Flowers* hermaphrodite, rarely unisexual, regular, sometimes dimorphous; inflorescence various, the flowers often involucrate. *Perianth* monophyllous, petaloid, usually small; tube persistent, campanulate funnel-shaped or salver-shaped, enveloping the fruit; limb 3—5-lobed, persistent or deciduous, the lobes plicate in bud. *Stamens* 1—30, hypogynous, sometimes unilateral; filaments usually unequal, inflexed in bud; anthers included or exserted, dorsifixed, didymous. *Ovary* free, 1-celled; style filiform, involute in bud; stigma small; ovule solitary, basal, erect. *Fruit* indehiscent, enclosed in the hardened perianth-tube. *Seed* erect; testa thin, adherent; albumen soft or floury; embryo curved or straight and with folded cotyledons; radicle inferior.

Erect or diffuse herbs; embryo hooked, the radicle long; limb of perianth funnel-shaped, 5-lobed on the margin, the lobes plicate; flowers paniculate or umbellate

1. **Boerhaavia.**

Trees or shrubs, sometimes climbing; embryo straight, the radicle short; limb of perianth 5—10-lobed, of ♂ flower funnel-shaped, of ♀ tubular, lobes induplicate-valvate; flowers in corymbose cymes.....2. **Pisonia.**

1. **Boerhaavia**, Linn.

Erect or diffuse herbs, often divaricately branched. *Leaves* opposite, often in unequal pairs. *Flowers* small, in panicles umbels or heads, articulated with the pedicels; bracteoles small, often deciduous, rarely involucrate. *Perianth*-tube long or short, ovoid below, narrowed above the ovary; limb funnel-shaped or campanulate, 5-lobed. *Stamens* 1—5, connate below around the ovary, exserted; filaments capillary, unequal; anthers didymous. *Ovary* oblique, stipitate; ovule erect; stigma peltate. *Fruit* small, enclosed in the ovoid turbinate or clavate, truncate, ribbed or angled, viscidly glandular perianth-tube. *Seed* with adherent testa; embryo hooked; cotyledons thin, broad, the outer the larger, enclosing the soft floury albumen; radicle long.

Fruit glandular on the ribs, not at the crown:—

Flowers sessile or very nearly so, in panicles of subcapitate umbels with lanceolate minute bracteoles; perianth very short, urceolate; fruit clavate, 5-ribbed, viscidly glandular:—

Leaves thick, in unequal pairs, ovate oblong or suborbicular, acute or obtuse, rounded or subcordate at base, glabrous above, white beneath, somewhat undulate on the margin, up to 2 in. long, 1·25 in. broad, petiole slender, up to 1 in. long, nerves 3—4 pairs.....1. *diffusa*.

Leaves coriaceous, in equal or unequal pairs, ovate or ovate-oblong, obtuse, rounded at base, scabrid on both surfaces, crispate-undulate on the margins, up to 1 in. long, ·75 in. broad, petiole up to ·25 in. long, nerves 5—6 pairs, prominent when dry.....2. *crispa*.

Flowers on capillary pedicels in umbels with linear lanceolate bracteoles; perianth ·25 in. long with slender tube and funnel-shaped limb; fruit clavate with large glands; leaves thick, triangular-ovate, acute, rounded or cordate at base, glabrous above, pubescent beneath, repand sinuate, up to 3 in. long, 1·5 in. broad, petiole to ·5 in.....3. *repanda*.

Fruit with large stalked globose glands on the crown, clavate; flowers in long-pedunculate racemes, in few-flowered whorls on a slender rhachis; pedicels filiform, perianth-tube slender, limb funnel-shaped; leaves thick, broadly ovate or suborbicular, obtuse, mucronate, cordate at base, glabrous, the margins sinuate, up to 2·25 in. long and broad, petiole to ·75 in.....4. *verticillata*.

1. *BOERHAAVIA DIFFUSA*, Linn. *B. repens*, Linn.; F. B. I. iv. 709.
B. procumbens, Roxb.; Wt. Ic. t. 874.

All plains Districts, also to some height in the hills, a weed of waste lands and road-sides.

A diffuse herb with stout rootstock and many erect or procumbent branches, the flowers red, the fruit very viscid, easily detached and so adherent to clothes or the fur of animals. It is very variable according to soil and climate.

2. *BOERHAAVIA CRISPA*, Heyne in Wall. Cat. 6771; F. B. I. iv. 709.
Deccan, in dry Districts (Heyne).

A stout very scabrid herb, with long peduncles.

3. *BOERHAAVIA REPANDA*, Willd.; F. B. I. iv. 709; Wt. Ic. t. 1766.
Deccan, in dry Districts.

A diffuse herb with pink flowers, often found climbing among bushes, the fruit with conspicuous viscid glands.

4. *BOERHAAVIA VERTICILLATA*, Poir.; F. B. I. iv. 710. *B. stellata*, Wt. Ic. t. 875.

Deccan and Carnatic, in dry Districts, often on black cotton soil.
A diffuse herb with long branches, white flowers and a fruit with curious glands round the top.

2. *Pisonia*, Linn.

Trees or shrubs, unarmed or with axillary spines. *Leaves* opposite or alternate, entire. *Flowers* small, usually dioecious, in panicle, subsessile or pedunculate cymes, bract and bracteoles small. *Male flowers*: perianth campanulate, the limb 5-lobed, the lobes induplicate-valvate; stamens 6—10, exserted, filaments connate below in a tube or ring, anthers oblong or didymous. *Female flowers*: perianth tubular, usually enlarged at base; ovary sessile, elongate, style included or exserted; stigma capitellate, peltate or fimbriate. *Fruit* enclosed in the coriaceous, oblong linear or clavate, perianth-base, compressed or 5-angled, usually with rows of viscid stipitate glands; utricle

membranous. *Seed* with a hyaline testa adnate to the pericarp, embryo straight; albumen soft, enclosed in the cotyledons, radicle inferior.

PISONIA ACULEATA, Linn.; F. B. I. iv. 711; Wt. Ic. tt. 1763—64.

N. Circars, Ganjam to Godavari, on the Coast, in forest lands, hedges and bushes, common, less so southwards as at Striharikota. Occasionally found inland, as in Anamalais, at 1,200 ft. (Fischer). A large thorny climbing shrub with opposite coriaceous elliptic or ovate leaves up to 3 in. long, the flowers in dense corymbose cymes, greenish-white. Wood of peculiar and interesting structure. The plant makes a good hedge, green or dry. Inland specimens are sometimes without thorns. Vern. *Ur.* Hati-ankusa.

P. morindifolia, R. Br.; Wt. Ic. t. 1765, is the Tree Lettuce, a small tree of the beach forests of the Andaman Islands, frequently found in gardens in Madras and other places near the sea on both coasts and noticeable for its very pale green leaves.

Mirabilis Jalapa, Linn., the Marvel of Peru, is a large herbaceous plant with showy flowers of various colours, crimson yellow white or striped, frequently grown in gardens and often seen run wild.

Bougainvillea spectabilis, Willd., and *B. glabra*, Chois., are large thorny climbing Brazilian shrubs very common in gardens. They have small pale yellow flowers with large and conspicuous magenta or purple bracts. A variety (*B. lateritia*) has the bracts brick-red and the leaves nearly tomentose.

Family CXVIII. AMARANTACEAE.

Herbs, rarely shrubs, erect or climbing. *Leaves* opposite or alternate; stipules 0. *Flowers* usually hermaphrodite, rarely polygamous or dioecious, small, usually in terminal and axillary, simple or paniced, spikes cymes or clusters; bracts hyaline or scarious; bracteoles 2, scarious. *Perianth* dry, calycine, persistent, usually of 5 free or slightly connate hyaline or scarious imbricate segments. *Stamens* 1—5, opposite the perianth segments; filaments free or connate below in a membranous hypogynous cup, often alternating with membranous staminodes; anthers dorsifixed, 1- or 2-celled. *Ovary* 1-celled, ovoid ellipsoid or globose; ovules 1 or more, amphitropous, erect or suspended from basal funicles; style sometimes simple with capitellate stigma, sometimes 2—3-fid with acute stigmas or styles 2 or 3 papillosely stigmatic on the lower face. *Fruit* a membranous utricle, rarely a berry or a capsule, breaking irregularly or circumscissile. *Seed* erect or inverted, orbicular ovate or reniform, compressed; testa crustaceous; tegmen, if present, membranous; embryo horseshoe-shaped or annular, surrounding a floury albumen.

Anthers 2-celled:—

Leaves alternate:—

Seeds several, utricle circumscissile.....1. **Celosia.**

Seeds solitary, erect:—

Flowers hermaphrodite:—

Flowers paniced; fruit an indehiscent utricle.....2. **Banalia.**

Flowers capitate; fruit a circumscissile utricle.....3. **Allmania.**

Flowers spicate; fruit indehiscent, crustaceous, rugose.....4. **Digera.**

- Flowers unisexual; fruit an indehiscent or circumscissile utricle
5. *Amarantus*.
 Leaves opposite; ovule and seed solitary, suspended from a basal funicle:—
 Flowers clustered, 1–3 perfect surrounded by others imperfect with hooked bristles or awns:—
 Stamens with interposed staminodes.....6. *Cyathula*.
 Staminodes 0.....7. *Pupalia*.
 Flowers all perfect:—
 Staminodes 0:—
 Perianth-segments ribbed; stamens 5:—
 Flower-spikes axillary.....8. *Psilotrichum*.
 Flower-spikes paniced.....9. *Psilostachys*.
 Perianth-segments hyaline; stamens 1 or 2.....10. *Nothosaerva*.
 Stamens with interposed staminodes; perianth-segments, bracts and bracteoles hardened, spinescent.....11. *Achyranthes*.
 Leaves alternate or fascicled, or with opposite and alternate mixed; stamens with interposed staminodes.....12. *Aerva*.
 Anthers 1-celled; leaves opposite; flowers in small clusters.....13. *Alternanthera*.

1. *Celosia*, Linn.

Herbs, usually annual, the stems sometimes woody below. *Leaves* alternate. *Flowers* hermaphrodite, in terminal or axillary, often dense, often interrupted spikes, sessile or shortly pedicelled, white or coloured; bracts and bracteoles scarious, shining. *Perianth*-lobes 5, calycine, slightly connate below, scarious, oblong or lanceolate. *Stamens* 5; filaments slender, connate below in a membranous hypogynous cup; anthers 2-celled. *Ovary* 1-celled, ovoid or subglobose; ovules 2 or more on long funicles from the base of the ovary; style 0 or short or long, sometimes elongating in fruit; stigma simple. *Fruit* a utricle dehiscing in circumscissile fashion near the middle, membranous or sometimes corky or coriaceous. *Seeds* 2 or more, erect, lenticular; testa crustaceous, black, often shining; embryo annular, surrounding the floury albumen; cotyledons linear.

Flowers in dense stout imbricate spikes 1–6 in. long, the perianth often pink at first, but becoming later shining white, its lobes about .25 in. long; leaves variable, linear or linear-lanceolate, rarely ovate or lanceolate, sometimes reaching 6 in. long and 1.5 in. broad.....1. *argentea*.

Flowers in small clusters in slender interrupted spikes:—

- Perianth-lobes .1 in. long; utricle gradually narrowed at apex, with style and 2 recurved stigmas; leaves ovate or lanceolate, acuminate, narrowed at base, up to 3 in. long, 2 in. broad, petiole to 1.5 in. long.....2. *pulchella*.
 Perianth-lobes about .075 in. long; utricle with a thickened head at apex, the 2 stigmas short and slender, recurved; leaves ovate, obtuse or subacute, rounded at base, up to 1.5 in. long, 1 in. broad, petiole to .75 in.....3. *polygonoides*.

1. *CELOSIA ARGENTEA*, Linn.; F. B. I. iv. 714; Wt. Ic. t. 1767.

All plains Districts, chiefly on cultivated land or among grasses, up to 4,000 ft. in the hills, common but not really indigenous. An erect glabrous annual up to 3 ft. high, the long shining flower-heads conspicuous.

2. *CELOSIA PULCHELLA*, Moq.; F. B. I. iv. 715; Wt. Ic. t. 1768.

Deccan, Horsleykonda in Chittoor, 4,000 ft. (Gamble); W. Gháts, Nilgiris, Pulneys and hills of Tinnevely and Travancore, at 3,000–6,000 ft.

A slender diffuse herb, the branches glabrous.

3. CELOSIA POLYGONOIDES, Retz.; F. B. I. iv. 715.

Deccan and Carnatic, on sandy soils.

A diffuse herb with many branches from a stout rootstock.

C. cristata, Linn., the Cockscomb plant, commonly cultivated in gardens and sometimes found as an escape, is easily recognized by the curious monstrous fasciated growth of its inflorescence, which may be red or yellow usually. It is very closely allied to *C. argentea*, and may be a variety of that species.

2. Banalia, Moq.

An erect glabrous branching herb. *Leaves* alternate, membranous. *Flowers* hermaphrodite, in clusters in axillary or terminal spikes, usually forming pale chaffy thyrsoid panicles; bracts hyaline, also the 2 bracteoles. *Perianth*-segments 5, calycine, oblong, scarious, membranous, 3-nerved. *Stamens* 5, the filaments united below in a cup; anthers 2-celled. *Ovary* ovoid, compressed; style erect; stigmas 2, recurved, papillose; ovule 1, pendulous on a slender funicle. *Fruit* a subglobose, indehiscent utricle. *Seed* orbicular, the testa black, crustaceous.

BANALIA THYRSIFLORA, Moq.; F. B. I. iv. 716; Wt. Ic. t. 1774.

W. Ghâts, from Wynaad southwards, at 2,000—6,000 ft.

A slender tall herb with conspicuous white or cream-coloured thyrsoid panicles; leaves rhomboid-ovate or ovate-lanceolate, acuminate, up to 4 in. long, 2 in. broad.

3. Allmania, R. Br.

Erect or diffuse herbs. *Leaves* alternate, entire. *Flowers* hermaphrodite; in small dichasia, usually of 3, the centre one sessile with 1 or no bracteoles, the side ones pedicellate with 1 bract and 2 bracteoles; these dichasia are collected in terminal or axillary globose or oblong heads; bracts and bracteoles narrow, scarious, usually hispid, with filiform tips. *Perianth* calycine, of 5 nearly free oblong lanceolate scarious lobes. *Stamens* 5, the filaments connate in a membranous hypogynous cup, anthers 2-celled. *Ovary* ovoid, narrowed in a straight style; ovule 1, erect; stigma 2-lobed. *Fruit* a subglobose or ovoid membranous utricle, circumscissily dehiscent. *Seed* erect, subglobose, in a cup-shaped arillus; testa black, shining, crustaceous; embryo annular, surrounding copious albumen; cotyledons linear; radicle inferior.

Flower-heads usually sessile, brown, globose; prostrate diffuse or rarely erect herbs with extremely variable leaves.....1. *nodiflora*.
Flower-heads more or less peduncled, white, oblong or ovoid, rarely globose; erect pale herbs with usually narrow spatulate leaves up to 5 in. long

2. *longepedunculata*.1. ALLMANIA NODIFLORA, R. Br.; F. B. I. iv. 716 (var. *Roxburghii*, Hook. f.).

Circars and Carnatic, in coast Districts.

A straggling many-branched herb with stout root-stock and obovate spatulate apiculate leaves, the flower-heads usually 5 in. in diam. Closely allied and often difficult to distinguish are the following varieties, established in the 'F. B. I.'

Var. *procumbens*, Hook. f. *Chamissoa nodiflora*, Wt. Ic. t. 1770, prostrate with long prostrate branches, small, variable, linear to orbicular leaves and small flower-heads. Coast of the Carnatic, on sand.

Var. *aspera*, Hook. f. *Chamissoa aspera*, Wt. Ic. t. 1772, erect but diffuse and hispidly hairy, the leaves linear-oblong or lanceolate, the flower-heads larger, often .75 in. in diam. Deccan Districts, west to the E. slopes of the Ghâts, less common in Circars or Carnatic, in fields.

Var. *dichotoma*, Hook. f. *Chamissoa dichotoma*, Moq.; Wt. Ic. t. 1771, erect dichotomous and nearly glabrous with elliptic or ovate apiculate leaves. Carnatic, from Salem and Nellore southwards.

Var. *angustifolia*, Hook. f. Erect, sometimes tall and slender, with linear or linear-oblong leaves often up to 3 in. long, and rather large sometimes peduncled flower-heads. N. Circars, Deccan, Carnatic and E. slopes of the W. Ghâts up to 6,000 ft.

2. ALLMANIA LONGEPEDUNCULATA, Gamble n. comb. *A. nodiflora*, R. Br., var. *longepedunculata*, Trimen. *A. albida*, R. Br.; F. B. I. iv. 717. *Chamissoa albida*, Wt. Ic. t. 1769.

Circars, Deccan and Carnatic, but chiefly near the coast.

A tall erect herbaceous plant with pale (even when dry) leaves and white flower-heads often with rather long peduncles.

4. *Digera*, Forsk.

An annual herb. *Leaves* alternate, entire, petioled. *Flowers* hermaphrodite, in axillary peduncled spikes, ternate, the 2 outer reduced to crested scales, the central perfect; bracts and bracteoles persistent. *Perianth* calycine, submembranous; segments 5, oblong, erect, the 2 outer larger. *Stamens* 5, hypogynous; filaments free, filiform; anthers 2-celled. *Ovary* 1-celled, compressed truncate; style filiform; stigmas 2, short, recurved. *Fruit* a subglobose, crustaceous, rugose nut enclosed in the perianth. *Seed* globose, erect; testa thin, adhering to the albumen; embryo annular; cotyledons linear.

DIGERA ARVENSIS, Forsk.; F. B. I. iv. 717. *Desmochoea muricata*, DC.; Wt. Ic. t. 732.

Deccan and Carnatic, a weed of roadsides and waste places. A slender herb with prostrate branches, the leaves variable, ovate elliptic or lanceolate, acute or obtuse, up to 3 in. long and nearly 2 in. broad, the petioles slender, often 1 in. long.

5. *Amarantus*, Linn.

Erect or decumbent annual herbs. *Leaves* alternate. *Flowers* small, monoecious, in axillary clusters or dense terminal thyrsoid panicles; bracts herbaceous, often persistent; bracteoles 2. *Perianth* calycine, of 2—5 membranous lobes, the ♂ usually ovate-lanceolate, awned, the ♀ oblong or obovate, usually mucronate and often smaller. *Stamens* 2—5, as many as the perianth-lobes; filaments free; anthers 2-celled. *Ovary* ovoid, compressed, 1-celled; ovule solitary, erect; styles short or 0; stigmas 2—3. *Fruit* an orbicular or ovoid compressed utricle, membranous and usually circumscissile, or coriaceous and indehiscent. *Seed* erect, orbicular, compressed; testa crustaceous; embryo annular, enclosing the floury albumen; cotyledons linear; radicle inferior.

Bracteoles awned or setaceous, equalling or exceeding the perianth-lobes; utricle dehiscent, circumscissile:—

Stamens and perianth-lobes 5 each:—

Leaf-axils with spines; leaves ovate or oblong, obtuse; bracts bristle-tipped; flower-clusters in dense or lax panicles, the axils often with spines

1. *spinosus*.

Leaf-axils not spinous; leaves elliptic or ovate-lanceolate; bracts acicular; flowers in thyrses:—

Leaves acute or acuminate; bracts recurved, exceeding the oblong-lanceolate acuminate perianth-lobes.....2. *paniculatus*.

Leaves obtuse, rarely acute; bracts hardly recurved, scarcely exceeding the ovate or obovate mucronate perianth-lobes.....3. *caudatus*.

Stamens and perianth-lobes 3 each:—

Erect plants, the flowers clustered in lower axils and also gradually joined in a long terminal spiciform panicle; leaves large but variable, long-petioled; perianth-lobes awned:—

Stigmas short and straight; awns of perianth-lobes long and tapering; leaves ovate, acute, cuneate at base, up to 5 in. long, 3 in. broad, petiole to 3 in., sometimes lanceolate or linear-lanceolate.....4. *gangeticus*.

Stigmas long and feathery; awns of perianth-lobes short, shorter in ♂ than in ♀, but the ♂ flowers generally larger; leaves elliptic-lanceolate, acuminate, cuneate and decurrent at base, up to 6 in. long, 2 in. broad, petiole to 2 in.

5. *Caturus*.

Diffuse, no terminal spike; stigmas short; awns of perianth-lobes short and abrupt; leaves ovate-elliptic or deltoid-ovate, emarginate, up to 1.5 in. long, 1 in. broad, the petiole to 1 in.....6. *mangostanus*.

Bracteoles acute or slightly awned, shorter than the perianth-lobes; utricle rugose; stamens and perianth-lobes 3 each:—

Utricle prominently rugose, indehiscent, acute; flowers in axillary and terminal panicles slender spikes; leaves ovate or deltoid, obtuse and often emarginate at apex, truncate or cuneate at base, up to 3 in. long, 2 in. broad, petiole to 2 in.....7. *viridis*.

Utricle ovoid, slightly rugose or waved, usually circumscissile; flowers in axillary clusters; leaves obovate, obtuse, rarely retuse, usually mucronate, cuneate at base, dotted, up to 1 in. long, .5 in. broad, petiole to .5 in.....8. *polygamus*.

1. *AMARANTUS SPINOSUS*, Linn.; F. B. I. iv. 718; Wt. Ic. t. 513.

All plains Districts, in waste places, fields and gardens and on roadsides; a common and troublesome weed.

An erect spinous herb with hard often reddish stems. The leaves are sometimes eaten as spinach. Vern. *Hind.* Kanta nutiya; *Tam.* Mulluk kirai.

2. *AMARANTUS PANICULATUS*, Linn.; F. B. I. iv. 718. *A. frumentaceus*, Buch.-Ham.; Wt. Ic. t. 720.

Deccan and other hilly regions, cultivated and run wild.

A tall annual herb grown for its seeds, which may be white red or black; the leaves give a good spinach though difficult to pick. Vern. *Tam.* Púngi kirai.

3. *AMARANTUS CAUDATUS*, Linn.; F. B. I. iv. 719.

Hills of Deccan and W. Gháts, cultivated only, chiefly in gardens, perhaps also sometimes found run wild. Lovelies-bleeding.

A tall herb with long heavy drooping thyrses of crimson flowers.

4. *AMARANTUS GANGETICUS*, Linn.; F. B. I. iv. 719. *A. oleraceus*, Roxb.; Wt. Ic. t. 715.

Most plains Districts, cultivated and run wild.

An erect leafy herb, grown as a spinach (ság). Vern. *Hind.* Lal ság.

Var. *tristis*, Prain. *A. tristis*, Roxb.; Wt. Ic. t. 713.

Many branches from near the base and more frequently cut and used. Cultivated.

5. *AMARANTUS CATURUS*, Heyne; F. B. I. iv. 720.

Deccan, without locality (Heyne).

An erect well-marked plant with thin leaves and long very slender flower-spikes. The utricle may perhaps not be dehiscent circumscissily; it has an elongated neck and slender plumose styles.

6. *AMARANTUS MANGOSTANUS*, Linn.; F. B. I. iv. 720.

Deccan and Carnatic, in most Districts, a weed of roadsides and waste lands, not common.

A diffusely-branched slender herb.

7. *AMARANTUS VIRIDIS*, Linn.; F. B. I. iv. 720. *A. fasciatus*, Roxb.; Wt. Ic. t. 717. *Euxolus caudatus*, Moq.; Wt. Ic. t. 1773.

All plains Districts, a weed of waste places and cultivated land.

An erect glabrous annual, the leaves much used as spinach.

8. *AMARANTUS POLYCAMUS*, Linn.; F. B. I. iv. 721. *A. polygonoides*, Roxb.; Wt. Ic. tt. 512, 719.

All plains Districts, a common weed of waste or cultivated land.

A small annual usually prostrate herb, the leaves often collected and used as spinach.

6. *Cyathula*, Lour.

Herbs or undershrubs. *Leaves* opposite, petioled, entire. *Flowers* small, hermaphrodite, in large or small, bracteate and bracteolate, fascicles with 1—2 perfect flowers and others imperfect, the fascicles in heads, racemes or spikes. *Perianth* of perfect flowers calycine, scarious, 5-lobed, the lobes acuminate or with hooked awns; of imperfect flowers reduced to hooked rigid awns. *Stamens* 5, the filaments connate below in a hypogynous membranous cup, with intervening lacerate or 2—3-fid staminodes; anthers 2-celled. *Ovary* obovoid, 1-celled; ovule solitary, pendulous from a long basal funicle; style simple, filiform; stigma capitellate. *Fruit* an ovoid membranous utricle enclosed in the perianth, its apex areolate. *Seed* oblong, inverse; testa coriaceous; embryo annular; cotyledons linear, flat; radicle erect.

CYATHULA PROSTRATA, Blume; F. B. I. iv. 722. *Desmochoeta prostrata*, DC.; Wt. Ic. t. 733.

Deccan, in Mysore and the Ceded Districts to Coimbatore, up to 3,000 ft.; W. Coast and W. Gháts, S. Canara to Travancore, up to 3,000 ft.

A slender herb, prostrate below and rooting at the nodes, the branches ascending, ending in slender racemes of fascicles of pale violet flowers, the leaves rhomboid or ovate, subacute, up to 2·5 in. long, 1·5 in. broad.

7. *Pupalia*, Juss.

Herbs or undershrubs. *Leaves* opposite, entire, petioled. *Flowers* green, hermaphrodite, fascicled in clusters with 1—2 perfect flowers, the rest imperfect, the clusters rather distant in simple or paniced

spikes; bracts and bracteoles scarious, awned. *Perianth* of perfect flowers calycine, of 5 nearly equal lanceolate acuminate 3—5-nerved lobes, of imperfect flowers reduced to stellately spreading hooked bristles. *Stamens* 5; filaments slender, subulate, shortly combined at the base; anthers 2-celled; staminodes 0. *Ovary* ovoid, 1-celled; ovule 1, pendulous from a long basal funicle; style simple; stigma capitate. *Fruit* an ovoid membranous utricle, enclosed in the perianth, the top areolate. *Seed* inverse, lenticular, rostellate; testa thinly crustaceous; tegmen membranous; embryo annular; cotyledons linear, flat; radicle ascending.

Leaves ovate or elliptic, up to 4 in. long:—

Herbaceous, glabrous or nearly so, annual or biennial; leaves ovate or elliptic-lanceolate, acuminate, up to 4 in. long, 2 in. broad, petioles to .75 in.; hooked bristles purple.....1. *atropurpurea*.
Shrubby, tomentose, perennial; leaves elliptic or ovate, acute or obtuse, often shortly apiculate, base usually rounded, up to 4.5 in. long, 2 in. broad, petioles to .5 in.; hooked bristles yellow.....2. *lappacea*.
Leaves orbicular or broadly obovate, retuse, thick, .75—1.25 in. in diam., decurrent at base to a short petiole; hooked bristles brown.....3. *orbiculata*.

1. *PUPALIA ATROPURPUREA*, Moq.; F. B. I. iv. 723. *Desmochaeta atropurpurea*, DC.; Wt. Ic. t. 731.

N. Circars, common; Deccan, in Coimbatore and to the E. slopes of the Gháts, less so.

A slender herb with long branches, the flower-clusters with loose brownish wool.

2. *PUPALIA LAPPACEA*, Moq.; F. B. I. iv. 724.

N. Circars, Deccan and Carnatic, westwards to the E. slopes of the Gháts.

A large straggling undershrub, the flower-clusters very white woolly.

Var. *velutina*, Hook. f. Densely nearly white-tomentose or velvety, the leaves smaller and usually orbicular—without locality (Wight).

3. *PUPALIA ORBICULATA*, Wt. Ic. t. 1783; F. B. I. iv. 724.

Coromandel Coast, especially near Madras, a sand-binding plant (see H. Cleghorn in 'Madr. Journ.' i.) of the sea beach.

An extensively spreading prostrate plant from a stout woody rootstock, the hooked bristles finally becoming as it were pinnate, the wool loose and white.

8. *Psilotrichum*, Blume.

Herbs or undershrubs. *Leaves* opposite, entire, petioled. *Flowers* white or greenish, hermaphrodite, in axillary, solitary or paniced, spikes or clusters; bracts small, persistent; bracteoles 2, small. *Perianth* calycine, of 5 slightly connate segments, the outer gibbous below, the inner rather smaller. *Stamens* 5; filaments subulate, shortly connate at the base; anthers 2-celled; staminodes 0. *Ovary* oblong or subglobose; ovule 1, pendulous from a long basal funicle; style simple, slender; stigma capitellate or bifid. *Fruit* a globose or compressed utricle, enclosed in the hardened perianth. *Seed* inverse, lenticular; testa coriaceous or crustaceous; embryo annular, enclosing the floury albumen; cotyledons flat; radicle ascending.

Spikes few, in upper axils, .5—1 in. long; perianth .25 in. long, deeply grooved, pubescent; bracts lanceolate, bracteoles ovate, both awned; leaves ovate-lanceolate, or lanceolate-acuminate, narrowed at base, glabrous, up to 3 in. long, 1 in. broad.

1. *nudum*.
Spikes many, in most axils under .5 in. long; perianth .15 in. long, ribbed, with silky wool; bracts ovate acuminate, bracteoles broadly ovate, both awned and villous; leaves ovate or elliptic, acute, rounded at base, glabrous or pubescent to even tomentose, up to 1.5 in. long, nearly 1 in. broad.....1. *calceolatum*.
Spikes 1—3 together, terminal, .5—.75 in. long; perianth .15 in. long, smoothly pubescent, not ribbed, segments mucronate; bracts ovate, mucronate, villous, bracteoles ovate, awned, glabrous; leaves ovate-lanceolate, acute, narrowed at base, scaberulous-villous, 1—1.5 in. long, .5—.75 in. broad.....3. *scleranthum*.

1. *PSILOTRICHUM NUDUM*, Moq.; F. B. I. iv. 724.

Carnatic, chiefly South, about Courtallum (Wight).

A many-branched undershrub.

2. *PSILOTRICHUM CALCEOLATUM*, Moq.; F. B. I. iv. 725. *P. nudum*, Wt. Ic. t. 1775.

Deccan and Carnatic, especially on W. side from Coimbatore to Tinnevely, in hill forests at low levels.

An erect or somewhat climbing undershrub, with many branches.

3. *PSILOTRICHUM SCLERANTHUM*, Thw.; F. B. I. iv. 725.

Travancore (Wight in 'Hb. Edinb.').

A small undershrub with whitish flowers, a Ceylon plant.

9. *Psilostachys*, Hochst.

Slender dichotomous herbs. *Leaves* opposite, petioled. *Flowers* minute, hermaphrodite, in slender spikes, trichotomous at the ends of the filiform branches of a lax panicle. *Perianth* calycine, 5-partite, the 2 or 3 outer lobes strongly 3-nerved, broader than the inner. *Stamens* 5, free; anthers 2-celled; staminodes 0. *Ovary* subglobose or ovoid, 1-celled; ovule solitary; styles slender; stigma capitellate. *Fruit* an indehiscent membranous utricle. *Seed* inverse; testa coriaceous; embryo hooked; cotyledons linear, broader than the ascending radicle.

PSILOSTACHYS SERICEA, Hook. f.; F. B. I. iv. 726. *Achyranthes sericea*, Koenig; Wt. Ic. t. 726.

Locality unknown (Koenig); Coromandel Coast, at Coconada (Gamble), at Kistnapatam, Neilore (Fischer), on the sea coast.

A very pretty slender erect silky herb with broadly ovate leaves up to 1 in. long, .75 in. broad. Bombay (Kathiawar) specimens seem to be more silvery silky than the E. coast ones.

10. *Nothosaerva*, Wight.

An annual herb with opposite spreading branches. *Leaves* opposite. *Flowers* very minute, woolly, hermaphrodite, in axillary, solitary or clustered spikes; bracts hyaline, persistent, bracteoles 2 hyaline. *Perianth* calycine, of 3—5 lobes, the lobes hyaline, obtuse, 1-nerved. *Stamens* usually 2, free; anthers 2-celled; staminodes 0. *Ovary* oblong, compressed; ovule solitary, pendulous from a long funicle; style short; stigma capitellate. *Fruit* a membranous oblong compressed utricle, enclosed in the perianth. *Seed* inverse, lenticular; testa crustaceous; embryo hooked, surrounding floury albumen; cotyledons linear; radicle superior.

NOTHOSAERVA BRACHIATA, Wt. Ic. t. 1776 bis (next No. 1921); F. B. I. iv. 726. *Pseudanthus brachiatus*, Wt. Ic. t. 1776 (*excl. analysis*).
Deccan and Carnatic, in most Districts.

An erect slender herb with very minute white flowers in fascicles of short close spikes, and membranous, ovate elliptic or lanceolate, leaves, usually acute, narrowed at base, up to 1·5 in. long.

11. *Achyranthes*, Linn.

Herbs, sometimes woody below. *Leaves* opposite, entire, petioled. *Flowers* hermaphrodite, in slender simple and paniced spikes, soon deflexed; bracts membranous, spinescent, persistent; bracteoles 2, spinescent. *Perianth* calycine, of 4—5 rigid, lanceolate, aristate segments somewhat connate below, ultimately ribbed and hardened. *Stamens* 2—5; filaments filiform, connate at the membranous base and alternating with as many quadrate staminodes which are toothed lacerate or with a toothed scale at the back; anthers 2-celled. *Ovary* oblong, subcompressed, 1-celled; ovule solitary, pendulous from a long basal funicle; style filiform; stigma capitellate. *Fruit* an oblong or ovoid utricle, rounded or areolate at apex, when ripe usually disarticulating above the bract. *Seed* inverse, oblong; testa coriaceous tegmen membranous; embryo annular, surrounding the floury albumen; cotyledons oblong, again incurved; radicle erect.

Aquatic plant; perianth in fruit much hardened, 3 in. long, the outer segment longer than the rest; bracteoles orbicular; staminodes with a fimbriate dorsal appendage; leaves elliptic-lanceolate, acuminate, pubescent, up to 6 in. long, 1 in. broad.....1. *aquatica*.

Dry ground plants; perianth in fruit somewhat hardened, under 25 in. long, the segments subequal; bracteoles spinous with hyaline wings:—

Wings of the bracteoles broad, nearly half as long as the spine; staminodes truncate, fimbriate, with or without dorsal appendages; leaves very variable

2. *aspera*.
Wings of the bracteoles merely auricles at the base; staminodes truncate, toothed but not fimbriate; leaves variable, elliptic lanceolate or linear, membranous, glabrous or pubescent.....3. *bidentata*.

1. *ACHYRANTHES AQUATICA*, R. Br.; F. B. I. iv. 730. *Centrostachys aquatica*, Wall.; Wt. Ic. t. 1780.

N. Circars, on the margins of rivers and ponds in Ganjam.
A tall rather fleshy water plant, rooting in mud, the stems thick and angular, the spikes sometimes reaching 18 in. long.

2. *ACHYRANTHES ASPERA*, Linn.; F. B. I. IV. 730; Wt. Ic. t. 1777.

All plains Districts, on roadsides and in waste places.
An erect herb reaching 3 ft. in height, with velvety tomentose, orbicular obovate or elliptic, usually obtuse, thick leaves, reaching 4 in. long, 3 in. broad, the slender spikes often reaching 18 in. in fruit, the disarticulating fruit easily adhering to animals or clothing, as in the other species, and so being carried away to be sown elsewhere.

Var. *rubro-fusca*, Hook. f. *A. rubro-fusca*, Wt. Ic. t. 1778. Leaves elliptic-ovate, acute, brown when dry, reddish, with the stems, when fresh. Nilgiri Hills.

Var. *porphyristachya*, Hook. f. Leaves elliptic, acuminate, glabrous or pubescent, membranous, the spikes slender and elongate, the perianth quite .25 in. long, the staminodes with appendages tufted at the back. Nilgiri and Pulney Hills.

3. *ACHYRANTHES BIDENTATA*, Blume; F. B. I. iv. 730; Wt. Ic. t. 1779. W. Ghâts, Nilgiris, Anamalais, Pulneys and hills of Malabar, also Bababudan Hills of Mysore, above 4,000 ft.

An erect herb, the leaves very variable, passing from ovate-lanceolate acuminate, pubescent, about 2 in. long, to lanceolate and finally linear, in some cases up to 8 in. long, 1.5 in. broad and nearly or quite glabrous.

12. *Aerva*, Forsk.

Herbs or undershrubs, erect prostrate or climbing. *Leaves* alternate or opposite or fascicled. *Flowers* hermaphrodite or polygamous, small or minute, in simple or paniced spikes; bracts and 2 bracteoles small. *Perianth* calycine, membranous, 5- rarely 4-lobed, the lobes equal or the outer wider, all or the inner only woolly. *Stamens* 5, rarely 4; filaments subulate, connate with interposed linear staminodes in a hypogynous cup; anthers 2-celled. *Ovary* ovoid or subglobose, 1-celled; ovule pendulous from a long basal funicle; style simple; stigma capitellate or 2-fid. *Fruit* a membranous utricle or a circumscissile capsule with coriaceous apex. *Seed* inverse; testa coriaceous; embryo annular, surrounding the floury albumen; cotyledons linear; radicle superior.

Perianth-lobes 5:—

Spikes axillary or in terminal panicles; leaves opposite or alternate.

Erect; leaves alternate, linear oblong or spatulate, obtuse or acute, densely tomentose, up to 2.5 in. long, about .5 in. broad; flowers dioecious, in densely white-woolly spikes 1—6 in. long forming leafless terminal panicles; stigmas 2, as long as the style.....1. *tomentosa*.

Climbing; leaves alternate and opposite, elliptic-ovate or lanceolate, acute, mucronate, pubescent, up to 4 in. long, 2 in. broad; flowers hermaphrodite, in ovoid or cylindric white-woolly spikes .25—1 in. long, and often in pairs, forming a lax panicle; stigmas very short, capitate.....2. *scandens*.

Spikes all axillary; leaves alternate:—

Erect or prostrate; leaves elliptic obovate or orbicular, obtuse or acute, pubescent above and white-woolly beneath, up to 1 in. long; flowers hermaphrodite or bisexual, minute, in small dense greenish-white heads or spikes, under .5 in. long, often clustered; stigmas 2.....3. *lanata*.

Bushy, prostrate below, then ascending; leaves orbicular or obovate, obtuse, thick, pubescent above, densely white- or slightly tawny-tomentose beneath, up to 2 in. long, 1.5 in. broad; flowers hermaphrodite, small, in small dense yellowish-white spikes .25 in. long, clustered; stigmas 2, short.....4. *Wightii*.

Perianth-lobes 4; spikes cylindrical, peduncled, .5—1 in. long, at the ends of short lateral branches, the flowers bisexual; leaves narrowly linear, opposite or fascicled at the nodes of the branchlets, .25—75 in. long; utricle circumscissile

5. *Monsoniae*.

1. *AERVA TOMENTOSA*, Forsk. *Ae. javanica*, Wt. Ic. t. 876; F. B. I. iv. 727.

Deccan and Carnatic, common.

A very white tomentose conspicuous undershrub. The male flowers seem to be very rare indeed. Perianth-lobes obtuse.

2. *AERVA SCANDENS*, Wall.; F. B. I. iv. 727; Wt. Ic. t. 724 (*exc. utricule and seed*).
N. Circars, Ganjam to Godavari, up to 5,000 ft.; Bababudan Hills of Mysore, at 4,000 ft., on waste land and climbing among bushes.
A straggling undershrub with long branches and silvery-white flower-spikes. Perianth-lobes acuminate.
3. *AERVA LANATA*, Juss.; F. B. I. iv. 728; Wt. Ic. t. 723 (*not good*).
A. floribunda, Wt. Ic. t. 1776 (analysis only), t. 1776 bis A (next t. 1921.)
All plains Districts, and up to about 3,000 ft. in the Hills.
A many-branched undershrub with small flower-spikes and leaves.
4. *AERVA WIGHTII*, Hook. f.; F. B. I. iv. 728.
W. Ghâts, hills about Courtallum and Naterikal, in Tinnevely (Wight, Hb. Madr.)
A many-branched bushy undershrub from a stout root-stock, the leaves thick, the perianth-lobes acuminate and aristate.
5. *AERVA MONSONIAE*, Mart.; F. B. I. iv. 728; Wt. Ic. t. 725.
Deccan and Carnatic, in dry sandy places, both near the Coast and inland, common.
A rather conspicuous and striking plant with a long tap-root, many prostrate or ascending branches and pale pink spikes of crowded flowers reaching up to 1 to 1·5 in. in length.

13. *Alternanthera*, Forsk.

Herbs, usually prostrate. *Leaves* opposite. *Flowers* hermaphrodite, small, white, in axillary often clustered heads, bract and 2 bracteoles scarious. *Perianth* calycine segments 5, unequal, the 2 lateral innermost, concave. *Stamens* 2—5; filaments short, connate in a short cup, with or without intervening staminodes; anthers 1-celled. *Ovary* orbicular or ovoid; ovule solitary, pendulous from a long basal funicle; style short; stigma capitellate. *Fruit* a compressed, ovoid orbicular or obcordate, utricule, the margins thickened or winged. *Seed* inverse, lenticular; testa crustaceous; embryo annular, surrounding the floury albumen; cotyledons narrow; radicle superior.

ALTERNANTHERA TRIANDRA, Lamk. *A. sessilis*, R. Br.; F. B. I. iv. 731; Wt. Ic. t. 727.

All Districts, in wet places, both in the plains and in the hills to over 7,000 ft. It may be found in salt or brackish water as in fresh (Alcock in Ganjam, also Hooper).

A prostrate herb with lanceolate oblanceolate or linear-oblong leaves 1·5—2 in. long, small white flowers in axillary clusters, 3 stamens and a broadly obcordate utricule.

Gomphrena globosa, Linn.; F. B. I. iv. 732; Wt. Ic. t. 1784, is the Globe Amaranth, a tall branched annual with large globose yellowish white or crimson heads of flowers, largely grown in gardens and often found as an escape. It probably came from America. Another species, provisionally identified as *G. decumbens*, Jacq. of Central America, is

found on road-sides about Madras and is reported to be spreading rapidly. *Telanthera ficoidea*, Moq., is a small S. American prostrate plant resembling *Alternanthera* and used in garden-borders as its leaves turn a crimson colour. It is commonly called *Alternanthera amabilis*.

Family CXIX. CHENOPODIACEAE.

Herbs or shrubs, sometimes mealy, sometimes fleshy. *Leaves* usually alternate, simple, exstipulate. *Flowers* small, usually green, hermaphrodite or unisexual, usually regular, often dimorphic; bracts 1 or 0; bracteoles 0 or 2. *Perianth* simple, calycine, of 3—5 simple or connate segments, imbricate in bud. *Stamens* usually 5, opposite the perianth-segments, perigynous or hypogynous, free or connate at the base; anthers 2-celled. *Ovary* ovoid globose or depressed, 1-celled; ovule solitary, basal or lateral, campylotropous; style terminal; stigma capitate 2—3 lobed or stigmas 2—5 free or slightly united. *Fruit* a small utricle, rarely a circumscissile capsule, enclosed in the enlarged sometimes fleshy perianth. *Seed* horizontal or vertical with crustaceous coriaceous or membranous testa; albumen floury, fleshy or 0; embryo curved, annular or spiral.

Stems not twining; bracteoles free from the perianth; anthers erect or incurved in bud:—

Embryo annular or horse-shoe-shaped:—

Stems leafy, not jointed:—

Fruiting perianth not winged; albumen copious:—

Flowers all similar, usually hermaphrodite.....1. *Chenopodium*.

Flowers dimorphic, the ♂ chacteolate with 3—5 perianth-segments, the ♀ 2-bracteolate without perianth.....2. *Atriplex*.

Fruiting perianth with transverse wings; albumen scanty.....3. *Kochia*.

Stems jointed, fleshy; leaves 0:—

Flowers in the scales of cone-like spikes; albumen fleshy...4. *Arthrocnemum*.

Flowers in cavities of successive joints; albumen 0.....5. *Salicornia*.

Embryo spiral, albumen 0:—

Perianth-segments not winged.....6. *Suaeda*.

Perianth-segments transversely winged.....7. *Haloxylon*.

Stems twining; bracteoles 2, adnate to the face of the perianth; anthers versatile; embryo spiral.....8. *Basella*.

1. *Chenopodium*, Linn.

Erect or prostrate herbs. *Leaves* alternate, entire, lobed or toothed. *Flowers* minute, hermaphrodite, in axillary clusters or cymes; bracts and bracteoles none. *Perianth* usually 5-lobed, the lobes concave, incurved. *Stamens* 5 or fewer, hypogynous or almost perigynous; anthers 2-celled. *Disk* 0 or annular. *Ovary* depressed-globose, rarely ovoid; ovule solitary, sessile; stigmas 2—5, sometimes united below in a style. *Fruit* a membranous utricle, enclosed in the perianth. *Seed* usually horizontal; testa crustaceous or coriaceous; embryo nearly or quite annular, surrounding the floury albumen.

An erect scentless herb, green or grey with white granular mealliness; the stems usually striped green or purple; flowers in clusters in paniced spikes; stigmas 2; seeds smooth, shining, somewhat keeled; leaves rhomboid deltoid or lanceolate, entire or lobed.....1. *album*.

A low rather foetid herb, green or with slight granular mealiness; the stems green; flowers in axillary spikes in spreading cymes; stigmas 2; seeds smooth, dull, sharply keeled; leaves rhomboid or deltoid ovate, sharply toothed.....2. *murale*. A tall strongly aromatic glandular herb, pale green; the stems striate, glandular-pubescent; flowers in slender, axillary or terminal, simple or paniced spikes; stigmas 5; seeds smooth, the margins rounded; leaves oblong-lanceolate, sinuate-dentate, the upper entire.....3. *ambrosioides*.

1. *CHENOPODIUM ALBUM*, Linn.; F. B. I. v. 3.

Most plains Districts, also in the Hills, a weed of road-sides, waste lands and cultivated ground. White Goosefoot.

A tall herb sometimes reaching 10 ft., clammy to the touch.

2. *CHENOPODIUM MURALE*, Linn.; F. B. I. v. 4.

Deccan, in Mysore and Coimbatore, probably an introduced weed, but not common.

A low herb, up to about 15 in. high.

3. *CHENOPODIUM AMBROSIODES*, Linn.; F. B. I. v. 4; Wt. Ic. t. 1786.

Deccan and W. Ghâts, up to 7,000 ft., in waste places and on cultivated land, probably not indigenous.

A tall aromatic often gregarious herb with very slender flowering spikes.

2. *Atriplex*, Linn.

Herbs or shrubs, usually mealy. *Leaves* alternate, rarely opposite. *Flowers* small, monoecious or dioecious, in axillary sessile clusters or in simple or paniced spikes; bracts 0, bracteoles in ♂ flowers 0, in ♀ 2, flat, accrescent, dilated in fruit and forming a 2-valved covering to it. *Perianth* in ♂ flower 3—5-partite, calycine, the lobes oblong or obovate, obtuse; in ♀ flowers 0. *Stamens* 3—5, inserted at the base of the perianth; filaments free or connate below; anthers didymous. *Ovary* ovoid or depressed-globose; ovule oblique or vertical; stigmas 2, subulate or filiform, connate below. *Fruit* a membranous utricle, rarely adnate to the seed, enclosed in the enlarged bracteoles. *Seed* erect or inverted, suspended from a long funicle or rarely horizontal; embryo annular, surrounding the floury albumen.

ATRIPLEX REPENS, Roth; F. B. I. v. 7. *Obione Koenigii*, Moq.; Wt. Ic. t. 1790.

E. Coast, from Nellore southwards, on sandy sea-shores.

An undershrub with thick rootstock and long procumbent branches rooting at the nodes, the leaves small, ovate or ovate-oblong, rounded at apex, entire, completely covered with minute white shining scales, up to .75 in. long; bracteoles in fruit thick and usually with warty protuberances on the back.

A. hortensis, Linn.; F. B. I. v. 6. *A. heterantha*, Wt. Ic. t. 1787, is a stout annual often tinged with red, the leaves ovate-lanceolate, the fruiting bracteoles orbicular and reticulate. It is sometimes cultivated as a spinach.

3. *Kochia*, Roth.

Herbs or undershrubs, usually villous or pubescent. *Leaves* alternate, sessile, narrow, entire. *Flowers* minute, axillary, solitary or in

clusters, hermaphrodite and ♀, rarely only ♂; bracts 0. *Perianth* subglobose; lobes 5, incurved, closing over the utricle, girt by 5 free or confluent wings. *Stamens* 5, usually exerted; anthers ovate. *Ovary* depressed-globose; style slender; stigmas 2 or 3, capillary. *Fruit* a membranous depressed utricle. *Seed* ovoid or orbicular, horizontal; testa membranous, embryo annular, the albumen scanty.

KOCHIA INDICA, Wt. Ic. t. 1791; F. B. I. v. 11.

Deccan, in Coimbatore, on salt soils (Wight).

A tall erect branching annual, the small leaves linear-lanceolate, the flowers in much soft brown wool especially round the perianth with its ovate scarious wings.

4. *Anthrocnemum*, Moq.

Fleshy jointed branching shrubs or herbs. *Leaves* 0. *Flowers* very small, hermaphrodite or monoecious (?) in cylindric conelike spikes, in clusters of 3 sunk in the hollows of the joints. *Perianth* calycine, usually 3-4-gonous, minutely toothed at apex, at length spongy. *Stamens* 1-3 (rarely seen, cf. Roxb.). *Ovary* ovoid; ovule 1 suspended on a basal funicle; style short; stigmas 2, subulate. *Fruit* an ovoid utricle, membranous or crustaceous; enclosed in the spongy perianth. *Seed* vertical, ovoid; testa membranous; embryo comma-shaped, partly enclosing the albumen, cotyledons very small, radicle inferior.

Stems prostrate, the branches erect, stout; fruiting spikes 2-25 in. in diam., 5-15 in. long; utricle crustaceous.....1. *indicum*.
Stems erect, the branches ascending, slender; fruiting spikes 1-15 in. in diam., 5-1 in. long; utricle membranous.....2. *fruticosum*.

1. *ANTHROCNEMUM INDICUM*, Moq.; F. B. I. v. 12. *Salicornia indica*, Willd.; Wt. Ic. t. 737.

E. and W. Coasts, in salt marshes.

A prostrate glaucous-green fleshy undershrub with numerous branches.

2. *ANTHROCNEMUM FRUTICOSUM*, Moq.

Var. *glaucum*, Moq. *A. ? glaucum*, Ung. Sternb.; F. B. I. v. 12.

E. Coast, from Madras (at Sadras, Lawson) to Tuticorin (Wight), in salt marshes.

A tall erect many-branched shrub.

5. *Salicornia*, Linn.

Fleshy, jointed, branched shrubs or herbs. *Leaves* 0. *Flowers* minute, hermaphrodite, ternate, in the axils of scaly bracts sunk in superposed and decussately opposite cavities of the internodes, forming cylindric spikes; bracteoles 2. *Perianth* calycine, obpyramidal. *Stamen* 1, anther oblong. *Ovary* ovoid, narrowed to the tip; ovule sessile; stigmas 2, subulate. *Fruit* an ovoid membranous utricle, enclosed in the spongy perianth. *Seed* erect, compressed; testa hispid; albumen 0; embryo conduplicate; radicle inferior, parallel to the cotyledons.

SALICORNIA BRACHIATA, Roxb.; F. B. I. v. 12; Wt. Ic. t. 738.

E. Coast, Chilka Lake in Ganjam, Coasts of Nellore, Chingleput, Tanjore and Tinnevely, in salt marshes.

An erect undershrub, the joints of the branches longer than in those of *Arthrocnemum* and resembling those of some species of *Viscum*. The flower-spikes are very slender.

6. *Suaeda*, Forsk.

Herbs or shrubs. *Leaves* fleshy, terete, rarely flattish. *Flowers* minute, axillary, usually hermaphrodite, rarely bisexual, bracteate and 2-bracteolate. *Perianth* short, calycine, globose or urceolate, 5-lobed or 5-partite, the lobes equal or unequal incurved. *Stamens* 5; filaments short; anthers rather large. *Disk* large or 0. *Ovary* ovoid or orbicular, sessile, adnate below to the perianth, rounded or truncate at the apex; ovule solitary, subsessile; style 0; stigmas subulate, papillose. *Fruit* a small membranous or spongy utricle included in the perianth. Seed erect, horizontal or oblique; testa coriaceous or crustaceous; albumen 0 or scanty; embryo slender, plano-spiral.

Perennial; seed usually erect:—

Flowers hermaphrodite, in dense globose clusters forming long spikes, leafless above; stigma 3; bracteoles with pectinate margins; leaves semiterete, oblong or ellipsoid or linear-obovate, up to .5 in. long, .2 in. broad.....1. *nudiflora*.
Flowers polygamous, in axillary clusters; stigmas 2—5; bracteoles with entire margins; leaves linear, obtuse or subacute, up to 1 in. long, .15 in. broad

2. *monoica*.

Annual; seed usually horizontal; flowers hermaphrodite, in small few-flowered clusters in lax elongate spikes; stigmas 3; bracteoles membranous, entire; leaves narrowly linear, semi-terete, up to 1 in. long, scarcely .1 in. broad.....3. *maritima*.

1. *SUAEDA NUDIFLORA*, Moq.; F. B. I. v. 14. *S. indica*, Moq.; Wt. Ic. t. 1796.

E. Coast, from the Chilka Lake southwards, on the sea coast, common.

A woody undershrub with many branches densely covered with flowers.

2. *SUAEDA MONOICA*, Forsk.; F. B. I. v. 13; Wt. Ic. t. 1792.

E. Coast, from the Kistna river southwards, on the sea coast.

A small erect bush, with many branches.

3. *SUAEDA MARITIMA*, Dumort.; F. B. I. v. 14; *Chenopodina indica*, Wt. Ic. t. 1793.

E. Coast from Madras southwards, on the sea coast, often near salt pans.

An erect slender annual.

7. *Haloxylon*, Bunge.

Shrubs or small trees with opposite jointed branches. *Leaves* opposite, triangular and short or elongate and terete. *Flowers* hermaphrodite, solitary or opposite or 1—3 together in spikes in the axils of ovate bracts; bracteoles 2. *Perianth* calycine, 5-lobed, the lobes concave, accrescent, horizontally winged on the back. *Stamens* 5 or fewer, on the margin or base of a cupular disk with alternating lobes (? staminodes); filaments linear; anthers ellipsoid or hastate. *Fruit* a subglobose or depressed utricle, enclosed in the perianth; stigma 2-lobed or

Seed horizontal; testa membranous; albumen
 equal.

Bunge; F. B. I. v. 15. *Caroxylon indicum*,

ore (Wight).

reaching 3—4 ft. high, turning black when
 old, fleshy, ovate, glabrous, the flowers rather
 conspicuous wings to the perianth-lobes.

8. *Basella*, Linn.

ing fleshy herbs. *Leaves* alternate, entire.
 sessile, spicate; bracts minute, caducous, bract-
 shaped cup, adnate to the perianth. *Perianth*
 lobes short, incurved, later accrescent and
 at the mouth of the perianth-tube; filaments
 stamens versatile. *Ovary* globose; ovule subsessile;
 ovate, papillose within. *Fruit* a globose utricle,
 with pericarp thin, adnate to the seed. *Seed*
 crustaceous; albumen scanty; embryo plano-
 convex, thin, convolute.

F. B. I. v. 20. *B. alba*, Linn.; Wt. Ic. t. 896.
 — cultivated. Indian Spinach.

It is a climbing herb with small white or red
 peduncles often becoming thickened. Leaves
 or acuminate, often cordate at base, up to
 1 d. It is a useful vegetable and makes a good
 salad. Poi; Tel. Batsalla.

the Beet, and *Spinacia oleracea*, Linn., the
 commonly cultivated in gardens. The S. Ameri-
 can *Spinacia*, H. B. & K., is an ornamental climber
 grown in Madras Gardens.

CXX. POLYGONACEAE.

very rarely trees, sometimes climbing. *Leaves*
 entire or serrulate; stipules (ocreae) scarious
 sheathing the stem. *Flowers* hermaphrodite,
 solitary or in small bracteate clusters; pedi-
 cels simple, calycine or corolline, inferior;
 ovate, imbricate in bud. *Stamens* 5—8, rarely
 more than the perianth-segments. *Disk* annular, glan-
 dular; styles 3 or 2, rarely 4; stigma capitate
 a small hard, usually trigonous or biconvex,
 at the base of the styles. *Seed* erect; testa membranous; albu-
 men minute; embryo various; radicle superior.

—pitellate; fruit a compressed or trigonous nutlet
 1. *Polygonum*.
 —triangular; fruit a triquetrous nutlet.....2. *Rumex*.

1. *Polygonum*, Linn.

Herbs or shrubs, rarely climbing. *Leaves* alternate, entire, rarely lobed; stipules membranous, connate in a tubular ocrea. *Flowers* hermaphrodite, small or minute, axillary or terminal, the clusters sessile or in spiciform capitate or paniced racemes; pedicels short, usually jointed under the perianth; bracts and bracteoles membranous, ocreate. *Perianth* green or coloured, 4—5, rarely 3-cleft, the 2 outer segments usually smallest. *Stamens* 5—8, rarely 1—4, perigynous; filaments filiform, often dilated at base or alternate with the lobes of an annular or glandular disk. *Ovary* compressed or trigonous; styles 2 or 3, free or slightly connate; stigmas usually capitellate. *Fruit* a compressed or trigonous nutlet, more or less included in the persistent perianth; pericarp usually hard and often shining. *Seed* albuminous, embryo lateral or excentric; radicle long, cotyledons small.

Flowers in axillary clusters; ocreae tubular, hyaline, lacerate; leaves small, under 1 in. long, usually oblong obovate or linear.....1. *plebejum*.

Inflorescence terminal:—

Inflorescence of sessile or pedicellate flowers in branched spikes or racemes:—

Nutlets biconvex:—

Bracts hispid and ciliate; ocreae .5—1 in. long, tubular, villous and strigose, truncate at mouth and rigidly bristle-ciliate; racemes 1.5—3 in. long, paniculate; leaves lanceolate, acuminate, silky pubescent, up to 8 in. long, 2 in. broad.....2. *tomentosum*.

Bracts small, acute, with long cottony hairs, minutely ciliate on the margins; ocreae up to 1 in. long, tubular, sparsely cottony, truncate at mouth; racemes 1—2 in. long, paniculate, cottony; leaves narrowly lanceolate, acuminate, densely white-cottony beneath, with prominent short nerves, up to 5 or more in. long.....3. *lanigerum*.

Bracts glabrous, ciliate or not:—

Bracts not ciliate on the margins; ocreae .75—1.5 in. long, tubular, glabrous, truncate at mouth, closely embracing the stem till they get torn; racemes slender, 2—4 in. long, paniculate; leaves linear-lanceolate, long acuminate, usually glabrous and gland-dotted, up to 9 in. long, 1.25 in. broad.....4. *glabrum*.

Bracts stiff-ciliate on the margins; ocreae .25—5 in. long, tubular, sparsely long strigose-hairy and ciliate; racemes few, .5—1 in. long, in panicles; leaves linear- or oblong-lanceolate, glabrous except the strigose midrib beneath, up to 2 in. long, .25 in. broad.....5. *minus*.

Nutlets trigonous, sometimes also biconvex on the same plant:—

Racemes stout; bracts closely imbricate, nearly glabrous but short-ciliate on the margins; ocreae .5—1 in. long, tubular, strigose, with very long ciliae at the mouth; leaves lanceolate or linear-lanceolate, acuminate, tapering at base, glabrous except the margins and midrib, up to 6 in. long, 1 in. broad.....6. *barbatum*.

Racemes slender; bracts more or less distant; perianth glandular:—

Ocreae tubular, glabrous, shortly and sparsely ciliate at the mouth; leaves lanceolate, acute, glabrous except the scabrid midrib beneath, up to 3 in. long, .75 in. broad; nutlets both trigonous and plano-convex.....7. *Hydropiper*.

Ocreae tubular, strigosely hispid, long-ciliate at the mouth; leaves lanceolate or elliptic lanceolate, acuminate, strigosely hairy beneath, up to 6 in. long, 1 in. broad.....8. *flaccidum*.

Inflorescence capitate, the heads single or in corymbs:—

Heads pedunculate, small, sessile in the axil of an involucre leaf; bracts ovate-oblong, membranous; perianth 4-fid; nutlets biconvex or subtrigonous, minutely pitted in lines; leaves deltoid-ovate, entire, acute, truncate or subcordate at base and decurrent as wings to the amplexicaul petiole, up to 2.5 in. long, 1 in. broad; ocreae membranous, obliquely truncate, hairy at base.....9. *punctatum*.

Heads pedunculate, without an immediate involucre leaf:—

Stems without prickles at the nodes; heads small, about .25 in. in diam., much bracteate, perianth 5-fid:—

Heads usually in pairs on glandular hispid peduncles; bracts ovate, acute, glabrous, chaffy; nutlets flat or trigonous; leaves deltoid-ovate, acute, ciliate, truncate or subcordate at base and shortly decurrent, up to 3 in. long, 2 in. broad; ocreae tubular below, split at the mouth, truncate, strigose and strigosely ciliate.....10. *sphaerocephalum*.

Heads in corymbose terminal panicles, the peduncles glandular hairy; bracts ovate, acute, glabrous; nutlets trigonous; leaves elliptic or ovate, acute or shortly acuminate, the margins entire or crenulate, the petiole auricled, up to 6 in. long, 3 in. broad; ocreae long, membranous, obliquely cleft, acuminate, and often much split when old.....11. *chinense*.

Stems more or less covered with retrorse prickles at the nodes, also on the midrib on the under-surface of the leaves; bracts ovate, acuminate, strigose and ciliate; heads elongate in short oblong racemes:—

Leaves oblong-lanceolate, acuminate, cordate or hastate at base, prominently prickly on the midrib beneath, up to 3 in. long, 1 in. broad; ocreae tubular, strigose and long ciliate, prickly at base.....12. *strigosum*.

Leaves linear or linear-lanceolate, acuminate, narrowed at base, not prominently but sparsely prickly on the midrib beneath, up to 6 in. long, 1 in. broad; ocreae tubular, oblique at mouth, glabrous, shortly ciliate, slightly prickly at base.....13. *pedunculare*.

1. *POLYGONUM PIEBEJUM*, R. Br.; F. B. I. v. 27, *P. indicum*, Heyne; Wt. Ic. t. 1808.

All plains Districts and up to 5,000 ft. in the hills.

A prostrate herb, usually from a woody rootstock, the branches flat, the flowers pink, the leaves small, usually, in this area, linear or obovate, up to .5 in. long (var. *indica*, Hook. f.) but often much smaller and sometimes longer and more linear.

Var. *Miqueliana*, Hook. f. Stems flexuous; leaves obovate, obtuse; flowers with long (.15—2 in.) pedicels. S. Canara (Hohenacker). The var. *polyneura*, Hook. f., seems to be the same but with shorter pedicels, longer leaves and the ocreae larger and nerved. S. Canara (Hohenacker).

2. *POLYGONUM TOMENTOSUM*, Willd.; F. B. I. v. 30.

N. Circars, Deccan and Carnatic, in ditches and other wet places.

A stout thick herbaceous plant with prostrate stems rooting at the nodes, the branches erect, thick and very hairy, the flowers large and white, the nutlets large, thick, crustaceous and shining, dark brown.

3. *POLYGONUM LANIGERUM*, R. Br.; F. B. I. v. 35.

Deccan, Geddesala in Coimbatore at 4,000 ft. (Fischer).

A stout herb, procumbent and creeping below, the branches erect, the flowers small, red or white, the nuts flat and shining; at once recognized by the white cottony wool.

4. *POLYGONUM GLABRUM*, Willd.; F. B. I. v. 34; Wt. Ic. t. 1797.

N. Circars, Deccan and Carnatic, South to S. Travancore, also E. side of W. Ghâts, up to 5,000 ft. in hilly country, in ditches and wet places.

An erect glabrous annual herb, reaching even 5 ft. in height, rooting from lower nodes, the flowers pink or white, the leaves very slender.

Var. *scabrinerve*, Hook. f. Leaves shorter, scabrid on the midrib beneath; racemes shorter and more closely paniced. W. Gháts, Pulney Hills at about 6,000 ft.

5. *POLYGONUM MINUS*, Huds.; F. B. I. v. 36. *P. strictum*, All.; Wt. Ic. t. 1800.

W. Gháts, Nilgiris and Pulneys, at 5,000—7,000 ft. in bogs and other wet places.

A low herb, creeping and rooting at the nodes, the racemes and leaves small, the small flowers pink.

6. *POLYGONUM BARBATUM*, Linn.; F. B. I. v. 37; Wt. Ic. t. 1798.

N. Circars, Deccan and Carnatic, in wet places.

An erect annual, conspicuous for the long fimbriate ciliae of the ocreae, the flowers white, the leaves lanceolate.

7. *POLYGONUM HYDROPIPER*, Linn.; F. B. I. v. 39.

W. Gháts, Anamalai and Pulney Hills, in wet places up to 6,000 ft.

A stout glabrous but often glandular annual with pink flowers.

8. *POLYGONUM FLACIDUM*, Meissn.; F. B. I. v. 39. *P. Donii*, Wt. Ic. t. 1801.

N. Circars and Deccan, in wet places in hill forests, also W. Gháts, Nilgiris and Pulneys, up to 6,000 ft.

A rather slender herb, with very long filiform flaccid racemes of usually pink flowers.

9. *POLYGONUM PUNCTATUM*, Buch.-Ham. *P. alatum*, Buch.-Ham.; F. B. I. v. 41. *P. nepalense*, Meissn.; Wt. Ic. t. 1804.

N. Circars, Mahendragiri Hill, Ganjam, 4,000 ft.; hills of the Deccan and Carnatic, usually above 4,000 ft.; W. Gháts, Nilgiris and Pulneys, above 4,000 ft., a weed in gardens and cultivated land.

A small, more or less procumbent annual, the flowers white or pink.

Var. *Metzianum*, Hook. f. Small and diffusely branched with small leaves and heads, the nutlet biconvex or trigonous. Coorg (Hohenacker), Pulney Hills, above 6,000 ft. (Saulière).

10. *POLYGONUM SPHAEROCEPHALUM*, Wall.; F. B. I. v. 43. *P. Wallichii*, Wt. Ic. t. 1805.

W. Gháts, Nilgiris, above 7,000 ft., especially on Doddabetta (Gamble, Lawson).

A somewhat creeping herb. The leaves are larger than in North Indian specimens.

11. *POLYGONUM CHINENSE*, Linn.; F. B. I. v. 44; Wt. Ic. t. 1806.

N. Circars, Mahendragiri Hill in Ganjam (Fischer); Deccan and Carnatic, in the hills, scarce; W. Gháts, in all Districts above 3,000 ft., common.

A rambling undershrub, semi-scandent over bushes, with white or pink flowers, variable in shape and size of leaf, the large elliptic ones (var. *ovalifolium*) perhaps the most common.

12. *POLYGONUM STRIGOSUM*, R. Br.; F. B. I. v. 47. *P. horridum*, Buch.-Ham.; Wt. Ic. t. 1803.

W. Gháts, Nilgiri and Pulney Hills, above 5,000 ft., in wet places.

A herbaceous plant with pink flowers, the nutlets trigonous, the stems at first decumbent and rooting, the branches erect.

13. *POLYGONUM PEDUNCULARE*, Wall. ; F. B. I. v. 48; Wt. Ic. t. 1802 C. W. Gháts, Pulney Hills.

A glabrous erect herb with lanceolate acute leaves up to 3 in. long, 1 in. broad, the heads very small, in slender dichotomous glandular cymes.

Var. *nilagiricum*, Hook. f. Leaves, linear-oblong or oblong-lanceolate, up to 6 in. long, .75—1 in. broad, the stems glabrous, the heads rather large. Nilgiri Hills, at 6,000 ft. (C. B. Clarke).

Var. *robustum*, Hook. f. Leaves linear-lanceolate, acuminate at both ends, up to 6 in. long, .75 in. broad, the stems scabrid, the heads rather large (Wt. Ic. t. 1802 B).

Var. *angustissimum*, Hook. f. Leaves narrowly linear up to 5 in. long, .3 in. broad, the stems nearly smooth, the heads often subcylindric (Wt. Ic. t. 1802 A). Nilgiri Hills at 6,000 ft.

P. molle, D. Don, is a shrubby species of the E. Himalaya, cultivated and now run wild in the higher Nilgiri Hills.

2. *Rumex*, Linn.

Annual or perennial herbs, rarely shrubs. *Leaves* various, mostly radical or cauline, alternate; stipules hyaline, ocreate, often disappearing with age. *Flowers* hermaphrodite monoecious or dioecious, in axillary clusters or in whorls arranged in simple or paniced racemes; pedicels jointed; bracts ocreate; bracteoles 0. *Perianth* simple, calycine; segments 6, rarely 4, the inner accrescent, entire or toothed, the midrib often enlarged or tubercled. *Stamens* 6; filaments short; anthers oblong. *Ovary* trigonous; ovule solitary; styles 3; stigmas fimbriate. *Fruit* a small nut, enclosed in the usually enlarged inner perianth-segments, the angles acute. *Seed* erect; embryo lateral, nearly straight; cotyledons linear or oblong.

Flowers hermaphrodite; stout herbs; inner perianth-segments coriaceous in fruit:—

Inner perianth-segments lanceolate, acute, entire or with few teeth, a very conspicuous oblong tubercle on the back; leaves oblong panduriform, obtuse, cordate at base, the margins waved or crisped, up to 8 in. long, 1.5 in. broad

1. *nigricans*.

Inner perianth-segments orbicular-ovate, reticulate, the margins with many teeth with hooked tips, one or more with a rather small tubercle on the back; leaves oblong- or triangular-ovate, acute or obtuse, cordate at base, up to 14 in. long, 5 in. broad.....2. *nepalensis*.

Flowers monoecious; fleshy herbs; inner perianth-segments membranous and reticulate in fruit; leaves elliptic or oblong, cordate or hastate at base.....*vesicarius*.
Flowers dioecious; slender herbs; inner perianth-segments very small, oblong, closely appressed to the nut in fruit; leaves small, lanceolate or hastate.....*Asetosella*.

1. *RUMEX NIGRICANS*, Hook. f.; F. B. I. v. 59.

N. Circars, on the Godavari (Gamble).

An erect stout annual herb reaching 1.5 ft. high, the stem grooved, the leaves with long slender petioles. The inflorescence is black when dry or nearly so.

2. *RUMEX NEPALENSIS*, Spreng.; F. B. I. v. 60; Wt. Ic. t. 1810.

W. Gháts, Nilgiri and Pulney Hills, above 6,000 ft.

A tall stout annual or perennial herb, sometimes with tuberous roots, the stems grooved, the leaves long-petioled.

R. vesicarius, Linn., is an annual herb, wild in the W. Himalayas elsewhere cultivated as a vegetable. It is at once recognized by the membranous pink or white reticulate inner fruiting perianth.

R. Acetosella, Linn., is a European common herb, the Sheep Sorrel, introduced and now run wild in the Nilgiris.

Fagopyrum esculentum, Moench., is the Buckwheat, occasionally grown as a grain crop in the hills. *Antigonon leptopus*, Hook. & Arn., is the Coral Creeper, a large handsome climbing shrub with pink flowers, a native of S. America and commonly grown in Indian gardens. *Muehlenbeckia platyclados*, Meissn., is a glabrous erect shrub, native of the Solomon Islands and often grown in Indian gardens. It has smooth flattened leaf-like branches and small flowers in lateral fascicles.

Family CXXI. PODOSTEMONACEAE.

After J. C. Willis in the 'Annals of the Royal Botanic Gardens, Peradeniya, Ceylon,' vol. i, pp. 181 and 267 (1902), with plates.

Aquatic herbs, usually annual, submerged and closely attached to rocks, the flowers appearing and the seeds germinating at the close of the rainy season when exposed by the fall of the water-level. Primary axis early giving rise to a *thallus*—the part of the plant that creeps on the rocks or lies near to them. Secondary shoots appear from the thallus, and may be found as rosettes of leaves or as growing or branching leaf-bearing axes. *Leaves* very simple and delicate (easily lost), changing to bracts and finally ending in a *spathe* or cupule which encloses the young flower. *Flowers* hermaphrodite, small, regular and trimerous with a perianth or zygomorphic and bimerous without one. *Stamens* hypogynous, in regular flowers 3, alternate with the perianth-segments, in zygomorphic flowers usually 2, monadelphous and usually with 2 staminodes; anthers introrse, 2-celled. *Ovary* superior, 2—3-celled, with thick placenta and delicate septa; ovules numerous, anatropous; stigmas 2—3. *Fruit* a usually pedicellate capsule, ribbed or smooth, septifragal. *Seeds* usually numerous, minute (in *Farmeria* 2 or 4); testa mucilaginous; albumen 0; embryo straight.

Flowers regular; perianth of 3 segments; stamens 3:—

Thallus a thread-like creeping root; secondary shoots long, complexly branched, freely floating, bearing ramuli or moss-like shoots of limited growth; floral axis subtended by few leaves, sometimes slightly connate.....1. *Tristicha*.

Thallus frondose, foliiferous, creeping, closely attached to rocks; secondary shoots of small rosettes of leaves on upper side of thallus; floral shoots arising from axial cupules.....2. *Lawia*.

Flowers zygomorphic, naked; stamens 1—3:—

Fruit ribbed, iso- or aniso-lobous, dehiscent, with many seeds; spathe erect, more or less cylindrical, opening at apex by several teeth:—

Thallus fucoid or dimorphic, usually freely floating; secondary shoots 1-flowered with scaly bracts; fruit isolobous.....3. *Dicraea*.

Thallus thread- or ribbon-like, creeping; secondary shoots erect with several flowers; bracts ditheous, not scaly; fruit anisolobous.....4. *Podostemon*.

Fruit smooth, anisolobous, dehiscent, with many seeds; spathe erect, toothed or bifid:—

Thallus fucoid or attached and closely creeping; secondary shoots small, with distichous leaves.....5. *Griffithella*.

Thallus crustaceous, attached to rock; secondary shoots large, erect, with 4-ranked leaves; spathe bilobed at tip.....6. *Willisia*.

Fruit ribbed, iso- or aniso-lobous, dehiscent, or smooth aniso-lobous, dehiscent or indehiscent, with many or few seeds; spathes more or less prostrate, splitting along the upper side; thallus closely attached to rock:—

Thallus crustaceous or ribbon-like, exogenously lobed or branched; secondary shoots usually prostrate when floriferous, 1-flowered with small scaly bracts; seeds very many, fruit dehiscent, iso- or aniso-lobous, ribbed or smooth

7. *Hydrobryum*.

Thallus ribbon-like, endogenously branched; secondary shoots as in *Hydrobryum* but behind the branches of thallus; seeds 2—4, fruit dehiscent or not, ribbed or not.....8. *Farmeria*.

1. *Tristicha*, Dup.-Th.

Submerged herbs with the habit of *Fontinalis* and other aquatic mosses, the roots creeping, filamentous, attached by feet; secondary shoots very many, often more or less paired on opposite sides, floating freely in the water. When most developed often long, many-flowered and frequently branched, but often quite short, unbranched and 1-flowered or vegetative only; branches of 2 kinds, long ones with the structure of the main axis and short ones consisting of a delicate axis with very many small leaves often tristichous. *Flowers* terminal, on pedicels subtended by 2—3 large or several ordinary leaves, the upper ones often more or less united; pedicel and ovary with deciduous cortex, which shrivels after flowering, the small flowers usually emerging through the water at the beginning of the dry season.

TRISTICHA RAMOSISSIMA, Willis. *Terniola ramosissima*, Wedd.; F. B. I. v. 63. *Dalzellia ramosissima*, Wt. Ic. t. 1920, f. 1.

W. Ghâts, rivers of S. Canara, Malabar, Cochin and Travancore (Johnson, Bourdillon, etc.), also Anamalai Hills, up to 4,000 ft.

A floating plant with very long filiform much-branched stems, narrowly linear leaves in tufts round the single pedicellate flower, which has 3 stamens and 3 long filamentous hairy stigmas. Branchlets not tristichous.

2. *Lawia*, Griff.

Herbs with frondose thalli, living on smooth rocks in rapids and waterfalls, submerged during the S.W. monsoon, flowering in the dry season when exposed. *Thallus* closely attached to the rock, suborbicular or stellate, attached by root-hairs, usually much branched with ribbon-like or flabelliform lobes. *Leaves* very numerous, simple, entire, usually acute, green or red, occurring either on the upper surface and edges of the thallus or in closely-packed rosettes on its older parts. *Flowers* terminal on the growing points of the margins of the thallus, rarely on the upper surface, solitary, on pedicels emerging from terminal axial leafy cupules; pedicel in flowering time 1—2.5 in. long, covered, as also the ovary, with a pellucid cellular cortex, which falls off after flowering, leaving an elastic pedicel up to 1.25 in. long, erect.

Stamens 3, alternating with the perianth-segments; anthers 2-celled, opening longitudinally. *Capsule* ellipsoid or obovoid, 9-ribbed, 3-celled, septifragal, valves incurved after dehiscence.

LAWIA ZEYLANICA, Tul. *Terniola zeylanica*, Tul.; F. B. I. v. 62. Var. *malabarica*, Willis.

W. Ghâts, S. Canara, at Sullia and Beltangadi (Barber); Tambra-
parni River in Tinnevely (Barber).

A frondose plant with thallus closely adhering and branching
the fruiting pedicel about 3 in. long, the fruit obovoid-elliptical.

3. *Dicraea*, Tul.

Submerged herbs with the habit of *Fucus* and other seaweeds. *Thallus* various, usually freely floating from an attached base, exogenously branched, with marginal ultimately 1-flowered secondary shoots; leaves usually subulate. *Flowers* zygomorphic, enclosed in spathes splitting irregularly at the tip and subtended by 2—8, usually 4, fleshy scaly bracts. *Stamens* 2 or 1, with staminodes on either side of the common axis. *Ovary* smooth, ripening to a 8- or rarely 8—12-ribbed isolobous fruit with very many seeds.

Thallus narrow, ribbon-like, flattened, attached at base, freely floating above, up to 1 ft. long; pedicels about .75 in. long.....1. *dichotoma*.

Thallus broad, algiform, freely branched, creeping or floating from an attached base, up to 1.5 ft. long; pedicels up to 1.5 in. long.....2. *stylosa*.

1. DICRAEA DICHOTOMA, Tul.; Wt. Ic. t. 1916, f. 2. *D. Wightii*, Tul.; Wt. Ic. t. 1916, f. 3. *D. longifolia*, Wt. Ic. t. 1916, f. 4. *D. rigida*, Wt. Ic. t. 1916, f. 5. *Podostemon dichotomus*, Gardn.; F. B. I. v. 64.

W. Ghâts, Nilgiris and Malabar Hills, up to 8,000 ft., on rocks in rapids.

Thallus narrow, usually zigzag, the leaves filiform.

2. DICRAEA STYLOSA, Wt. Ic. t. 1917, f. 2. *D. algaeformis*, Bedd.; Trans. Linn. Soc. xxv. t. 24. *Podostemon stylosus*, Benth.; F. B. I. v. 64. *P. algaeformis*, Benth.; F. B. I. v. 65.

W. Ghâts, S. Canara to Travancore, Nilgiris and Anamalais, up to 5,000 ft.

Thallus broad, seaweed-like, the bracts helmet-shaped.

4. *Podostemon*, Michx.

Herbs of eddies and rapids, in mountain streams. *Thallus* thread- or ribbon-like; secondary shoots ascending, several-flowered, with long subulate leaves and no scaly bracts. *Flowers* zygomorphic, naked, terminal with a tubular or funnel-shaped erect spathe rupturing irregularly at the tip. *Stamens* 2 or 1, monadelphous, with a staminode at each side of the common axis, and sometimes at the fork of the partial filaments. *Ovary* ellipsoid; stigmas 2, simple, subulate, with small papillae. *Fruit* unequally lobed, 8-ribbed, one valve persistent with 3 decurrent ribs, the other deciduous.

Stamens usually 2; flowers not cleistogamic; ovary not winged.....1. *subulatus*.
Stamen 1; flowers cleistogamic; ovary with 6 broad wings.....2. *Barberi*.

1. *PODOSTEMON SUBULATUS*, Gardn. ; F. B. I. v. 65 ; Wt. Ic. t. 1918, 1.
W. Gháts, Anamalai Hills, on the Monica Estate at 3,500 ft.
(Willis, Barber).
Easily recognized by the long slender subulate leaves, attached to the rocks in tufts and sheathing at base.
2. *PODOSTEMON BARBERI*, Willis.
W. Gháts, hills of S. Canara, at Beltangadi (Barber).
A little-known species, with broad thallus, closely attached to the rock, the spathe very long, the fruit pedicel upto .8 in. long.

5. *Griffithella*, Warming.

Minute herb attached to rocks in running streams. *Thallus* algiform, very polymorphous ; secondary shoots marginal or on central parts, small with included axis in vegetative condition, ultimately slightly exserted. *Leaves* distichous. *Flowers* naked, zygomorphic, emerging from an erect or ascending tubular or funnel-shaped spathe irregularly split at the tip. *Stamens* 2, monadelphous ; staminodes 2, at the sides of the filament-sheath. *Ovary* very oblique ; stigmas 2, simple, subulate or more or less lobed, with small papillae. *Capsule* quite smooth, nearly spherical, unequally lobed, splitting obliquely into a larger persistent and smaller deciduous lobe.

GRIFFITHELLA HOOKERIANA, Warming. *Podostemon Hookerianus*, Wedd. ; F. B. I. v. 65. *Mniopsis Hookeriana*, Tul. ; Wt. Ic. t. 1918, f. 4.

W. Gháts, in S. Canara at Beltangadi and Sullia (Barber).
A curious lichen-like plant. The S. Canara plants belong to the var. *G. Willisiana*, Warming, characterized by a short spathe and toothed or fimbriate stigmas, the fruiting pedicels .1—6 in. long.

6. *Willisia*, Warming.

Small tufted herbs with erect imbricate shoots. *Thallus* small, crustaceous, fleshy, closely attached to the rock ; secondary shoots crowded, erect, forming a dense tuft, the shoots with imbricate scaly leaves ; in addition, during the vegetative season one or more shoots are found with leaves not imbricate but long and filiform and non-floriferous. *Leaves* of floriferous shoots decussate and triquetrous. *Flowers* naked, zygomorphic, sessile, terminal, the spathes bifid at tip. *Stamens* 2, monadelphous, with two staminodes. *Ovary* ellipsoid ; stigmas 2, subulate, smooth. *Capsule* smooth, with a slight rib in the centre of each valve, anisolobous, one valve deciduous, the other persistent on a bifid stalk, when the non-vascular tissues fall away.

WILLISIA SELAGINOIDES, Warming. *Mniopsis selaginoides*, Bedd. ; Trans. Linn. Soc. xxv. t. 28. *Podostemon selaginoides*, Benth. ; F. B. I. v. 58.

W. Gháts, Anamalais to 3,500 ft. (Beddome, Wight, Barber, Willis).

A very curious species with shoots resembling *Lycopodium Selago*, attached in tufts to the thallus on rocks.

7. *Hydrobryum*, Endl.

Small green herbaceous plants closely attached to rocks. *Thallus* crustaceous or branched; secondary shoots marginal with 3—8 bracts, usually prostrate. *Leaves* simple, subulate. *Flowers* zygomorphic, stalked or sessile, emerging from a boat-shaped spathe splitting mainly along the upper side. *Stamens* 2 or 1, equalling or exceeding the ovary, staminodes linear. *Ovary* subglobose, 2-celled; stigmas 2, rather large, subulate or lobed or dentate, sometimes obtuse, entire or lacerate. *Fruit* small, sessile or stalked, smooth or 8—12-ribbed, isolobous or anisolobous with numerous seeds.

Fruit sessile, smooth, thallus branched.....1. *sessile*.
Fruit stalked, 8-ribbed:—

Thallus crustaceous, stamens short.....2. *olivaceum*.

Thallus crustaceous, stamens very long.....3. *Johnsonii*.

Thallus ribbon-like, branched, stamens of varying length.....4. *lichenoides*.

1. *HYDROBRYUM* SESSILE, Willis.

W. Gháts, streams of S. Canara, at Beltangadi (Barber).

A curious little plant with distichous bracts bearing the sessile fruit.

2. *HYDROBRYUM* OLIVACEUM, Tul.; Wt. Ic. t. 1918, f. 2. *H. griseum*, Tul.; Wt. Ic. t. 1918, f. 3. *Podostemon olivaceus*, Gardn.; F. B. I. v. 66.

W. Gháts, Anamalai Hills, at 3,500 ft. (Barber, Willis), form *anamalaiense*; Nilgiris, Pykara River at 5,000—6,000 ft. (Gardner, Brandis, Willis), form *griseum*.

A common very small species "easily distinguishable by its crustaceous thallus and erect clearly-ribbed fruit."

3. *HYDROBRYUM* JOHNSONII, Willis. *Mniopsis Johnsonii*, Wt. Ic. t. 1918, f. 5. *Podostemon Johnsonii*, Wedd.; F. B. I. v. 66.

W. Gháts, mountain streams in Malabar (Johnson).

4. *HYDROBRYUM* LICHENOIDES, Kurz. *Podostemon acuminatus*, Wedd.; F. B. I. v. 66. *P. microcarpus*, Wedd.; F. B. I. v. 66.

W. Gháts, streams of S. Canara (Barber), form *Kanarensis*; Anamalai Hills, at 3,500 ft. (Willis), form *Fentonii*.

The most common, but also the most variable species.

8. *Farmeria*, Willis.

Dendritically-branching herbs, adherent to smooth rocks in eddies and rapids. *Thallus* ribbon-like, closely attached, regularly branched; secondary shoots as in *Hydrobryum* but behind the branches of thallus instead of in anterior axils. *Bracts* prostrate, thicker on upper side, usually about 6, scaly, with deciduous tips; spathe as in *Hydrobryum*, splitting on upper side. *Stamen* 1 usually. *Ovary* more or less globose, with thickened placenta and 2—4 ovules on the under-side; lower loculus more or less abortive; stigmas large, subulate. *Fruit* small, the upper lobe larger, 2—4-seeded.

FARMERIA INDICA, Willis.

W. Gháts, Tambraparni river, near Tinnevely (Barber).

A small species with thread-like thallus and ribbed, dehiscent, shortly stalked, 4-seeded fruits.

Family CXXII. ARISTOLOCHIACEAE.

Herbs or shrubs, often climbing, usually with more or less unpleasant odour. *Leaves* alternate, petioled, entire or lobed; stipules 0. *Flowers* hermaphrodite, often large, usually lurid; terminal axillary or lateral, solitary racemose or cymose; bracts various, often 0. *Perianth* simple, corolline, superior, regular or irregular, 3-lobed or tubular and variously shaped; lobes valvate. *Stamens* 6 or more, adnate in 1 or 2 series to the style-column; anther-cells parallel, extrorse, opening dorsally. *Ovary* 4—6-celled; placenta parietal, free or meeting at the axis; ovules numerous, anatropous; style columnar, ending in stigmatic lobes. *Fruit* a capsule or berry. *Seeds* numerous, horizontal or pendulous; albumen fleshy, copious; embryo minute.

Shrubs; perianth regular, equally 3-lobed; capsule elongate; leaves ribbed and reticulate.....1. *Apama*.

Trailing or climbing herbs or shrubs; perianth irregular, tubular with an inflated base and 2-lipped limb; capsule septicidally 6-valved; leaves various or pitted.....2. *Aristolochia*.

1. *Apama*, Lamk.

Shrubs or undershrubs, often with stellate hairs. *Leaves* alternate, petiolate, 3—5-ribbed at the base, the ribs often extending beyond the middle, nerves and reticulation prominent. *Flowers* in axillary terminal or subradical bracteate cymes. *Perianth* shortly campanulate, 3-lobed, the lobes valvate. *Stamens* 6—12, 1-seriate, free or connate near the base; anthers extrorse, the cells parallel, the connective thick and sometimes produced. *Ovary* inferior, elongate, 4-celled; style-column thick; stigmas 3 or more, linear; ovules numerous, uniseriate in vertical rows from the axis, pendulous. *Fruit* an elongate, 4-gonous, septicidally 4-valved capsule. *Seeds* many, oblong, trigonous, rugose or pitted; albumen fleshy; embryo minute.

Leaf with the ribs next to the midrib prominent and reaching nearly three-quarters of the way up, nerves 3—4 pairs from the midrib; perianth-lobes sub-orbicular, slightly acute at apex; anthers in 3 groups of 3, the connectives shortly apiculate; style column short, the stigmas longer.....1. *siliquosa*.
Leaf with the ribs next to the midrib like the nerves, scarcely reaching halfway up, nerves from the midrib 6—10 pairs, joining in arches; perianth-lobes obovate, abruptly apiculate; anthers free with slender filaments, the connective produced in a triangular apiculus; style-column long, the stigmas about as long...2. *Barberi*.

1. *APAMA SILIQUOSA*, Lamk. *Bragantia Wallichii*, R. Br.; F. B. I. v. 73; Wt. Ic. t. 520.

W. Gháts, in all Districts, in evergreen forest undergrowth, up to 4,000 ft.

An erect shrub with grey bark, the very reticulate distichous leaves oblong lanceolate or oblanceolate, long-acuminate, up to 9 in. long 2.5 in. broad, the erect capsules up to 4 in. long.

2. *APAMA BARBERI*, Gamble in Kew Bull. 1924, 386.

W. Gháts, Kannikatti in Tinnevely (Barber).

A shrub with branches covered with long corky lenticels, the leaves lanceolate, acuminate, with shorter side ribs and many more nerves than the former species, up to 8 in. long, 2 in. broad.

2. *Aristolochia*, Linn.

Shrubs or perennial herbs, prostrate or climbing. *Leaves* alternate, entire or lobed, often with a stipule-like leaf of an undeveloped bud in the axil; petiole dilated at base. *Flowers* solitary or fascicled or racemose in the leaf-axils; bracts often rather large. *Perianth* very variable in shape, size and colour, the tube inflated below, then contracted in a cylindrical neck, then expanded in a dilated oblique usually 2-lipped limb. *Stamens* usually 6, adnate to and around the style-column; anther-cells 2, extrorse. *Ovary* inferior, more or less 6-celled; placenta parietal or intruded or connate in the axis; ovules very many, 2-seriate; style-column thick, divided above the anthers in a 3—6-lobed stigmatiferous disk. *Fruit* a septicidal capsule, 6-valved or splitting through the placentas. *Seeds* numerous, horizontal, often covered in part with the remains of the placenta; albumen fleshy; embryo minute, close to the hilum.

Stems prostrate; leaves glaucous, reniform or broadly ovate, cordate at base with a wide sinus, up to 3 in. in diam.; flowers solitary with a large orbicular bract, tube and limb 1—1·75 in. long; stigmatic lobes glandular hairy; seeds flattened but thickened, one side completely covered with round glands, ·2 in. long

1. *bracteata*.

Stems twining; leaves green; flowers in racemes with small bracts; seeds winged:—
Leaves very variable, linear to obovate-oblong or subpanduriform, rounded or slightly cordate at base, up to 6 in. long, 3 in. broad; tube and limb of perianth 1·5 in. long; stigmatic lobes incurved; seeds flattened, thin, broadly winged, glands only opposite the cotyledons, ·3 in. long.....2. *indica*.
Leaves large, ovate, acute or acuminate, deeply cordate with a deep but narrow sinus, the upper lanceolate, up to 8 in. long, 4·5 in. broad; tube and limb of perianth 1—1·5 in. long; stigmatic lobes in a cone; seeds flattened, broadly winged, glands only in the middle, ·3 in. long.....3. *Tagala*.

1. *ARISTOLOCHIA BRACTEATA*, Retz; F. B. I. v. 75.

N. Circars, Deccan and Carnatic, on dry soils, especially black-cotton.

A perennial herb with greenish tube and dark purple lip to the perianth, which is linear with revolute margins, the capsule about ·75 in. long, oblong-ellipsoid, 12-ribbed. A nauseously bitter plant, used as an anthelmintic. Vern. *Hind*. Kiramar; *Ur*. Paniri.

2. *ARISTOLOCHIA INDICA*, Linn.; F. B. I. v. 75. *A. lanceolata*, Wall.; Wt. Ic. t. 1858.

All Districts, at low levels, on hedges and among bushes.

A perennial twiner with greenish-white tube, the lip darker and oblong, the capsules 1·5—2 in. long, ribbed. A bitter plant like the former, said to be an antidote to snake-bite. Vern. *Hind*, Isharnal; *Tel*. Isara.

3. *ARISTOLOCHIA TAGALA*, Cham. *A. Roxburghiana*, Klotzsch; F. B. I. v. 75. *A. acuminata*, Roxb.; Wt. Ic. t. 771.

W. Ghâts, S. Canara and Mysore to Tinnevely, at rather low levels and chiefly on the E. side.

A climbing shrub with greenish-yellow tube and purple-brown lip to the flowers, the capsule very variable in size, up to 2 in. long and long-stalked.

Family CXXIII. PIPERACEAE.

Herbs or shrubs, usually aromatic, the branches often swollen at the nodes. *Leaves* alternate opposite or whorled, often gland-dotted; stipules none or 2 connate or adnate to the petiole. *Flowers* minute, hermaphrodite or unisexual, bracteate, in axillary or terminal catkin-like spikes. *Perianth* 0. *Stamens* 1—10, hypogynous or connate with the ovary at its base; anthers often jointed on the filaments, the cells dehiscing longitudinally. *Ovary* usually 1-celled with a single terminal orthotropous ovule, sometimes of 3—4 carpels; stigmas sessile, simple or pericillate. *Fruit* an indehiscent berry in species with 1 cell, otherwise of separate cocci or follicles. *Seed* adherent to the endocarp, globose ovoid or oblong; testa thin; albumen floury; embryo in a cavity remote from the hilum; cotyledons minute or obsolete; radicle superior.

Flowers dioecious; spikes solitary; fruit an ovoid or globose fairly large berry; leaves usually with prominent ribs.....1. **Piper.**

Flowers hermaphrodite, very small:—

Spikes soft and thick, 3—7 together in umbels; berry trigonous, cuneiform; leaves often very large, orbicular-cordate.....2. **Heckeria.**

Spikes slender, solitary fascicled or paniced; berry very minute, dry, globose or ovoid; leaves usually small and succulent.....3. **Peperomia.**

1. **Piper**, Linn. (in part).

Shrubs, rarely herbs, erect or scandent, often glandular and aromatic, the branches with swollen nodes. *Leaves* entire, often unequal-sided; stipules various. *Flowers* minute, dioecious, rarely hermaphrodite, each in the axil of a bract with or without lateral bracteoles, arranged in spikes often very closely congested and usually opposite the leaves. *Perianth* 0. *Stamens* 2—4, rarely more; filaments short; anthers 2-celled, the cells distinct. *Ovary* 1-celled; ovule solitary; style short or 0; stigmas 2—5. *Fruit* a small ovoid or globose 1-seeded berry. *Seeds* usually globose; testa thin; albumen floury; radicle superior.

Flowers in cups probably formed of connate bracts making receptacles alternate on rather fleshy spikes; leaves elliptic-ovate or lanceolate, 3-ribbed at base with another pair a little higher up, the nervules reticulate:—

Receptacles distant, stalked, recurved, the spikes glabrous, ♂ very long

1. *galcatum*. ✓

Receptacles close, sessile, globose, the spikes minutely pubescent or downy

2. *trichostachyon*. ✓

Flowers subtended by peltate orbicular bracts, ♂ with 2 stamens, ♀ with sessile stigmas, usually 3—5-lobed; berries partly sunk in the rhachis:—

Leaves with prominent ribs from the base or near it:—

Fruiting spikes cylindric, thick; ♂ spikes narrow:—

Leaves glabrous:—

Fruiting spikes about .75 in. long, .25 in. thick; ♂ spikes 1—3 in. long; upper leaves ovate or ovate-oblong, acute, often unequally cordate at base, sessile and amplexicaul, lower leaves ovate, deeply and widely equally cordate, petioled, all 7-ribbed, glabrous.....3. *longum*. ✓

Fruiting spikes up to 5 in. long, .5 in. thick, ♂ spikes 3—6 in. long, very narrow; leaves ovate-oblong or ovate-cordate, petioled, 5—7-ribbed, glabrous

Bette. ✓

Leaves pubescent, especially on the nerves beneath and the lower surface when young, later nearly or quite glabrous, lanceolate, acuminate, very

unequally cordate with incurved auricles at base, 7-nerved, rugose or bullate, up to 4 in. long, 2 in. broad, fruiting spikes 75 in. long, ♂ spikes slender, 1-1.5 in. long.....4. *Hapnium*.

Fruiting spikes globose, 3-5 in. in diam., ♂ spikes very slender, 2-3 in. long; leaves elliptic-ovate or lanceolate, obtusely caudate-acuminate, acute at base, 3-5-ribbed with another pair a little higher up, shortly petioled

5. *brachystachyum*.

Fruiting spikes loose and often interrupted, ♂ spikes narrow, elongate:—
Leaves somewhat coriaceous, ovate, acute or obtusely acuminate, obtuse or subcordate at base, sparsely hirsute, 5-7-ribbed from the base or close to it, up to 4 in. long, 2 in. broad; ♀ spikes very slender when young, 2 in. long.....6. *Hookeri*.

Leaves very coriaceous, elliptic-ovate or ovate-oblong, obtusely acute or rarely acuminate, obtuse or shortly cordate at base, 3-5-ribbed from the base with another pair about .25 in. above it and usually alternate; all ribs as well as transverse nerves and reticulation very prominent, margin often recurved, up to 4.5 in. long, 2.5 in. broad; ♂ spikes usually about 4 in. long, ♀ spikes stout, the fruit fleshy.....7. *Schmidtii*.

Leaves pinnately nerved, not ribbed, the nerves 5-6 pairs, lanceolate, long acuminate, unequally acute at base, glabrous, up to 6 in. long, 2 in. broad; stipules lanceolate, .5-75 in. long; ♂ spikes 3-4 in. long, narrow, on slender peduncles up to 3 in. long, ♀ not known.....8. *Barberi*.

Flowers subtended by bracts adnate to the rachis:—

Bracts forming a short cup under the flowers (♂, ♀ or ♂) the bracteoles in ♀ in a hood-like ridge above; leaves coriaceous, broadly ovate (in ♂ often elliptic and narrow), acuminate, glabrous, 5-9-ribbed, 2-3 pairs of ribs basal, the others higher up, often impressed above, up to 9 in. long, 4.5 in. broad; ♂ spikes slender, usually 4-5 in. long, ♀ slender, up to 6 in. long, the berries large, .25 in. in diam. or more.....9. *nigrum*.

Bracts adnate to the rachis with decurrent free membranous margins, confluent in the ♀ with the bracteoles above the ovary, under-surface crispate-hairy:—

Leaves membranous:—

Leaves beneath, also branchlets and petioles, pubescent with crisped hairs; leaves variable in shape, usually ovate or elliptic-ovate, abruptly acuminate, rounded or cordate, often unequally, at base, 5-7-ribbed from the base, two upper pairs a little higher and extending to the tip, up to 5 in. long, 3.5 in. broad; ♂ spikes slender, 3 in., ♀ to 6 in. or more

10. *hymenophyllum*.

Leaves beneath covered with round silvery scales, above often bullate; leaves variable in size, elliptic or lanceolate, acuminate, acute and often oblique at base, 5-7-ribbed, the upper pair rather higher up and reaching the tip, up to 6 in. long, 2.5 in. broad; ♂ spikes very slender, 4-6 in., ♀ to 6 in.

11. *argyrophyllum*.

Leaves and branchlets quite glabrous, ovate or suborbicular, abruptly acuminate, rounded or cordate, sometimes obliquely, at base, 7-ribbed from the base, up to 4 in. long, 3.5 in. broad; the ♂ spikes extremely slender, elongate, up to 10 in. long.....12. *attenuatum*.

Leaves broadly ovate or orbicular, rarely elliptic, abruptly acuminate at base, 5-8-ribbed quite from the base or the leaves transverse and reticulate, joining the ribs, and ♀ spikes rather thick, 3-4 in. long, berries rather close.....13. *Wightii*.

E. J. N. 80, Muldera Wightii

Hills (P

dense

9. *PIPER NIGRUM*, Linn.; F. B. I. v. 90.
W. Ghâts, in all Districts, at 1,500—5,000 ft., in evergreen forest; largely cultivated. Black or White pepper.
A stout glabrous climbing shrub, at first rooting at the nodes like ivy, the leaves small and cordate, gradually getting larger, later sending out strong flowering branches with large leaves and berries up to .25 in. diam. Dr. Barber would apparently separate a form with big berries but it hardly seems even of varietal rank. It probably arose from chance cultivated seeds.
10. *PIPER HYMENOPHYLLUM*, Miq.; F. B. I. v. 93; Wt. Ic. t. 1942.
W. Ghâts, from Mysore and the Nilgiris southwards, in evergreen forests, at 1,500—5,000 ft.
A slender climber at first rooting at the nodes and having broad cordate leaves, afterwards spreading and branching, with narrower and often elliptic variable leaves, the berry small. Berries small, globose, or slightly oblong, .1—2 in. in diam.
11. *PIPER ARGYROPHYLLUM*, Miq.; F. B. I. v. 93; Wt. Ic. t. 1941.
W. Ghâts, Coorg and Nilgiris southwards, in evergreen forest and Shola, 1,500—7,000 ft.
A slender climber similar to the last (in some cases more slender) and difficult sometimes to separate from it, for crisped hairs occur to some extent in this and white scales may sometimes be found in that as also in *P. Wightii*. Berries globose, .2—3 in. in diam. A small-leaved form (var. 2 or var. 5 of the F. B. I.) may perhaps have to be separated when better known.
12. *PIPER ATTENUATUM*, Buch.-Ham.; F. B. I. v. 92; Wt. Ic. t. 1933.
P. sylvestre, Wt. Ic. t. 1937; F. B. I. v. 93. *P. trioicum*, Roxb.; Wt. Ic. tt. 1935, 1936.
N. Circars, forests of the hills of Vizagapatam and Godavari at 2,000—3,000 ft.; W. Ghâts, Malabar and Nilgiris to Travancore and Tinnevely, in evergreen forests at low levels.
A slender climber with often somewhat zigzag branchlets and ovate-cordate leaves, the berries globose, very small. This seems to be the Circar species which Roxburgh cultivated at Samulcotta as true pepper.
13. *PIPER WIGHTII*, Miq.; F. B. I. v. 94; Wt. Ic. t. 1939.
W. Ghâts, Nilgiris and Pulneys, above 6,000 ft. in Shola forests.
A stout climber with smooth stems, at first rooting ivy-like on trees and with small cordate leaves, later branching out and spreading, the leaves rather variable but always prominently reticulate, the berries small with prominent stigmas. White scales, as in *P. argyrophyllum*, are often found on the under-surface of the leaves, but this is a much stouter plant.
P. Betle, Linn., is the Betel pepper, a perennial Malay creeper extensively cultivated in hot damp localities for its leaves (Pán) which are rolled up with portions of areca nut, lime, catechu, cardamoms and other ingredients, sold in shops and universally chewed. The plants are cultivated in special trellised gardens.

2. *Heckeria*, Kunth.

Shrubs, usually with succulent branches. *Leaves* large, long-petioled, orbicular or peltate, cordate at base, the petiole sheathing. *Flowers* very minute, hermaphrodite, in very close slender cylindrical spikes in pedunculate umbels in the axils of the leaves; bracts pedicelled, peltate. *Perianth* 0. *Stamens* 2—3, at the base of the ovary; anthers very small, 4-valvate. *Ovary* free; stigmas 3. *Fruit* a very small indehiscent, usually trigonous berry. *Seeds* adherent to the pericarp; albumen floury.

HECKERIA SUBPELTATA, Kunth. *Piper subpeltatum*, Willd.; F. B. I. v. 95. *Pothomorphe subpeltata*, Miq.; Wt. Ic. t. 1925.

W. Ghâts, in all Districts, in evergreen forests, up to 3,000 ft. A large herbaceous shrub, often 3—5 ft. high with orbicular acute, deeply cordate leaves palmately nerved and reticulate, up to 12 in. in diam., the spikes often 5—6 in. long, 3—7 together in the umbel, the fruits trigonous.

3. *Peperomia*, Ruiz & Pav.

Annual or perennial usually succulent herbs. *Leaves* alternate, opposite or whorled, entire, pellucid-punctate; stipules 0. *Flowers* minute, hermaphrodite, sessile or sunk in the rhachis, erect, in terminal or leaf-opposed, solitary or paniced, rarely axillary spikes; bracts sessile, often peltately attached. *Perianth* 0. *Stamens* 2; filaments very short; anther-cells confluent. *Ovary* 1-celled, obtuse acute or beaked; ovule solitary, erect; stigma lateral or terminal, usually penicillate. *Fruit* a minute, indehiscent, almost dry nutlet, the pericarp very thin. *Seed* minute, testa membranous; albumen floury.

Leaves coriaceous, small, .2—3 in. in diam., rarely more, pale when dry, the ribs and nerves invisible:—

Leaves in whorls of 4, orbicular, nearly sessile, glabrous; spikes stout, .75—1.5 in. long, with pubescent rhachis, the peduncles about .5—.75 in. long, the nutlets ovoid, acute.....1. *reflexa*.

Leaves opposite or alternate, obtuse or emarginate, with slender petiole .2 in. long, minutely puberulous; spikes slender, .75 in. long, with glabrous rhachis, the peduncles scarcely .25 in. long, the nutlets ellipsoid.....2. *Heyneana*.

Leaves fleshy, opposite or alternate or both, the ribs and sometimes nerves visible:—

Leaves and stems glabrous or very nearly so:—

Leaves mostly alternate, prominently 5-ribbed from the base, elliptic-ovate, acute, cuneate at base, up to 3.5 in. long, 2 in. broad, the petiole to .75 in.; spikes very slender, up to 4 in. long, the peduncle to 1 in., the nutlets globose, scurfy and black-punctate.....3. *Thomsoni*.

Leaves mostly opposite or the upper whorled, lower ones often alternate, 3-ribbed:—

Leaves obovate, obtuse or emarginate, cuneate at base, up to 1.5 in. long, 1 in. broad, the petiole .2—.5 in.; spikes rather stout, up to 2 in. long, the peduncle to 1 in., the nutlets ovoid, minutely scaly.....4. *portulacoides*.

Leaves elliptic orbicular or obovate, obtuse, rounded at base, up to .75 in. in diam., the petiole to .25 in., the side ribs very obscure; spikes slender, up to 2 in. long, the peduncle short, the nutlets ovoid, minutely rugose and scurfy.....5. *Wightiana*.

Leaves and stems pubescent with crisped hairs, leaves usually opposite, 3—5-ribbed from the base, but rather obscurely, elliptic-ovate or obovate, rounded or slightly acute, up to 1.5 in. long, 1 in. broad, petiole to .5 in.; spikes slender, often in terminal panicles, up to 4 in. long, the peduncle .75 in., the nutlets globose, punctate.....6. *dindigulensis*.

Leaves very thin, membranous when dry, broadly ovate-deltoid, acute, 5—7-ribbed, opposite and alternate, about 1 in. in diam.; spikes very slender, opposite the leaves, the nutlets ribbed and reticulate.....*pellucida*.

1. *PEPEROMIA REFLEXA*, A. Dietr.; F. B. I. v. 99; Wt. Ic. t. 1923, 1.
N. Circars, in Ganjam and up to 4,000 ft. on Mahendragiri;
W. Ghâts in all Districts from the Coimbatore Hills and Nilgiris
southwards, usually above 4,000 ft.
A succulent tufted herb growing epiphytically on tree-trunks.
2. *PEPEROMIA HEYNEANA*, Miq.; F. B. I. v. 99.
Bababudan Hills of Mysore, at 6,000 ft. (Meebold), Ootacamund
in Nilgiris (G. King).
A small epiphytic herb with emarginate leaves, sometimes up
to 1 in. long, but usually much smaller.
3. *PEPEROMIA THOMSONI*, Hook. f.; F. B. I. v. 97. *P. dindigulensis*,
Wt. Ic. t. 1921, *not* of Miq. (not good).
W. Ghâts, Anamalai and Pulney Hills, at rather low levels.
A large-leaved (comparatively) succulent epiphyte rooting in
moss on the branches of trees.
4. *PEPEROMIA PORTULACOIDES*, A. Dietr.; F. B. I. v. 98; Wt. Ic. t.
1922, 2. *P. courtallensis*, Miq.; Wt. Ic. t. 1923, 2.
W. Ghâts, hills of Tinnevely and Travancore, Avalanché in
Nilgiris, probably over 5,000 ft.
An erect glabrous succulent herb, growing on rocks and tree-
trunks.
5. *PEPEROMIA WIGHTIANA*, Miq.; F. B. I. v. 98; Wt. Ic. t. 1924 (except
pubescence).
W. Ghâts, Nilgiris and Pulneys above 4,000 ft.
A small slender succulent herb, growing on moist rocks and
on the branches of trees. The tips of the leaves are sometimes
ciliate.
6. *PEPEROMIA DINDIGULENSIS*, Miq.; F. B. I. v. 98. *P. Heyneana*, Wt.
Ic. t. 1922, 1, *not* of Miq.
N. Circars, Bison Hill, Godavari (Barber); Carnatic, Shevaroy
Hills of Salem, Kollimalai Hills of Trichinopoly; W. Ghâts,
from Malabar southwards at about 2,000—4,000 ft.
An erect, rather large, succulent herb, growing on wet rocks
or on tree branches, conspicuous by its pubescence.
7. *PEPEROMIA PELLUCIDA*, H. B. & K.
Madras, a weed in gardens; W. Coast, at Trevandrum, intro-
duced and clearly run wild, a native of S. America.
A slender succulent herb with weak procumbent stems.

Family CXXIV. CHLORANTHACEAE.

Herbs, shrubs or trees, usually aromatic. *Leaves* opposite, usually toothed, the petioles often connate in a sheath; stipules small, subulate, usually on the margin of the sheath. *Flowers* in terminal or pseudo-axillary spikes heads or panicles, unisexual or hermaphrodite from the ♂ and ♀ cohering supported by a bract: ♂ flowers without perianth, ♀ also or with a 3-toothed limb adnate to the ovary.

Stamens 1 or 3, connate; filaments very short and thick; anthers 2-celled, or if 3, side ones 1-celled. *Ovary* 1-celled; ovule 1, orthotropous, pendulous; style very short. *Fruit* a small, ovoid or globose, drupe, exocarp fleshy, endocarp crustaceous. *Seed* pendulous; testa membranous; albumen copious, fleshy; embryo minute; cotyledons divaricate or scarcely distinct; radicle inferior.

1. *Chloranthus*, Swartz.

Perennial herbs or shrubs, the stems articulate at the nodes. *Flowers* in terminal simple or paniced spikes, hermaphrodite; the ♂ and ♀ connate on a bract; perianth 0. *Stamens* 1 or 3 confluent; if 3 the central anther 2-celled, the side ones 1-celled. *Ovary* with subsessile truncate stigma.

CHLORANTHUS BRACHYSTACHYS, Blume; F. B. I. v. 100. *Sarcandra chloranthoides*, Gardn.; Wt. Ic. t. 1946.

W. Ghâts, hills of Malabar, Bolumpatti Valley, Anamalais, Pulneys and Tinnevely at 2,000—5,000 ft., in moist forests.

A small bush reaching 4 ft. in height, the lanceolate leaves coarsely spinous-serrate, reaching 7 in. long, the single stamen with large thickened connective and filament, the berries globose, purplish-black.

Family CXXV. MYRISTICACEAE.

Evergreen tree, often stellately tomentose. *Leaves* alternate, entire, often pellucid-punctate; stipules 0. *Flowers* small, dioecious, regular, in axillary or lateral panicles cymes umbels or fascicles, rarely in racemes; bracteoles persistent or caducous. *Perianth* gamophyllous, inferior, with 3, sometimes 2 or 4, lobes valvate in bud. *Androecium* in ♂ flowers of 3 or more extrorse anthers connate in a sessile or stipitate column, ring or disk; anthers 2-celled, linear or ovate. *Ovary* in ♀ flowers superior, free, 1-celled; ovule 1 basal, erect, anatropous; stigma capitate discoid or lobed. *Fruit* more or less fleshy, splitting usually into 2, rarely 4, valves. *Seeds* erect, enclosed in a thin or fleshy, entire or lacerate, coloured, often aromatic arillus; testa usually thick, albumen copious, hard, ruminant; embryo very small, basal; cotyledons divaricate, flat or crumpled; radicle short, inferior.

Anthers attached by their backs to a column formed of the connate filaments:—

- | | |
|---|----------------------------|
| Anther-column sessile, the apices of the anthers free..... | 1. <i>Gymnacranthera</i> . |
| Anther-column stipitate and usually produced beyond the anthers which are completely attached to it..... | 2. <i>Myristica</i> . |
| Anthers attached by their bases stellately to a peltate usually stipitate column formed of the connate filaments..... | 3. <i>Knema</i> . |

1. *Gymnacranthera*, Warb.

Trees. *Leaves* alternate, entire, evergreen, pergamaccous. *Flowers* small, dioecious, ♂ in fascicles in axillary panicles, ♀ in short axillary racemes, bracts deciduous. *Perianth* 3—4-lobed. *Androecium* sessile, the connectives combined in an oblong thick column; anthers 6—12, elongate, the lower parts adnate to the column by their backs,

the apices free, often inflexed over the column. *Ovary* ovoid; stigmas sessile, connate, scarcely bilobed. *Fruit* globose or ovoid; pericarp thick, fleshy; arillus laciniate almost to the base. *Seed* conforms to the fruit; testa woody; albumen ruminant; cotyledons divaricate, connate at base.

GYMNACRANTHERA CANARICA, Warb. Monog. Myrist. 368. *Myristica canarica*, King, Ann. Calc. iii. 307, t. 138. *M. Farquhariana*, Wall.; F. B. I. v. 108 in part; Bedd. Fl. t. 270.

W. Ghâts, from S. Canara southwards to Travancore, in evergreen forests at low levels about 1,000 ft. alt.

A very large evergreen tree with oblong leaves up to 10 in. long, 4 in. broad, glaucous beneath. The fruit is globose about 1 in. in diam. Bark smooth, brown; wood yellowish-grey, coarse, moderately hard, of little value. The seeds can be used in the making of candles, as they contain much fat. Vern. Kan. Pindî; Mal. Undai pānu.

2. Myristica, Linn.

Trees. *Leaves* alternate, entire, evergreen, pergamaceous or chartaceous. *Flowers* small, dioecious, in cymes umbels or fascicles, from the axils of the leaves or of the scars of fallen leaves, the peduncles usually thick; bracts deciduous; bracteoles persistent, usually oblique, at the base of the perianth. *Perianth* 3-lobed. *Androeceum* stalked, the filaments and connectives connate in a column usually produced beyond the anthers; anthers 12—30 elongate. *Ovary* ovoid; stigmas connate, 2-lobed. *Fruit* large, ovoid or oblong; pericarp thick, succulent, rarely leathery; arillus laciniate. *Seed* conform to the fruit; testa hard; albumen ruminant; cotyledons connate.

Flowers urceolate in paniced cymes, the peduncles slender; ♀ larger than ♂; leaves rather thin:—

Cymes few-flowered, at most 3—5 in ♂, fewer in ♀; perianth 2—3 in. long, tawny-villous, the pedicels drooping, about .5 in. long; leaves elliptic-lanceolate, acuminate, 3—5 in. long, 1.5—2 in. broad, subglaucous beneath, nerves about 8 pairs; fruit broadly pyriform, up to 2 in. long, the pericarp yellow, the arillus red and much lacinate *fragrans*.
 Cymes dichasioid, up to 20 in ♂ flowers, only 3 or 4 in ♀; perianth 2—2.5 in. long, subglabrous, the pedicels about .25 in. long; leaves elliptic-oblong, sub-obtuse, 3—7 in. long, 1—3 in. broad, brown beneath, nerves about 10 pairs; fruit cylindrical, 2—3 in. long, .75 in. broad, villous, the arillus yellow 1. *malabarica*.

(Flowers ovoid, in short cymes or fascicles on thick woody peduncles; leaves thick and large with prominent nerves:—)

Leaves beneath densely reddish tomentose, smooth and glabrous above, oblong or elliptic-oblong, acute at apex, rounded at base, 12—24 in. long, 4—6 in. broad, main nerves 20—26 pairs, impressed above, petiole stout, .5—1 in. long, channelled; flowers rather small, densely rusty tomentose, ♀ slightly larger but less numerous than ♂; fruit oblong up to 4 in. long, densely tomentose, the arillus orange-red and deeply much lacinate 2. *magnifica*.

(Leaves beneath glabrous and usually glaucous, smooth above:—)

Leaf nerves and transverse nervules conspicuous, leaves 5—10 in. long, 2.5—4 in. broad; fruit globose, 2—2.5 in. in diam., the pericarp fleshy, the lacinae of the orange-red arillus with their ends separate 3. *Beddomei*.
 Leaf nerves only conspicuous, the rest faint, leaves oblong lanceolate up to 10 in. long, 4 in. broad; fruit lanceolate, 1.5—2.5 in. long, the pericarp fleshy, the lacinae of the arillus drawn together at their tips 4. *contorta*.

1. MYRISTICA MALABARICA, Lamk.; F. B. I. v. 103; Bedd. Fl. t. 269; King Ann. Calc. t. 109; Warb. Monog. Myrist. t. xii. 1.
W. Gháts, in evergreen forests from S. Canara southwards, at low levels up to 1,000 ft.
A tree reaching 50 ft. in height and a diam. of 1·5 ft. Bark greenish-black, smooth; wood yellowish-brown tinged with grey, moderately hard, not durable and of little use. Vern. *Kan.* Kanagi; *Tam.* Patthiri; *Mal.* Ponnám pánu.
2. MYRISTICA MAGNIFICA, Bedd. Fl. t. 268; F. B. I. v. 104; King Ann. Calc. t. 119.
W. Gháts, Travancore and parts of Tinnevely and Canara (Bourdillon), especially common about Kolaturpoli, in swampy ground in evergreen forests.
A lofty tree reaching 90—100 ft. in height (Cooke), 120 ft. (Bourdillon), often buttressed and furnished with numerous aerial roots, which start from the trunk at 10—20 ft. above ground and spread along the ground, rising in loops above it. Bark purplish-black, smooth; wood yellowish-white, soft and perishable. Vern. *Mal.* Kotha pánu.
3. MYRISTICA BEDDOMEI, King Ann. Calc. 291, t. 118. *M. laurifolia*, Hook. f. & Th., var. *lanceolata*, Hook. f.; F. B. I. v. 103. *M. laurifolia*, Bedd. Ic. t. 267 fruit only (flowering branch is probably *M. malabarica*).
W. Gháts, in all Districts, in evergreen forests, up to 5,000 ft. Wild Nutmeg.
A large tree reaching 90 ft. in height, with a diameter of about 2·5 ft. Bark blackish-green, rather smooth; wood yellowish brown, moderately hard, perishable and of no great value. Vern. *Kan.* Jajikai; *Mar.* Jayaphal; *Tam.* Kathu jathikai; *Mal.* Pattha pánu.
4. MYRISTICA CONTORTA, Warb. Monog. Myrist. 507, t. 16 part.
W. Gháts in S. Canara and Malabar up to 3,000 ft., in evergreen forest; Lower Pulneys (Bourne).
A large tree, apparently only really separable from *M. Beddomei* by the fruit, and quite doubtfully distinct from it.
M. fragrans, Houtt., is the Nutmeg tree, native of the E. Moluccas and cultivated more or less throughout Malaya. In India it is only found as a specimen tree in a few localities, chiefly Botanic Gardens like Barliyar, where the climate is sufficiently hot and moist. The "nutmeg" is given by the large seed, and the arillus outside it gives the spice known as "mace."

3. Knema, Lour.

Trees. *Leaves* alternate, evergreen, coriaceous or chartaceous. *Flowers* small, dioecious, ♂ in fascicles on thick peduncles from the axils of leaves or of the scars of fallen leaves, ♀ similar but fewer and rather longer; bracts deciduous; pedicles bracteolate. *Perianth* 3-lobed. *Androecium* usually stalked; filaments and connectives connate in a peltate disk; anthers 8—20, free, attached stellately to the margin of the disk, dehiscing downwards. *Ovary* ovoid; style short, thick;

stigmas 2, lacinate on the margins. *Fruit* ovoid or oblong; pericarp thick, fleshy, tomentose; arillus lacinate at the apex only. *Seed* conform to the fruit; albumen ruminant; cotyledons divaricate or sub-erect.

KNEMA ATTENUATA, Warb. *Myristica attenuata*, Wall.; F. B. I. v. 110; King Ann. Calc. t. 152. *M. corticosa*, Bedd. Fl. t. 271, not of Lour.

W. Ghâts, from S. Canara southwards, in evergreen forests up to 2,000 ft.

A moderate-sized tree with oblong-lanceolate acuminate leaves up to 8 in. long, 2–3 in. broad, prominently and regularly nerved, glaucous and rusty pubescent beneath, the flowers stellately pubescent, the fruit ovoid, 1.5 in. long, the aril of a brilliant crimson. Bark greenish-black, smooth; wood pale brown, moderately hard, of little value. Vern. *Kan.* Rukt maru; *Tam.* Chora pathiri; *Mal.* Chora panu.

Family CXXVI. LAURACEAE.

Erect aromatic trees or shrubs, or (*Cassytha*) leafless twining parasites, usually evergreen. *Leaves* alternate, rarely opposite or subopposite, entire, stipules 0. *Flowers* regular, small hermaphrodite or dioecious, in axillary or lateral cymes clusters racemes or panicles, sometimes in umbellules; bracts deciduous, often involucrate, sometimes 0. *Perianth* usually inferior; tube short, often enlarging in fruit; lobes usually 6, sometimes more, sometimes only 4, in 2 series, equal or unequal, deciduous or persistent in fruit, sometimes enlarged as are the pedicels. *Stamens* usually a multiple of the perianth-lobes, in 2–4 series on the tube; filaments of the inner rows usually, of the outer sometimes with a pair of glands attached or alongside; anthers erect, 2–4-celled, the cells dehiscing by upcurved, at length deciduous, valvular lids, the 4th row of stamens often reduced to glands; in ♀ flowers the stamens replaced by staminodes, usually linear or clavate, the inner biglandular as in ♂. *Ovary* sessile at the base of the perianth-tube, 1-celled; ovule solitary, anatropous, pendulous from the top of the cell. *Fruit* a dry or fleshy berry or drupe, naked or enclosed in the perianth-tube or supported by the more or less enlarged perianth-tube and lobes, the pedicel frequently thickened. *Seed* pendulous; testa membranous; albumen 0; cotyledons plano-convex, fleshy; radicle minute, superior.

Trees or shrubs:—

Stamens of 3rd row, when present, with extrorse anthers:—

Anthers 2-celled:—

Fruit surrounded by the enlarged perianth-tube.....1. *Cryptocarya*.

Fruit not surrounded by the enlarged perianth-tube:—

Fruiting perianth persistent.....2. *Apollonia*.

Fruiting perianth deciduous.....3. *Beilschmiedia*.

Anthers 4-celled:—

Leaves opposite or subopposite rarely alternate, usually 3- or more-ribbed; fruiting perianth enlarged into a cupule embracing the fruit

4. *Cinnamomum*.

- Leaves alternate:—
 Fruiting perianth-tube enlarged, fruiting pedicels enlarged, thick and usually warted.....5. *Alseodaphne*.
 Fruiting perianth-tube and pedicels hardly enlarged:—
 Fruiting perianth-lobes reflexed.....6. *Machilus*.
 Fruiting perianth-lobes erect, cup-like.....7. *Phoebe*.
 Stamens of all rows with introrse anthers, the lower cells sometimes lateral:—
 Fertile stamens 9; involucre bracts deciduous in flower; leaves usually subverticillate, 3-ribbed or 1-ribbed, penninerved.....8. *Actinodaphne*.
 Fertile stamens normally 9 or 12, frequently more, rarely less; involucre bracts persistent in flower; leaves alternate or subopposite, penninerved.....9. *Litsea*.
 Fertile stamens 6; involucre bracts early deciduous; leaves alternate or subverticillate, 3-ribbed.....10. *Neolitsea*.
 Leafless filiform twining parasites with suckers; stamens with 4-celled anthers, outer two rows introrse, inner row extrorse.....11. *Cassytha*.

1. *Cryptocarya*, R. Br.

Evergreen trees or shrubs. *Leaves* usually alternate, penninerved or 3-ribbed, more or less coriaceous. *Flowers* small, hermaphrodite, in axillary or subterminal pedunculate panicles; bracts and bracteoles present but often early caducous. *Perianth-tube* turbinate or ovoid, ultimately narrowed at the top; lobes 6, in two rows, subequal. *Stamens* 9 perfect, those of the 1st row introrse opposite the 3 outer perianth lobes, those of the 2nd row introrse opposite the 3 inner lobes, within and alternate with the stamens, 6 stipitate glands, then those of the 3rd row extrorse opposite the stamens of the 1st row, then, slightly within these, 3 stipitate cordate staminodes opposite the stamens of the 2nd row; all stamens 2-celled, the connective often produced. *Ovary* sessile at the bottom of the perianth-tube and enclosed in it; style shortly exserted; stigma obtuse or capitate. *Fruit* drupaceous, hardened or fleshy, smooth or ribbed, enclosed in the accrescent perianth-tube; pericarp membranous or thinly crustaceous, more or less free from the perianth-tube. *Seed* with a membranous testa, often not separable from the pericarp; cotyledons thick, fleshy; radicle minute.

Leaves beneath with prominent nerves and transverse nervules, all fulvous-tomentose, the reticulation also villous, elliptic-obovate, abruptly sharp-acuminate, up to 8 in. long, 4 in. broad; flowers in short axillary fulvous panicles of cymes with prominent bracts and bracteoles, apparently persistent.....1. *anomalayana*.

Leaves beneath glabrous except sometimes the midrib and nerves; bracts and bracteoles deciduous:—

Flowers in spreading terminal or axillary panicles:—

Leaves ovate or elliptic, obtuse or suddenly shortly acute at apex, rounded or even truncate at base, shining above, reddish-glaucous beneath, the nerves distant, impressed above, the transverse nervules also distant but distinct, reticulation not dotted-areolate, up to 5 in. long, 2.5 in. broad; panicles usually axillary, fulvous-pubescent, up to 5 in. long.....2. *Beddomei*.

Leaves elliptic or elliptic-oblong, glaucous beneath, the nerves prominent beneath, the transverse nervules indistinct, the reticulation dotted-areolate:—

Main nerves 9—12 pairs, leaf-apex abruptly and obtusely acuminate, base rounded, up to 9 in. long, 4 in. broad; berry globose, .5 in. in diam., dull and smooth.....3. *Bourdillonii*.

Main nerves 6—8 pairs, leaf-apex obtuse or emarginate, sometimes slightly acute, base acute, 3—5 in. long, 1—2 in. broad; berry ovoid, 1.5 in. long, .75 in. broad, furrowed and often lenticellate.....4. *Lawsonii*.

Flowers in short congested axillary or terminal tawny-tomentose panicles:—

Leaves elliptic- or ovate-oblong, obtuse or slightly acute at apex, rounded at base, smooth and dull above, glaucous beneath and reticulate, the nerves 5—7 pairs often pubescent; up to 4 in. long, 2·25 in. broad; berry ovoid, black, 5 in. long.....*S. neilgherrensis*.

Leaves ovate-obovate or oblong, sometimes almost orbicular, obtuse or emarginate at apex, obtuse at base, shining above, subglaucous beneath, the transverse nervules prominent, the nerves 5—8 pairs; sometimes tornenrose, up to 4 in. long, 2·5 in. broad; berry oblong, 1 in. long, 3—4 in. broad, smooth

6. *Stocksii*.

1. *CRYPTOCARYA ANAMALAYANA*, Gamble in Kew Bull. 1925, 126. *C. sp.*; F. B. I. v. 121.
W. Ghâts, Anamalai Hills, at 3,000 ft. (Bedd., Barber).
A tree with rather thin leaves with prominent transverse nervules and fulvous tomentose branchlets and inflorescence.
2. *CRYPTOCARYA BEDDOMEI*, Gamble in Kew Bull. 1925, 127.
W. Ghâts, S. Canara plains (Beddome); Udumanparai in Anamalais (Barber).
A tree with coriaceous leaves.
3. *CRYPTOCARYA BOURDILLONII*, Gamble in Kew Bull. 1925, 127. *C. Wightiana*, Hook. f.; F. B. I. iv. 120 in part, not of Thw.
W. Ghâts, Kolaturpoli, Travancore, up to 500 ft. in evergreen wet forest (Bourdillon), S. Tinnevely (Beddome).
A tall tree, probably in part *C. Wightiana*, Bourd. Trav. Trees 296. The main nerves are smooth or slightly raised above, the midrib impressed, the transverse nervules subparallel. In young shoots the leaves may reach a large size, more than 12 in. long and 6 in. broad, with a thick petiole of 2 in.
4. *CRYPTOCARYA LAWSONI*, Gamble in Kew Bull. 1925, 127.
W. Ghâts, Kundahs Sholas in Nilgiris above 5,000 ft. (Lawson, Gamble); hills of Tinnevely (Beddome, Tadulingam).
A lofty tree in Tinnevely (Beddome); in Nilgiris a stout not very tall one. The main nerves are short and curved, smooth above, the midrib impressed, the transverse nervules merged in the reticulation.
5. *CRYPTOCARYA NEILGHERRENSIS*, Meissn. *C. Stocksii*, Hook. f.; F. B. I. v. 120 in part, not of Meissn.
W. Ghâts, Nilgiris at about 6,000 ft. (Wight, Gamble), Anamalais at 2,500 ft. (Beddome), in Shola forest.
A large tree (Beddome). The midrib and main nerves of the leaves are impressed above, the branchlets tawny-pubescent and lenticellate.
6. *CRYPTOCARYA STOCKSII*, Meissn.; F. B. I. v. 120 in part.
W. Ghâts, Canara to the Pulneys, Anamalais and hills of Travancore at about 4,000—5,000 ft.; Bababudan Hills of Mysore (Talbot).
A large or medium-sized tree with very coriaceous leaves and prominently lenticellate branches. The midrib and main nerves are much impressed above, and the margins often reflexed, the branchlets prominently lenticellate.

2. *Apollonias*, Nees.

Evergreen trees. *Leaves* scattered, chiefly near the ends of the branchlets, penninerved. *Flowers* very small, hermaphrodite, in axillary or subterminal racemes, the peduncles and pedicels slender. *Perianth*-tube short; lobes 6, in two rows, subequal. *Stamens* 9 perfect, those of the 1st and 2nd rows introrse, opposite the perianth-lobes, those of the 3rd row opposite the first and extrorse, with a pair of stalked glands at their bases, those of the 4th row reduced to ovate or cordate staminodes, all stamens 2-celled only. *Ovary* sessile, stigma depressed-capitate. *Fruit* drupaceous, globose or ovoid, seated on the slightly enlarged perianth lobes.

APOLLONIAS ARNOTII, Nees; F. B. I. v. 121; Wt. Ic. t. 1819; Bedd. Fl. t. 291.

W. Ghâts, forests of Tinnevely and Travancore (Wight, Barber, Lawson); Nilgiris (Gardner), in evergreen forest, at 2,500—5,000 ft. rare.

A moderate-sized tree with narrowly lanceolate long acuminate leaves, similar to those of *Phoebe lanceolata*, which has 4-celled anthers and stouter peduncles and pedicels. Vern *Mal.* Chenthanam.

3. *Beilschmiedia*, Nees.

Evergreen trees or shrubs. *Leaves* alternate or opposite, usually coriaceous, penni-nerved, venose-reticulate. *Flowers* small, hermaphrodite, axillary lateral or subterminal, in racemes or panicles. *Perianth*-tube short; lobes 6, subequal, deciduous. *Stamens* 9 perfect, those of the 1st and 2nd rows introrse, those of the 3rd row extrorse, staminodes of the 4th row cordate or ovoid, stipitate; glands 6, stipitate, nearly as large as the staminodes, between the 2nd and 3rd row of stamens; all anthers 2-celled. *Ovary* sessile, free from the perianth, attenuate into the style; stigma obtuse. *Fruit* an oblong ovoid or globose berry, the pedicels not or only slightly thickened. *Seed* with a membranous testa; cotyledons fleshy, often with a rudimentary dissepiment, sometimes ruminant.

Leaf buds small, pubescent, without coriaceous scales:—

Ovary glabrous; leaves usually alternate, elliptic- or oblong-lanceolate, obtuse or bluntly acuminate, cuneate at base, shining above, main nerves about 8—12 pairs, joined by a prominent areolate reticulation, up to 7 in. long, 2.5 in. broad; racemes axillary or lateral, pubescent, under 1 in. long, the bracts narrow, deciduous; berry oblong-obovoid up to 1—1.5 in. long.....1. *Roxburghiana*.
Ovary villous, leaves usually opposite, ovate lanceolate, obtusely acute, attenuate at base, dull above and below, main nerves 6—10 pairs, irregular, joined by a not very prominent reticulation, up to 7 in. long, 1.5—3 in. broad; racemes axillary and terminal, fulvous-villous, about 1 in. long and with prominent concave silky deciduous bracts; berry purple, cylindric, 1—1.5 in. long, .75 in. in diam., the peduncle red.....2. *Bourdillonii*.

Leaf-buds elongate, perulate, the scales lanceolate; leaves usually opposite, elliptic-lanceolate, obtusely acute or acuminate, acute at base, shining, glabrous, main nerves 10—12, the reticulation prominent, raised and areolate, up to 6 in. long, 2.5 in. broad; panicles axillary and terminal, with slender peduncles and pedicels, not bracteate; berry ovoid, up to 1.25 in. long, in diam. .7 in. smooth, purple

3. *Wightii*.

1. BEILSCHMIEDIA ROXBURGHIANA, Nees; F. B. I. v. 121; Wt. Ic. t. 1828. N. Circars, hills of E. Gháts on Mahendragiri, the Palkondas and in Rampa, from Ganjam to the Godavari, at 1,500—4,000 ft. (Gamble).
A large or moderate-sized tree with coriaceous leaves, the nerves and reticulation all prettily raised on the upper surface. Wood white, moderately hard, even-grained. Vern. Hind. Konhaia.
2. BEILSCHMIEDIA BOURDILLONT, Brandis Ind. Trees 528. *B. fagifolia*, Bedd. Fl. t. 263, not of Nees.
W. Gháts, S. Canara to Travancore, in evergreen forests up to 1,500 ft.
A large tree, the rather soft leaves both opposite and alternate. Bark dark green; wood pale brown, hard and heavy, but not used. Vern. Mal. Mora Kutthi.
3. BEILSCHMIEDIA WIGHTII, Benth.; F. B. I. v. 124. *Haasia Wightii*, Nees; Wt. Ic. t. 1831; Bedd. Fl. t. 298.
W. Gháts, Anamalais, Pulneys and hills of Travancore, up to 4,000 ft. in evergreen forests.
A large tree with characteristic perulate buds and flowers in panicles 4 in. long, the ovary glabrous. Bark brown, rough; wood hard, greyish-white with a silvery grain.

4. Cinnamomum, Blume.

Evergreen trees or shrubs, usually with aromatic bark. *Leaves* opposite or sometimes alternate, usually ribbed from near the base. *Flowers* small, hermaphrodite, in axillary lateral or subterminal cymes or panicles, in the latter case the branches usually ending in dichasia with the middle flower largest. *Perianth*-tube short, funnel-shaped, enlarged in fruit; lobes 6, subequal, persistent or partly truncate or deciduous in fruit. *Stamens* 9 perfect, those of the 1st and 2nd rows opposite the perianth-lobes introrse and eglandular, those of the 3rd row opposite the 1st row extrorse and bearing on the filaments 2 usually stipitate glands; staminodes of the 4th row opposite the 2nd row usually cordate and stipitate; anthers 4-celled. *Ovary* sessile at the bottom of the perianth-tube, narrowed into the rather thick style; stigma discoid or obscurely 3-lobed. *Fruit* a berry seated on the usually cup-shaped enlarged perianth-tube, the lobes persistent deciduous or sometimes truncate near their middle. *Seed* conform to the fruit; testa membranous; cotyledons fleshy.

— Leaves opposite or only sometimes alternate:—

Flowers few only, axillary, peduncles and pedicels slender, usually long:—

Flowers very small, under .1 in. long, glabrous, as are the stamens and ovary, in dichasioid cymes; stamens minute, the filaments very short; leaves elliptic-ovate or lanceolate, obtusely acuminate, 3-ribbed from about .2 in. above the base, minutely reticulate with many horizontal transverse nervules, up to 5 in. long, 2 in. broad, 1. *gracile*.
Flowers small, .15 in. long, grey-pubescent, in subumbellate cymes, the filaments villous; leaves linear-lanceolate, acuminate, acute at base, 3-ribbed from the base, glabrous, up to 4 in. long, 1.25 in. broad, but usually much narrower

2. *riparium*.

Flowers .2 in. long, fulvous-tomentose, in rather short fulvous racemes, often reduced to threes, the filaments villous; leaves ovate, acute or acuminate, acute at base, 3-ribbed from about .2 in. above the base, tawny villous beneath when young, sparsely so when old, up to 3 in. long, 1.4 in. broad...3. *travancoricum*.
Flowers many, in axillary or terminal panicles:—

— Leaves glabrous:—

Panicles long, many-branched, with long peduncles and pedicels, the flower-buds globose, grey-pubescent, perianth .1—2 in. long:—

Leaves large, oblong or elliptic-oblong or oblong-lanceolate, acute or acuminate, often sphacelate, 3-ribbed from at or a little above the base, the side ribs running almost to the apex, the transverse nervules horizontal and parallel, up to 18 in. long, 4.5 in. broad.....4. *iners*.

— Leaves moderate-sized, ovate or elliptic-ovate or ovate-lanceolate, shining above:—

— Leaves 3—5-ribbed from a little above the base, the chief side ribs ending about three-fourths up, nervules irregularly reticulate, the base usually rounded, up to 6 in. long, 3 in. broad.....5. *zeylanicum*.

Leaves 3—5-ribbed from about .3 in. above the base, ovate, obtuse at apex, attenuate at base into the long petiole, the ribs faint, the side ones ending about half-way up, nervules obscure, but 2—3 pairs of faint nerves from the midrib.....6. *litseaefolium*.

Panicles short and compact, but long-peduncled, up to about 3 in. in length, fulvous tomentose, pedicels short, perianth .25 in. long; leaves broadly ovate, obtuse or acute, rounded or acute at base, often glaucous beneath, 3—5-sometimes 7-ribbed from .3 to .5 in. above the base, a few nerves both from the midrib and side ribs, reticulation areolate; up to 4 in. long, 3.5 in. broad.....7. *Wightii*.

Panicles long-peduncled, but comparatively few-flowered, up to 5 in. long in all, the flowers elongate, with the thickened perianth up to .5 in. long; leaves elliptic-ovate or oblong, obtuse, narrowed at base into the broad petiole, 3—5-ribbed, the 3 inner from nearly .5—1 in. above the base, reaching nearly to the apex, the middle two with nerves; up to nearly 9 in. long, 2.5—3.5 in. broad.....8. *macrocarpum*.

Leaves hairy, at any rate on the under surface:—

Flowers small, .2 in. long with pedicels, the buds globose, yellowish-tawny tomentose, in panicles up to 4 in. long; leaves elliptic-oblong or ovate-lanceolate, acute or acuminate, 3-nerved from at or a little above the base and the side ribs nearly to the apex, when young glaucous and yellowish-pubescent beneath, afterwards glabrous; up to 7 in. long, 2.5 in. broad, but mature leaves usually much smaller.....9. *sulphuratum*.

Flowers rather large, .3 in. long, usually in threes on the branches of densely fulvous-tomentose panicles 1—4 in. long; leaves also when young densely fulvous-tomentose on both sides, less so when old, opposite or alternate, ovate or oblong, sometimes lanceolate or even orbicular, obtuse or acute, 3—5-ribbed from near the base, the side ribs to the apex, often joined to the centre ones by nerves; up to 5 in. long, 2 in. broad.....10. *Perrottetii*.

Leaves all alternate, thinly coriaceous, ovate or orbicular; caudate-acuminate, acute or rounded at base, glabrous, 3—5-ribbed, the side ribs prolonged to the apex, 3—5 in. long, 1.5—3 in. broad, shortly petioled; flowers minute, in short axillary pedunculate pubescent cymes about 1 in. long.....11. *caudatum*.

1. *CINNAMOMUM GRACILE*, Hook. f.; F. B. I. v. 133.

W. Ghâts, evergreen forests of Tinnevely and Travancore, at 2,500—5,000 ft.

A small straggling shrub, the berry apparently depressed globose.

2. *CINNAMOMUM RIPARIUM*, Gamble in Kew Bull. 1925, 128.

W. Ghâts, from below Coorg to the Anamalais and N. Travancore, on river banks in the low country (Bourdillon).

A graceful little tree with bright blue shining ovoid berry, .5 in. long (*C. gracile*, Bourd. Trav. Trees 302, not of Hook. f.).

3. CINNAMOMUM TRAVANCORICUM, Gamble in Kew Bull. 1925, 128.
W. Ghâts, evergreen forests near Chimunji, Travancore, at 4,000 ft. and upwards (Bourdillon).
A small or medium-sized tree reaching 30 ft. in height and 10 in. in diam. of trunk. Berry ovoid, purplish-blue, 5 in. long (*C. sulphuratum*, Bourd. Trav. Trees 302, *not of* Nees).
4. CINNAMOMUM INERS, Reinw.; F. B. I. v. 130; Wt. Ic. II. 122 bis, 130.
W. Ghâts from Mysore and Coorg to the Anamalais and Travancore, in evergreen forests, up to about 4,000 ft.; Carnatic, Shevaroy Hills of Salem and Kollimalai Hills of Trichinopoly. A large or medium-sized tree with coriaceous shining long leaves and ovoid berry, the fruiting perianth not ribbed.
5. CINNAMOMUM ZEYLANICUM, Blume; F. B. I. v. 131; Wt. Ic. I. 123.
W. Ghâts from S. Canara southwards, at low levels, sometimes cultivated. Cinnamon.
A moderate-sized tree. Bark brown, rough; wood light red, moderately hard, somewhat scented but not used. When cultivated for its bark it is usually, as in Ceylon, grown in coppice, hence the shape of the leaves in specimens is rather variable. Berry ovoid, dark purple, the persistent perianth ribbed. Vern. *Hind.* Dalchini; *Tam.* Karruwa; *Tel.* Sanalinga; *Mal.* Karuva.
6. CINNAMOMUM LITSEAEFOLIUM, Thw.; F. B. I. v. 133.
W. Ghâts, hills of Tinnevely (Tadulingam), without locality (Beddome), Coimbatore (Brandis).
A tree with long-petioled leaves obscurely ribbed and nerved.
- ✓ 7. CINNAMOMUM WIGHTII, Meissn.; F. B. I. v. 132.
W. Ghâts, Coorg, Nilgiris, Anamalais and Pulneys, in Shola forests, above 6,000 ft., most common at the highest levels as about Ootacamund.
A stout tree with very coriaceous leaves and ovate-oblong berries supported by a truncate cup; these berries are frequently diseased and then become globose.
8. CINNAMOMUM MACROCARPUM, Hook. f.; F. B. I. v. 133. *C. iners*, Wt. Ic. I. 130?
W. Ghâts, Sispara and other places in Nilgiris at about 6,000 ft. (Lawson, Gamble); Iyerpadi in Coimbatore (Barber).
A tree with coriaceous shining leaves and large globose-oblong berry reaching nearly 1 in. in length and supported by a large thickened cup and pedicel. The 4th row staminodes usually bear glands like the 3rd row stamens.
- ✓ 9. CINNAMOMUM SULPHURATUM, Nees; F. B. I. v. 132.
W. Ghâts, Coorg and Mysore to N. Coimbatore, Nilgiris and Anamalais, in Shola forests at about 4,000—6,000 ft.
A tree with pale yellowish branches and leaves, the ellipsoid berry 5—75 in. long, seated on the persistent perianth with spreading lobes. Specimens from high levels have usually shorter and more rounded leaves.
10. CINNAMOMUM PERROTTEII, Meissn.; F. B. I. v. 134.
W. Ghâts, Nilgiri Hills, in Shola woods, above 6,000 ft.

short; lobes 6, subequal or the outer slightly the smaller, spreading or reflexed in fruit. *Stamens* 9 perfect, those of the 2nd row opposite the perianth-lobes, introrse, with long filaments and a pair of stipitate glands at their base; stamens of the 3rd row opposite the 1st row, extrorse, with slender filaments and a pair of stipitate glands at their base; staminodes of the 4th row opposite the 2nd row, cordate, stipitate; anthers 4-celled. *Ovary* sessile, style slender; stigma small or discoid. *Fruit* an ovoid ellipsoid or globose, seated on the scarcely enlarged perianth, which is reflexed, pedicel not enlarged. *Seed* conform to the fruit; testa thin; cotyledons fleshy.

MACHILUS MACRANTHA, Nees; F. B. I. v. 140; Wt. I. Bedd. Fl. t. 264. *M. glaucescens*, Wt. Ic. t. 1825.

N. Circars, hills of Vizagapatam, about 4,000 ft (Lushington); Deccan, in hill country as at Nandidrú and the forests of North Coimbatore; W. Gháts, in districts from S. Canara and Coorg to Nilgiris Anamala and hills of Travancore, in evergreen forests up to 10,000 ft. A large evergreen tree with flowers in subterminal panicles. Leaves variable in size from elliptic-oblong, rounded ends, to oblong-lanceolate acute, glaucous beneath. Fruit in size variable as represented in Wight's two plates. Bark black, globose, .5--.75 in. in diam. Bark pale brown, reddish-white darkening on exposure, rough, used for medicinal and other purposes. Vern. Tam. Kolla mávu; Kan. Mal. Urávu; Badaga Kroma.

7. *Phoebe*, Nees.

Evergreen shrubs or trees. *Leaves* alternate, often fascicled at the ends of the branchlets, penninerved; leaf-buds ovate or lanceolate, covered with a few scales. *Flowers* hermaphrodite or rarely polygamous, in terminal or subterminal panicles. *Perianth*-tube short; lobes 6, subequal or the outer slightly the smaller, spreading or reflexed in fruit and clasping its base. *Stamens* 9, perfect, those of the 1st and 2nd row introrse eglandular, the filaments slender; stamens of the 3rd row opposite the 1st row extrorse with 2 large stipitate glands at their base; staminodes of the 4th row opposite the 2nd row, cordate, stipitate; anthers 4-celled. *Ovary* sessile, usual style slender; stigma discoid. *Fruit* an ovoid ellipsoid or globose, seated on the erect and persistent enlarged perianth-lobes, which is reflexed, pedicel not enlarged. *Seed* conform to the fruit; testa thin; cotyledons fleshy.

Branchlets, leaves and inflorescence glabrous; flowering peduncles 1-2 in. long, elongating in fruit, collected usually in the uppermost axils; leaves long acuminate, long cuneate at base, up to 10 in. long and about 1 in. broad, glabrous, usually glaucous beneath, with a few transverse nervules distant; berry black, narrowly ellipsoid, glabrous, up to .5 in. long. 1. Branchlets, leaves beneath and inflorescence minutely grey-puberulous; flowering peduncles very slender, 3-4 in. long, usually lateral from the base of the uppermost axils; leaves oblanceolate, long-acuminate, cuneate at base, up to 9 in. long, 3.5 in. broad, usually glaucous beneath, with a few transverse nervules distant; berry ovoid, .3 in. long. 2. Branchlets, leaves beneath and inflorescence rusty-tomentose; flowering peduncles 1-2 in. long, both axillary and lateral near the ends of the branchlets; leaves elliptic or obovate, acuminate, cuneate at base, up to 6 in. long,

A small tree or (perhaps) shrub with coriaceous leaves, often concave when old, much fulvous tomentose on leaves and branchlets. Berry ovoid, about .5 in. long, seated on the perianth cup with reflexed lobes.

11. *CINNAMOMUM CAUDATUM*, Nees; F. B. I. v. 134.

N. Circars, Mahendragiri Hill in Ganjam at 4,500 ft. (Gamble), hills of Vizagapatam, at 4,500 ft. (A. W. Lushington).

A small tree, the berries ovoid about .5 in. long, seated on the enlarged perianth-tube, the lobes recurved. The inner perianth-lobes are smaller than the outer.

C. Camphora, Nees, is the Camphor tree of Japan, sometimes cultivated in India, though scarce in Madras.

5. *Alseodaphne*, Nees.

* Evergreen trees. *Leaves* alternate, often crowded at the ends of the branchlets, penninerved. *Flowers* small, hermaphrodite, in axillary or subterminal panicles. *Perianth*-tube short, continuous with the pedicel; lobes 6, subequal, or the 3 outer rather the smaller. *Stamens* 9 perfect, those of the 1st and 2nd rows opposite the perianth-lobes, introrse, those of the 3rd row opposite the 1st row, extrorse, with 2 rather large glands on the inner bases of the filaments, staminodes of the 4th row opposite the 2nd row, cordate, stipitate; anthers all 4-celled. *Ovary* ovoid or globose; style slender; stigma peltate. *Fruit* an ellipsoid or globose berry seated on the top of the enlarged thick fleshy often warted peduncle, the perianth-lobes scarcely enlarged and usually persistent. *Seed* conform to the fruit; cotyledons fleshy.

1. *ALSEODAPHNE SEMECARPIFOLIA*, Nees; F. B. I. v. 144; Wt. Ic. t. 1826.

W. Gháts, S. Canara and Malabar, in evergreen forests, at rather low levels.

A large or moderate-sized tree with many branches, the leaves elliptic-oblong or obovate, rounded or emarginate at apex, cuneate at base, often glaucous beneath, minutely reticulate, up to 6 in. long, 3 in. broad; peduncles in fruit rough; berry ellipsoid, smooth, .5—.75 in. long. Bark yellowish-brown; wood dark brown, moderately hard, said to be useful.

Var. *angustifolia*, Meissn. Leaves elliptic-oblong or lanceolate, glaucous beneath.

W. Gháts, lower Pulney Hills (Bourne).

Var. *parvifolia*, Hook. f.; Wt. Ic. t. 1827; Bedd. Fl. t. 297. Leaves obovate or oblanceolate, 2—3 in. long, very glaucous beneath and black when dry, the panicles short, the fruit large.

W. Gháts, Pulney Hills, Sirumalai hills of Madara and Hills of Travancore at about 4,000—5,000 ft.

6. *Machilus*, Nees.

Evergreen trees, leaf-buds perulate with imbricate scales. *Leaves* alternate, penninerved, reticulate. *Flowers* small or moderate-sized, hermaphrodite, in panicles from upper axils. *Perianth*-tube usually

short; lobes 6, subequal or the outer slightly the smaller, persistent, spreading or reflexed in fruit. *Stamens* 9 perfect, those of the 1st and 2nd row opposite the perianth-lobes, introrse, with long filaments, those of the 3rd row opposite the 1st row, extrorse, with slender filaments and a pair of stipitate glands at their base; staminodes of the 4th row opposite the 2nd row, cordate, stipitate; anthers 4-celled. *Ovary* sessile, style slender; stigma small or discoid. *Fruit* a globose or oblong berry seated on the scarcely enlarged perianth, whose lobes are reflexed, pedicel not enlarged. *Seed* conform to the fruit; testa thin.

MACHILUS MACRANTHA, Nees; F. B. I. v. 140; Wt. Ic. t. 1824; Bedd. Fl. t. 264. *M. glaucescens*, Wt. Ic. t. 1825.

N. Circars, hills of Vizagapatam, about 4,000 ft. (A. W. Lushington); Deccan, in hill country as at Nandidrúg, Mysore, and the forests of North Coimbatore; W. Gháts, in most Districts from S. Canara and Coorg to Nilgiris Anamalais, Pulneys and hills of Travancore, in evergreen forests up to 7,000 ft. A large evergreen tree with flowers in subterminal panicles. Leaves variable in size from elliptic-oblong, rounded at both ends, to oblong-lanceolate acute, glaucous beneath. Flowers also in size variable as represented in Wight's two plates. Berry black, globose, .5—75 in. in diam. Bark pale brown; wood reddish-white darkening on exposure, rough, used for planking and other purposes. Vern. *Tam.* Kolla mávu; *Kan.* Kurma; *Mal.* Urávu; *Badaga* Kroma.

7. *Phoebe*, Nees.

Evergreen shrubs or trees. *Leaves* alternate, often fascicled at the ends of the branchlets, penninerved; leaf-buds ovate or lanceolate with few scales. *Flowers* hermaphrodite or rarely polygamous, in axillary or subterminal panicles. *Perianth*-tube short; lobes 6, subequal, erect and accrescent in fruit and clasping its base. *Stamens* 9, perfect, those of the 1st and 2nd row introrse eglandular, the filaments slender, those of the 3rd row opposite the 1st row extrorse with 2 large stipitate glands at their base; staminodes of the 4th row opposite the 2nd row, cordate or sagittate, stipitate; anthers 4-celled. *Ovary* sessile, usually globose; style slender; stigma discoid. *Fruit* an ovoid ellipsoid or globose berry, seated on the erect and persistent enlarged perianth-lobes. *Seed* conform to the fruit; testa thin; cotyledons fleshy.

Branchlets, leaves and inflorescence glabrous; flowering peduncles 1—2 in. long, elongating in fruit, collected usually in the uppermost axils; leaves lanceolate, long acuminate, long cuneate at base, up to 10 in. long and about 2 in. broad; berry black, narrowly ellipsoid, glabrous, up to .5 in. long.....1. *lanceolata*. Branchlets, leaves beneath and inflorescence minutely grey-puberulous; flowering peduncles very slender, 3—4 in. long, usually lateral from the branches below the uppermost axils; leaves oblanceolate, long-acuminate, cuneate often narrowly at base, up to 9 in. long, 3.5 in. broad, usually glaucous beneath, the nerves and transverse nervules distant; berry ovoid, .3 in. long.....2. *paniculata*. Branchlets, leaves beneath and inflorescence rusty-tomentose; flowering peduncles 1—2 in. long, both axillary and lateral near the ends of the branchlets; leaves elliptic or obovate, acuminate, cuneate at base, up to 6 in. long, 2 in. broad,

nerves rather close, transverse nervules close and prominently parallel; berry ovoid, 3 in. long.....3. *Wightii*.

1. *PHOEBE LANCEOLATA*, Nees; F. B. I. v. 141; Wt. Ic. t. 1821.
W. Gháts, Wynaad, Nilgiris, Anamalais and hills of Travancore, in evergreen forests, at 3,000—5,000 ft., rather scarce.
A medium-sized tree, the young branches usually with yellowish-white bark. Wood greyish white with olive-brown heartwood, hard and close-grained.
2. *PHOEBE PANICULATA*, Nees α ; F. B. I. v. 142 *in part*.
N. Circars, hills of Vizagapatam at 4,500 ft. (A. W. Lushington); Deccan, hills of N. Coimbatore; Carnatic, Kollimalai Hills of Trichinopoly; W. Gháts, Wynaad, Pulney and Sirumalai Hills of Madura, about 3,000—5,000 ft. A tree with nearly black branchlets.
3. *PHOEBE WIGHTII*, Meissn.; Bedd. Fl. t. 192. *P. paniculata*, Nees β ; F. B. I. v. 142 *in part*; Wt. Ic. t. 1820.
W. Gháts, Nilgiris, Anamalais and Pulneys, in Shola forests, above 5,000 ft.; Bababudan Hills of Mysore at 4,500 ft.; Kollimalai Hills of Trichinopoly.
A moderate-sized tree common in Nilgiri sholas. Bark thin, brown; wood brown, smooth, with brown medullary patches.
Vern. *Badaga*, Kumára.

8. *Actinodaphne*, Nees.

Evergreen trees or shrubs. *Leaves* subverticillate, rarely scattered or opposite, sometimes triple-ribbed, penninerved, the leaf-buds with imbricate perulate scales. *Flowers* small, dioecious, in axillary or lateral dense bracteate sessile or peduncled clusters or short racemes bearing bracteateumbellules of usually 5, the bracts imbricate, caducous, the pedicels lengthening after the fall of the bracts. *Perianth-tube* short; lobes 6, subequal. *Stamens* in σ flowers 9, those of the 1st and 2nd row opposite the perianth-lobes, those of the 3rd row opposite those of the 1st, the filaments 2-glandular; anthers all oblong, introrse, 4-celled, filaments slender. *Staminodes* in φ flowers also 9, those of the 1st and 2nd rows spatulate or linear, those of the 3rd row linear and 2-glandular. *Ovary* in φ flowers ovoid attenuate into the style; stigma dilated; in σ flowers 0 or a pistillode. *Fruit* a berry resting on the enlarged hardened flat or concave perianth-tube, the lobes persistent or deciduous. *Seed* with thin testa; cotyledons thick, usually hemispheric.

Leaves comparatively small, usually under 6 in. long and at most 1.5 in. broad, coriaceous, more or less glaucous beneath, whorled, minutely reticulate:—

Leaves lanceolate, acuminate; φ flowers in sessile umbels; fruiting perianth with persistent lobes:—

Leaves up to 5 in. long, innovations fulvous-silky, midrib and petiole fulvous-tomentose, main nerves short, about 12—15 pairs.....1. *salicina*.

Leaves up to 4 in. long, innovations dull rusty-tomentose, midrib, petiole and leaf margins when young fulvous-tomentose, main nerves 8—10 pairs, curved.....2. *lanata*.

Leaves elliptic or oblong, acute or obtuse at apex, acute at base, up to 2.5 in. long, 1 in. broad, innovations fulvous-villous or -silky but mature leaves glabrous; fruiting perianth with deciduous lobes.....3. *campanulata*.

Leaves comparatively large, usually more than 6 in. long and 1·5 in. broad,
 chartaceous.

1. *LAUREL* with the lowest pair of main nerves usually opposite, subtriple-nerved:—

Lowest pair extending two-thirds up the blade, other nerves from the midrib about 3—4 pairs, leaves elliptic, shortly acuminate, cuneate at base, fulvous-tomentose as are the branchlets, petioles and inflorescence, up to 5 in. long, 2 in. broad.....4. *Bourneae*.

Lowest pair only shortly prolonged, scarcely to one-third of the blade, other nerves about 10 pairs, leaves oblong-lanceolate, acute at both ends, glabrous, glaucous beneath, up to 9 in. long, 2·5 in. broad.....5. *madraspatana*.

Leaves penninerved, the lowest pair not opposite:—

Leaves oblong-lanceolate or -oblanceolate, acuminate at both ends, the nerves very oblique, in whorls of 7—10, up to 9 in. long, 2·5 in. broad, under-surface softly grey- or cinnameous-tomentose; ♀ fruiting flowers in peduncled umbels.....6. *Bourdillonii*.

Leaves obovate, obtuse or obtusely acute at apex, long-cuneate at base, densely rufous-tomentose beneath and on midrib above, also on petiole, branchlets and ♀ inflorescence, up to 6 in. long, 2·5 in. broad, main nerves 8—9 pairs, often branched.....7. *Lawsonii*.

Leaves elliptic-lanceolate, acuminate, attenuate at base, fulvous-villous beneath, up to 10 in. long, 3 in. broad:—

Leaves shining above, thickly villous beneath, the nerves and nervules not prominent; ♀ fruiting flowers with patelliform shallow perianth-tube, the berry globose, 3 in. in diam.....8. *hirsuta*.

Leaves somewhat shining above, sparsely villous beneath between the nerves, the nerves and nervules very prominent; ♀ fruiting flowers with cup-shaped perianth-tube, the berry small (immature).....9. *Tadulingami*.

1. ACTINODAPHNE SALICINA, Meissn.; F. B. I. v. 148.

W. Ghâts, Sispara in Nilgiris, at 5,000—6,500 ft. in Shola forests.
 A tree with narrow slender leaves, the ♂ flowers, and fruit so far not yet known.

2. ACTINODAPHNE LANATA, Meissn.; F. B. I. v. 149.

W. Ghâts, Nilgiri Hills (Wight, Gamble), at about 5,000—6,000 ft. in Shola forests.
 A tree with lanceolate leaves and a black globose berry about 3 in. in diam., the ♂ flowers not yet known.

3. ACTINODAPHNE CAMPANULATA, Hook. f.; F. B. I. v. 148. *A. salicina*, Bedd. Fl. t. 295, not of Meissn.

W. Ghâts, hills of Tinnevely, at 4,000 ft. (Beddome, Hooper and Ramaswami).

A medium-sized tree (Bedd.), apparently a shrub (Hook. f.), with a globose berry about 25 in. in diam.

Var. *obtusa*, Gamble. Leaves narrower, about 7 in. broad, oblong, obtuse at apex, nearly black when dry. An elegant little tree up to 30 ft. high (Bourdillon).

W. Ghâts, evergreen forests of Travancore at 3,000—4,000 ft. (Bourdillon).

4. ACTINODAPHNE BOURNEAE, Gamble in Kew Bull. 1925, 128.

W. Ghâts, Sholas of the Pulneys Hills about Kodaikanal, 6,000 ft. (Bourne).
 A small tree.

5. ACTINODAPHNE MADRASPATANA, Bedd. ex. Hook. f.; F. B. I. v. 149.

A. Hookeri, Meissn., var. *longifolia*. *A. Hookeri*, Bedd. Fl. t. 296, at any rate as for description.

Deccan, Seshachalam Hills of Cuddapah at 3,000 ft. (Wight, Gamble, Fischer); Kambakam Hills of Chingleput at 2,000—2,400 ft. (Fischer); Pulicat Hills (W. Elliot).

A tree with long leaves very white beneath, close to *A. angustifolia*, Nees, of Bengal and Assam (Haines in 'Bot. Bihar and Orissa'), but distinct in fruit and in leaf-venation. Sir W. Elliot's specimen has a leaf 10 in. long, 4 in. broad.

6. *ACTINODAPHNE BOURDILLONII*, Gamble in Kew Bull. 1925, 129.

W. Ghâts, in most Districts from S. Canara to Nilgiris, Anamalais and hills of Travancore, up to 6,000 ft.

A small tree reaching 30 ft. in height, the young leaves quite white (Bourdillon), the wood of no value. The ♂ flowers are in large clusters with concave bracts, usually, like the ♀, pedunculate from the scars of fallen leaves.

7. *ACTINODAPHNE LAWSONII*, Gamble in Kew Bull. 1925, 129.

W. Ghâts, in S.E. Wynaad, about 4,000 ft. (Lawson).

Apparently a small tree. A specimen of C. B. Clarke's from Coonoor is probably this and has larger and rather thinner leaves.

8. *ACTINODAPHNE HIRSUTA*, Hook. f.; F. B. I. v. 152. *A. Hookeri*, Bedd. Fl. t. 296, figure only?

W. Ghâts, Wynaad, Anamalais and hills of Travancore, in evergreen forests up to 3,000 ft.

A large tree reaching 60 ft. in height and a diameter of 18 in., the innovations very fulvous-silky.

9. *ACTINODAPHNE TADULINGAMI*, Gamble in Kew Bull. 1925, 130.

W. Ghâts, Canara to Anamalais, Travancore and Tinnevely, in evergreen forests up to 2,000 ft.

A tree, similar to the last but with leaves with very different nervation.

9. *Litsea*, Lamk.

Evergreen, rarely deciduous trees or shrubs. *Leaves* alternate or sometimes opposite, penninerved. *Flowers* dioecious, in umbellules of several together, usually 4—6 but in some cases up to 15, supported by 4—6 or more concave involucre bracts; the umbellules sessile or peduncled in axillary or lateral clusters or in racemes, rarely solitary. *Perianth-tube* in ♂ flowers 0 or very small, in ♀ flowers funnel-shaped; lobes normally 6, sometimes more, sometimes 0 or very early caducous, equal or unequal. *Stamens* in ♂ flowers normally 9 or 12, in four rows, those of rows 1 and 2 usually eglandular, those of row 3 and row 4 when present with 2-glandular filaments; all stamens with 4 cells, the cells introrse or the lower pair lateral; ovary 0 or rudimentary. *Staminodes* in ♀ flowers as the stamens of the ♂ but those of the outer rows clavate or linear, those of the inner rows subulate and 2-glandular; ovary enclosed in the perianth-tube or free; style thick, often curved; stigma dilated, irregularly lobed. *Fruit* a globose ovoid ellipsoid or oblong berry, seated on the enlarged perianth-tube with the more or less thickened pedicel; pericarp usually succulent. *Seed* with thin testa and fleshy cotyledons.

Perianth-lobes incomplete or 0; stamens often many:—

Umbellules solitary, many-flowered, peduncled, with large bracts; leaves elliptic or obovate, acute or acuminate, rounded or narrowed at base, nearly glabrous above, fulvous-tomentose or pubescent beneath, up to 10 in. long, 3—4 in. broad, the main nerves 10—15 pairs; berry depressed globose, black, 4 in. in diam.

1. *deccanensis*.

Umbellules in pedunculate umbels or corymbs, bracts medium-sized; leaves variable, lanceolate elliptic or oblong even ovate or obovate, usually obtuse, obtuse or acute at base, glabrous above except on midrib, glabrous to grey-pubescent beneath, very minutely reticulate, up to 9 in. long, 4 in. broad, the main nerves 8—12 pairs; berry globose, purple, 25 in. in diam.

2. *chinensis*.

Umbellules solitary or in clusters, peduncled, the bracts medium-sized; leaves elliptic oblong or obovate, obtuse or acute, glabrous, prominently scrobiculate, up to 6 in. long, 1.5 in. broad, the main nerves 6—8 pairs; berry globose, 25 in. in diam.

3. *ligustrina*.

Perianth-lobes complete:—

Leaves glabrous beneath or nearly so:—

Umbellules, ♂ solitary peduncled, ♀ in few-flowered peduncled racemes, all glabrous, small; leaves membranous, elliptic-oblong, abruptly acuminate, narrowed at base, glaucous beneath, up to 5 in. long, 2 in. broad, main nerves 6—12 pairs, slender.

4. *venulosa*.

Umbellules long-peduncled, in sessile or short-peduncled umbels, minutely puberulous; leaves subcoriaceous, elliptic-oblong or lanceolate, acute, narrowed at base, glaucous and finely reticulate beneath, up to 10 in. long, 3 in. broad, main nerves about 12 pairs, irregular.

5. *laeta*.

Umbellules subsessile, in axillary or lateral clusters:—

Leaves subcoriaceous, elliptic-obovate or lanceolate, shortly acute, narrow at base, very minutely puberulous beneath, up to 6 in. long, 1.5 in. broad, the main nerves 6—7 pairs, obscure.

6. *coriacea*.

Leaves oblong-lanceolate, acuminate, narrowed at base, glabrous or very minutely puberulous and reticulate beneath, up to 7 in. long, 1.5 in. broad, the main nerves about 10—12 pairs.

7. *laevigata*.

Leaves narrowly linear-lanceolate, acuminate at both ends, glabrous and reticulate beneath, up to 4.5 in. long, 1 in. broad, the main nerves 6—7 pairs.

8. *mysorensis*.

Umbellules in racemes:—

Leaves black when dry, coriaceous, quite glabrous as are the racemes, long- (75 in.), petioled, elliptic, obtusely acute or acuminate, narrowed at base, up to 5 in. long, 2 in. broad, main nerves 9—12 pairs, scarcely visible

9. *nigrescens*.

Leaves reddish-brown beneath when dry, greenish above:—

Leaves very coriaceous, quite glabrous, thick-petioled, elliptic, elliptic-oblong or lanceolate, obtuse or acute at apex, narrowed or rounded at base, up to 6 in. long, 2.5 in. broad, main nerves 8—12 pairs, not prominent; berry depressed globose, 1 in. in diam. on a short flattened undulate perianth-tube, the pedicel very thick.

10. *oleoides*.

Leaves coriaceous, glabrous, elliptic- or lanceolate-oblong, acute or acuminate, narrowed at base, up to 8 in. long, 2.5 in. broad, main nerves 8—12 pairs prominent; berry ellipsoid, .5 in. long, seated on the cup-shaped perianth-tube.

11. *Stocksii*.

Leaves coriaceous, glabrous, often very red beneath, elliptic- or linear-oblong, acute, narrowed at base, up to 6 in. long, 2 in. broad, main nerves 10—12 pairs, prominent; berry (not ripe) ovoid, seated on the obconic perianth-tube.

12. *glabrata*.

Leaves white-glaucous beneath when dry:—

Leaves elliptic-obovate or lanceolate-oblong, obtuse or acute, narrowed at base, glabrous, or pubescent only on the nerves when young, up to 7 in. long, 2.5 in. broad, but usually smaller, the 7—10 pairs of main nerves very faint; berry ellipsoid, nearly .5 in. long, seated on the cup-shaped perianth-tube with thick pedicels.

Stocksii var. *glabrescens*.

Leaves linear-oblong or lanceolate, obtuse or acute, up to 3.5 in. long, .75 in. broad, the main nerves 8—10 pairs rather close and prominent

13. *Beddomei*.

Leaves pubescent or tomentose beneath:—

Umbellules in sessile or subsessile axillary or lateral clusters:—

Leaves alternate:—

Leaves chartaceous, elliptic or elliptic-oblong or -obovate, obtuse or slightly acute at apex, rounded at base, softly fulvous-pubescent beneath, up to 8 in. long, 4 in. broad, main nerves 8—12 pairs, transverse nervules parallel; berry ovoid or ellipsoid, .3 in. long, on a small recurved flattened perianth-tube.....14. *polyantha*.

Leaves coriaceous, elliptic-oblong or -obovate, obtuse, slightly acute at base, *roughly fulvous-pubescent beneath*, up to 9 in. long, 4.5 in. broad, main nerves 10—12 pairs, transverse nervules parallel and conspicuous; berry ellipsoid, 1 in. long, .6 in. broad, on a deep obconic warted cup .5 in. long.....15. *insignis*.

Leaves subcoriaceous, obovate or obovate-oblong, obtuse and abruptly acute at apex, cuneate at base, minutely fulvous-pubescent beneath, up to 9 in. long, 4 in. broad, main nerves 12—18 pairs, closer towards the base; berry oblong, .5 in. long, on a cup-shaped 2—4-cleft glabrous, usually sessile perianth-tube.....16. *Bourdillonii*.

Leaves usually opposite at the ends of the branchlets, alternate lower down, membranous, oblong or obovate, acuminate, fulvous pubescent beneath, especially on the nerves, up to 7 in. long, 2 in. broad, main nerves 8—12, looped to join near the margin, berry globose, on a cup-shaped, shortly lobed perianth-tube.....17. *travancorica*.

Umbellules in racemes:—

Leaves comparatively small, obovate elliptic or lanceolate, obtuse or rarely acute, fulvous-pubescent beneath, especially on the nerves, sometimes nearly glabrous, up to 4 in. long, 2 in. broad, main nerves 4—8 pairs prominent, the transverse nervules obscure; berry ovoid, .4—5 in. long, seated on the cup-shaped perianth-tube, the pedicel thickened.....18. *Wightiana*.

Leaves large, elliptic or obovate-oblong, acute or acuminate, densely fulvous-tomentose beneath, up to 10 in. long, 4 in. broad, main nerves 10—15 pairs, prominent as are the transverse nervules; berry oblong, .5—7.5 in. long, seated on the turbinate perianth-tube with thick pedicel.....19. *floribunda*.

1. LITSEA DECCANENSIS, Gamble n. comb. *L. tomentosa*, Heyne; F. B. I. v. 157. *Tetranthera tomentosa*, Roxb.; Wt. Ic. t. 1834.

Deccan, in the hills of Cuddapah, Mysore and Chittoor at about 2,000—4,000 ft.; Carnatic, hills of S. Arcot, Salem and Trichinopoly; W. Ghâts, in all Districts, in rather dry forests at 3,000—6,000 ft.

A moderate-sized tree with soft grey or tawny branchlets and leaves. The wood is said to be yellowish and likely to be useful. Vern. *Mar.* Chikua; *Tel.* Naramamidi; *Tam.* Perumbandali.

2. LITSEA CHINENSIS, Lamk. *L. sebifera*, Pers.; F. B. I. v. 157. *Tetranthera apetala*, Roxb. Cor. Pl. t. 147.

N. Circars, from Ganjam to the Godavari, in hill forests; Deccan, in the hills of Nellore (Ramaswami) and Cuddapah (Gamble), very scarce in the forests of the W. Ghâts.

A moderate-sized tree with thin leaves of variable size, shape and pubescence. Bark brown; wood greyish-brown, moderately hard. Vern. *Hind.* Maida; *Tel.* Narra alagi.

3. LITSEA LIGUSTRINA, Hook. f.; F. B. I. v. 158. *Tetranthera ligustrina* Nees; Wt. Ic. t. 1835.

Deccan, hills of N. Coimhatore, 2,000—5,000 ft.; W. Ghâts, Nilgiris, Pulneys and hills of Tinnevely, especially Nilgiris on E. side, at 3,000—6,000 ft.

A small tree, with glabrous very reticulate leaves.

4. *LITSEA VENULOSA*, Hook. f.; F. B. I. v. 161.
W. Gháts, hills of Tinnevely about Courtallum, 3,000—4,000 ft. (Wight, Beddome).
A straggling evergreen shrub.
5. *LITSEA LAETA*, Wall.; F. B. I. v. 169.
N. Circars, Mahendragiri in Ganjam, at 4,000 ft. (Gamble), Rampa Hills at 2,500 ft. (Gamble).
A small tree, the berry globose, seated on a turbinate enlarged perianth-tube nearly 5 in. in diam.
6. *LITSEA CORIACEA*, Hook. f.; F. B. I. v. 166.
W. Gháts, S. Canara, Coorg, Wynaad, Anamalais and evergreen forests of Travancore, up to 4,000 ft.
A small tree with leaves often green above, dull grey beneath when dry, the branchlets puberulous, the umbellules grey-silky in bud, the berry small, ovoid, in a cup-shaped perianth-tube.
Vern. *Tam.* Panni thali; *Mal.* Maravetti thali.
7. *LITSEA LAEVIGATA*, Gamble n. comb. *Tetranthera attenuata* var. *laevigata*, Nees, Syst. Laur. 677.
W. Gháts, in the Tinnevely Hills about Courtallum (Wight); hills of Mysore at 2,000 ft. (Meebold).
A tree with leaves when dry green above, reddish brown beneath, the branchlets pale, the umbellule bracts grey silky, the berry oblong in a small obconic perianth-tube.
8. *LITSEA MYSORENSIS*, Gamble in Kew Bull. 1925, 130.
W. Gháts, hills of Mysore at 3,000—4,000 ft. (Meebold), Wynaad (Beddome).
A small or medium-sized tree with very small sessile clusters of umbellules.
9. *LITSEA NIGRESCENS*, Gamble n. comb. *Tetranthera Panamanja*, Wt. Ic. t. 1836, *not of* Buch.-Ham.
W. Gháts, hills of Tinnevely and Travancore, at low levels (Wight, Bourdillon).
A moderate-sized tree, the racemes 1.5 in. long, the fruit not known.
10. *LITSEA OLEOIDES*, Hook. f.; F. B. I. v. 175.
W. Gháts, Nilgiris, Anamalais and hills of Travancore, above 4,000 ft. in evergreen forests, especially common in S. Nilgiri sholas towards Sispara.
A large tree with thick leaves, the racemes fulvous pubescent, about 2 in. long. The uppermost leaves are sometimes opposite.
11. *LITSEA STOCKSII*, Hook. f.; F. B. I. v. 176.
W. Gháts, Nilgiris, Anamalais and hills of Travancore, at 2,000—6,000 ft. in evergreen forests.
A small tree, the racemes usually short and few-flowered, silky pubescent.
Var. *glabrescens*, Hook. f. Leaves very white beneath.
W. Gháts, in Nilgiris, on W. side, Naduvatam to Sispara, at 4,000—6,000 ft.
A small tree.

12. *LITSEA GLABRATA*, Hook. f.; F. B. I. v. 178.
W. Gháts, Nilgiris and Pulneys, above 6,000 ft., in Shola forest;
Bababudan Hills of Mysore at 5,000 ft. (Meebold).
A tree.
13. *LITSEA BEDDOMEI*, Hook. f.; F. B. I. v. 177.
W. Gháts, hills of Tinnevely and Travancore about 4,000 ft.,
in evergreen forests (Beddome, Bourdillon, Barber).
A small tree with small leaves and short flower-racemes.
14. *LITSEA POLYANTHA*, Juss.; F. B. I. v. 162. *Tetranthera monopetala*,
Roxb. Cor. Pl. t. 148; Brand. For. Fl. t. 45.
N. Circars, hills of Ganjam and Vizagapatam, at 3,000—4,000 ft.
(A. W. Lushington); hills of Godavari (Gamble, Herb-Madr.),
usually in shady places and ravines.
A moderate-sized evergreen tree with soft leaves when young,
and not very conspicuous transverse nervules 1 in. apart.
Bark dark grey, smooth, scaly; wood olive-grey, soft, not much
used. Vern. *Hind.* Maida; *Ur.* Mosonea.
15. *LITSEA INSIGNIS*, Gamble in Kew Bull. 1925, 130.
W. Gháts, Anamalai Hills (Barber), hills of Travancore, at low
levels up to 1,000 ft. (Bourdillon) in evergreen forests.
A lofty tree with yellowish flowers in great quantity on the old
wood, leaving tubercles. The leaves are thick and the parallel
transverse nervules 2 in. apart, the fruit and its cup very large.
16. *LITSEA BOURDILLONII*, Gamble in Kew Bull. 1925, 131.
W. Gháts, Anamalais and hills of Travancore, at 2,500—6,000 ft.
in evergreen forests.
A moderate-sized or large tree with the flowers, both ♂ and ♀,
in dense tufts on the branchlets, axillary or lateral. The
usually close main nerves of the obovate leaves are
characteristic.
17. *LITSEA TRAVANCORICA*, Gamble in Kew Bull. 1925, 132.
W. Gháts, hills of Travancore, in evergreen forests (Lawson,
Venkoba Row).
A tree.
18. *LITSEA WIGHTIANA*, Hook. f.; F. B. I. v. 117 in part. *Cylicodaphne*
Wightiana, Nees; Wt. Ic. t. 1833.
W. Gháts, Nilgiri Hills, above 6,000 ft., in Shola forests, com-
mon; hills of Travancore and Tinnevely, above 4,000 ft., in
evergreen forests, less so.
A large evergreen tree with tawny branchlets and foliage.
Bark light brown, smooth, with somewhat horizontal lenticels;
wood yellowish brown, hard; apparently only used for fuel.
Vern. *Badaga* Keynjee.
Var. *tomentosa*, Meissn. Leaves oblong-lanceolate, acuminate,
narrower and with more (up to 10) pairs of main nerves, the berry
larger, the cup deeper.
W. Gháts, Anamalais and Pulney Hills, above 6,000 ft., com-
mon; Nilgiris scarce.

19. *LITSEA FLORIBUNDA*, Gamble n. comb. *L. Wightiana*, Hook. f.; F. B. I. v. 177 in part. *Cylicodaphne floribunda*, Bl. in Mus. Bot. Lugd. Bat. i. 387. *Tetranthera Wightiana*, Bedd. Fl. t. 293.

W. Ghâts, in all Districts, at 2,000—6,000 ft., in evergreen forests; Bababudan Hills and hills of W. Mysore and Coimbatore, on Nilgiris chiefly on E. slopes up to Coonoor and Kotagiri.

A large or moderate-sized tree, the ♂ racemes often 3—4 in. long.

10. *Neolitsea*, Merr.

Evergreen trees. *Leaves* alternate opposite or in whorls, triple-ribbed, usually areolate-reticulate; buds perulate. *Flowers* dioecious, in 3—7-flowered umbellules arranged in clusters or short racemes in the axils of the upper leaves or on the branchlets between the nodes, the clusters with small bracts at their bases; involucre bracts 4, deciduous, pedicels elongating. *Perianth*-lobes 4. *Stamens* in ♂ flowers 6, those of the 2 outer rows eglandular, those of the 2 inner biglandular opposite the 1st row; anther-cells all introrse or the lower lateral. *Staminodes* of ♀ flowers 6, arranged as the stamens, usually linear or linear-clavate. *Ovary* ovoid; style thick; stigma usually peltate in ♂ flowers 0 or a small pistillode. *Fruit* a globose or ellipsoid berry seated on the somewhat enlarged perianth-tube and somewhat elongate pedicel; pericarp smooth. *Seed* conform to the fruit, cotyledons hemispheric.

Fruiting perianth very small compared with the berry, about .1 in. in diam:—

Berry oblong, .3—4 in. in diam., on a crenate perianth-tube scarcely .1 in. in diam.; leaves subcoriaceous, glabrous, glaucous beneath, elliptic- or oblong-lanceolate, obtusely acute, up to 4 in. long, 1—1.5 in. broad, nerves from the midrib 2—4 pairs.....1. *zeylanica*.
Berry globose, .5 in. in diam., on a very small entire perianth-tube; leaves very coriaceous, thickly fulvous-villous when young on the ribs and nerves beneath, very white-glaucous, ovate, acuminate, up to 7 in. long, 3 in. broad, nerves from the midrib 3—5 pairs, outside the side ribs about 5—6, all prominent, the transverse nervules parallel.....2. *Fischeri*.

Fruiting perianth rather large compared with the berry, .25 in.:—

Fruiting perianth cup-shaped, entire; berry globose, .3—4 in. in diam.; leaves coriaceous, glabrous, sometimes glaucous beneath, elliptic-ovate or even orbiculate, shortly acute, up to 5 in. long, 3 in. broad, minutely but prominently scrobiculate; nerves from the midrib 2—3 pairs, obscure.....3. *scrobiculata*.
Fruiting perianth patelliform, entire; berry globose, about .25 in. in diam.; leaves chartaceous or subcoriaceous, glabrous, very glaucous beneath when young, ovate or lanceolate, acuminate, up to 7 in. long, 3 in. broad, areolate, nerves from the midrib 2—3 pairs, faint.....4. *foliosa* var. *caesia*.

1. *NEOLITSEA ZEYLANICA*, Merr. *Litsea zeylanica*, Nees; F. B. I. v. 178 in part; Wt. Ic. tt. 132, 1844; Bedd. Fl. t. 294; *L. oblonga*, Nees; Wt. Ic. t. 1845.

N. Circars, Mahendragiri in Ganjam, at 4,000 ft.; Deccan, hills of Mysore and Coimbatore; W. Ghâts, in all Districts, in evergreen and Shola forests, above 2,000 ft.

A small or moderate-sized tree. Bark thick, smooth, grey; wood light brown to yellow, moderately hard, said to have the scent of Sweet Briar (Bedd.).

2. *NEOLITSEA FISCHERI*, Gamble in Kew Bull. 1925, 132.
W. Ghats, Anamalais and hills of Cochin and Travancore, above 6,000 ft., in evergreen forest.
A large tree with large tawny perulate buds and golden fulvous young leaves and shoots. The old leaves are large and very coriaceous with prominent ribs, nerves and transverse nervules. It somewhat resembles *Actinodaphne Hookeri* var. *dasy-poda* but the fruit is different.
3. *NEOLITSEA SCROBICULATA*, Gamble n. comb. *Litsea scrobiculata*, Meissn. in DC. Prodr. xv. i. 223.
W. Ghats, Nilgiris, about 6,000 ft.; hills of Tinnevely.
A tree reaching 50 ft. in height, the leaves long-petioled.
4. *NEOLITSEA FOLIOSA*, Gamble n. comb. *Litsea foliosa*, Nees in Syst. Laur. 622.
Var. *caesia*, Meissn. in DC. Prodr. xv. i. 222.
N. Circars, hills of Vizagapatam, Rampa Hills of Godavari, about 2,000 ft.; Deccan, Seshachalam Hills of Cuddapah, hills of Mysore and Coimbatore; Carnatic, Javadi Hills of S. Arcot; W. Ghats, hills of S. Travancore, all at low levels and up to 5,000 ft. at most.
A tree with long-petioled, usually long-acuminate very glaucous leaves.

11. *Cassytha*, Linn.

Filiform twining parasites, adhering to their host by suckers. *Leaves* consisting of minute scales or 0. *Flowers* small, hermaphrodite, spicate capitate or racemose; bracteoles 3. *Perianth*-tube short and globose or turbinate and as long as the lobes; lobes 6, the 3 outer smaller. Perfect *stamens* 9 or 6, 2-celled; those of the 1st row opposite the outer perianth-lobes introrse, those of the 2nd row opposite the inner, also introrse, sometimes reduced to staminodes; those of the 3rd row opposite the 1st row extrorse, the filaments with a pair of glands at the base; within these and opposite the 2nd row, 3 sessile or stipitate staminodes. *Ovary* globose, free in flower but included in the perianth-tube, which closely covers it in fruit; style short; stigma small or capitate. *Fruit* a drupe enclosed in the enlarged inflated perianth-tube, crowned by the remains of the lobes and stamens; pericarp of 2 layers, the outer thin, the inner thick and hard. *Seed* conform to the drupe; testa thin; cotyledons fleshy, at length confluent.

Stems fairly stout about 1 in. thick where attached to the host, very long and twining cord-like; flowers sessile, in spikes 1.5—2 in. long; drupe globose

1. *filiformis*.
Stems very slender, thread-like; flowers sessile, in very small peduncled heads; drupe oblong ovoid, bluntly 6-angled.....2. *capillaris*.

1. *CASSYTHA FILIFORMIS*, Linn.; F. B. I. v. 188; Wt. Ic. t. 1847.
All plains Districts, on bushes, especially near the coast.
Common on various species of young trees and bushes.
2. *CASSYTHA CAPILLARIS*, Meissn.; F. B. I. v. 188.
Tinnevely District, at Kannikatti (Barher), also in Ceylon.
A rare species, found by Barber on *Apama Barberi*.

Persea gratissima, Gaertn., the Avocado Pear, of the West Indies, is sometimes found in cultivation for its pleasant fruit.

Family CXXVII. HERNANDIACEAE.

Trees or climbing shrubs. *Leaves* alternate, simple or pinnate, entire or lobed; stipules 0. *Flowers* hermaphrodite, monoecious or polygamous, regular, usually small, white or greenish. *Perianth* superior; lobes free or shortly united below in two valvate 3—5-merous whorls or in one imbricate 4—8-merous whorl. *Stamens* 3—5 in one whorl; anthers 2-celled, dehiscing introrsely or laterally by 2 valves; staminodes glandular, in 1 or 2 whorls outside the stamens or absent. *Ovary* inferior, 1-celled; ovule solitary, pendulous, anatropous. *Fruit* dry, often longitudinally ribbed, sometimes with 2—4 longitudinal wings or with 2 terminal wings formed by accrescent perianth-lobes, or else wingless and enclosed in an inflated cupule. *Seed* solitary; albumen 0; cotyledons large, more or less lobed and twisted.

Gyrocarpus, Jacq.

A tall tree with thick branches. *Leaves* alternate, large, long-petioled, entire or lobed, clustered towards the ends of the branches. *Flowers* small, unisexual, ♂ very numerous, ♀ few, also a few hermaphrodite mixed, in large dense ebracteate cymes. *Perianth* in ♂ flowers, 4—7-partite, in ♀ 2-lobed, the lobes enlarged in fruit. *Stamens* 4—7, inserted at the bottom of the perianth, alternating with as many clavate staminodes; anthers 2-celled, dehiscing by valves. *Ovary* 1-celled; ovule 1, pendulous from the apex of the cell; stigma sessile. *Fruit* drupe-like, crowned with the long wing-like persistent perianth-lobes. *Seed* solitary; cotyledons large, convolute.

GYROCARPUS AMERICANUS, Jacq. *G. Jacquini*, Roxb. Cor. Pl. t. 1; Bedd. Fl. t. 196; F. B. I. ii. 461.

N. Circars, especially in Godavari and Kistna, in forests of the E. Ghâts; Deccan and Carnatic, in deciduous forests, extending West to the E. slopes of the W. Ghâts.

A large deciduous tree with large soft leaves often deeply lobed. Bark thin, greyish-white with a silvery lustre; wood soft, grey, in considerable demand for making catamarans, also for boxes, trays and toys. Vern. *Hind.* Zaitun; *Ur.* Pitella; *Tel.* Tanaku.

Family CXXVIII. PROTEACEAE.

Trees or shrubs, rarely herbs. *Leaves* alternate, rarely opposite or verticillate, entire toothed or pinnatisect; stipules 0. *Flowers* capitate spicate racemose or rarely solitary, hermaphrodite, regular or irregular; bracts small, caducous or nearly obsolete, sometimes imbricate, hardened in fruit forming a cone; bracteoles 0—2. *Perianth* inferior; lobes 4, at first valvately connate in a tube with gibbous base, at length more or less separating with recurved tips. *Stamens* 4, on and opposite to the perianth-lobes; anthers erect, the connective continuous with the filaments, cells 2 introrse, dehiscing longitudinally. *Disk* of 4

hypogynous scales, sometimes 0. *Ovary* superior, sessile or stipitate, 1-celled, often oblique; style terminal, thickened at tip; stigma terminal or lateral; ovules solitary or in pairs or many, biseriate. *Fruit* a nut or drupe indehiscent or ultimately opening on the inner edge or at the tip, or a follicle or capsule with often coriaceous valves. *Seeds* solitary or in pairs or few; testa membranous or coriaceous, sometimes winged; albumen 0; cotyledons compressed or fleshy, often unequal; radicle short, inferior or lateral.

Helicia, Lour.

Trees or large shrubs. *Leaves* alternate, entire toothed or pinatisect. *Flowers* in terminal and axillary racemes, hermaphrodite, regular, usually in pairs; bracts small, caducous; bracteoles minute. *Perianth*-tube slender; limb narrow, ovate or oblong, lobes revolute in flower. *Stamens* 4; anthers oblong, connective produced in an apiculus. *Disk* of 4 hypogynous scales, free or connate. *Ovary* sessile; style slender; stigma terminal; ovules 2, basal or lateral, attached below the middle. *Fruit* a subglobose hard nut. *Seeds* 1—2, subglobose or hemispheric; testa rugose or veined; cotyledons fleshy.

Leaves petioled, acute at base, elliptic-oblong, acuminate, coarsely dentate, up to 7 in. long, 3 in. broad; flowers in bud 5—7 in. long

1. *nilagirica*.
Leaves subsessile, rounded at base, obovate-oblong, obtusely acute, entire or distantly serrate, up to 9 in. long, 3.5 in. broad, shining above and reticulate; flowers in bud 7—1 in. long.....2. *travancorica*.

1. *HELICIA NILAGIRICA*, Bedd.; F. B. I. v. 190.

W. Gháts, Walaghát in Malabar at 3,000 ft. (Beddome); Devála in S.E. Wynaad at 3,000 ft. (Gamble), in evergreen forests.

A small tree with chartaceous leaves and globose purple fruit .5 in. in diam.

2. *HELICIA TRAVANCORICA*, Bedd.; F. B. I. v. 191. *H. robusta*, Bedd. Fl. t. 301, not of Wall.

W. Gháts, hills of Tinnevely and Travancore, at 4,000 ft. on the banks of streams (Bedd.).

A handsome tree of good size with coriaceous leaves and greenish-yellow flowers, the fruit globose, .75 in. in diam.

Several species of chiefly Australian Proteaceous shrubs are in cultivation in the Botanic Gardens in the Nilgiris. *Grevillea robusta*, A. Cunn., the Silk Oak, a moderate-sized handsome tree of Australia, has been much cultivated in S. India, both in the forests for its handsome prettily grained wood, and in tea estates as a shade plant. It is so far acclimatized that it reproduces itself naturally from seed.

Family CXXIX. THYMELAEACEAE.

Shrubs or trees with rough fibrous bark, rarely herbs. *Leaves* alternate or opposite, simple, entire. *Flowers* usually hermaphrodite, in axillary or terminal heads umbels clusters or racemes; bracts various, often forming an involucre. *Perianth* regular, tubular or

campanulate, often corolline, 4—5-lobed, the lobes imbricate in bud, often with scales at their bases within. *Stamens* as many or twice as many as the lobes of the perianth, those opposite the lobes usually attached above the alternate ones; filaments short; anthers erect, 2-celled, dehiscing longitudinally. *Disk* hypogynous, annular cupular or of scales, sometimes 0. *Ovary* superior, 1—2-celled; ovule 1 in each cell, anatropous, pendulous from the apex of the cell; style short or long, terminal or excentric; stigma usually capitate. *Fruit* a small berry drupe or capsule. *Seed* solitary or one in each cell, pendulous or lateral; testa crustaceous, rarely membranous; albumen fleshy or 0; cotyledons fleshy, usually thick; radicle short, superior.

Ovary 1-celled, 1-ovuled; fruit indehiscent; flowers in close bracteate heads; stamens 10.....1. *Lasiosiphon*.
Ovary 2-celled, cells 1-ovuled; fruit a loculicidal capsule; flowers in small ebracteate umbels; stamens 5.....2. *Gyrinops*.

1. *Lasiosiphon*, Fresen.

Silky shrubs. *Leaves* opposite or alternate and scattered. *Flowers* hermaphrodite, in dense heads with broad bracts. *Perianth*-tube cylindric, circumscrib above the ovary; lobes 5, spreading; scales above the stamens 5, alternate with the perianth-lobes. *Stamens* 10 in 2 rows, the upper or all shortly exserted; anthers oblong or linear. *Disk* 0 or short, annulate. *Ovary* sessile, 1-celled; style filiform; stigma capitate. *Fruit* small, dry, included in the base of the perianth, pericarp membranous. *Seed* conform to the pericarp; testa crustaceous; albumen scanty or 0.

LASIOSIPHON ERIOCEPHALUS, DCNE.; F. B. I. v. 197. *Gnidia eriocephala*, MEISSN.; Wt. Ic. t. 1859.

W. Ghâts, in all Districts, at 4,000—7,000 ft. in open forests.

A small tree or large shrub with linear-oblong leaves and bright yellow flowers in dense terminal white silky heads surrounded by an involucre of silky bracts. Bark grey, smooth, the inner bark fibrous; wood white or yellowish-white, hard. Vern. *Tam.* Nacchi nár; *Mal.* Nanju.

Var. *sisparensis*. *Gnidia sisparensis*, MEISSN.; Wt. Ic. t. 1860. *Leaves* obovate obtuse subsessile; heads with fulvous hairs.

Sispara in Nilgiris (Gardner); Palghát Hills (Beddome); Mysore (Lobb.).

2. *Gyrinops*, Gaertn.

Small trees. *Leaves* alternate, shining, the lateral nerves very fine, numerous and parallel. *Flowers* hermaphrodite, in terminal and axillary few-flowered, umbels, ebracteate, bracteoles small. *Perianth*-tube slender; lobes 5, spreading; scales above the stamens connate in a ring. *Stamens* 5, in one row at the mouth of the perianth-tube and opposite the lobes; anthers subsessile. *Ovary* stalked, 2-celled; ovule 1 in each cell; style subulate; stigma ovoid. *Fruit* a stipitate compressed ovoid capsule; loculicidally 2-valved. *Seeds* ovoid, with a tail-like basal appendage; testa crustaceous; albumen 0.

GYRINOPS WALLA, Gaertn.; F. B. I. v. 199; Wt. Ic. t. 1850; Bedd. Fl. t. 303.

Tinnevely (Beddom), a Ceylon plant.

A small tree with yellowish foliage, the leaves oblong, obtusely acuminate, 2—4 in. long, about 1 in. broad, with close minute parallel nerves.

Wikströmia viridiflora, Meissen. is a Malay shrub, cultivated in gardens in Madras.

Family CXXX. ELAEAGNACEAE.

Trees or shrubs, often thorny, with numerous silvery or coppery scales on the branches inflorescence and under-surface of the leaves especially. *Leaves* alternate or opposite, entire; stipules 0. *Flowers* small, regular, hermaphrodite or dioecious, solitary or in axillary fascicles spikes or racemes; bracts small, deciduous. *Perianth* in hermaphrodite or ♀ flowers tubular, constricted above the ovary, persistent below, deciduous above, limb 2—4-lobed; in ♂ flowers reduced to a 2—4-lobed limb. *Stamens* in hermaphrodite flowers adnate to the throat of the perianth-tube, as many as the lobes and alternate with them, in ♂ flowers to perianth-base, twice as many as the lobes; filaments free; anthers oblong, 2-celled, the cells dehiscing longitudinally. *Ovary* free, 1-celled; style filiform; stigma lateral; ovule 1, basal, erect, anatropous. *Fruit* a nut, closely covered by the thickened perianth-base, pericarp membranous. *Seed* erect; testa hard; albumen scanty or 0; cotyledons thick, fleshy; radicle inferior.

Elaeagnus, Linn.

Trees or shrubs, often thorny, with silvery or stellate scales. *Flowers* hermaphrodite, axillary, solitary or in fascicles or racemes. *Perianth*-tube campanulate or funnel-shaped, narrowed above the ovary; lobes 4, valvate, deciduous. *Stamens* 4, on the mouth of the perianth, on a ring, alternate with the lobes. *Ovary* 1-celled; style linear; stigma lateral. *Fruit* a nut enclosed in the thickened perianth-base. *Seed* with hard shining testa.

Scales very shining, silvery only; flowers small, the perianth-tube narrowly cylindrical, the clusters few-flowered only; leaves thin, elliptic-lanceolate, up to 3 in. long, 1.5 in. broad, acute at apex, 5—6-nerved; drupe small, ellipsoid-oblong, 3—6 in. long, the putamen grooved.....1. *indica*.

Scales shining or dull, silvery and coppery, usually mixed; clusters many-flowered:—
Leaves rather large, up to 8 in. long, 3 in. broad, thin, elliptic or elliptic-oblong or obovate, acute or acuminate at apex, 5—6-nerved; perianth-tube urceolate, 2—3 in. long; drupe large, oblong, 5—1 in. long, the putamen grooved

2. *conferta*.

Leaves medium-sized, 2—3 in. long, 1.5—2 in. broad, thick, ovate or ovate-oblong or orbicular, obtuse or rarely acute at apex, usually rounded at base, 3—4-nerved; perianth-tube broadly urceolate, 2—3 in. long; drupe oblong-ellipsoid, 5—7.5 in. long.....3. *Kolaga*.

1. *ELAEAGNUS INDICA*, Servetaz in Bull. Herb. Boiss., ser. 2, viii. 393.
Deccan, hills of N. Coimbatore, to 3,500 ft.; Carnatic, hills of S. Arcot, Salem and Madura, west to E. slopes of W. Ghâts.
A slender straggling shrub.

2. ELAEAGNUS CONFERTA, Roxb. *E. latifolia*, Linn.; F. B. I. v. 202 *in part only*; Brand. For. Fl. t. 46.
N. Circars, hills of Vizagapatam (A. W. Lushington); W. Coast and W. Ghâts, at low levels, but occasionally up to 5,000 ft.
A large often thorny straggling shrub with red edible fruit.
3. ELAEAGNUS KOLOCA, Schlecht. in DC. Prodr. xiv. 611. *E. latifolia*, Linn.; F. B. I. v. 202, *in part only*; Wt. Ic. t. 1856.
W. Ghâts, Nilgiris and Pulneys above 5,000 ft., margins of Shola woods and open scrub forests; Bababudan Hills of Mysore.
A large sometimes thorny straggling or climbing shrub with orange-red edible fruit. Vern. Tam. Kolungai.

Family CXXXI. LORANTHACEAE.

Evergreen shrubs, rarely herbs, usually parasitic on the branches of trees; stems much branched, often jointed. *Leaves* opposite or sometimes alternate, coriaceous, entire, sometimes reduced to scales or 0; stipules 0. *Flowers* regular or zygomorphic, hermaphrodite or unisexual, sometimes large and brightly coloured, sometimes inconspicuous, in racemes spikes heads or fascicles, usually bracteate and often with 2 or more bracteoles. *Calyx* adnate to the ovary; limb annular or cupular, entire or shortly toothed, sometimes 0. *Petals* or perianth-segments 3—8, valvate, free or more or less connate in a tube. *Stamens* as many as and opposite to the petals and more or less adnate to them; filaments slender or 0; anthers basifixed or dorsifixed, opening by longitudinal slits or by rows of cells or by pores. *Ovary* inferior, 1-celled; usually without distinct placenta; style short or long; stigma simple. *Fruit* a 1-seeded berry or drupe with fleshy pericarp and often viscid mesocarp. *Seed* solitary without distinct testa; alhumen fleshy or none; embryo straight, usually fleshy; radicle superior.

Calyx present, though the limb is sometimes reduced to a rim only; flowers hermaphrodite, anthers basifixed:—

- | | |
|---|-------------------------|
| Calyx-tube supported by a bract, no bracteoles..... | 1. Loranthus. |
| Calyx-tube supported by a bract and two bracteoles..... | 2. Elytranthe. |
| Calyx obsolete or represented by a rim; flowers unisexual:— | |
| Anthers 2-celled, opening longitudinally; plants without leaves.... | 3. Korthalsella. |
| Anthers opening by many pores, combined with the perianth-lobes; plants with or without leaves..... | 4. Viscum. |

1. **Loranthus**, Linn. (restricted).

Parasitic shrubs with many branches. *Leaves* opposite or alternate or both, usually thick and fleshy or coriaceous, entire. *Flowers* hermaphrodite, usually coloured, in racemes spikes cymes or fascicles, in the axils of leaves or of the scars of fallen leaves, rarely terminal; bract usually small, supporting the base of the calyx-tube; bracteoles 0. *Calyx*-tube adnate to the ovary, the limb short, truncate or toothed. Corolla polypetalous or gamopetalous, regular or zygomorphic; lobes 4—6, valvate, free or more or less connate in a tube, erect or reflexed, the tube often split down one side. *Stamens* as many as the corolla-lobes and adnate to them; filaments usually slender; anthers basifixed,

usually linear, opening by longitudinal cells, sometimes septate. *Disk* 0. *Ovary* 1-celled; style filiform, sometimes geniculate; stigma entire, obtuse or capitate. *Fruit* baccate, globose ovoid ellipsoid or oblong, crowned by the persistent calyx-limb. *Seed* albuminous, adnate to the pericarp, usually surrounded by glutinous pulp; testa 0; embryo straight; radicle superior.

Corolla lobes free:—

Flowers in spikes, on excavations in a thickened rhachis; leaves coriaceous, opposite or alternate, the innovations mealy-pubescent:—

Leaves lanceolate, obtusely elacuminate at apex, narrowed at base, up to 3 in. long, 1 in. broad, petiole .2—3 in. long; spikes 1—2 in. long; flowers in bud .25 in.1. *Hookerianus*.

Leaves elliptic orbicular or obovate, obtuse at apex, slightly narrowed at base, up to 1.5 in. long, .5—1 in. broad, petiole .1—2 in. long; spikes 1—1.5 in. long; flowers in bud .4 in.2. *Wightii*.

Flowers in racemes, solitary or fascicled on the nodes of old branchlets; leaves coriaceous, opposite or alternate:—

Branchlets, leaves and inflorescence glabrous:—

Flowers in bud .15—25 in. long, straight, terete, in slender racemes 1—3 in. long; leaves elliptic ovate or orbicular, obtuse, narrowed at base, up to 4 in. long, 2.5 in. broad, petiole .2—4 in. long.3. *Wallichianus*.

Flowers in bud .5—75 in. long, straight or curved, angular, in rather stout often solitary racemes up to 4 in. long; leaves broadly ovate or elliptic, obtuse, usually rounded cordate or sometimes auricled at base, up to 6 in. or more long, 3.5 in. broad, petiole stout, .5—7 in. long.4. *intermedius*.

Branchlets and inflorescence, sometimes the leaves more or less, furfuraceous pubescent; flowers in bud .5—1 in. long, curved, angular, in racemes 2—4 in. long; leaves ovate, obtuse or obtusely acute, acute or rounded or auricled at base, up to 5 in. long, 2.5 in. broad, petiole to 1 in. long.5. *obtusatus*.

Corolla gamopetalous:—

Corolla-lobes 4; flowers in bud narrow, clavate at tip and acute, densely covered with mealy golden tomentum, in axillary fascicles or short cymes, the tube .5—1 in. long, split down one side:—

Leaves ovate, orbicular or elliptic, obtuse, rounded at base, nearly glabrous above, more or less rusty tomentose beneath, up to 3 in. long, 1.5 in. broad; petiole short, sometimes 0.6. *buddleioides*.

Leaves ovate, covered, more or less, on both surfaces, with white or tawny flocculent tomentum:—

Leaves coriaceous, obtuse or slightly acute at apex, cordate at base, up to 4 in. long, 2.5 in. broad, petiole .75 in. long.7. *cordifolius*.

Leaves subcoriaceous, bluntly acute or obtuse at apex, narrowed or rounded at base, up to 3.5 in. long, 2.5 in. broad, petiole .5—1 in. long

8. *pulverulentus*.

Corolla-lobes 5:—

Corolla densely tomentose:—

Bracts large, up to .5 in. long; calyx-teeth distant; corolla-tube .75—1 in. long, curved, somewhat inflated at the middle, grey-tomentose without; leaves alternate, orbicular or obovate, obtuse, up to 1 in. in diam., sometimes much less, softly white grey or tawny tomentose.9. *bracteatus*.

Bracts small, ovate:—

Calyx-teeth short, triangular, regular; corolla-tube curved, split half-way, inflated below, .4—6 in. long, densely rusty-floccose-woolly; leaves alternate, obovate, obtuse, cuneate at base, black above when dry, densely rusty-floccose below, up to 2.5 in. long, 1 in. broad, nerves 3 pairs, prominent.10. *tomentosus*.

Calyx-teeth long and irregularly lobed; corolla-tube curved, split half-way, gibbously inflated below the middle, .5—75 in. long, rusty-villous; leaves obovate, obtuse, cuneate at base, blackish green above when dry, thinly grey- or tawny-pubescent beneath or glabrous, up to 3 in. long, 1.5 in. broad, 3-nerved at base; berry oblong.11. *recurvus*.

Corolla at first stellate-pubescent, afterwards nearly or quite glabrous:—

Bract boat-shaped, longer than the calyx; calyx very white-lanate, shortly and evenly toothed; corolla-tube slender, inflated at the middle, .75 in. long; leaves obovate, obtuse, cuneate at base, grey-lanate, up to 1 in. long, .4 in. broad.....12. *courtallensis*.

Bract ovate, shorter than the calyx; calyx-lobes irregular and again toothed; corolla-tube slender, straight or very slightly inflated above, finally glabrous without, .75—1.25 in. long; leaves obovate, obtuse or retuse, cuneate at base, 3-nerved, up to 1.5 in. long, .75 in. broad, glabrous and black when dry.....13. *cuneatus*.

Corolla glabrous without, with very rare exceptions:—

Flowers in racemes:—

Branchlets terete:—

Racemes 1—4 in. long, solitary or fascicled, usually upcurved with upcurved flowers varying in length from 1—2.5 in.; bract concave; calyx entire, truncate; leaves thickly coriaceous, opposite or alternate, varying from elliptic or oblong to orbicular cordate or to linear, and up to 7 in. long, 4 in. broad; berry ovoid-oblong.....14. *longiflorus*.

Racemes about 1 in. long, many-flowered, the flowers 1—1.5 in. long; bract short, cup-shaped; calyx cupular, obtusely unequally 5-lobed; leaves very coriaceous, large, opposite or alternate, obtuse, elliptic-oblong or orbicular, up to 4 in. long, 2 in. broad.....15. *sarcophyllus*.

Branchlets trigonous; racemes 1—1.5 in. long, the flowers .5—75 in. long; bract cup-shaped, very oblique; calyx cupular, spreading, truncate; leaves very coriaceous, large, broadly elliptic ovate or orbicular, obtuse or acute, up to 6 in. in diam.....16. *trigonus*.

Flowers in axillary fascicles or cymes:—

Flowers sessile, fascicled at the nodes of the branches; corolla 1 in. long, the lobes spirally twisted; bract very small; calyx-limb cupular, entire; leaves very coriaceous, opposite, sessile, ovate elliptic or orbicular, obtuse, acute at base, up to 4.5 in. long, 2 in. broad, 3—5-ribbed; berry globose.....17. *elasticus*.

Flowers solitary or in very short peduncled cymes, chiefly in the axils of fallen leaves; corolla 1 in. long, cleft to the middle, one or two divisions to the base, lobes recurved; bract small; calyx obscurely toothed; leaves very coriaceous, opposite, variable, usually elliptic-oblong -lanceolate or -obovate, obtuse, narrowed at base, up to 6 in. long, 4 in. broad, nerves few and irregular; berry obovoid.....18. *neelgherrensis*.

Flowers in axillary or lateral peduncled umbellate cymes, corolla 1—1.5 in. long, very straight, erect; bracts cup-like but one-sided; calyx-lobes triangular; leaves coriaceous, opposite or alternate, oblong-lanceolate, acute, cuneate at base, up to 3 in. long, 1.25 in. broad, the nerves obscure; berry oblong.....19. *memecylifolius*.

Flowers in groups of about 5, the bracts forming a large bell-shaped involucre, the groups 2—3 together in the axils of the leaves or of the scars of fallen leaves; calyx-tube tomentose, limb shortly 5-toothed; corolla slender, 1.5—2 in. long, constricted slightly below the limb; leaves thinly coriaceous, opposite or alternate, orbicular or oblong, rounded at base, up to 5 in. long, 3 in. broad.....20. *lageniferus*.

1. LORANTHUS HOOKERIANUS, W. & A. 381; F. B. I. v. 207.

W. Gháts, Nilgiris, Anamalai Hills and hills of Tinnevely, up to 4,000 ft.

A rather slender parasitic shrub, the branches speckled with minute tubercles. Has been found on *Mallotus philippinensis* (Fischer).

2. LORANTHUS WIGHTII, Hook. f.; F. B. I. v. 207.

W. Gháts, Courtallum and Chokampatti hills of Tinnevely, about 3,500 ft. (Wight, Beddome).

A slender parasitic shrub with speckled nodose branchlets.

3. *LORANTHUS WALLICHIANUS*, Schultes; F. B. I. v. 205; W. & A. 381; Wt. Ic. t. 143.
W. Gháts, in all Districts from S. Canara southwards, up to about 4,000 ft.
A rather stout parasitic shrub with pale brown terete branchlets and pale red flowers. Found by Fischer on *Helicteres* and *Memecylon*.
4. *LORANTHUS INTERMEDIUS*, Wight; Hook. f. in F. B. I. v. 205.
W. Gháts, Nilgiris, Pulneys and hills of Travancore, at 3,000—6,000 ft.
A stout parasitic shrub, the flowers red, common in Nilgiri Sholas and often on *Cinnamomum Wightii* (Barber) and *Machilus macrantha* (Fischer).
5. *LORANTHUS OBTUSATUS*, Wall.; F. B. I. v. 205; W. & A. 381; Bidie Report on Neelgh, Loranth. t. iii.
W. Gháts, in most Districts, especially at high levels in Nilgiris, Pulneys, etc., at above 5,000 ft.
A large parasitic shrub with red and orange flowers, often found on *Rhododendron*, *Symplocos*, *Daphniphyllum* and many other Shola trees, also on *Acacia Melanoxylon* in the plantations.
6. *LORANTHUS BUDDLEIODES*, Desv.; W. & A. 382. *L. Scurrula*, Roxb. Cor. Pl. t. 140; F. B. I. v. 208, *not* of Linn.
N. Circars, Mahendragiri Hill in Ganjam, 4,500 ft. (Fischer and Gage), Rampa Hills (V. Narayanswami); Deccan, hills of Mysore, Bellary and Coimbatore; W. Gháts, chiefly on W. and E. slopes, up to 6,000 ft.
A parasitic shrub found growing on various different kinds of tree; flowers greenish-yellow.
7. *LORANTHUS CORDIFOLIUS*, Wall.; F. B. I. v. 209.
Deccan, in hilly country, Chittoor to Coimbatore, 2,000—3,000 ft.; W. Gháts, Nilgiris, at 2,000—5,000 ft.
A large parasitic shrub, conspicuous from the thick fascicles of orange-tawny flowers and white or pale brown young leaves and shoots.
8. *LORANTHUS PULVERULENTUS*, Wall.; F. B. I. v. 211.
N. Circars, forests of the E. Gháts, Ganjam to Rampa, at 1,000—2,500 ft. (Gamble, Barber).
A stout parasitic shrub, found on deciduous trees chiefly.
9. *LORANTHUS BRACTEATUS*, Heyne; F. B. I. v. 213. *L. tomentosus*, W. & A. 385; Wt. Ic. t. 378.
N. Circars, Deccan and Carnatic, in forests of Vizagapatam, Nellore, S. Arcot, Cuddapah and Kurnool, up to 2,000 ft. westwards to the E. slopes of W. Gháts.
A small parasitic shrub, the flowers in cymes or umbels of 3—5, greenish, striped, on various species of deciduous tree.
10. *LORANTHUS TOMENTOSUS*, Heyne; F. B. I. v. 212; Bidie t. viii.
Deccan, hills of Mysore and N. Coimbatore, 3,000—5,000 ft.; W. Gháts in S. Canara (Hohenacker), Coorg, Wynaad, at 3,000—4,000 ft. (Gamble), and southwards.

A small parasitic shrub, the branchlets nearly black; found in Coorg on *Neolitsea zeylanica*, also by Fischer on various other kinds of tree.

11. *LORANTHUS RECURVUS*, Wall.; F. B. I. v. 213; W. & A. 383. *L. Candolleanus*, W. & A. 385; Wt. Ic. t. 305.
W. Ghâts, Nilgiri Hills, in Shola woods above 6,000 ft.
A parasitic shrub with smooth grey bark, ovoid-oblong fruits, yellow flowers and characteristic calyx, reported as growing in the Nilgiri Sholas and plantations on *Acacia Melanoxylon*, *Viburnum*, *Glochidion*, etc.
12. *LORANTHUS COURTALENSIS*, Gamble, *n. comb.* *L. bracteatus*, Heyne, var. *angustifolia*, Hook. f.; F. B. I. v. 213.
W. Ghâts, Pulney Hills and hills of Tinnevely about Courtallum, (Wight, Barber).
A slender twiggy parasitic shrub.
13. *LORANTHUS CUNFATUS*, Heyne; F. B. I. v. 214; W. & A. 385; Bidie t. ix.
N. Circars and Deccan, in hilly country; W. Ghâts, in most Districts, at various levels, common.
A bushy shrub with grey bark and prominent nodes, parasitic on a great variety of trees and shrubs, indigenous and introduced (like *Acacia Melanoxylon*). The corolla is greenish-yellow outside, orange within, the stigma red, also the fruits.
14. *LORANTHUS LONGIFLORUS*, Desv.; F. B. I. v. 214; W. & A. 384; Wt. Ic. t. 302. *L. bicolor*, Roxb. Cor. Pl. t. 139.
All plains Districts, chiefly in deciduous forests, common. A large parasitic shrub with handsome and conspicuous racemes of scarlet orange or pink flowers succeeded by pink berries. It is found on a great number of different hosts.
Var. *falcatus*, Kurz. Leaves linear or falcate, up to 6 in. long, the flowers rather short.
Plains Districts, chiefly in the dry country, frequently on *Acacia* and its neighbours.
Var. *amplexifolius*, Tbw. Leaves large, orbicular or shortly oblong, obtuse cordate and amplexicaul at base, the flowers often long and the racemes frequently terminal. *L. amplexifolius*, DC.; Bidie t. vii.
W. Ghâts, chiefly in hilly regions up to 6,000 ft., in most Districts.
Var. *pubescens*, Hook. f. Leaves rather small, oblong, racemes with the flowers minutely pubescent.
W. Coast and lower hills of W. Ghâts.
15. *LORANTHUS SARCOPHYLLUS*, Wall.; W. & A. 384; F. B. I. v. 217.
W. Ghâts, Nilgiris and hills of Madura (Wight).
A very stout parasitic shrub, much resembling *L. longiflorus* but recognized by the calyx-lobes. Said to grow on *Ficus*.
16. *LORANTHUS TRIGONUS*, W. & A. 386; F. B. I. v. 219.
W. Ghâts and W. Coast from S. Canara southwards, Coorg, Nilgiris and Pulneys up to 3,000 ft.; Bababudan Hills of Mysore, at 3,500 ft. (Meebold).
A large very thick and fleshy parasitic shrub with warted

branches and trigonous branchlets, found on the Banyan fig (*Gamble*) and other trees.

17. *LORANTHUS ELASTICUS*, Desv.; F. B. I. v. 216; W. & A. 386; Wt. Ic. t. 343. *L. Euphorbiae*, Wt. Ic. t. 1063.

Deccan, in Mysore; Carnatic, Kambakam Hill in Chingleput, 2,000 ft., Melpat in S. Arcot, Kollimalai Hills of Trichinopoly; W. Coast, S. Canara to Travancore also at low levels in W. Ghâts.

A dichotomously branching parasitic shrub with striped green and white flowers, red stamens and a pink berry. It is not uncommon on the mango, orange, nutmeg, *Samadera*, *Thespesia*, and other trees of hot low-level country. The smaller-leaved *L. Euphorbiae* is found on the tree *Euphorbias*, *E. tortilis* and *E. antiquorum*, in Coimbatore, and is perhaps distinct.

18. *LORANTHUS NEELCHERRENSIS*, W. & A. 382; F. B. I. v. 216; Wt. Ic. t. 1020; Bidie tt. iv. v. x.

W. Ghâts, Nilgiris, Anamalais and Pulneys, at high levels above 4,000 ft.

A large woody parasitic shrub with crimson-scarlet flowers, orange inside the tube, the berry red, also the young leaves. It is common on many shola trees and also very frequent on the introduced Australian *Acacias*.

Var. *Clarkei*, Hook. f. Flowers small with short corolla-lobes. Nilgiri Hills at 7,000 ft. (C. B. Clarke).

19. *LORANTHUS MEMECYLIFOLIUS*, W. & A. 383; F. B. I. v. 217.

W. Ghâts, Nilgiri Hills, above 5,000 ft.

A stout glabrous parasitic shrub with scarlet corolla. It occurs on various shola trees, *Rhododendron*, *Rapanea*, *Daphniphyllum*, etc.

20. *LORANTHUS LAGENIFERUS*, Wt. Ic. t. 306; F. B. I. v. 218.

W. Coast, S. Canara, Mysore and Malabar, apparently in deciduous forests (Wight, Rangachari).

A large parasitic shrub, the involucre reddish, the corolla green or green and red. Dr. Cooke gives it as found on *Holarrhena* and *Adina*.

2. *Elytranthe*, Blume (amplified).

Parasitic shrubs. *Leaves* opposite or subopposite, more or less coriaceous, entire. *Flowers* few, in spikes racemes or pairs with 1 bract and 2 bracteoles which may be free or combined in a cup. *Calyx*-tube cylindric, the limb small, truncate. *Corolla*-tube usually entire, more or less cylindric or funnel-shaped; lobes 5 or 6, usually 6, equal, reflexed in flower. *Stamens* 5—6, anthers basifixed, often septate. *Ovary* enclosed in the calyx-tube; style slender; stigma usually capitate. *Fruit* and *seed* as in *Loranthus*.

Corolla 1—2 in. long, cleft to nearly half-way down, usually curved; leaves ovate-oblong or lanceolate, up to 5 in long, 2 in. broad.....1. *loniceroides*.
Corolla under 1 in. long, cleft to below the middle, hardly curved; leaves elliptic-lanceolate, up to 4 in. long, 1.5 in. broad.....2. *capitellata*.

In both species the bract and bracteoles are orbicular, the latter combined in a cup, the anthers septate, very slender.

1. ELYTRANTHE LONICEROIDES, Engler. *Loranthus loniceroides*, Linn.; F. B. I. v. 221; Wt. Ic. t. 203; Bidie t. vi. *except anthers and ovary*. W. Ghâts, in Mysore, Nilgiris, Anamalais and Pulneys, chiefly at levels above 5,000 ft.; a form in Coimbatore below 3,000 ft. has smaller leaves.
A large parasitic shrub with variegated corolla, the tube scarlet or pink below changing to yellow, the lobes green. The berry is green tipped with the cylindric calyx-limb. The large-leaved hill form is abundant on Australian Acacias, but also occurs on various Shola trees; the small-leaved one is chiefly found on *Terminalia*, *Anogeissus* and various species of fig.
2. ELYTRANTHE CAPITELLATA, Engler. *Loranthus capitellatus*, W. & A. 382; F. B. I. v. 221.
Deccan and Carnatic, in hilly country, westwards to the lower hills of the W. Ghâts, up to about 3,000 ft.
A parasitic shrub with variegated corolla, the tube white changing to red and above to green, with purple lines. It is found on various plains trees like the mango, figs, etc.

3. Korthalsella, van Tiegh.

Leafless parasitic small shrubs, the branches jointed, furnished with bracteate scales at the joints, the joints all in the same plane. *Flowers* in the axils of the scales, monoecious, surrounded by tufts of hair, ♂ and ♀ with 3 perianth-lobes which are persistent after flowering in ♀. *Anthers* 3, 2-celled, the cells opening introrsely by longitudinal slits, but the anthers being connected at their margins, the pollen issues from a central aperture. *Ovary* obovoid; placenta central; stigma small. *Fruit* an obovoid fleshy berry with viscid mesocarp, embryo basal. *Seed* albuminous.

KORTHALSELLA JAPONICA, Engler. *Viscum japonicum*, Thunb.; F. B. I. v. 226. *V. moniliforme*, W. & A. 380; Wt. Ic. t. 1018, and Spic. Neelg. t. 87

W. Ghâts, Nilgiri, Anamalai and Pulney Hills, above 5,000 ft.

A small densely tufted parasitic undershrub with obovate keeled flattened joints and minute flowers. It is found on Shola trees, especially on *Rhododendron*, *Vaccinium*, *Eurya* and *Ilex*.

Var. *coralloides*: *Viscum moniliforme*, W. & A., var. *coralloides*, Wt. Ic. t. 1019, is really only a smaller form with narrower joints.

4. Viscum, Linn.

Parasitic shrubs, growing on trees; branches usually 2–3-chotomous, jointed, the internodes terete, angular or flattened. *Leaves* opposite, flat and thick or reduced to small scales. *Flowers* usually monoecious, small, fascicled or solitary or more often in triads, in the axils of the leaves or at the nodes of the branches, rarely terminal; bracts small; bracteoles 2, free or connate in a cup. *Perianth*-tube in ♂ solid, in ♀ adnate to the ovary; lobes usually 4, sometimes 3, short, ovate or triangular. *Stamens* as many as the perianth-lobes and adnate to them, dehiscing introrsely by numerous pores. *Ovary* inferior,

1-celled; ovules solitary or paired; stigma sessile or subsessile. *Fruit* a succulent berry with soft viscid mesocarp. *Seed* adnate to the pericarp; albumen copious, solid; embryo terete enclosed in the albumen, solitary or 2 to each seed.

Leafy shrubs:—

Leaves always present and persistent:—

Leaves acuminate at apex, obliquely ovate or lanceolate, often falcately curved, narrowed at base, 3–5-ribbed, 1.5–4 in. long, .5–1 in. broad; bracteoles apiculate; lateral flowers of triads usually ♀, central ♂ or wanting; berry oblong.....1. *monoicum*.

Leaves obtuse at apex; bracteoles not apiculate:—

Berry globose, very minutely papillose; leaves obovate elliptic or oblong, petioled, obtuse or slightly acute, attenuate at base, 3- rarely 5-ribbed, 1–2 in. long, .4–1.5 in. broad; lateral flowers of triads usually ♂, central sometimes all ♀.....2. *orientale*.

Berry oblong:—

Berry smooth; leaves elliptic, waved at the margin, obtuse or very slightly acute, shortly petioled, 1–2 in. long, .4–1 in. broad; 3–5-ribbed; flower-triads clustered, the flowers all or lateral ♀, inner ♂, the ♀ elongate, the ♂ often with 3 perianth-lobes only.....3. *orbiculatum*.

Berry, especially when young, covered with little warts; leaves obovate or oblong, obtuse or slightly acute, attenuate at base to a short petiole, .5–1.5 in. long, .4–.7 in. broad, 3- rarely 5-ribbed; flowers fascicled, in peduncled triads, the lateral usually ♂.....4. *verruculosum*.

Leaves apparently deciduous, sometimes wanting altogether:—

Leaves usually present, broadly orbicular-obovate, emarginate and usually mucronate at apex, cuneate and decurrent at base, about 1–1.25 in. in diam., obscurely 3- or pedately 5-ribbed; middle flower of triad usually ♂; berry ovoid, rough, white or pale green.....5. *capitellatum*.

Leaves usually absent, when present only on lower branches, obovate, about 1 in. long, 3-ribbed; outer flowers of triads usually ♂; berry very small, subglobose.....6. *ramosissimum*.

Leaves few and sparse, yellow when dry like the angular branchlets, oblanceolate, up to 1.5 in. long, about .3 in. broad, 3-ribbed; outer flowers of triads ♂.....7. *mysorenses*.

Leafless shrubs:—

Internodes of the branchlets tetragonous, uniform; flowers minute, in triads, sessile, solitary or whorled at the nodes, the ♂ flowers usually lateral, the ♀ central; berry minute, globose, .1 in. in diam.....8. *angulatum*. Internodes of the branchlets flattened, broadening gradually from the base to the top; each at right angles to its neighbours, but twisted near the base, so that all seem to be in one plane; flowers in axillary fascicles of 1–3, the central flower of a triad usually ♀; berry globose, up to .15 in. in diam., glassy white.....9. *articulatum*.

1. *VISCUM MONOICUM*, Roxb.; F. B. I. v. 224; W. & A. 379 (under *V. orientale*).

N. Circars, hills of Ganjam and Vizagapatam, up to 3,500 ft. (Barber, A. W. Lushington); W. Ghâts, Pülney Hills in Poombarai valley (Bourne), Nilgiris (G. Thomson).

A parasitic shrub with rather thin leaves and usually yellowish berry.

2. *VISCUM ORIENTALE*, Willd.; F. B. I. v. 224; W. & A. 379.

N. Circars and Carnatic, especially Coast Districts, but also westwards to lower hills of W. Ghâts in Coimbatore.

A rather large shrub, parasitic on many kinds of tree, *Albizzia*, *Pongamia*, *Wrightia*, etc., berry purple.

3. *VISCUM ORBICULATUM*, Wt. Ic. t. 1016; Spic. Neilg. t. 86; F. B. I. v. 224.
W. Ghâts, Nilgiri Hills, above 5,000 ft.
A small bushy shrub with angular grooved branches, found by Wight on *Vaccinium Leschenaultii*.
4. *VISCUM VERRUCULOSUM*, W. & A. 379; F. B. I. v. 224.
Deccan, hills of N. Coimbatore; W. Ghâts, Nilgiris, Anamalais and hills of Tinnevely and Travancore, up to 6,000 ft.
A parasitic shrub with usually terete branches.
5. *VISCUM CAPITELLATUM*, Sm.; F. B. I. v. 225; W. & A. 380.
Carnatic, Coast of S. Arcot (Lawson); Deccan, N. Coimbatore Hills (Fischer); W. Ghâts, S. E. Wynaad at 3,000 ft. (Gamble).
A small parasitic shrub with stout usually terete branches, found in two forms, the leafy one (α of W. & A.) with obtuse broad obovate leaves, perhaps *V. trilobatum*, Talbot, the other with few obovate spatulate leaves (β of W. & A.) and usually more floriferous. It has been found on various trees, *Rhizophora*, *Salvadora*, etc., also on *Loranthus longiflorus*, especially var. *jalcatius*.
6. *VISCUM RAMOSISSIMUM*, Wall.; W. & A. 380; F. B. I. v. 225.
Deccan, in Mysore and Coimbatore; W. Ghâts, Nilgiris to hills of Tinnevely up to 6,000 ft.
A many and slenderly branched parasitic shrub, almost broom-like, with terete branches and branchlets. It is found on various trees, *Acacia*, *Rhus*, *Santalum*, *Ficus*, also on *Loranthi*.
7. *VISCUM MYSORENSE*, Gamble in Kew Bull. 1925, 329.
Deccan, Arsikere in Mysore, about 2,000 ft. (Meebold).
A parasitic shrub, yellow when dry, the internodes of the branchlets angular or flattened.
8. *VISCUM ANGULATUM*, Heyne ex DC.; F. B. I. v. 225. *V. ramosissimum*, Wt. Ic. t. 1017, except ♂ flowers.
W. Ghâts, in most Districts on the lower hills up to 4,000 ft., chiefly on N. and E. sides; forests of N. Coimbatore.
A leafless slender parasitic shrub, found on various species of chiefly deciduous trees.
9. *VISCUM ARTICULATUM*, Burm.; F. B. I. v. 226. *V. attenuatum*, DC.; W. & A. 380.
N. Circars and Carnatic from the Godavari southwards, westwards to the lower hills of W. Ghâts.
A slenderly-branched parasitic shrub, the internodes scarcely 3 in. in maximum diameter, longitudinally striate. The ♂ flowers are very small and scarce, the ♀ very often solitary, the berry 1 in. in diam. Found on many species, chiefly of deciduous trees.
Var. *dichotomum*, Kurz. Much stouter and more common, but not easily separated in some cases, the internodes up to 5 in. broad and very prominently striate; flowers larger and usually in triads; berry about 15 in. in diameter.
N. Circars, Deccan and Carnatic in most Districts, on many species of tree.

Family CXXXII. SANTALACEAE.

Trees, shrubs or herbs, many being parasitic or semiparasitic on the branches or roots of other plants. *Leaves* alternate or opposite, entire, sometimes scale-like or 0; stipules 0. *Flowers* hermaphrodite or unisexual, regular, small, solitary or in simple or compound cymes; bracts usually small; bracteoles 2, sometimes 1 or both obsolete. *Perianth* superior or partly inferior, 3–8-lobed or -toothed, the lobes often with a tuft of hairs behind the anthers. *Stamens* as many as and opposite to the perianth-lobes, attached to or above the perianth-base; anthers 2-celled. *Disk* epigynous or perigynous. *Ovary* 1-celled, inferior; ovules 2–3, adnate to or pendulous from a central column; style short; stigma entire or 3–6-lobed. *Fruit* a nut or drupe. *Seed* globose or ovoid, smooth rugose or sulcate; testa thin or wanting; albumen copious, fleshy; embryo usually terete; radicle superior.

Herbs; perianth semi-superior, the tube adnate to the base of the ovary and usually produced above it; fruit a small nut.....1. *Thesium*.
Trees or shrubs; perianth superior, the tube adnate to the ovary, not produced above it; fruit a drupe:—

Not spinous; anther-cells distinct, parallel; drupes small:—

Leaves opposite; stamens with interposed processes; flowers hermaphrodite, the perianth-lobes usually 4.....2. *Santalum*.
Leaves alternate; stamens without interposed processes; flowers polygamous, the perianth-lobes usually 3.....3. *Osyris*.

Often spinous; anther-cells divergent or confluent; leaves alternate, drupe large
4. *Scleropyrum*.

1. *Thesium*, Linn.

Slender perennial herbs, usually parasitic on roots. *Leaves* alternate, narrow, decurrent. *Flowers* minute, greenish, solitary and axillary or in 2-chotomous cymes, hermaphrodite. *Perianth* adnate to the ovary, the tube produced above it; lobes 5, rarely 4. *Stamens* 5 or 4, inserted at the base of the perianth-lobes, included. *Ovary* inferior; ovules 2–3, pendulous from a basal often flexuous column; style cylindric or very short; stigma capitate or lobed. *Fruit* a dry nut, often ribbed. *Seed* conform to the nut; embryo terete, straight or oblique; cotyledons small; radicle as long as or longer than the cotyledons.

THESIUM WIGHTIANUM, Wall.; F. B. I. v. 230; Wt. Ic. t. 1852, *except the anthers*.

W. Gháts, Nilgiris and Pulneys and Atapadi Hills of Malabar, above 6,000 ft., on the downs among grass.

A slender plant with many straggling branches often procumbent at the base, narrow linear leaves, small solitary flowers, and a small hard globose nut.

2. *Santalum*, Linn.

Trees or shrubs usually semiparasitic on the roots of other kinds; branches usually slender, glabrous. *Leaves* opposite or rarely alternate, glabrous. *Flowers* hermaphrodite, axillary or in terminal 3-chotomous paniculate cymes; bracts minute. *Perianth*-tube campanulate or ovoid, adnate to the base of the ovary; lobes 4, rarely 5, valvate, with a tuft

of hairs on the face. *Stamens* 4 or 5, adnate to the bases of the perianth-lobes, alternating with the fleshy scales of the disks; filaments short; anthers ovate, the cells distinct, parallel. *Disk* of the scales between the stamens. *Ovary* at first free, later semi-inferior; ovules 2—3, pendulous from below the top of a long acuminate central column; style elongate; stigma 2—3-lobed. *Fruit* a subglobose drupe, annulate on the top by the deciduous perianth, endocarp rugose. *Seed* subglobose; albumen copious; embryo terete, slender; radicle longer than the cotyledons.

SANTALUM ALBUM, Linn.; F. B. I. v. 231; Bedd. Fl. t. 256. *Sirium myrtifolium*, Roxb. Cor. Pl. t. 2.

N. Circars, in Vizagapatam, scarce; Carnatic, hills of S. Arcot, Salem and southwards; Deccan, in all Districts but especially in Mysore, Coimbatore and plains N. of Nilgiris, up to 3,000 ft.; W. Ghâts, on E. slopes in Mysore, Coorg and Nilgiris; in dry open scrub forests and hedgerows. Sandal. A small evergreen usually semiparasitic glabrous tree with elliptic-ovate leaves up to 3 in. long, 1.5 in. broad, glaucous beneath, the flowers brownish-purple, the drupe black when ripe. Bark dark grey, rough; wood hard and close-grained, sapwood white, scentless, heartwood yellowish-brown, strongly scented and in great demand for carvings, the distillation of oil, export to China, etc., and in burial ceremonies. For an account of the parasitism and growth of the tree, the "spike" disease, etc., see Troup, Silv. Ind. Trees iii. 749. Vern. *Hind.* Chandan; *Tam.* Srigandam; *Tel.* Chandanum.

3. *Osyris*, Linn.

Shrubs with angular branchlets. *Leaves* alternate, entire; stipules 0. *Flowers* small, axillary, polygamous (♂ and ♀), the ♂ flowers in clusters, the ♀ often solitary. *Perianth-tube* solid in the ♂ flowers, adnate to the ovary in the ♀; lobes 3—4, triangular, valvate, with a tuft of hair on the face. *Stamens* 3 or 4, inserted at the base of the perianth-lobes; anther-cells distinct. *Disk* angular, between the stamens. *Ovary* inferior, sunk in the perianth-tube; ovules 2—4, pendulous from a short central placenta; style short; stigma 3—4-lobed. *Fruit* a globose or ovoid drupe. *Seed* globose, solitary; embryo small, in the centre of copious fleshy albumen.

OSYRIS ARBOREA, Wall.; F. B. I. v. 232. *O. Wightiana*, Wall.; Wt. Ic. t. 1853.

N. Circars, Mahendragiri Hill in Ganjam, at 4,500 ft. (Gamble); Deccan, in hills in Mysore, on Horsleykonda, Chittoor, 4,000 ft.; Carnatic, Shevaroy Hills of Salem; W. Ghâts, in most Districts, above 3,000 ft.

An evergreen shrub with coriaceous elliptic-lanceolate even orbicular leaves mucronate at apex, very small flowers and small hard yellow drupe. Bark greyish-brown, rough; wood red, close-grained. Vern. *Mar.* Popli.

4. *Scleropyrum*, Arnott.

Trees with axillary spines. Leaves alternate, coriaceous. Flowers polygamous, in short catkin-like spikes at the leafless nodes of the branchlets. Perianth-tube of ♂ flowers solid, of ♀ or ♂ flowers adnate to the ovary; lobes 4–5, valvate or sub-imbricate, with a tuft of hair behind the stamens. Stamens 4–5, inserted at the base of the lobes; filaments bifid, the anther-cells on separate branches, dehiscing transversely. Disk annular, undulate. Ovary inferior; ovules 3, pendulous from the top of a central column; style short; stigma large, peltate. Fruit a pyriform drupe on a thickened pedicel, crowned by the remains of the perianth-lobes; exocarp thick, fleshy, endocarp hard. Seed 1, globose; albumen copious; embryo terete, central; cotyledons oblong.

SCLEROPYRUM WALLICHIANUM, Arn.; F. B. I. v. 234; Wt. Ic. t. 241.

Pyralia Wallichiana, A. DC.; Bedd. Fl. t. 304.

W. Ghâts, S. Canara to Travancore, in evergreen forests, up to 3,000 ft.; Coorg and Wynaad, 3,000–5,000 ft.

A small tree with thick, sharp, conical spines, small reddish flowers and large red drupe, the leaves ovate-oblong, up to 7 in. long, 3 in. broad, 3–5-ribbed at base.

Family CXXXIII. BALANOPHORACEAE.

Glabrous, fleshy root-parasites, without leaves, stomata or chlorophyll, the rhizomes hard and warted, through the rind of which the flowering stems burst irregularly and are usually stout and scaly. Flowers monoecious or dioecious, crowded in large globose or elongate stoutly-peduncled heads, the ♂ and ♀ flowers very dissimilar; the ♂ of 3–8 valvate perianth-lobes, fairly large, sometimes 0; the ♀ without perianth and very minute or confluent with the ovary, often mixed with clavate bodies. Stamens as many as the perianth-lobes and opposite to them or the filaments connate in a column or tube; anthers free or connate, 2–many-celled, opening by pores or valves or bursting irregularly. Ovary 1–3-celled, ovule 1 in each cell usually pendulous; styles 1–2 or 0, stigmas simple or capitellate. Fruit minute, 1-seeded. Seed usually adherent to the pericarp, testa thin or 0, albumen granular and oily; embryo very minute.

Balanophora, Forst.

Glabrous fleshy herbs with a tuberous rootstock warted with lenticels abounding in a waxy secretion. Peduncles bursting through the rootstock, which forms a ring or sheath at their base. Flowers: ♂ with a perianth of 2–6 valvate lobes, stamens 2–∞, the filaments 0 or connate in a column, the anthers (in our species) horse-shoe-shaped; ♀ without perianth, ovary ellipsoid, 1-celled; style long, slender; stigma simple, many minute flowers surrounding a clavate body. Fruit minute, crustaceous. Seed globose; albumen oily; embryo of 2–3 cells only.

Heads in ♂ cylindric, in ♀ ovoid; perianth-lobes usually 4, oblong, acute, reflexed; staminal column elongate.....1. dioica.

Heads in ♂ obovoid or subglobose, in ♀ globose, often very large; perianth-lobes usually 4, short, obtuse, erect; staminal column short.....2. **indica.**

1. **BALANOPHORA DIOICA**, R. Br.; F. B. I. v. 237.

N. Circars, hills of Vizagapatam (Gamble).

As the ♂ flowers only are available, the identification is uncertain.

2. **BALANOPHORA INDICA**, Wall.; F. B. I. v. 237.

W. Ghâts, in the hills from Nilgiris to Travancore, up to 5,000 ft.

A thick rather common parasite, often very large, especially with the globose ♀ heads, reddish-brown or purple.

Family CXXXIV. BUXACEAE.

Trees or shrubs, rarely herbs. *Leaves* opposite or alternate, usually coriaceous and evergreen; stipules 0. *Flowers* unisexual, usually monoecious, in axillary or rarely terminal spikes or racemes, the ♂ and ♀ usually adjoining each other but the ♀ sometimes distinct; bracteate and bracteolate. *Perianth* calyciform, the lobes free and imbricate. *Stamens* as many as and usually opposite to the perianth-lobes; filaments erect, broad; anthers dorsifixed, the cells dehiscing longitudinally. *Ovary* 2—3-celled, rarely more, the cells 1—2-ovuled, the ovules with dorsal raphe; styles 2—3, short, usually recurved. *Fruit* a 2—3-celled capsule, or an indehiscent berry. *Seeds* 2—3 in each cell, often reduced to 1; testa crustaceous, smooth; albumen copious; cotyledons fleshy, flattened; radicle superior.

Leaves opposite; ♀ flowers in the spikes usually above the ♂; fruit capsular, dehiscent..... **Buxus.**
Leaves alternate; ♀ flowers in the spikes usually below the ♂, often separate and single; fruit a berry, indehiscent.....1. **Sarcococca.**

Sarcococca, Lindl.

Glabrous evergreen shrubs. *Leaves* alternate, entire, penni- or tripli-nerved. *Flowers* in short axillary racemes, monoecious, the ♀ below the ♂; bract 1; bracteoles few in ♂, more numerous and decussate in ♀. *Perianth-lobes* 4 in ♂, 4—6 in ♀ in opposite pairs. *Stamens* 4, opposite the perianth-lobes; filaments thick; anthers adnate to their tops, cells introrse. *Ovary* 2—3-celled; ovules 2 in each cell, the raphe dorsal; styles 2, recurved, the inner faces furrowed and papillose. *Fruit* an indehiscent coriaceous or fleshy berry, the endocarp hard. *Seeds* 1—2; testa membranous; albumen fleshy; cotyledons flat, cordate.

Leaves usually distinctly tripli-nerved, from about .5 in. above the base, lanceolate, long-acuminate at apex, acute at base, up to 6 in. long, 2.5 in. broad; racemes up to 1 in. long.....1. *trinervia.*
Leaves less distinctly tripli-nerved from nearer the base, ovate to ovate-elliptic, shortly and suddenly acuminate at apex, rounded and then acute at base, up to 3 in. long, 1.75 in. broad; racemes about .5 in. long.....2. *brevifolia.*

1. **SARCOCOCCA TRINERVIA**, Wt. Ic. t. 1877. *S. saligna* var. *densiflora*, Muell. Arg. *S. pruniformis*, Lindl.; F. B. I. v. 266 in part.

N. Circars, Mahendragiri Hill in Ganjam, 4,500 ft. (Gamble), Daringabadi (Barber), hills of Vizagapatam (A. W. Lushington):

W. Gháts, from Nilgiris southwards, usually at 4,000—7,000 ft., sometimes at low levels, S. Canara (Beddome), usually in forest undergrowth.

A large evergreen shrub. Bark light brown; wood white, close-grained, like boxwood, sometimes used for walking-sticks.

2. *SARCOCOCCA BREVIFOLIA*, Stapf in Herb. Kew. *S. saligna* var. *brevifolia*, Muell. Arg.

W. Gháts, Nilgiris, on Doddabetta 8,000 ft., in Shola undergrowth.

An evergreen shrub.

The Box, *Buxus sempervirens*, Linn., is commonly used for hedges on the Cinchona Estates in Nilgiris.

Family CXXXV. EUPHORBIACEAE.

Herbs, shrubs or trees, rarely climbers, often with milky juice. *Leaves* alternate or opposite, simple or rarely compound, usually stipulate, often glandular. *Flowers* usually small, often minute, monoecious or dioecious, the inflorescence variable. *Perianth* usually calycine, rarely petaloid, sometimes of both calyx and corolla, sometimes wanting in one or both sexes. *Calyx* inferior, valvate or imbricate, often different in the sexes. *Petals* when present free, sometimes scale-like, sometimes absent or different in the sexes. *Stamens* various, definite or indefinite; filaments free or connate; anthers 2-celled, the cells parallel or divaricate, dehiscing longitudinally or sometimes transversely. *Disk* various, usually annular, entire or lobed, or of free scales or 0. *Ovary* usually sessile, rarely stipitate, usually 3-celled; ovules in each cell 1 or 2, pendulous from the inner angle; style usually as many as the cells, free or more or less connate, erect or spreading, the inner faces usually stigmatic. *Fruit* usually capsular of 2-valved cocci separating from a persistent axis, sometimes indehiscent or drupaceous, 1—3-celled. *Seeds* attached laterally near to or above the middle of the cell with or without a caruncle or arillus; albumen usually copious fleshy; embryo straight, the radicle superior, the cotyledons broad and flat.

Cells of the ovary 2-ovuled except in 1:— (1—26)

Inflorescence of many pedicelled bracteolate stamens as ♂ flowers surrounding a single pedicelled ♀, the whole contained in a 4—5-lobed involucre:—

Involucre regular or nearly so.....1. *Euphorbia*.

Involucre obliquely zygomorphous.....*Pedilanthus*.

Flowers distinct, not contained in an involucre:—

Leaves simple, alternate:— (2—24)

Petals present, small:— (2—4)

Calyx valvate; filaments combined in a column:—

Fruit a drupe with 2 pyrenes; ovary 2-celled.....2. *Bridelia*.

Fruit a capsule; ovary 3-celled.....3. *Cleistanthus*.

Calyx imbricate; stamens free.....4. *Actephila*.

Petals wanting; calyx-lobes imbricate in bud:— (5—24)

Disk present, usually conspicuous and of glands:— (5—15)

Flowers, at any rate ♂, in clusters:— (5—14)

Fruit a dry capsule of 3 2-valved cocci:— (5—11)

Calyx-lobes 6 in both ♂ and ♀:— (5—7)

- Stamens 3, the filaments connate:—
 Stamens small, not apiculate; styles short, bifid, sunk in the top of the ovary.....5. *Agynceia*.
 Stamens elongate, apiculate; styles combined in a terminal column.....6. *Pseudoglochidion*.
 Stamens 6, the filaments free.....7. *Chorisandra*.
 Calyx-lobes 5 in both ♂ and ♀:—
 Stamens 5, the filaments connate.....8. *Neopeltandra*.
 Stamens 3, the filaments connate wholly, in part, or sometimes not at all.....9. *Phyllanthus*.
 Calyx-lobes 4 in ♂, 6 in ♀; stamens 2 or 4, the filaments connate.....10. *Reidia*.
 Calyx-lobes 4 in both ♂ and ♀; stamens 4, the filaments free.....11. *Prosorus*.
- Fruit a berry:— (12—13)
 Fruit small, fleshy, with 6—12 crustaceous seeds; ovules superposed; calyx-lobes 5.....12. *Kirganelia*.
 Fruit large, of 3—6 hard cocci in a fleshy epicarp:—
 Calyx-lobes 5—6; stamens 3, the filaments connate.....13. *Embllica*.
 Calyx-lobes 4; stamens 4, the filaments free.....14. *Cicca*.
 Fruit dry or fleshy with 6 cocci; stamens 5, the filaments free, alternating with the disk-glands and surrounding the pistillode.....14. *Fluggea*.
- Flowers in spikes or racemes, often panicled; ovary 1-celled.....15. *Antidesma*.
- Disk central, orbicular; stamens 4 to many:—
 Ovary 1-celled; drupe 1-seeded.....16. *Hemicyclia*.
 Ovary 2—4-celled; drupe 2—4-seeded.....17. *Cyclostemon*.
 Disk combined with the calyx-lobes, the 3 stamens in a column:—
 Anthers sessile on the angle of the column; calyx of both ♂ and ♀ spreading.....18. *Sauropus*.
 Anthers adnate to the column; calyx of ♂ turbinate, of ♀ spreading.....19. *Breynia*.
- Disk wanting:— (20—24)
 Stamens connate by their connectives in a column; styles also connate in a column; flowers in clusters.....20. *Glochidion*.
 Stamens free or rarely connate by their filaments:— (21—24)
 Flowers in spikes or racemes:—
 Fruit capsular:—
 Seeds without an aril; stamens 1—5; ♂ flowers in catkin-like spikes, ♀ in clusters.....21. *Aporosa*.
 Seeds with an aril; stamens 4—8; flowers in racemose spikes often in fascicles on the trunk.....22. *Baccaurea*.
 Fruit a drupe with woody endocarp; flowers in axillary racemes; stamens 5 or more.....23. *Daphniphyllum*.
 Flowers: ♂ in clusters, ♀ subsolitary; stamens 2—3 central.....24. *Putranjiva*.
- Leaves simple, whorled; calyx-lobes 5—6.....25. *Mischodon*.
 Leaves trifoliolate; calyx-lobes 5; flowers in panicles of racemes.....26. *Bischofia*.
- Cells of the ovary 1-ovuled:— (27—57)
 Filaments inflexed in bud; ♂ calyx imbricate valvate or nearly open; pistillode 0; indumentum scaly or stellate.....27. *Croton*.
 Filaments erect, rarely inflexed, but then pistillode conspicuous:— (28—56)
 Calyx in ♂ valvate:— (28—45)
 Petals present in ♂ flowers:— (28—30)
 Calyx 5-lobed, closed in bud then regularly valvate; herbs or undershrubs very stellate-hairy.....28. *Chrozophora*.
 Calyx irregularly valvate; trees or shrubs:—
 Not lepidote or stellate-pilose; pistillode prominent.....29. *Agrostistachys*.
 Lepidote or stellate-pilose; fruit drupaceous, indehiscent.....30. *Aleurites*.

- Petals in ♂ flowers 0:— (31–45)
 Partial inflorescence not involucre:— (31–44)
 Filaments free or shortly connate:— (31–44)
 Filaments not branched:— (31–41)
 Styles free or only slightly connate:— (31–40)
 Anthers not vermiculiform or linear:— (31–39)
 Anther-cells pendulous or adnate:— (31–37)
 Anthers 2-celled:— (31–35)
 Stamens numerous:—
 Fruit indehiscent; styles linear.....31. *Trewia*.
 Fruit a capsule; styles plumose.....32. *Mallotus*.
 Stamens 2–9:—
 Filaments inflexed.....33. *Symphyllia*.
 Filaments straight, dilated.....34. *Coelodepas*.
 Filaments slender.....35. *Alchornea*.
 Anthers 4-celled or 2-celled and 4-valved:—
 Connective produced; capsule large.....36. *Cleidion*.
 Connective not produced; capsule small.....37. *Macaranga*.
 Anther-cells discrete, ascending, divaricate
 Racemes uniformly floriferous; cocci dehiscing loculicidally
 38. *Claoxylon*.
 Racemes interrupted; cocci dehiscing loculand septically
 39. *Micrococca*.
 Anthers vermiculiform or linear; styles lacinate.....40. *Acalypha*.
 Styles connate; calyx of ♀ accrescent; stinging climbers
 41. *Tragia*.
 Filaments much branched; staminal bundles indefinite:—
 Leaves entire, penninerved:—
 Calyx-lobes of ♀ soon deciduous.....42. *Homonoia*.
 Calyx-lobes of ♀ enlarged after flowering.....43. *Lasiococca*.
 Leaves palmatifolobed.....44. *Ricinus*.
 Filaments connate in a column.....*Hevea*.
 Partial inflorescence involucre; climbers.....45. *Dalechampia*.
 Calyx in ♂ flowers:— (46–54)
 Petals present in ♂ flowers:— (46–52)
 Petals free:— (46–51)
 Stamens numerous:— (46–50)
 Flowers glomerate-spicate or racemose:— (46–48)
 Calyx not or scarcely enlarged in fruit:—
 Flowers in ♀ with petals.....46. *Ostodes*.
 Flowers in ♀ with no or very minute petals.....*Codiaeum*.
 Calyx enlarged under the fruit:—
 Flowers in ♀ with petals.....47. *Dimorphocalyx*.
 Flowers in ♀ apetalous.....48. *Blachia*.
 Flowers paniculate, the panicles branching dichasially:—
 Leaves palmatinerved.....49. *Jatropha*.
 Leaves penninerved.....50. *Tritaxis*.
 Stamens 3–8, usually 3.....51. *Trigonostemon*.
 Petals connate; leaves palmatinerved; fruit a drupe.....52. *Givotia*.
 Petals in ♂ flowers 0:—
 Leaves usually deeply lobed; ♂ calyx large, coloured.....*Manihot*.
 Leaves not lobed; ♂ calyx small, not coloured:—
 Disk of ♂ outside the stamens; leaves not punctate.....53. *Baliospermum*.
 Disk-glands large or only peripheric; leaves pellucid-punctate
 54. *Gelonium*.
 Calyx of ♂ open or slightly imbricate, usually much reduced; disk 0:—
 Calyx of ♂ 3-lobed; stamens 3 or 2:—
 Seeds carunculate; herbs.....55. *Sebastiania*.
 Seeds not carunculate; trees.....56. *Excoecaria*.
 Calyx of ♂ 2–3-lobed; stamens 2–3; seeds not carunculate.....57. *Sapium*.

1. *Euphorbia*, Linn.

Herbs, shrubs or small trees of various habit and with copious milky, usually acrid, juice. *Leaves* alternate or opposite, usually entire, often (in the fleshy species) caducous or much reduced; stipules various. *Flowers* monoecious, combined in an inflorescence of many ♂ *florets* surrounding a solitary ♀ and accompanied by many *bracteoles*, usually setaceous, but sometimes combined in a sheath, sometimes 0; the whole enclosed in a 4—5-lobed turbinate or campanulate *involucre*, having also between the lobes at their sinuses thick *glands*, which have sometimes horns and sometimes a petaloid spreading *limb*. *Perianth* 0 or of minute scales. *Stamen* in ♂ florets solitary, the filament jointed on a pedicel; anther 2-celled, erect, the cells usually subglobose, opening longitudinally. *Floret* of ♀ a 3-celled ovary on an often decurved pedicel; ovule solitary in each cell; styles 3, free or connate; stigmas simple or 2-fid. *Fruit* a capsule of 3 2-valved *cocci* separating elastically from a persistent axis, and dehiscing ventrally or both ventrally and dorsally. *Seeds* albuminous; testa more or less crustaceous, often with a caruncle; cotyledons flat; radicle superior.

Herbs, prostrate or ascending; leaves opposite; glands of involucre 4—5, usually with a petaloid limb:—

Erect and dichotomously branching; limb of gland more or less conspicuous, petaloid:—

Floral leaves distichous, imbricate, enclosing the involucre which are solitary or 2—3 only:—

Limb of gland entire or sinuate; leaves cordate, usually unequally, at base, minutely areolate-reticulate, serrulate:—

Limb of gland scarcely .05 in. long; plants nearly or quite glabrous; leaves elliptic-oblong, obtuse:—

Cocci obtusely keeled, hirsute or glabrous; seeds obtusely 4-angled, transversely furrowed or glabrous; limb white.....1. *pycnostegia*.

Cocci keeled and angled at base, nearly glabrous; seeds ovoid, papillose; limb pink.....2. *zornioides*.

Limb of gland .1 in. long, pink; plant with soft spreading hairs; leaves elliptic or orbicular, obtuse, the floral much imbricate; cocci rounded, hirsute; seeds 4-angled, transversely furrowed.....3. *elegans*.

Limb of gland pectinately lacinate; seeds transversely furrowed:—

Limb of gland glabrous or nearly so; leaves very small; cocci hirsute; seeds brown.....4. *fimbriata*.

Limb of gland with long hairs; leaves about .5—75 in. long, obliquely ovate-cordate, obtuse, serrulate; cocci rounded, hirsute; seeds white

5. *cristata*.

Floral leaves not distichous and imbricate:—

Limb of gland multifid almost to the base, the gland itself minute; leaves membranous, elliptic or oblong, obtuse, disantly serrulate, up to .75 in. long; cocci glabrous, keeled; seeds with 3—4 parallel furrows...6. *longistyla*.

Limb of gland entire, not multifid:—

Cocci with 2 dorsal wings; seeds obtusely 4-angled, papillose; involucre in small cymes, the limb of the gland rounded, white; leaves linear-oblong, mucronate, up to 1 in. long, .25 in. broad.....7. *notoptera*.

Cocci not winged:—

Involucres in subcorymbose terminal cymes; limb of gland broadly rounded, pink or white; leaves linear-oblong, coriaceous; obtusely acute, unequally cordate at base, up to 1 in. long, .2 in. broad; cocci glabrous, keeled.....8. *linearifolia*.

Involucres in terminal and axillary cymes:—

Dwarf glabrous seashore shrub with fleshy branches and leaves, the latter elliptic, obtuse, unequally rounded at base, up to 1 in. long,

- .5 in. broad; cymes corymbose, spreading, much bracteate; glands oblong, the limb very small or 0; cocci glabrous; seeds globose, smooth.....9. *Atoto*.
- Erect slender inland herbs; not fleshy; seeds with shallow furrows:—
 Cymes not capitate; plant nearly glabrous; leaves thin, glaucous, elliptic oblong or obovate, obtuse, serrulate, up to 1 in. long, .5 in. broad; limb of gland small, retuse, white or pink; cocci hispid; seeds reddish-glaucous.....10. *hypericifolia*.
- Cymes capitate, often in pairs; plants with hispid often yellowish hairs; leaves obliquely elliptic or lanceolate, acute, serrulate, up to 1.5 in. long, .5—.75 in. broad, pale beneath; limb of stalked gland minute or 0; cocci appressed pubescent; seeds reddish.....11. *hirta*.
- Erect herbs, also with many prostrate or spreading branches:—
 Limb of gland pink, the 2 upper large obliquely oblong, obtuse or notched, the 2 lower small; leaves green, obliquely obovate or linear-spathulate, crenulate at tip, up to .5 in. long, .25 in. broad; cocci obtusely keeled, minutely papillose; seeds with shallow furrows.....12. *rosea*.
- Limb of gland white, all subequal, rounded, sometimes 0; leaves green, but often with a red spot, elliptic oblong or obovate, obtuse, oblique at base, up to .5 in. long, .2 in. broad; cocci keeled, glabrous or slightly pubescent; seeds smooth.....13. *corrigioides*.
- Prostrate herbs with very small leaves; involucre solitary or in small axillary cymes; limb of gland minute or 0:—
 Stems hispidly hairy; capsules pubescent or hirsute; leaves areolate-reticulate:—
 Cocci rounded or only slightly obtusely keeled, covered with appressed stiff hairs; seeds 4-angled with faint furrows; leaves oblong or ovate, crenulate at tip, obliquely subcordate at base, up to .25 in. long, the nerves obscure.....14. *thymifolia*.
- Cocci prominently keeled, with stiff spreading hairs on the keels; seeds 4-angled, with deep furrows; leaves elliptic or obovate, crenulate, oblique at base, up to .3 in. long, 3-nerved, the nerves all prominent.....15. *prostrata*.
- Stem and capsules glabrous, the latter obtusely keeled; seeds obtusely 4-angled, glabrous, sometimes faintly furrowed; leaves elliptic or obovate, rounded or emarginate, oblique at base, rarely over .15 in. long, the nerves obscure.....16. *microphylla*.
- Shrubs or trees or plants with thickened underground stem, the branches often angular and with stipular spines; glands of involucre without a petaloid limb:—
 Stems not developed above ground, stout and cylindric, 6—18 in. or more long; leaves radical, obovate, cuneate, early deciduous; scapes erect, dichotomous, bracteate; involucre hemispheric, the lobes lacerate-multifid; glands 5, oblong; capsule glabrous; seeds ovoid, smooth.....17. *acaulis*.
- Stems well developed above ground:—
 Branches spreading, unarmed, cylindric; leaves 0 or small and linear-oblong, deciduous; involucre pedicelled, clustered in the axils of the branchlets; glands peltate; cocci subglobose, smooth, .3 in. long; seeds ovoid, smooth.....18. *Tirucalli*.
- Branches thick, fleshy, armed with stipular spines:—
 Main stems practically none but many branches from the base up to even 7 ft. high, 2 in. in diam., terete, smooth; spines in pairs from large conical tubercles, in spirals, the spines .25—.5 in. long, red, sharp, often with 2 smaller ones above; leaves small, fleshy, suborbicular, .3—.5 in. long, deciduous; glands oblong; capsule red, sharply angled.....19. *caducifolia*.
- Main stem present, thick and tree-like:—
 Leaves large, oblanceolate, usually at least 6 in. long; involucre usually in threes on a short fleshy peduncle, the lobes fimbriate, the glands transversely oblong:—
 Branches cylindric with pairs of straight spines inserted on flat corky bases, arranged in vertical lines; leaves obtuse.....20. *Nivulia*.
- Branches more or less angular with small pairs of spines on small corky bases, arranged in spiral lines; leaves shortly acute.....21. *neriifolia*.

Leaves small, usually very early deciduous; branches angular:—

Styles simple:—

Branchlets 3-winged with straight spines in pairs; leaves obovate, spatulate, mucronate, up to 2 in. long, .75 in. broad; bracteoles sheathing, laciniate.....22. *trigona*.

Branchlets 5-winged with narrow sharp spines; leaves oblanceolate, acute, mucronate, up to 2 in. long, .5 in. broad; bracteoles slender, fimbriate at tip.....23. *Cattimandoo*.

Styles bifid at apex:—

Branchlets thick and broad 3—5-winged, with sharp spines; leaves few, very small; glands fleshy, thick, spongily pitted, bracteoles sheathing, deeply laciniate.....24. *antiquorum*.

Branchlets rather slender, much twisted, 3—5-winged, with sharp spines, the wings thin, foliaceous; leaves minute, ovate; glands large, hard and thin, glabrous; bracteoles sheathing, fimbriate at tip

25. *torilis*.

Herbs with erect stems umbellately branched above, the lower leaves or sometimes all alternate, the upper opposite; glands of involucre without a petaloid limb:—

Glands of the involucre 2-horned; capsule smooth; seeds carunculate:—

Seeds with a white leprous tuberculate testa; leaves linear or linear-lanceolate, 1—1.5 in. long, .1—2 in. broad, the floral leaves shorter and broader in proportion; lobes of the involucre short, ovate, ciliolate.....26. *dracunculoides*.

Seeds with a smooth, bluish-grey to black testa; leaves linear-lanceolate or oblanceolate, 2—4 in. long, .25—.75 in. broad, the floral leaves broadly ovate-cordate, acute, mucronate; lobes of the involucre long, subquadrate ciliate

27. *Rothiana*.

Glands of the involucre not horned:—

Glands peltate; cocci rounded, smooth; leaves oblanceolate, acute, serrate, the upper larger, up to 1.5 in. long, those near the involucre ovate to cordate; lobes of the involucre narrow, ciliate, longer than the glands.....28. *peltata*.

Glands oblong; capsules smooth, the cocci rounded; seeds reticulate, carunculate; leaves obovate or spatulate, obtuse, serrulate, the floral larger, up to 2 in. long; lobes of the involucre fimbriate.....29. *helioscopia*.

1. EUPHORBIA PYCNOSTEGIA, Boiss.; F. B. I. v. 246.

W. Ghâts, hills of S. Canara and Malabar.

A slender branching herb, glabrous except the floral internodes and capsule, the leaves up to 1.5 in. long, .5 in. broad, floral leaves smaller, ovate; cocci hirsute.

Var. *laxa*, Boiss. Floral heads more open, cocci glabrous, also seeds.

Bababudan Hills of Mysore, at 5,000 ft. (Talbot, Meebold).

2. EUPHORBIA ZORNIOIDES, Boiss.; F. B. I. v. 246.

Bababudan Hills of Mysore at 3,500 ft. (Meebold); Anamalais (Beddome).

A slender glabrous herb, with woody stem, the leaves narrow, mucronate, floral leaves small, ovate, gradually smaller upwards, ciliate on the edges.

3. EUPHORBIA ELEGANS, Spr.; F. B. I. v. 146.

N. Circars and Deccan from Godavari to Kurnool, in shady places in deciduous forest.

An erect herb or undershrub with conspicuous floral leaves and pink flowers, the leaves scarcely 1 in. long.

4. EUPHORBIA FIMBRIATA, Heyne in Roth Nov. Sp. Pl. 227. *E. cristata*, Hook. f. in F. B. I. v. 247 in part.

Deccan, Sakrable in Mysore (Barber); Tinnevelly Ghâts (Beddome).

- A dwarf undershrub with thick rootstock and many short branchlets, the involucre very villous.
5. *EUPHORBIA CRISTATA*, Heyne; F. B. I. v. 247.
Deccan and Carnatic, from the Kistna river southwards, west to the E. slopes of the Gháts, in forest undergrowth, up to 3,000 ft.
A straggling undershrub with thick rootstock.
6. *EUPHORBIA LONGISTYLA*, Boiss.; F. B. I. v. 247.
Deccan, in the Ceded Districts, up to 2,000 ft. (Heyne, Wight, Gamble).
An erect delicate herb reaching 10 in. in height, with slender root and numerous filiform branches, the long styles conspicuous.
7. *EUPHORBIA NOTOPTERA*, Boiss.; F. B. I. v. 247.
W. Coast in rice-fields and other cultivated land, on laterite soil in S. Canara (Fischer).
A slender erect herb with narrow, usually deflexed leaves.
8. *EUPHORBIA LINEARIFOLIA*, Roth; F. B. I. v. 249.
Deccan, at Cumhuin in Kurnool (Bourne) also, but without geographical locality (Heyne and Wight).
A glabrous glaucous herb with thick rootstock and branches. Roth says that the limb is pink with a red spot.
9. *EUPHORBIA ATOTO*, Forst.; F. B. I. v. 248.
W. Coast, in S. Canara, Malabar and Travancore, on the sea-coast.
A fleshy shrub with long stout rootstock and stout much-branched stems.
10. *EUPHORBIA HYPERICIFOLIA*, Linn.; F. B. I. v. 249.
N. Circars, Deccan and Carnatic, west to the E. slopes of the Gháts, up to 3,000 ft., common.
A slender herb reaching 1—2 ft. high.
11. *EUPHORBIA HIRTA*, Linn. *E. pilulifera*, Linn.; F. B. I. v. 250.
All plains Districts, especially on roadsides and waste land, common.
A straggling ascending hispid herb reaching 1—2 ft. high.
12. *EUPHORBIA ROSEA*, Retz; F. B. I. v. 251.
N. Circars, coast of Ganjam; S. Deccan and Carnatic, on sandy soils, especially near the coast.
A herb with long rootstock and many prostrate branches, the styles long and conspicuous. The coast form (*E. auricularia*, Boiss.) has the two upper limbs of the glands shorter and broader and the leaves more rounded and fleshy.
13. *EUPHORBIA CORRIGIOLOIDES*, Boiss.; F. B. I. v. 251.
S. Deccan and Carnatic, usually near the coast, but also inland to Bellary.
A herb with stout rootstock and many branches which are often long and trailing with leaves in distinct pairs, often conspicuous with a red blotch.

14. *EUPHORBIA THYMIFOLIA*, Linn.; F. B. I. v. 252.
All plains Districts and on hills in Deccan and Carnatic at low elevations, often a roadside and garden weed.
An annual prostrate herb.
15. *EUPHORBIA PROSTRATA*, Ait.; F. B. I. v. 266.
Deccan and Carnatic, occasionally, usually probably as a weed in gardens. An introduced plant, native of W. Indies.
A prostrate herb.
16. *EUPHORBIA MICROPHYLLA*, Heyne; F. B. I. v. 252.
Circars, Deccan and Carnatic, especially near the sea and on river banks.
A glabrous herb with prostrate branches, spreading star-like from the root.
Var. *nilagirica*. *E. nilagirica*, Miq.; F. B. I. v. 265. A rather larger plant with larger leaves and more sharply keeled cocci.
Nilgiri Hills (Hohenacker), probably at low levels in dry places.
17. *EUPHORBIA ACAULIS*, Roxb. *E. fusiformis*, Buch.-Ham. in Don Prodr. 62; F. B. I. v. 257.
Bababudan Hills of Mysore (Law).
A dwarf unarmed glabrous herb, flowering in the hot season, the leaves up to 9 in. or more long, the tuber often very large, even to 2 ft.
18. *EUPHORBIA TIRUCALLI*, Linn.; F. B. I. v. 254.
Most plains Districts, naturalized and cultivated as a hedge plant, native of tropical Africa. Milk Bush.
A large shrub or small tree. Flowers very small, the bracteoles among the ♂ laciniate at tip; bark greenish-brown; wood white or grey, moderately hard, said to give a good powder charcoal. Vern. *Hind.* Sehnd; *Tam., Mal.* Tiru Kalli.
19. *EUPHORBIA CADUCIFOLIA*, Haines in Ind. For. xl. 154; Fischer in Kew Bull. 1925, 341.
Deccan, hills of Palnád in Gunjur, hills of Kurnool and Cuddapah, among rocks (Fischer).
A much-branched thorny shrub with smooth green bark. Vern. *Tel.* Kartai-jemadu.
20. *EUPHORBIA NIVULLA*, Buch.-Ham.; F. B. I. v. 255; Wt. Ic. t. 1862.
N. Circars and Deccan to Mysore and Coimbatore, on rocky hills in dry open forests; often also cultivated.
A tree with straight trunk reaching 10–30 ft., the branches whorled. Wood white, soft, even-grained. The milky juice is used in medicine. Vern. *Tam.* Kalli; *Kan.* Yelli Kalli.
21. *EUPHORBIA NERIIFOLIA*, Linn.; F. B. I. v. 255.
Cultivated and sometimes run wild, chiefly in Northern Districts.
A small tree 6–15 ft. high with whorled branches.
22. *EUPHORBIA TRIGONA*, Haw.; F. B. I. v. 256 in part; Wt. Ic. t. 1863.
Deccan, on dry rocky hills.
A small tree with thick trunk reaching 6–7 ft., the involucre in dichasioid cymes of 3, the middle one with ♀ flowers, the

others usually only ♂. The cocci are more or less compressed, the seeds smooth.

23. *EUPHORBIA CATTIMANDOO*, W. Elliot in Wt. Ic. t. 1993. *E. trigona*, Haw.; F. B. I. v. 256 *in part*.

N. Circars, dry hills about Vizagapatam (W. Elliot); Deccan, hills of Kistna and Kurnool.

‡An erect shrub or small tree, giving an abundant milk which hardens to a kind of gutta-percha.

24. *EUPHORBIA ANTIQUORUM*, Linn.; F. B. I. v. 255; Wt. Ic. t. 897.

Low hills and rocky ground in most dry Districts, also commonly cultivated as a hedge plant.

A small tree, reaching 25 ft. high, the involucre in short cymes of 3, the cocci compressed. Vern. *Hind.* Tidhara-Sehnd; *Tam.* Sadura-Kalli.

25. *EUPHORBIA TORTILIS*, Rottl. ex Wt. Ic. t. 898; F. B. I. v. 256. *Tel.* Pedda jamadu.

Carnatic, from Nellore to Thinnevelly, on dry hills.

An erect shrub with thin-winged branchlets bearing involucre in cymes of 3.

26. *EUPHORBIA DRACUNCULOIDES*, Lamk.; F. B. I. v. 262.

N. Circars and Deccan, on dry waste lands and in cultivated ground in the plains.

A much-branched glaucous herb with very narrow leaves.

27. *EUPHORBIA ROTHIANA*, Spr.; F. B. I. v. 263; Wt. Ic. t. 1864.

N. Circars, Mahendragiri Hill in Ganjam, 4,000 ft. (Fischer); Deccan, hills of Mysore and Coimbatore; W. Gháts, in all Districts, at 4,000—7,000 ft., usually in damp places.

An erect glabrous glaucous herb, the flowering branches whorled with conspicuous floral leaves.

Var. *pubescens*, Boiss. Branchlets and leaves softly pubescent. Coorg (Hohenacker).

28. *EUPHORBIA PELTATA*, Roxb.; F. B. I. v. 262.

Interior of the Coromandel Coast (Roxburgh), see Fl. Ind. and Icon. 1248 in Herb. Kew.

A small annual erect herb.

29. *EUPHORBIA HELIOSCOPIA*, Linn.; F. B. I. v. 262.

Nilgiri Hills, introduced and run wild, native of Europe and temperate Asia. Sun Spurge.

An erect annual herb.

Euphorbia pulcherrima, Willd., the Poinsettia, is a well-known ornamental garden shrub with bright crimson or occasionally yellow or white floral leaves. *E. heterophylla*, Linn., is an annual herb from Tropical America, which is often found as a weed in Indian gardens. It has narrow floral leaves, green near the apex and nearly reddish at base. *E. splendens*, Boj., is a small prickly very much branched shrub with showy crimson flowers, common in gardens in the plains. It is a native of Madagascar.

2. *Bridelia*, Willd.

Shrubs or trees, sometimes climbing; stems often spinose. *Leaves* alternate, entire, usually with prominent nerves and transverse nervules; stipules early deciduous. *Flowers* small, monoecious or dioecious, in axillary or spicate clusters, sessile or shortly pedicelled; bracts small, scale-like. *Calyx* of 5 valvate lobes. *Petals* 5, small, alternate with the calyx-lobes, in ♂ usually stalked, cucullate and dentate, in ♀ spathulate. *Disk* flat, the ♂ with an annular rim, the ♀ with an inner corona, erect and enclosing the ovary. *Stamens* 5, on an erect gonophore, the filaments radiating from it and surrounding a pistillode, anther-cells parallel. *Ovary* 2-celled; ovules 2 in each cell; styles 2, free or shortly united, forked or subentire. *Fruit* a drupe, with 1—2 usually single-seeded pyrenes. *Seed* with usually fleshy albumen; cotyledons thin, usually broad and truncate or emarginate; radicle superior.

Trees or shrubs; fruits globose or didymous, the pyrenes more or less furrowed; stipules narrow:—

Main nerves strong, straight, parallel, joining a marginal thickened one, more than 15 pairs, cross-nervules also many and parallel:—

Flowers in clusters in spikes, monoecious, the ♀ much larger than the ♂; leaves chartaceous, elliptic-oblong or obovate, acute obtuse or even retuse at apex, usually obtuse at base, glabrous or puberulous beneath, up to 9 in. long, 4 in. broad, main nerves often forked near the margin; drupe black, globose, about .25 in. in diam., the pyrene furrows curved and deep.....1. *retusa*.

Flowers in clusters in the leaf-axils, pedicelled or not, dioecious; leaves coriaceous, the main nerves close and regular; stipules long-acuminate, deciduous:—

Leaves elliptic-oblong, obtuse or emarginate at apex, obtuse or cordate at base, brown-tomentose beneath, up to 5 in. long, 2.5 in. broad; drupe black, depressed globose, .25 in. in diam., the pyrene furrows deep, the ridges branching from the middle one and curved.....2. *Roxburghiana*.

Leaves oblong, acute or obtusely acute at apex, usually acute at base, glabrous and cinereous-glaucous beneath, up to 3.5 in. long, 1.25 in. broad; drupe globose, .3 in. in diam., the pyrene furrows rather shallow, the ridges curved.....3. *cinerascens*.

Main nerves not markedly straight or parallel, often branched, but always eventually joining a marginal thickened one, less than 15 pairs, cross-nervules also more or less parallel; flowers monoecious, very small:—

Leaves oblong-lanceolate or oblanceolate, acute at apex, acute or obtuse at base, glaucous and pubescent beneath, up to 4 in. long, 1.5 in. broad; drupe globose, black, .2 in. in diam., the pyrene furrows deep, the ridges radiating from a prominent central one.....4. *tomentosa*.

Leaves rhombic-obovate or sometimes oblanceolate, acute at apex, long-cuneate at base, usually glabrous, up to 4.5 in. long, 2.5 in. broad; drupe globose, .25 in. in diam., the pyrene furrows shallow, the ridges rounded, curving from a central one.....5. *montana*.

Climbers; fruits oblong, the pyrenes smooth; flowers in long axillary or terminal spikes with small leaves and zig-zag rachises, usually monoecious, but the ♂ and ♀ on separate spikes:—

Disk of the ♀ flowers with a ring of bristles at the base within, the calyx enlarged in fruit; leaves elliptic-ovate or -obovate, acute at apex, rounded at base, fulvous tomentose beneath, up to 4 in. long, 2 in. broad, the main nerves 10—12 pairs, parallel, joining a marginal one, the transverse nervules also regular and parallel; drupe black, .5 in. long.....6. *stipularis*.

Disk of the ♀ flowers without a ring of bristles at the base within, the calyx not enlarged in fruit; leaves elliptic, obtuse at apex, rounded or cordate at base, fulvous-pubescent beneath, up to 5 in. long, 2.5 in. broad, the main nerves 7—10 pairs, parallel, joining a marginal one, the transverse nervules also more or less parallel; drupe black, .3 in. long.....7. *scandens*.

1. *BRIDELIA RETUSA*, Spreng.; F. B. I. v. 268 *in part*; Bedd. Fl. t. 260; Brand. For. Fl. t. 55. *Cluytia spinosa*, Roxb. Cor. Pl. t. 172.
All Forest Districts, especially in the N. Circars and in deciduous forests, though usually by streams and in ravines, in the hills up to 3,500 ft.
A small or moderate-sized tree, with conical thorns on the stems and branches when young. Bark grey or brown; wood grey to olive-brown, with a pretty silver grain, useful and durable. Vern. *Hind.* Kaj, Kassi; *Ur.* Kosi; *Tel.* Koramaddi, Verri Karaka; *Tam.* Mulu Maruthu; *Mal.* Mukkayini; *Kan.* Asana.
2. *BRIDELIA ROXBURGHIANA*, Gehrm. in Engl. Jahrb. xli, Beibl. 95, 30. *B. retusa*, Spr., var. *Roxburghiana*, Hook. f.; F. B. I. v. 268.
W. Ghâts, in all Districts of the hills up to 5,000 ft., especially on the E. side; hills of Mysore and N. Coimbatore; Shevaroy Hills of Salem.
A large tree, probably thorny when young, the branches with shining bark, the branchlets fulvous-tomentose.
3. *BRIDELIA CINERASCENS*, Gehrm. l. c. *B. retusa*, Spr., var. *glauca*, Hook. f.; F. B. I. v. 268.
Deccan, Palkonda Hills of Cuddapah (Fischer), Veligonda Hills of Nellore (M. S. Ramaswami), Kambakam Hills of Chingleput (K. Rangachari).
A moderate-sized tree, apparently thorny when young, the flowers greenish-yellow, the drupe purple-black.
4. *BRIDELIA TOMENTOSA*, Blume; F. B. I. v. 271.
N. Circars, in forest, Ganjam (Gamble); Palkonda Hills of Vizagapatam (Sir W. Elliot); Annavaram in Godavari (K. Rangachari).
A large shrub or small tree with nearly black slender branchlets, the leaves with about 10—12 pairs of curved parallel unbranched main nerves.
5. *BRIDELIA MONTANA*, Willd.; F. B. I. 269 *in part only*; Roxb. Cor. Pl. t. 171. *B. Hamiltoniana*, Wall.; F. B. I. v. 271.
N. Circars, Ganjam to Kistna in dry forests; Deccan, hills of Cuddapah and Kurnool, up to 3,000 ft.
A large much-branching shrub or small tree, the leaves rather thin and large, and the stem tree-like in moister or more shady places, the leaves thick and small and often yellowish and the stems bushy in open dry ones, the main nerves very oblique, 6 to 10 pairs, usually branched near the margin. Vern. *Tel.* Pantenga.
6. *BRIDELIA STIPULARIS*, Blume; F. B. I. v. 270, *in part*. *Cluytia scandens*, Roxb. Cor. Pl. t. 173, *not good*.
N. Circars, Palkonda Hills of Vizagapatam (J. Campbell, Gamble), Lamsingi Hills (A. W. Lushington, Rangachari).
A large climbing shrub, with fulvous-tomentose branches, often thorny when young, the leaves on flowering shoots small but often wanting.
7. *BRIDELIA SCANDENS*, Gehrm. *B. stipularis*, Hook. f.; F. B. I. v. 270 *in part, not of* Blume.

W. Ghats, S. Canara and Mysore to Travancore, up to 3,000 ft. A large climbing shrub with thorny stems and branches, the flowering spikes often long and distichous with small leaves.

3. *Cleistanthus*, Hook f.

Trees or shrubs. *Leaves* alternate, bifarious, entire. *Flowers* monoecious, small, in axillary clusters or spikes of clusters, sessile or the ♀ pedicelled. *Calyx* of 5 or sometimes 6 valvate lobes, in the ♀ cupular under the ovary. *Petals* alternate with the calyx-lobes, minute. *Disk* in ♂ flat or pulvinate, in ♀ with an inner corona, more or less enclosing the ovary. *Stamens* 5 or 6, on an erect gonophore, the filaments rising from it and enclosing a lobed pistillode; anther-cells parallel. *Ovary* 3-celled, usually with long hairs; ovules 2 in each cell; styles 3, free, bifid. *Fruit* a sessile or stipitate capsule with 3 2-valved cocci. *Seed* without aril or caruncle; albumen copious or scanty; cotyledons thin or fleshy, often folded.

Capsule large, .75—1 in. in diam., hard and woody, dark brown, shining; seed globose; calyx-lobes lanceolate, .25 in. long; petals minute, linear; leaves elliptic obovate or orbicular, often retuse at apex, up to 4.5 in. long, 3 in. wide; ovary glabrous.....1. *collinus*.

Capsule small, less than .5 in. in diam.; ovary villous:—

Flowers in clusters in axillary spikes; seed heart-shaped; calyx-lobes .1 in. long; petals minute, obovate; leaves ovate or lanceolate, acuminate at apex, acute or rounded at base, glabrous, up to 3.5 in. long, 1.5 in. broad.....2. *patulus*.

Flowers in axillary clusters:—

Branches slender; calyx-lobes .1 in. long; petals minute, ovate; leaves lanceolate, long-acuminate, glabrous, up to 4.5 in. long, 1.5 in. broad, the main nerves irregular, branched and reticulate, stipules very small...3. *travancorensis*. Branches rather thick, rufous-villous; calyx-lobes 1.25 in. long; petals spatulate; leaves oblanceolate, acuminate, glaucous and thinly pubescent beneath, up to 6 in. long, 1.75 in. broad, main nerves arched, 6—10 pairs, stipules linear-lanceolate, .2 in. long.....4. *malabaricus*.

1. *CLEISTANTHUS COLLINUS*, Benth.; F. B. I. v. 274. *Cluytia collina*, Roxb. Cor. Pl. t. 169.

N. Circars, common; Carnatic, in most Districts, in dry forests; Deccan, especially Hyderabad; Malabar (Bournes).

A small deciduous tree. Bark dark brown, rough; wood dark reddish-brown, hard and strong, valuable for houseposts and fences. The outer crust of the capsule is poisonous and used to kill fish. Vern. *Hind.* Garrar; *Ur.* Korada; *Tel.* Korei, Wodesha; *Tam.* Wodayu, Wodan.

2. *CLEISTANTHUS PATULUS*, Muell. Arg.; F. B. I. v. 279, *Amanoa indica*, Wt. Ic. t. 1911.

N. Circars, in Kallikota (Prain), Palkonda Hills of Vizagapatam (Gamble); Deccan, in Mysore, Kistna and Cuddapah (Beddome); Carnatic, Kambakam Hills in Chingleput, hills of Tinnevely (Rangachari), chiefly in ravines or dry evergreen forest.

A small or moderate-sized tree with horizontal branches. Bark thin; wood "colour of dry rose leaves" (Roxb.), hard and close-grained. The seeds have very thin albumen and large fleshy truncate cotyledons.

3. *CLEISTANTHUS TRAVANCORENSIS*, Jablonszky in Engl. Pflanzenreich iv. 147. viii. 21.
W. Gháts, evergreen forests of Travancore at 2,500 ft. (Bourdillon).
A small tree.
4. *CLEISTANTHUS MALABARICUS*, Muell. Arg.; F. B. I. v. 276.
W. Gháts, evergreen forests from the Gairsoppa Falls (Talbot) to Travancore (*vide* Bourdillon in "Trees Trav."), at 1,000—3,000 ft.
A large shrub or small tree with fulvous-hairy capsules.

4. *Actephila*, Blume.

Trees or shrubs. *Leaves* alternate, usually large, entire; stipules deciduous. *Flowers* monoecious or dioecious, ♂ in axillary clusters, short-pedicelled, ♀ solitary or few together, long-pedicelled, bracts small. *Calyx*-lobes 5, imbricate, in ♂ small and rounded, in ♀ longer and oblong or lanceolate, often unequal. *Petals* small, inserted under the disk, in ♂ oblong, in ♀ rounded. *Disk* broad, entire or lobed. *Stamens* 3—6 inserted on the disk, filaments shortly combined at the base in a gonophore enclosing a 3-cleft pistillode. *Ovary* sessile, 3-lobed; ovules 2 in each cell; styles short, free or connate at the base, entire or bifid. *Fruit* a hard septicidal capsule of 3 cocci. *Seeds* usually solitary in the cocci, 3-gonous, rounded on the outer face, flat on the 2 inner; testa loose and fragile, often with an inner one membranous; albumen 0 or very scanty; cotyledons fleshy, unequal, the interior one smaller.

ACTEPHILA EXCELSA, Muell. Arg.; F. B. I. v. 282. *A. neilgherrensis*, Wt. Ic. t. 1910.

W. Gháts, most Districts, in evergreen forests, and Shola woods, up to 6,000 ft.; Bababudan Hills of Mysore.

A small tree reaching a height of 25 ft., with greyish-brown bark. Leaves somewhat coriaceous, shining, variable, lanceolate obovate or oblanceolate, acute, glabrous, up to 7 in. long, 3 in. broad; capsules depressed globose up to 1.5 in. in diameter. The Mysore specimens agree best with Dalzell's type; the rest are all Wight's *neilgherrensis*, possibly distinct.

5. *Agyneia*, Vent.

Glabrous herbs; stems often angular or compressed. *Leaves* small, alternate, entire; stipules acuminate. *Flowers* minute, monoecious, ♂ in axillary clusters, ♀ larger, solitary; bracts numerous, stipule-like. *Calyx*-lobes 6. ♂ gland-dotted and white-margined, hooded on the bark, ♀ acute, dotted but hardly margined. *Petals* 0. *Disk* in ♂ 6-lobed, in ♀ 0. *Stamens* 3, central, connate, the filaments combined in a gonophore column; cells parallel, extrorse. *Ovary* ovoid, 3-celled, truncate; ovules 2 in each cell; styles 3, very short, bifid, sunk in the top of the ovary. *Fruit* a capsule, splitting into 3 2-valved cocci. *Seeds* 6, slender, curved, with an elongated hilum; testa double, outer white, corky, inner membranous; albumen fleshy; embryo curved, the cotyledons flat.

AGYNEIA BACCIFORMIS, A. Juss.; F. B. I. v. 285; Wt. Ic. t. 1893.

East Coast, in grassy pastures near the sea.

An annual or biennial herb with straggling branches and small oblong elliptic or obovate leaves about .5 in. long, the capsules ovoid obtuse .25 in long.

6. Pseudoglochidion, Gamble.

Evergreen trees or shrubs. *Leaves* alternate, bifarious, entire, very shortly petioled. *Flowers* small, dioecious, in axillary clusters. *Calyx* in ♂ flowers of 6 biseriate imbricate lobes; in ♀ also 6-lobed, but smaller. *Petals* 0. *Disk* in ♂ flowers conspicuous, of 6 fimbriate glands, in ♀ annular, crenate. *Stamens* 3, erect, slightly joined by their connectives or free, the filaments connate in a short column; anthers extrorse, the cells dehiscing longitudinally; the connective produced in an apiculus. *Ovary* ovoid, 3-celled; ovules 2 in each cell; styles connate in a cylindric column, minutely 6-toothed at apex. *Capsule* 3-4-celled; depressed. *Seeds* trigonous, rounded on the back, often pitted on the faces; cotyledons fleshy, unequal.

PSEUDOGLOCHIDION ANAMALAYANUM, Gamble in Kew Bull. 1925, 330.

W. Ghâts, Anamalai Hills, about 4,000 ft. (Barber, Fischer)

A small tree reaching a height of 15 to 20 ft., the leaves lanceolate, up to 3.5 in. long, 1.25 in. broad, regularly nerved, glaucous beneath; the capsule 3-4-lobed, glabrous and .3-.4 in. broad.

7. Chorisandra, Wight.

Shrub, branchlets pale and rough. *Leaves* membranous, glabrous, pinnately arranged on short slender branchlets; stipules minute. *Flowers* dioecious or monoecious, minute, ♂ in dense axillary fascicles with short filiform pedicels; ♀ also axillary, with long slender pedicels. *Calyx*-lobes 6, smaller and more rounded in ♂ than in ♀. *Disk* flattened, with 6 depressed lobes alternating with the calyx-lobes. *Stamens* 6, erect with long free slender filaments; anthers short, the cells dehiscing longitudinally. *Ovary* 3-celled; ovules 2 in each cell, pendulous from the middle of the axis; style short, 3-lobed, the lobes bifid with recurved branches. *Fruit* a 3-celled papery capsule, splitting into 6 valves, but often only 3-seeded. *Seeds* small; testa loose; cotyledons small in rough albumen.

CHORISANDRA PINNATA, Wt. Ic. t. 1994.

N. Circars, Deccan and Carnatic, from Vizagapatam southwards to Madras, westwards to Cuddapah and Kurnool. It is common and more or less gregarious on laterite soils, especially in hollows to the W. of the Pulicat Lake.

A low branching shrub with very pale rough bark, hard wood and small ovate or elliptic very thin and easily detached leaflets.

8. Neopeltandra, Gamble.

Slender undershrubs. *Leaves* alternate, membranous; stipules small, ciliate, caducous. *Flowers* axillary, monoecious, ♂ in short racemes covered with imbricating ciliate bracts, ♀ from below them,

solitary, long-pedicelled. *Calyx*-lobes 5, imbricate. *Disk* saucer-like, broad, lining the inside of the calyx. *Stamens* 5, the filaments connate below in a column, free above and spreading; anthers 2-celled, dehiscing longitudinally; pistillode 0. *Ovary* 3-celled; ovules 2 in each cell, pendulous; styles 3, bifid. *Fruit* a 3-celled small capsule, the cocci thinly crustaceous, splitting into two. *Seeds* 2 or usually only 1 in each cell; testa crustaceous, prominently pitted; albumen fleshy; cotyledons flat, elliptic, leafy, the radicle as long and curved.

Leaves ovate- or elliptic-lanceolate, long and sharply acuminate, acute or rounded at base, up to 6 in. long, 2 in. broad, main nerves 6—8 pairs; ♂ flowers with ovate ciliate bracts, ♀ solitary with pedicel about 1 in. elongating to 3 in. in fruit; capsules .25 in. broad; seed curved .65 in. long, obscurely pitted

1. *longipes*.

Leaves elliptic or ovate, acute at apex, rounded or acute at base, up to 2.5 in. long, 1.5—2 in. broad, main nerves 4—6 pairs, slender; ♂ flowers with lanceolate bracts; ♀ solitary, pedicels about .5 in., longer in fruit; capsule .1—1.5 in. broad; seed slightly curved, .05 in. long, strongly pitted.....2. *suberosa*.

1. *NEOPELTANDRA LONGIPES*, Gamble. *Phyllanthus longipes*, Muell. Arg.; F. B. I. v. 287. *Peltandra longipes*, Wt. Ic. t. 1891.

W. Ghâts, hills from Coimbatore to Anamalais and hills of Tinnevely in evergreen forests up to 6,000 ft.

A slender undershrub with white bark and very thin leaves.

2. *NEOPELTANDRA SUBEROSA*, Gamble. *Phyllanthus suberosus*, Wt. in Wall. Cat. 7910; F. B. I. v. 287.

Hills of the N. Circars, in Vizagapatam and Godavari; Deccan, Veligonda Hills of Nellore (Ramaswami); W. Ghâts, Bolampatti Hills of Coimbatore (Fischer), Pulney Hills (Bourne).

A very slender undershrub with pale bark, the leaves very membranous and variable in size.

9. *Phyllanthus*, Linn. (modified).

Herbs or shrubs. *Leaves* small, alternate, distichous, the branchlets resembling pinnate leaves; stipules narrow. *Flowers* very small, monoecious, in axillary clusters or solitary, bracteate. *Calyx* lobes 5—6, imbricate. *Petals* 0. *Disk* in ♂ of small glands, in ♀ of glands or annular. *Stamens* 3, more or less free or the filaments combined in a column; anthers oblong or didymous, dehiscing vertically or transversely. *Ovary* 3-celled; styles 3, free or connate at base, 2-fid. *Fruit* a capsule with 3 crustaceous or thin 2-valved cocci. *Seeds* trigonous, rounded at back.

Anthers erect, the cells dehiscing vertically, the filaments united in a column:—

Shrubs; seeds foveolate:—

Leaf branchlets 2—6 in. long; leaves oblong, obtuse or apiculate, .4—75 in. long, main nerves 6—8 pairs; styles spreading; seed-pits conspicuous

1. *polyphyllus*.

Leaf branchlets 1—3 in. long, or little more; leaves elliptic-oblong, obtuse, apiculate, .2—3 in. long, main nerves obscure; styles short; seed-pits very minute.....2. *Lawii*.

Herbs or small undershrubs:—

Capsules smooth, the seeds with concentric lines of minute tubercles, and minute cross-bars:—

Leaves glabrous, subcoriaceous, obovate or oblanceolate, cuneate, rounded or retuse at apex, mucronate, glaucous, up to 1.25 in. long; stipules lanceolate,

- peltate; ♂ flowers minute, fascicled, ♀ solitary, on filiform pedicels; anthers subsessile.....3. *maderaspatensis*.
 Leaves glabrous, membranous, elliptic or ovate, acute, up to 1.25 in. long; stipules lanceolate, decurrent; ♂ flowers minute, fascicled, ♀ solitary, on thickened pedicels; anthers free above.....4. *Rheedii*.
 Capsules verrucose, the seeds prominently transversely ridged and with faint cross-bars; leaves glabrous or hispid on the margins, chartaceous, oblong, apiculate, up to .75 in. long; stipules subulate; ♂ flowers very minute, ♀ larger, sessile; anthers sessile.....5. *urinaria*.
 Anthers subglobose, the cells dehiscing transversely or on a slant:—
 Stipules peltate, subsagittate; capsule more or less verrucose, seeds minutely tubercled; disk of ♂ of large flat glands; filaments free:—
 Disk of ♀ saucer-shaped, thin, wavy; style lobes recurved, flattened on the ovary:—
 Leaves elliptic, obtuse, apiculate, the margins thickened, the nerves 4–5 prominent, joining in arches, .2–.4 in. long, .1–.2 in. broad; ♂ flowers subsessile, ♀ pedicelled; capsule glandular.....6. *Narayanswamii*.
 Leaves linear-oblong, obtuse or acute at apex, apiculate, the margins thickened, the nerves invisible, .5–.75 in. long, .1–.3 in. broad; ♂ flowers few, minute, subsessile, ♀ more numerous, on filiform pedicels.....7. *simplex*.
 Leaves of upper branchlets elliptic, obtuse, about .3 in. long, of lower stems elliptic-oblong, up to .75 in. long, .4 in. broad, the nerves about 5 pairs, faint, glaucous beneath; ♂ flowers many, in fascicles, ♀ few, both on filiform pedicels.....8. *Gardneriana*.
 Disk of ♀ cushion-shaped, thick; style lobes erect, spreading; leaves elliptic or elliptic-oblong, obtuse, up to 2 in. long, 1 in. broad, the nerves about 7 pairs, glaucous beneath, glabrous or hispid; ♂ flowers fascicled, shortly pedicelled, ♀ long-pedicelled.....9. *Macraei*.
 Stipules not peltate, lanceolate; seeds with regular lines of very minute tubercles joined by minute cross-bars; filaments connate in a column:—
 Leaves coriaceous or fleshy, orbicular or obovate, obtuse or apiculate, scarcely .25 in. in diam.; disk of ♂ of minute glands, of ♀ cushion-shaped; style-arms recurved with short lobes.....10. *rotundifolius*.
 Leaves membranous, usually glaucous beneath:—
 Leaves usually broadly obtuse at apex, very variable in size but usually under .5 in. long, elliptic-obovate or -oblong, prominently distichous so that the branchlets resemble pinnate leaves; anthers transversely dehiscing; disk of ♂ of minute glands, of ♀ saucer-shaped with erect lobes; styles recurved.....11. *Niruri*.
 Leaves usually acute, sometimes rounded, at apex, elliptic or obovate, up to at most .75 in. long:—
 Stipules lanceolate, long-acuminate; flowers rather large, the calyx-lobes with prominent scarious margins; disk of ♂ flowers with star-like glands, of ♀ saucer-shaped, crenulate or lobed; staminal column long, anther-slits transverse; styles erect, shortly bifid.....12. *debilis*.
 Stipules ovate, acute or acuminate, small; flowers very small, the calyx-lobes with obscure scarious margins; disk of ♂ flowers with peltate glands, of ♀ cushion-like, broadly lobed; staminal column slender, anthers reniform; styles erect with slender lobes.....13. *Missionis*.

1. *PHYLLANTHUS POLYPHYLLUS*, Willd.; F. B. I. v. 290; Wt. Ic. t. 1895, fig. 2.

Deccan, hill forests of Kurnool, Cuddapah, Chittoor and Nellore, Kambakam Hill in Chinglepur; Carnatic, Javadi Hills in S. Arcot, S. to hills of Tinnevely, up to 4,000 ft.; E. slopes of Nilgiris.

A shrub or small tree somewhat resembling *Emblica officinalis* in leaf but quite different in fruit.

2. *PHYLLANTHUS LAWII*, Grah.; F. B. I. v. 290.

N. Circars, in Godavari and Kistna; Carnatic, hills of Salem;

- W. Gháts, Wynaad to Travancore, gregarious on the banks and in the beds of rocky rivers.
A straggling shrub with long purplish branches armed with stipular tubercles bearing small thorns, the flowers pink. Vern. *Mal. Uri*.
3. *PHYLLANTHUS MADERASPATENSIS*, Linn.; F. B. I. v. 292; Wt. Ic. t. 1895, fig. 3.
N. Circars, Deccan and Carnatic on dry lands, especially black cotton soils and near the sea coast.
An erect or decumbent herb, sometimes nearly an undershrub.
 4. *PHYLLANTHUS RHEEDII*, Wt. Ic. t. 1895, fig. I (*poor*); F. B. I. v. 293.
W. Gháts, most Districts from S. Canara to Nilgiris, Anamalais, and the hills of Tinnevely above 5,000 ft.
A slender branching erect herb, the calyx-lobes usually white-margined.
 5. *PHYLLANTHUS URINARIA*, Linn.; F. B. I. v. 293. *P. leprocarpus*, Wt. Ic. t. 1895, fig. 4.
All plains Districts, in forest undergrowth and among grasses, up to 3,000 ft.
An annual or perennial erect herb, with more or less sensitive leaflets, which are sometimes pink when young.
 6. *PHYLLANTHUS NARAYANSWAMI*, Gamble in Kew Bull. 1925, 329.
N. Circars, Rampa Hills of Godavari, at 4,500 ft. (V. Narayanswami), perhaps on rocks.
A small wiry undershrub with many branchlets from a stout rootstock.
 7. *PHYLLANTHUS SIMPLEX*, Retz.; F. B. I. v. 295. *Macraea oblongifolia*, Wt. Ic. t. 1902, fig. 1.
N. Circars and Carnatic from the Chilka Lake to Madras; Deccan, in N. Coimbatore, on hot dry soils, up to 3,000 ft. in hilly country.
A stiff almost woody herb with long flattened branches.
 8. *PHYLLANTHUS GARDNERIANUS*, Baill. *P. simplex*, var. *Gardneriana*, F. B. I. v. 295, *Macraea Gardneriana*, Wt. Ic. t. 1902, fig. 3. *M. ovalifolia*, Wt. Ic. t. 1902, fig. 4.
W. Gháts, in all Districts from S. Canara to Tinnevely, but especially common in Nilgiris, Anamalais and Pulneys, above 5,000 ft.
A slender undershrub with woody rootstock and long branches, the leaves smaller in size upwards, plants of dry hill tops often dwarfed and with very small leaves.
 9. *PHYLLANTHUS MACRAEI*, Muell. Arg.; F. B. I. v. 296. *Macraea Rheedii*, Wt. Ic. t. 1901.
W. Gháts, Sholas of the Pulney Hills at 5,000–7,000 ft. (Bourne, etc.); Agastiamalai Peak, Tinnevely (Barber). A shrub, apparently reaching 2–3 ft. in height, with long weak flattened branchlets and capsules prominently warted when wet, leaf margins sometimes ciliate.
Var. *hispidus*. Branchlets and leaves softly hispid, the latter usually cordate at base.

Pulney Hills, on the outer edges of woods (*Wight*), Levinge's Path, 7,000 ft. (*Munch*).

10. *PHYLLANTHUS ROTUNDIFOLIUS*, Klein; F. B. I. v. 299.
N. Circars and Carnatic, sands on the sea-coast.
A prostrate or slightly ascending fleshy herb with stout root-stock and long trailing branches.
11. *PHYLLANTHUS NIRURI*, Linn.; F. B. I. v. 298; Wt. Ic. t. 1894.
All plains Districts, a weed of gardens and cultivated land.
A branching annual herb reaching 12—18 in. high. It is often used in native medicine. Vern. *Hind.* Jar-amla.
12. *PHYLLANTHUS DEBILIS*, Herb. Ham.; F. B. I. v. 299.
N. Circars and Carnatic, in shady places in the hill forests, West to the E. slopes of the Ghâts.
An erect slender herb or undershrub with many very slender branchlets.
13. *PHYLLANTHUS MISSIONIS*, Hook. f.; F. B. I. v. 297.
W. Ghâts, on E. slopes, Coimbatore to Tinnevely, at low levels.
An erect undershrub with rather distant leaves.

P. spectosus, Jacq., is a shrub with flattened branches, often found in gardens in the plains.

10. *Reidia*, *Wight*.

Shrubs or undershrubs, usually with erect stems bearing many spreading branchlets towards the top. *Leaves* alternate, usually membranous; stipules small, often many and persistent. *Flowers* monoecious, axillary, ♂ and ♀ in fascicles, the ♂ with rather short filiform pedicels, the ♀ with longer pedicels widening upwards; bracts very small, often numerous and imbricate. *Calyx*-lobes in ♂ 4, in ♀ 6, persistent and sometimes enlarging in fruit. *Corolla* 0. *Disk* in ♂ of 4 glands alternate with the calyx-lobes, in ♀ of 6 glands combined in a fleshy ring or cup. *Stamens* 2 or 4, the filaments united in a column around a pistillode; anthers dehiscing horizontally. *Ovary* 3-celled, 2 ovules in each cell; styles 3, deeply 2-fid. *Fruit* a capsule of 3 thinly crustaceous 2-valved cocci. *Seeds* triangular, glabrous or appressed hairy; cotyledons oblong.

Calyx-lobes of ♂ dentate or lacerate:—

- Calyx*-lobes of ♂ narrow, deeply lacerate, of ♀ less cut; ♂ flowers very small on short pedicels rising from a tuft of imbricate bracts, several together in clusters on the lower part of the branchlets, ♀ flowers larger, at the ends of the branchlets; leaves ovate-lanceolate, acute, unequal at base, up to 2 in. long, glaucous beneath.....1. *Gageana*.
Calyx-lobes of ♂ suborbicular, lacerate, of ♀ less so; flowers few, in axillary clusters, but usually ♂ in lower, ♀ in upper axils; disk of ♀ cup-shaped; leaves ovate, acute, somewhat unequal at base, reticulate, up to 3 in. long, 1.25 in. broad.....2. *fimbriata*.
Calyx-lobes of ♂ orbicular-ovate, dentate, of ♀ slightly toothed; flowers few, ♂ in lower axils, ♀ near the ends of the branches; disk of ♀ cushion-shaped; fruit large, about 1 in. in diam.; leaves ovate-lanceolate, acuminate, unequal-sided, glaucous beneath, up to 2.5 in. long, 1.5 in. broad.....3. *megacarpa*.

Calyx-lobes of ♂ not dentate or lacerate:—

Leaves large, at least 1 in. long; flowers usually fascicled:—

Calyx-lobes of ♀ greatly enlarged in fruit and closely imbricate; disk in ♂

annular, in ♀ saucer-shaped; leaves elliptic or elliptic-oblong, acute or obtuse, rounded at base, equal-sided, up to 2.5 in. long, 1 in. broad.....4. *macrocalyx*. Calyx-lobes of ♀ larger than those of ♂ but less enlarged in fruit.

Flowers of both ♂ and ♀ axillary to the leaves, the ♀ rather large; calyx-lobes ovate, glandular-striate, disk in ♂ broadly 4-lobed, in ♀ flat; leaves ovate, acute, obtuse at base, glaucous beneath, up to 2 in. long, 1.25 in. broad.....5. *Beddomei*.

Flowers in leaf-axils and also on long terminal leafless branchlets with linear bracts and stipules; calyx-lobes orbicular, disk tubercled; leaves triangular-ovate, acuminate, rounded at base, nearly equal-sided, reticulately nerved, up to 2 in. long, 1 in. broad.....6. *Bailloniana*.

Leaves small, under 1 in. long; branchlets prominently rough with many stipules; flowers solitary:—

Capsule glabrous; calyx-lobes of ♂ ovate, of ♀ oblong, reflexed after flowering; disk-lobes of ♂ small and distinct, of ♀ a small ring; leaves obliquely unequally obovate, acute at base, glaucous beneath, up to .75 in. long

7. *longiflora*.

Capsule densely covered with soft branched hairs:—

Calyx-lobes ovate acuminate ciliate; disk-glands truncate, dotted; leaves obliquely ovate-oblong, apiculate, pale beneath, softly villous, up to 1 in. long, .5 in. broad.....8. *floribunda*.

Calyx-lobes broadly ovate, short, glabrous, with few pellucid dots; disk-glands truncate, dotted; leaves obliquely ovate-falcate, long-apiculate, pale beneath, up to .4 in. long, .2 in. broad.....9. *stipulacea*.

1. *REIDIA GAGEANA*, Gamble in Kew Bull. 1925, 331.
W. Gháts, hills of Travancore and Tinnevely, in evergreen forest at about 2,000 ft. (Lawson, Beddome).
An undershrub, remarkable for the densely clustered ♂ flower with much lacerate calyx-lobes in ♂, less so in ♀, the ends of the branchlets leafless, but many-stipular.
2. *REIDIA FIMBRIATA*, Wt. Ic. t. 1904, fig. 1. *Phyllanthus fimbriatus*, Muell. Arg.; F. B. I. v. 302.
W. Gháts, Sispara Ghát in Nilgiris, at 4,000 ft. (Beddome, Gamble).
A glabrous shrub, the capsule nearly .25 in. in diam.
3. *REIDIA MEGACARPA*, Gamble in Kew Bull. 1925, 332.
W. Gháts, Devala in S.E. Wynaad at 3,000 ft. (Gamble).
A glabrous undershrub with large pale-coloured capsule, soon splitting, the seeds appressed-hairy.
4. *REIDIA MACROCALYX*, Gamble, n. comb. *Phyllanthus macrocalyx*, Muell. Arg.; F. B. I. v. 301. *R. latifolia*, Wt. Ic. t. 1904, fig. 2? Bababudan Hills, Mysore (Law.); Sivagiri Hills, Tinnevely (Wight).
A much-branched undershrub.
5. *REIDIA BEDDOMEI*, Gamble in Kew Bull. 1925, 331.
Chokampatti Hills of Tinnevely, at 5,000 ft. (Beddome); hills of Travancore (Bourdillon).
A glabrous undershrub.
6. *REIDIA BAILLONIANA*, Gamble, n. comb. *Phyllanthus Baillonianus*, Muell. Arg.; F. B. I. v. 300.
W. Gháts, hills of Tinnevely.
A shrub reaching 3—4 ft. in height, the leaves often marbled with white and purple, the fruit .25 in. long.

7. REIDIA LONGIFLORA, Gamble, n. comb. *Phyllanthus longiflorus*, Heyne; F. B. I. v. 302. *R. ovalifolia*, Wt. Ic. t. 1904, fig. 3 (not good).
W. Gháts, hills of Travancore and Tinnevely about 2,000 ft.
A small bush about 2 ft. high with pretty pink flowers (Bourdillon).
8. REIDIA FLORIBUNDA, Wt. Ic. t. 1903. *Phyllanthus Wightianus*, Muell. Arg.; F. B. I. v. 303.
Carnatic, Melpat in S. Arcot, Shevaroy Hills, Kollimalai Hills;
W. Gháts on E. side of Nilgiris and Pulneys, at about 2,000—4,000 ft.
A branching shrub, the branchlets rough with scars and stipules, the flowers red, the leaves with a pink tinge.
9. REIDIA STIPULACEA, Gamble in Kew Bull. 1925, 332.
W. Gháts, Anamalai and Pulney Hills, in thick undergrowth.
A straggling shrub with very rough branchlets having long and persistent brown stipules.

11. *Prosorus*, Dalz.

Trees. *Leaves* alternate, thin, deciduous. *Flowers* dioecious, small, ♂ numerous, in axillary fascicles with capillary pedicels, ♀ solitary or few together, axillary, pedicels long and stouter. *Calyx*-lobes 4 in both sexes. *Disk* annular, fleshy. *Stamens* 4, with free filaments, anthers oblong, extrorse, the cells dehiscing longitudinally. *Ovary* 3-celled; ovules 2 in each cell; styles short, bifid, the branches recurved. *Fruit* a globose capsule with thin epicarp, 6-seeded. *Seeds* irregularly trigonous, arillate, blue; albumen coarse; cotyledons small, flat.

PROSORUS INDICUS, Dalz. *Phyllanthus indicus*, Muell. Arg.; F. B. I. v. 305.

W. Gháts, Anamalai Hills (Beddome), hills of Tinnevely (Wight), Coorg and Wynaad (*vide* Beddome).

A small deciduous tree with membranous distichous elliptic or ovate acute leaves up to 6 in. long, 3 in. broad.

12. *Kirganelia*, Baill.

Shrubs, usually climbing or straggling. *Leaves* alternate, small or moderate-sized, distichous, thin; stipules lanceolate. *Flowers* monoecious, ♂ and ♀ mixed, in axillary clusters, sometimes in pairs or solitary, the clusters sometimes appearing racemose from the absence of leaves; pedicels filiform. *Calyx*-lobes 5, imbricate, the 3 inner often the larger. *Petals* 0. *Disk* in ♂ or ♀ of 5 fleshy glands. *Stamens* 5, in 2 series, the outer with free filaments, the inner 2 or 3 with the filaments connate in a column; anthers dehiscing longitudinally. *Ovary* 5—12-celled; ovules 2 superposed in each cell; stigmas as many or half as many as the cells, minute, sessile, 2-lobed. *Fruit* a fleshy 5—12-celled berry, the seeds superposed. *Seeds* trigonous; testa crustaceous, albumen fleshy; cotyledons flat, truncate.

KIRGANELIA RETICULATA, Baill. *Phyllanthus reticulatus*, Poir.; F. B. I. v. 288. *Anisonema multiflorum*, Wt. Ic. t. 1899.

All plains Districts, especially in hedges or waste places near villages and in thickets along streams.

A straggling shrub with slender branches, small elliptic obovate or orbicular or spatulate thin leaves and a purple fleshy berry about .2 in. in diam. Bark brown, thin; wood reddish-white, hard. Vern. *Hind.* Panjuli; *Tel.* Nella purududu, Phulsar; *Tam.* Pula, Pullanti.

13. *Emblica*, Gaertn.

Trees, branchlets distichous. *Leaves* small, pinnately arranged on the branchlets; stipules minute, scarious. *Flowers* very small, monoecious, in axillary fascicles, ♂ and ♀ mixed or frequently ♀ in lower and ♂ in upper axils of present or fallen leaves. *Calyx*-lobes 5–6, oblong. *Petals* 0. *Disk* in ♂ 0 or of minute glands alternate with the calyx-lobes, in ♀ cupular, the margin lacerate. *Stamens* 3, the filaments connate in a column, the anthers cohering by the connectives, which end in an apiculus, cells distinct dehiscing longitudinally. *Ovary* 3-celled; ovules 2 in each cell; styles connate at base with broad recurved twice-branched arms. *Fruit* depressed-globose, fleshy, with 3 bony 2-valved cocci. *Seeds* 6, trigonous; albumen fleshy; cotyledons flat, broad, cordate or truncate.

Leaves on the branchlets very many, 100 or more sometimes, linear oblong, apiculate, .3–.75 in. long, about .1 in. broad; glands in ♂ very small; style-arms in ♀ thick and twice bifid, sometimes broad, spreading.....1. *officinalis*.
Leaves on the branchlets many, up to about 50, elliptic-oblong, rounded or retuse at apex, .5–.9 in. long, .2–.3 in. broad; glands in ♂ larger; style-arms in ♀ slender, usually twice bifid, recurved.....2. *Fischeri*.

1. *EMBLICA OFFICINALIS*, Gaertn.; Wt. Ic. t. 1896. *Phyllanthus emblica*, Linn.; F. B. I. v. 288; Bedd. Fl. t. 258; Brand. For. Fl. t. 52.

N. Circars, Deccan and Carnatic, in dry deciduous forests and up to 4,000 ft. as on Mahendragiri; also in W. Ghâts, occasional on dry slopes. Emblic Myrabolam.

A small or moderate-sized deciduous tree, the branchlets and rhachises villous. Bark light grey, exfoliating; wood red, hard and close-grained, useful for poles, implements and furniture, and good under water. The fleshy fruits are .5–1 in. in diam., and are used for tanning and sometimes eaten. Vern. *Hind.* Aonla; *Ur.* Oura, ounla; *Tel.* Usiriki; *Tam.* Nelli.

2. *EMBLICA FISCHERI*, Gamble in Kew Bull.

Carnatic, Kambakam Hills of Chingleput, Veligonda Hills of Nellore (M. Ramaswami); Deccan, hills of N. Coimbatore (Fischer); W. Ghâts, Anamalai Hills to 3,000 ft. (Barber).

A small tree with rather large leaves, the branches pale brown, rough, the fruit not known.

14. *Fluggea*, Willd.

Shrubs, unarmed or thorny, branchlets angular. *Leaves* alternate, entire, distichous. *Flowers* dioecious, minute, pedicelled, axillary, ♂ in clusters, ♀ subsolitary. *Calyx*-lobes 5, imbricate, subpetaloid. *Petals* 0. *Disk* in ♂ of 5 or less glands alternate with the stamens; in ♀ annular

flat, toothed. *Stamens* 5, rarely less, the filaments free, exserted; anthers erect, the cells dehiscing longitudinally. *Ovary* 1—3-celled; styles free, recurved, usually 2-fid; pistillode in ♂ erect 2—3-fid. *Fruit* globose, coriaceous or outside fleshy, separating into distinct 2-valved cocci. *Seeds* triquetrous; testa crustaceous; albumen scanty; embryo curved, the cotyledons flat.

Unarmed; leaves 1—3 in. long, 1.5 in. broad, elliptic or obovate, rounded at apex; main nerves 5—7 pairs; fruits usually dry and very small, but some larger and with a fleshy pericarp.....1. *virosa*. Branchlets ending in spines; leaves .5—1 in. long, rarely more, obovate or orbicular, sometimes emarginate, glaucous, reticulate; fruit dry, globose, white, .25 in. in diam.....2. *Leucopyrus*.

1. *FLUGGEA VIROSA*, Baill. *F. microcarpa*, Bl.; F. B. I. v. 328.

All dry Districts, in deciduous forest and second-growth areas, in the hills to 4,000 ft.

A small tree or large shrub, the leaves very variable in size and shape. Bark smooth, thin, reddish-brown; wood red, hard, close-grained, useful for agricultural tools. Vern. *Hind.* Dalme.

2. *FLUGGEA LEUCOPYRUS*, Willd.; F. B. I. v. 328; Wt. Ic. t. 1875.

All dry Districts, in open places, especially near the coast, rising in the hills to 3,000 ft.

A large stiff straggling shrub, the ends of the branchlets sharply spinous, the fruits white. Wood hard and close-grained. Vern. *Hind.* Hartho; *Tel.* Tella purugudu; *Tam.* Madpulantti.

15. *Antidesma*, Linn.

Small trees or shrubs. *Leaves* alternate, entire; stipules narrow. *Flowers* dioecious, very small, in slender, axillary or terminal, simple or branched spikes or racemes. *Calyx*-lobes 3—5, rarely more. *Petals* 0. *Stamens* 2—5, inserted on or within the disk; filaments exsert; connective broad, lunate, the anther-cells ending its wings, dehiscence transverse. *Disk* annular or cushion-like. *Ovary* 1-celled; ovules 2 in each cell; stigmas 2—4, usually short; pistillode in ♂ clavate or globose or 0. *Fruit* a small more or less compressed drupe, crowned by the lateral or terminal stigmas. *Seed* small; albumen fleshy; cotyledons broad, flat.

Stamens inserted in hollows of the disk:—

Stamens 3—5, usually 3:—

Spikes of ♂ flowers slender, of ♀ short, the clusters close; leaves coriaceous, shining, ovate, obtusely acuminate, mucronate, up to 5 in. long, 2 in. broad, but often much smaller, main nerves about 10 pairs joined in arches and reticulate.....1. *zeylanicum*.

Racemes of ♂ flowers long, of ♀ long, the clusters distant; leaves chartaceous, shining above, elliptic-oblong, acuminate, mucronate, up to 9 in. long, 3 in. broad, main nerves 7—8 pairs, oblique, prominent, looped and with transverse nervules.....2. *Menasu*.

Stamens 2; flowers in slender racemes; leaves thin, dull, elliptic or obovate, acute, up to 4 in. long, 2 in. broad, main nerves 5—8 pairs, faint.....3. *diandrum*.

Stamens inserted within the disk:—

Disk of 5 free lobes, pubescent; stamens 4—7; flowers in villous panicle spikes; leaves orbicular obovate or oblong, obtuse or emarginate, up to 3 in. in diam., softly fulvous-tomentose, main nerves 5—7 pairs.....4. *Ghaesembilla*.

Disk lobed, surrounding the 3—5 stamens and a central truncate pistillode; ♂

flowers in rather thick glabrous spikes, the ♀ racemed; leaves elliptic oblong or obovate, acute or acuminate, usually shining, up to 7 in. long, 2.5 in. broad, main nerves about 8 pairs, curved and looped.....5. *Bunius*.

1. *ANTIDESMA ZEYLANICUM*, Lamk. *A. Alexiteria*, Linn. *in part*; F. B. I. v. 359.

Carnatic, Kambakam Hill in Chingleput, at 2,000 ft. (Fischer); W. Gháts, W. Nilgiris to the hills of Travancore and Tinnevely, in evergreen forests.

A small tree reaching 25 ft. high, the small drupe red.

2. *ANTIDESMA MENASU*, Miq.; F. B. I. v. 364.

W. Gháts, in all Districts, in evergreen forests up to 6,000 ft.; hills of N. Coimbatore; Shevaroy Hills of Salem.

A small branching tree with a red edible drupe. Wood darkish-red (Bourdillon). Vern. *Mal.* Puthara vál.

3. *ANTIDESMA DIANDRUM*, Roth; F. B. I. v. 361. *A. lanceolarium*, Wall.; Wt. Ic. t. 766 (not typical). *Stilago diandra*, Roxb. Cor. Pl. t. 166.

N. Circars, Deccan and Carnatic in deciduous forests at low levels, to South Travancore; W. Gháts, on lower eastern slopes, scarce in Malabar.

A small deciduous tree with thin leaves pleasantly acid and purplish-red edible fruits. Bark smooth, grey; wood pinkish-grey, hard and close-grained. Vern. *Hind.* Amári; *Ur.* Nuniári; *Tel.* Pellagumudu.

4. *ANTIDESMA GHAESEMBILLA*, Gaertn.; F. B. I. v. 357. *A. paniculatum*, Roxb.; Wt. Ic. t. 820. *A. pubescens*, Roxb. Cor. Pl. t. 167; Wt. Ic. t. 821.

N. Circars, Deccan and Carnatic, in deciduous forests at low elevations; W. Coast, in Travancore and Malabar.

A small deciduous tree with a red-purple edible small drupe. Bark grey or pale brown; wood red, the heartwood darker. Vern. *Hind.* Umtoa; *Ur.* Nuniári; *Tel.* Polari, pulsar, Kathupulitsi.

5. *ANTIDESMA BUNTUS*, Spr.; F. B. I. v. 358; Wt. Ic. t. 819.

N. Circars, hills of Vizagapatam, at 4,500 ft. (A. W. Lushington); W. Gháts, Pulney Hills and hills of Tinnevely.

A small evergreen tree with reddish drupe.

16. *Hemicyclia*, W. & A.

Trees or shrubs. *Leaves* evergreen, alternate, entire or slightly toothed, usually unequal at base. *Flowers* dioecious, ♂ in clusters in the axils of the leaves or on the branchlets below them, ♀ usually solitary, pedicels in ♀ longer than in ♂, often lengthened in fruit. *Calyx*-lobes usually 4, sometimes 5, imbricate, the inner usually the larger. *Petals* 0. *Stamens* 4–24, inserted round the disk, filaments free; anthers erect, the cells parallel. *Disk* flat or saucer-shaped, often crenate on the margins. *Ovary* obliquely ovoid, 1-, rarely 2-celled; ovules 2 in each cell; stigma 1, sessile or on a short style, broadly reniform or semi-orbicular, flat or recurved. *Fruit* a globose, obovoid

or ellipsoid drupe with hard endocarp. Seed usually solitary, arillate; albumen fleshy, embryo straight; cotyledons broad, flat.

Stamens 6—12:—

Leaves obtuse, very coriaceous, glabrous, elliptic, rounded or cordate at base, entire or sometimes repand-toothed, nerves very obscure, up to 3 in. long, 2 in. broad; calyx-lobes small, ciliate; stigma orbicular, peltate, crenulate; fruit .3 in. in diam., globose, red.....1. *sepiaria*.

Leaves acute or acuminate, coriaceous:—

Leaves entire, nerves prominent and reticulate; calyx-lobes densely fulvous-tomentose; stigma mushroom-shaped:—

Pedicels slender, of ♂ up to .5 in., of ♀ longer, in fruit 1—2 in.; leaves glabrous, elliptic or lanceolate, abruptly and obtusely acuminate at apex, slightly unequal at base, main nerves 10—12 pairs, up to 5 in. long, 2.5 in. broad; clusters about 5—6 flowers; fruit obovoid, .75—1 in. long...2. *elata*.

Pedicels short, about .25 in., tawny-villous; clusters about 3—4 flowers:—

Leaves elliptic-oblong, obtusely acute, unequal at base, up to 6 in. long, nearly 2 in. broad, main nerves about 10—15 pairs.....3. *venusta*.

Leaves lanceolate, obtusely acuminate, the point often twisted, the base slightly unequal, up to 3.5 in. long, 1.5 in. broad, main nerves about 8 pairs with fine reticulation; fruit obovoid or ellipsoid, .7 in. long, its pedicel .5 in.....4. *Wightii*.

Leaves crenate-serrate, glabrous, ovate-lanceolate, acuminate, slightly unequal at base, up to 3 in. long, 1.5 in. broad, main nerves 8—10 pairs, obscure; clusters up to 8 flowers, the pedicels slender, villous; calyx-lobes thin, ciliate; fruit ovoid, red, glabrous, .5 in. long.....5. *travancorica*.

Stamens about 24; leaves entire, ovate, obtusely and often retusely acuminate, unequal at base, minutely reticulate beneath, up to 2.5 in. long, 1.25 in. broad, main nerves 5—6; clusters about 4—6 flowers, the pedicels .25 in. long; calyx-lobes fulvous-pubescent.....6. *Porteri*.

1. *HEMICYCLIA SEPIARIA*, W. & A.; F. B. I. v. 337; Wt. Ic. t. 1872 ♂.
N. Circars, Deccan and Carnatic, in dry evergreen and semi-evergreen forests, eastwards to the drier slopes of the Ghâts.
A small evergreen tree or branching shrub. Bark grey, thin, smooth; wood white with a greyish-brown heart-wood, very hard and close-grained, like boxwood, but apparently little used except for fuel. Vern. *Tel.* Bira; *Tam.* Virai; *Kan.* Hira.
2. *HEMICYCLIA ELATA*; Bedd. Fl. t. 279; F. B. I. v. 339.
W. Ghâts, forests of the Wynaad at 2,000—4,000 ft.; Anamalais and hills of Travancore and Tinnevely.
A lofty straight glabrous tree reaching 90—100 ft. in height (Bedd.), with shining leaves, the reticulated secondary nerves not very prominent. The wood is said to be strong and suitable for building. Bourdillon likens it to box.
3. *HEMICYCLIA VENUSTA*, Thw.; F. B. I. v. 339. *Astylis venusta*, Wt. Ic. t. 1992.
W. Ghâts, W. slopes of Nilgiris in Ochterlony Valley (Wight) and on Sispara Ghât (Beddome) about 3,000—5,000 ft.
A shrub or small tree with many often drooping branches, the reticulated nervation irregular but not very prominent.
4. *HEMICYCLIA WIGHTII*, Hook. f.; F. B. I. v. 339.
W. Ghâts, Anamalai and Ayamalai Hills and hills of Travancore at 3,000—5,000 ft., in evergreen forests.
A small or moderate-sized tree reaching 40 ft. in height. Stem fluted; bark white, smooth, thin; wood pale grey, hard and

close-grained, but liable to split, used for posts. Vern. *Tam.* Vellelambu; *Mal.* Vella Kasavu.

5. *HEMICYCLIA TRAVANCORICA*, Bourd. Trav. Trees, 329.

W. Ghâts, evergreen forests of S. Travancore near Ariyankavu at 1,000 ft. (Bourdillon) in evergreen forests.

A medium-sized graceful tree. Bark pale brown, smooth; wood greyish-white, hard and close-grained. Vern. *Tam.* Vellei pillai.

6. *HEMICYCLIA PORTERI*, Gamble in Hook. Ic. t. 2701.

Carnatic, Warsanad Valley, Madura, near streams at 2,000 ft. (Ported). Cegilwood.

A small evergreen tree, the flowers larger. Bark grey, thin, peeling off in flakes; wood yellowish-white, hard and close-grained, used in building.

17. *Cyclostemon*, Blume.

Trees. *Leaves* alternate, entire or toothed, base often unequal-sided. *Flowers* dioecious, in axillary or lateral clusters, the lateral ones often on tubercles on old wood. *Sepals* 4–6, imbricate, the buds globose. *Petals* 0. *Stamens* few or many, inserted round a rather broad disk; anthers with parallel cells. *Disk* annular or saucer-shaped, sometimes with reflexed marginal lobes, often ribbed. *Ovary* 2–4-celled; ovules 2 in each cell; style short or elongate; stigmas dilated, spreading or connate and peltate. *Fruit* a subglobose ovoid or oblong indehiscent drupe, the pericarp crustaceous, endocarp granular; cocci 2–4, usually 2. *Seed* usually solitary in the cells; testa thin; albumen thick, fleshy; cotyledons broad and flat.

Flowers axillary; disk glabrous with 7–10 stamens round it; ♂ flowers in clusters, ♀ solitary, the ovary fulvous-tomentose; leaves subcoriaceous, elliptic or elliptic-oblong, obtuse or obtusely acute, up to 6 in. long, 2.5 in. broad, main nerves 12–15 pairs, reticulate between.....1. *assamicus*.
Flowers sometimes axillary, but usually in clusters on old wood:—

Disk small, fulvous-villous; stamens many:—

Flowers sessile or very nearly so, calyx fulvous-villous; drupe about 1 in. in diam.; leaves and branchlets glabrous; leaves coriaceous, oblong, abruptly acuminate at apex, entire or distantly serrate, up to 9 in. long, 3 in. broad, main nerves about 10 pairs joined by prominent reticulation...2. *macrophyllus*.
Flowers pedicelled, the pedicels .25 in. long; leaves on nerves beneath and branchlets fulvous-villous; calyx tomentose; leaves subcoriaceous oblong, abruptly obtusely acuminate at apex, entire or distantly serrate, up to 9 in. long, 3 in. broad, main nerves about 9 pairs joined by not prominent reticulation

3. *malabaricus*.

Disk large, glabrous, radiately ribbed and with inflexed marginal lobes; ♂ flowers pedicelled, ♀ nearly sessile; calyx glabrous except the ciliate margins; drupe 1.5–2 in. in diam.; leaves coriaceous, glabrous, oblong or elliptic-oblong, abruptly obtusely acuminate, entire or distantly serrate, up to 8 in. long, 3 in. broad, main nerves 8–10 pairs, reticulation prominent.....4. *confertiflorus*.

1. *CYCLOSTEMON ASSAMICUS*, Hook. f.; F. B. I. v. 342.

N. Circars, Mahendragiri Hill in Ganjam at 4,500 ft. and Palkonda Hills in Vizagapatam, at 2,000 ft. (Gamble), in most places.

A small branching evergreen tree with shining leaves and scarlet fruit .5–.75 in. long.

2. *CYCLOSTEMON MACROPHYLLUS*, Bl. ; F. B. I. v. 340 ; Bedd. Fl. t. 278.
W. Gháts, Coorg and Wynaad to the Anamalais and hills of Tinnevely and Travancore, at 2,000—4,000 ft., in evergreen forests.
A large evergreen tree with fluted stem and rough yellow fleshy fruit 1 in. in diam. Bark grey ; wood yellowish-brown, hard.
Vern. *Mal.* Mala payin.
3. *CYCLOSTEMON MALABARICUS*, Bedd. ; F. B. I. v. 341 ; Bedd. Ic. t. 183.
W. Gháts, hills of Tinnevely and Travancore, at 3,000—5,000 ft., in evergreen forests, at higher elevations than the last.
A medium-sized tree with very oblong leaves and a tomentose fruit 1 in. in diam.
4. *CYCLOSTEMON CONFERTIFLORUS*, Hook. f. ; F. B. I. v. 341.
W. Gháts, Chenat Nair Forest, Malabar (Lobo), northwards to Kanara, southwards to Travancore (Bourdillon), in evergreen forest.
A large tree with a large yellow fruit, the stigmas of the ♀ 2, large and semicircular.

18. *Sauropus*, Blume.

Shrubs or undershrubs. *Leaves* alternate, distichous, membranous, entire ; stipules minute. *Flowers* monoecious, minute, axillary, pedicelled, clustered or solitary. *Calyx* 6-lobed, ♂ disciform, urceolate or turbinate, the bases of the lobes with thickened folds sometimes reflexed ; ♀ larger and accrescent. *Petals* 0. *Disk* 0. *Stamens* 3, the filaments combined in a trigonous column, the anthers seated on the angles, the cells linear. *Ovary* ovoid or globose, 3-celled, rounded or concave at the apex ; ovules 2 in each cell ; styles 3, on the angles of the top of the ovary, the arms curved. *Fruit* a globose or depressed fleshy or coriaceous capsule, 6-valved or rupturing irregularly, with 6 trigonous crustaceous cocci. *Seeds* with fleshy albumen ; cotyledons broad, flat.

Apex of the ovary with 3 style-bearing produced angles ; leaves triangular lanceolate from a broad base, up to 5 in. long, 2 in. broad, glaucous beneath, with 6—7 main nerves ; fruit white, .5—75 in. in diam.....1. *androgynus*.
Apex of the ovary broad, the margin crenulate, the style-bearing angles widely separate:—

Calyx-lobes narrowly triangular, acute, the folds reflexed ; leaves elliptic or suborbicular, about .5—1 in. in diam., glabrous ; fruit globose, .3 in. in diam.

2. *quadrangularis*.

Calyx-lobes cuneate, retusely 2-lobed, the folds narrow ; leaves elliptic or orbicular, acute or obtuse, .5—75 in. in diam., hispid-pubescent ; fruit depressed-globose, .25 in. in diam.....3. *pubescens*.

1. *SAUROPUS ANDROGYNUS*, Merr. *S. albicans*, Bl. ; F. B. I. v. 332. *S. indicus*, Wt. Ic. t. 1952, fig. 2.

W. Gháts, from the Wynaad southwards, in evergreen forest, at 2,000—4,000 ft.

An erect shrub reaching 4 ft. in height.

2. *SAUROPUS QUADRANGULARIS*, Muell. Arg. ; F. B. I. v. 335, *Ceratogynum rhamnoides*, Wt. Ic. t. 1900 (not good).

N. Circars, in Vizagapatam and Godavari, on cultivated land (Roxb.), also in the hills; W. Gháts, in most Districts at low levels.

A small shrub, with many twiggy branchlets.

3. *SAUROPUS PUBESCENS*, Hook. f.; F. B. I. v. 335.

Hills of Vizagapatam, up to 4,000 ft. (A. W. Lushington, Barber).
A small shrub, similar to the last but pubescent. The branches are sometimes compressed and winged.

19. *Breynia*, Forst.

Shrubs or small trees. *Leaves* small, alternate, entire, petioled, often distichous. *Flowers* monoecious, minute, axillary. *Calyx* in ♂ turbinate or hemispheric, truncate, lobes 5—6, with the rounded glands of the tube behind them; in ♀ campanulate or rotate, 6-lobed, sometimes accrescent in fruit. *Petals* 0. *Disk* 0. *Stamens* 3, the filaments connate in a column, the cells linear parallel, distinct. *Ovary* globose or truncate or depressed at top, 3-celled; either styles 3 sessile or connate in a short column, or stigmas 3 sunk in the apex of the ovary. *Fruit* globose or depressed, more or less succulent, indehiscent or with a 6-valved pericarp enclosing cocci. *Seeds* with membranous testa; albumen fleshy; cotyledons broad; radicle long.

Calyx of ♀ enlarged in fruit, the fruit itself depressed-globose, orange, dehiscent, .5—75 in. in diam.; styles slender, bifid; leaves membranous, broadly elliptic, obtuse, .5—1 in. long.....1. *patens*.
Calyx of ♀ very little enlarged in fruit, the fruit globose, red, .25—5 in. in diam.; styles very short; leaves membranous, elliptic or ovate, obtuse or acute, up to 2 in. long, nearly 1 in. broad, but usually much smaller.....2. *rhamnoides*.

1. *BREYNIA PATENS*, Rolfe; F. B. I. v. 329. *Melanthesa turbinata*, Wt. Ic. t. 1897. *M. obliqua*, Wt. Ic. t. 1898, fig. 2.

Carnatic, hills of Chingleput, S. Arcot and Trichinopoly; W. Gháts, in dry forest localities at low levels up to 4,000 ft.
A shrub reaching about 4 ft. high.

2. *BREYNIA RHAMNOIDES*, Muell. Arg.; F. B. I. v. 330. *Melanthesa rhamnoides*, Wt. Ic. t. 1898, fig. 1.

N. Circars, Deccan and Carnatic, in deciduous forests, chiefly in open places; W. Gháts, Malabar and Travancore, less common.
A large shrub reaching 10 ft. in height, 20 ft. (Bourdillon).
Vern. *Tel.* Yellari; *Tam.* Manipulnati.

20. *Glochidion*, Forst.

Evergreen trees or shrubs. *Leaves* alternate, bifarious, entire, shortly petioled. *Flowers* small, monoecious or dioecious, in axillary clusters. *Calyx* in ♂ of 6 lobes, in 2 series, imbricate, spreading; in ♀ shortly tubular with 6 often unequal lobes. *Petals* 0. *Disk* 0. *Stamens* 3—8, connate by their connectives in a column, the connectives produced in usually free tips; anthers with linear cells, extrorse. *Ovary* 3—15-celled; ovules 2 in each cell; styles connate in a column lobed at the tip, the column sometimes short but usually gradually lengthening; pistillode in ♂ usually 0 or very small behind the anthers.

Fruit a capsule of 3 or more 2-valved cocci, globose or orbicular or depressed or intruded at the base and apex crowned by the often enlarged style; the cocci crustaceous or coriaceous, the epicarp separable or not. *Seeds* hemispheric or laterally compressed; testa crustaceous; albumen fleshy; cotyledons flat.

Anthers 4 or more:—

Style a broad shallow cone hollowed at the apex, pubescent at base without; leaves coriaceous, orbicular, obtuse, 2—3 in. in diam.....1. *littorale*.

Style conical, cleft at the tip; flowers in shortly peduncled umbels or fascicles; fruit globose, sometimes beaked; stipules falcate, acuminate:—

Leaves beneath and branches and inflorescence finely grey-pubescent; leaves elliptic or ovate-oblong, shortly acute at apex, unequal and often subcordate at base, up to 6 in. long, 3 in. broad, main nerves 6—8 pairs; style pubescent; capsules 2—3 in. long, conical, beaked.....2. *tormentosum*.

Leaves and branches and inflorescence glabrous; leaves ovate lanceolate or oblong, shortly acute at apex, unequal and rounded or cordate at base, up to 8 in. long, 3 in. broad, main nerves 8—12 pairs; style glabrous; capsules 3—4 in. long, often beaked, later depressed.....3. *zeylanicum*.

Anthers 3:—

Branchlets, inflorescence and leaves more or less pubescent:—

All parts prominently velvety pubescent; leaves elliptic ovate or lanceolate, obtuse or subacute, 2—5 in. long, 1—2 in. broad (larger in shoots), main nerves 6—8 pairs; stamen connective acute at apex; style cylindric, villous, 4—6-lobed; capsules 3—5 in. in diam., depressed, the seeds red.....4. *velutinum*.

Branchlets, inflorescence and leaf midribs tawny, crispate pubescent; leaves subcoriaceous, ovate, obtusely acuminate at apex, narrowed at base, with 5—6 very oblique prominent nerves, up to 4 in. long, 1.5 in. broad; style columnar, elongate; capsule 6-lobed, depressed at apex, crowned by the style-column.....5. *arboresum*.

Branchlets and inflorescence softly fulvous-tomentose, the leaves beneath sparsely pubescent; leaves oblong, obtuse or obtusely acuminate, 4—5 in. long, 1.25 in. broad, main nerves 6—8 pairs, arched; style short, depressed globose; capsule 6-lobed, smooth, .25 in. diam.....6. *johnstoni*.

Branchlets slender, fulvous-puberulous; leaves chartaceous, ovate or ovate-oblong, acuminate at apex, narrowed or obtuse and equal at base, glabrous, main nerves 6—8 pairs, up to 6.5 in. long, 2 in. broad; style thick, elongate and widening upwards with triangular lobes.....7. *siparense*.

Branchlets slender, sparsely puberulous; leaves chartaceous, lanceolate, acuminate, unequal at base, glabrous, reticulate; main nerves 8—10 pairs, up to 5 in. long, 1.5 in. broad; style thick, widening upwards; capsule glabrous, .5 in. broad, tipped by the slender columnar style.....8. *pauciflorum*.

Branchlets and leaves glabrous, sometimes the flowers only very slightly puberulous:—

Leaves chartaceous, elliptic or oblong, obtuse or acute, the base unequal, reticulate, main nerves 6—8 pairs, up to 4 in. long, 1—1.25 in. broad; style very stout, short, truncate; capsule .4 in. broad, tipped with the short thick style.....9. *neilgherrense*.

Leaves submembranous, ovate, ovate-lanceolate or ovate-oblong, obtuse or shortly acuminate, reticulate, main nerves 6—8 pairs, up to 4 in. long, 1.5 in. broad; style very short, widening at the lobes; capsule .4 in. broad, tipped with the short thick style.....10. *fagifolium*.

Leaves lanceolate or oblong-lanceolate, acuminate at both ends, rather unequal at base, up to 5 in. long, 1.5 in. broad; style conical.....11. *ellipticum*.

Leaves chartaceous, elliptic or elliptic-oblong, abruptly acuminate at apex, acute or obtuse at base, main nerves 7—10, prominent, up to 5 in. long, 2 in. broad; style very small, conical; capsule .3 in. in diam., depressed.....12. *malabaricum*.

Leaves ovate or obovate, shortly acute at apex, unequal at base, main nerves 5—6 pairs, reticulation prominent, up to 4 in. long, 1.5 in. broad; style columnar eventually.....13. *Bourdillonii*.

1. *GLOCHIDION LITTORALE*, Blume; F. B. I. v. 308.
W. Coast, Malabar (Beddome, Wight).
A small tree.
2. *GLOCHIDION TOMENTOSUM*, Dalz.; F. B. I. v. 309.
W. Gháts in S. Canara, Coorg, Mysore, more scarce in Malabar and Travancore, up to 4,000 ft., in grass land.
A small tree with rather large leaves and somewhat angular branchlets, the stipules generally erect.
3. *GLOCHIDION ZEYLANICUM*, A. Juss.; F. B. I. v. 310.
N. Circars, hills of Godavari; Carnatic, Kambakam Hills in Chingleput; W. Gháts, from Mysore southwards, in evergreen forests up to 3,000 ft., common along streams and in swampy places (Bourdillon).
A small tree, reaching 30 ft. in height, the flowers yellow, the capsules orange, the stipules reflexed. As also with *G. tomentosum*, the old leaves when dry are whitish above, almost bullate and very brittle. The variety *G. canaranum*, Miq. (Hohenacker), has rather smaller leaves and a round, prominently-beaked capsule.
4. *GLOCHIDION VELUTINUM*, Wt. Ic. t. 1907, fig. 2; F. B. I. v. 322.
N. Circars, Ganjam to Godavari, up to 4,500 ft. on Mahendragiri (Fischer and Gage); Carnatic, Shevaroy Hills of Salem (Perrottet); W. Gháts, Nilgiris, Anamalais, Pulneys and hills of Travancore, up to 6,000 ft.
A small tree. Bark brown, rough; wood red, hard, not used.
5. *GLOCHIDION ARBOREUM*, Wt. Ic. t. 1907, fig. 1; F. B. I. v. 316.
W. Gháts, Sivagiri Hills of Tinnevely.
A small tree, the inflorescence branchlets zigzag, the ♀ pedicels elongate in fruit.
6. *GLOCHIDION JOHNSTONEI*, Hook. f.; F. B. I. v. 314.
W. Coast and W. Gháts, in Cochin (Johnstone); Mysore, at 2,000 ft. (Meebold).
Apparently a small tree with long angular branchlets.
7. *GLOCHIDION SISPARENSE*, Gamble, n. comb. *G. arboreum*; Hook. f.; F. B. I. v. 316 in part, not of Wt.
W. Gháts, Sispara in Nilgiris at 5,000 ft. (Wight, Lawson, Gamble).
A tree with glabrous leaves and few and distant flowers, the lobed calyx pubescent.
8. *GLOCHIDION PAUCIFLORUM*, Gamble, n. comb. *G. arboreum* var. *pauciflorum*, Hook. f. in Hb. Kew.
W. Gháts, Sholas of the Nilgiri and Pulney Hills, about 5,000—7,000 ft.
A rather common tree, very near the last and also with few-flowered clusters, but with narrower more reticulate leaves and large capsule, the leaves nearly black when dry.
9. *GLOCHIDION NEILGHERRENSE*, Wt. Ic. ii. 29; F. B. I. v. 316; Bedd. Fl. t. 277.
W. Gháts, Nilgiri Hills above 5,000 ft. in Shola forests, common; hills of N. Coimbatore.

A moderate-sized tree with many-flowered clusters in zigzag branches, the leaves usually black when dry or the upper side greenish. Bark reddish-brown, thin, peeling off in flakes; wood red, moderately hard. Vern. *Badaga* Hanikay.

10. *GLOCHIDION FAGIFOLIUM*, Hook. f.; F. B. I. v. 312.

W. Ghâts, Nilgiris, in Shola forests on the downs about 7,000 ft. A tree, the thin leaves prominently reticulate and often greenish-brown when dry.

11. *GLOCHIDION ELLIPTICUM*, Wt. Ic. t. 1906; F. B. I. v. 321 *G. Hohenackeri*, Bedd.; F. B. I. v. 314.

W. Ghâts, all Districts, in evergreen forests, up to about 4,000 ft. A moderate-sized tree.

Var. *Ralphii*. *G. Ralphii*, Hook. f.; F. B. I. v. 314. Branchlets very slender; leaves smaller, scarcely 2·5 in. long, ·75 in. broad; flowers, especially ♀, very small. S. Tinnevely, at 3,500 ft. (Beddome).

12. *GLOCHIDION MALABARICUM*, Bedd.; F. B. I. v. 319.

W. Ghâts, Coorg to Travancore, at low levels; Pulney Hills (?) (Bourne).

A small tree, the leaves with prominent curved and arching nerves.

13. *GLOCHIDION BOURDILLONII*, Gamble in Kew Bull. 1925, 330. *G. rigidum*, Bourd. Trav. Trees 334.

W. Ghâts, evergreen forests at low levels up to 4,000 ft., in ravines and near streams (Bourdillon).

A small evergreen tree, the leaves reticulate.

21. *Aporosa*, Blume.

Trees. *Leaves* alternate, entire or rarely sinuate-toothed; stipules small. *Flowers* dioecious, ♂ minute, in axillary solitary or clustered catkin-like spikes, ♀ in short bracteate spikes. *Calyx*-lobes 3–6, usually 4, membranous, the ♀ larger than in ♂. *Petals* 0. *Stamens* 1–5, central; filaments capillary, anthers didymous. *Disk* 0. *Ovary* 2-, rarely 3-celled; ovules 2 in each cell; stigmas small, plumose, spreading and recurved; pistillode in ♂ minute or 0. *Fruit* an ellipsoid ovoid or globose capsule, opening irregularly or partially 2–4-valved; epicarp thin or thick and spongy or fleshy, endocarp thin, often separable; cells glabrous or hairy within. *Seeds* oblong or suborbicular, usually plano-convex; albumen fleshy; cotyledons broad, flat.

Capsule smooth or rugose when dry, glabrous or hairy:—

Capsule glabrous:—

Capsule globose, pedicelled, ·4 in. in diam.; ♂ catkins up to 2 in. long; leaves elliptic-oblong, acuminate, rounded or acute at base, up to 7 in. long, 3 in. broad.

1. *Lindleyana*.

Capsule fusiform, beaked, up to ·75 in. long, ♂ catkins stout, up to 1 in. long; leaves obovate or orbicular, obtuse or retuse, cuneate at base, up to 5 in. long, 3 in. broad.

2. *fusiformis*.

Capsule sparsely villous, ovoid, ·5 in. long; ♂ catkins very short scarcely ·5 in. long; leaves lanceolate, caudate acuminate, acute at base, up to 4 in. long, 1·5 in. broad.

3. *acuminata*.

Capsule ovoid, covered with long soft processes and rugose, beaked, up to 1 in. long; ♂ catkins ·75 in. long, prominently bracteate; leaves oblong, long and often caudately acuminate, rounded at base, pubescent on the nerves, up to 6 in. long, 2 in. broad.

4. *Bourdillonii*.

1. *APOROSA LINDLEYANA*, Baill ; F. B. I. v. 349 ; Bedd. Fl. t. 286. *Scepa Lindleyana*, Wt. Ic. t. 361.
W. Gháts, from S. Canara and Mysore to Annamalais and Travancore Hills, in ever green forests up to 3,000 ft.
A small or medium-sized evergreen tree with coriaceous leaves. Bark brown, smooth ; wood brown, rough, said to be useful. Vern. *Kan.* Sulla, sali ; *Tam.* Vittil ; *Mal.* Vetti.
2. *APOROSA FUSIFORMIS*, Thw. ; F. B. I. v. 351.
W. Gháts, hills of Travancore, in evergreen forest at 2,000—3,000 ft. (Bourdillon).
A small tree with very coriaceous leaves in Ceylon, rather less so in Madras.
3. *APOROSA ACUMINATA*, Thw. ; F. B. I. v. 348.
W. Gháts, Anamalais and hills of Travancore, in evergreen forests up to 3,000 ft.
A small tree, sometimes a shrub.
4. *APOROSA BOURDILLONII*, Stapf in Hook. Ic. t. 2204.
W. Gháts, evergreen forests of N. Travancore at low levels (Bourdillon).
A small tree, reaching 25 ft. in height.

22. *Baccaurea*, Lour.

Trees. *Leaves* alternate, entire or rarely crenate-serrate, penninerved, stipules caducous. *Flowers* dioecious, rarely monoecious, in simple or compound spikes or racemes. *Calyx*-lobes, 4—5, usually unequal, imbricate. *Petals* 0. *Stamens* 4—8 ; filaments short, free ; anthers small, didymous. *Disk* 0. *Ovary* ovoid or globose, 2—5-celled ; ovules 2 in each cell ; stigmas 2—5, small, sessile, free or connate in a short style ; pistillode in ♂ flowers pubescent, orbicular, sessile or stipitate. *Fruit* an ovoid globose obovoid or fusiform 2—4-celled capsule, late dehiscent ; pericarp thick or thin, coriaceous, crustaceous, or woody. *Seeds* broad, compressed ; testa with a thick aril-like covering ; albumen hard or fleshy ; cotyledons flat.

BACCAUREA COURTALENSIS, Muell. Arg. ; F. B. I. v. 367. *B. sapida*, Bedd. Fl. t. 280. *Pierardia macrostachys*, Wt. Ic. tt. 1912, 1913.

W. Gháts, from S. Canara southwards, in evergreen forest, up to 3,000 ft.

An evergreen tree remarkable for the flowers growing in long racemose spikes, in tufts on tubercles on the stems and branches, often "in great profusion, the whole trunk appearing as a crimson mass (Bedd.)." *Leaves* oblanceolate, acuminate, up to 7 in. long, 3 in. broad. *Fruit* crimson, about 1 in. in diam., edible. *Bark* pale brown, rough ; *wood* yellowish-white. Vern. *Kan.* Koli kuki ; *Mal.* Mutta Thuri.

23. *Daphniphyllum*, Blume.

Trees, branches stout, the leaves near the tops. *Leaves* alternate, entire, long-petioled, usually glaucous beneath. *Flowers* dioecious, sometimes monoecious in axillary racemes. *Calyx*-lobes 3—8, small. *Petals* 0.

Stamens 5—12, free; anthers large, the cells parallel, dehiscing laterally, connective apiculate. *Disk* 0. *Ovary* imperfectly 2-celled; ovules 2 in each cell; stigmas thick, recurved, undivided; pistillode in ♂ 0. *Fruit* an ovoid or oblong drupe, the pericarp woody. *Seed* solitary; testa membranous; albumen copious fleshy; embryo small, the cotyledons narrow.

DAPHNIPHYLLUM NEILGHERRENSE, Rosenth. *D. glaucescens*, Muell. Arg., not of Bl.; F. B. I. v. 353. *D. Roxburghii*, Baill.; Bedd. Fl. t. 288. *Goughia neilgherrensis*, Wt. Ic. tt. 1878, 1879.

W. Ghâts, Shola forests of the Nilgiris and southwards, above 5,000 ft.; Bababudan Hills of Mysore.

A medium-sized evergreen tree with elliptic or obovate-oblong obtuse leaves, usually glaucous beneath, reaching 5 in. by 3 in., the petioles 2 in., the drupe 5 in. long, greenish-red. Bark brown, somewhat corky; wood grey, even-grained, only used as fuel. Vern. *Badaga* Nir kocki; Nir chappay.

24. *Putranjiva*, Wall.

Trees. *Leaves* alternate, evergreen, entire or serrulate, reticulate. *Flowers* monoecious or dioecious, axillary ♂ in clusters, ♀ subsolitary. *Calyx-lobes* 3—6, imbricate. *Petals* 0. *Stamens* 2—4 in the centre of the flower, filaments free or connate; anthers erect, the cells parallel. *Disk* 0. *Ovary* ovoid, 2—3-celled; ovules 2 in each cell; styles 2—3, spreading, dilated into broad fleshy stigmas. *Fruit* an ovoid or globose drupe with hard endocarp. *Seed* solitary, ovoid; testa crustaceous; albumen fleshy; cotyledons obovate, cordate, flat.

PUTRANJIVA ROXBURGHII, Wall.: F. B. I. v. 336; Wt. Ic. t. 1876; Bedd. Fl. t. 275; Brand. For. Fl. t. 53.

N. Circars, Deccan and Carnatic, also in suitable places in Malabar, usually on river banks and in shady valleys, up to about 2,000 ft. A moderate-sized evergreen tree with coriaceous, elliptic-oblong, serrulate leaves up to 4 in. long, 1.5 in. broad. Bark dark grey with horizontal lenticels; wood grey, moderately hard, close-grained, useful for small purposes. The nuts are strung in necklaces and rosaries. Vern. *Hind.* Jia puta, putranjiva; *Ur.* Paishandia; *Tel.* Kadrajuvi; *Tam.* Karupala.

25. *Mischodon*, Thw.

Tree. *Leaves* whorled, coriaceous, entire, penninerved. *Flowers* dioecious, in axillary panicles, the ♀ elongating in fruit. *Calyx-lobes* 5—8, usually 6, imbricate, often unequal. *Stamens* usually 6, exserted, the filaments free, villous, as are the anthers, which dehisce longitudinally. *Disk* in ♂ 0, in ♀ annular. *Ovary* 3—4-celled; ovules 2 in each cell; stigmas 3—4, large, sessile, flat; pistillode in ♂ 3-lobed. *Fruit* a capsule of 3 2-valved cocci. *Seeds* 1—2 in each coccus, testa crustaceous, shining; albumen fleshy; cotyledons broad, flat.

MISCHODON ZEYLANICUS, Thw.; F. B. I. v. 344; Bedd. Fl. r. 290.

W. Ghâts, Anamalai Hills (Beddome), hills of Tinnevely; common in Ceylon.

A large tree with bluntly tetragonous branchlets, and linear-oblong leaves reaching 8 in. long and 2·5 in. broad, but usually narrower, the young ones bright red. The capsules are large, 75 in. in diam. Trimen says the timber is excellent. Vern. *Tam.* Tampanai.

26. *Bischofia*, Blume.

Large tree. *Leaves* alternate, 3-foliolate, often crenate. *Flowers* dioecious, minute, in axillary or lateral paniced racemes; ♂ scattered or clustered, ♀ scattered longer-pedicellate. *Calyx*-lobes 5, ♀ concave, obtuse, enclosing the anthers but later reflexed, ♀ ovate, caducous. *Petals* 0. *Stamens* 5, filaments short, anthers large with parallel cells; staminodes in ♀ small or 0. *Disk* 0. *Ovary* 3—4-celled; ovules 2 in each cell; styles long, linear, stigmatic on the inner face; pistillode in ♂ a flat disk on short stalk. *Fruit* a globose fleshy berry with 3—4-cells lined with a parchment-like 2-valved endocarp. *Seeds* oblong-trigonus; testa crustaceous; albumen fleshy; cotyledons flat, ovate.

BISCHOFIA JAVANICA, Bl.; F. B. I. v. 344; Bedd. Fl. t. 259. *Microchus Roeperianus* W. & A.; Wt. Ic. t. 1880.

N. Circars, Deccan and Carnatic, in hilly country, in ravines up to 4,000 ft., W. Gháts, in evergreen forests, in all Districts.

A large deciduous tree, the large leaflets elliptic-ovate crenate up to 5 in. long. Bark rough, brown; wood red, smooth, moderately hard, useful for planking and other purposes. Vern. *Hind.* Kein; *Tam.* Thondi, Milachityan; *Mal.* Thirippu, nira.

27. *Croton*, Linn.

Trees or shrubs, rarely herbs. *Leaves* alternate, rarely opposite or whorled, usually 2-glandular at the base; stipules linear. *Flowers* usually monoecious, solitary or clustered on the rhachis of a terminal raceme; bracts small. *Calyx* 5- (rarely 4- or 6-) partite, the lobes imbricate or valvate. *Petals* 5 (rarely 4 or 6), in ♂ usually smaller than the calyx-lobes, in ♀ very small or 0. *Disk* annular or of glands opposite the calyx-lobes. *Stamens* many, inserted on the villous receptacle; filaments free, inflexed in bud, then erect; anther-cells parallel. *Ovary* 3- (rarely 2—4-) celled; ovule solitary in each cell; styles long, 2—4-cleft, slender; pistillode in ♂ 0. *Fruit* a capsule 3-valved or of 3 deciduous 2-valved cocci. *Seeds* 3, smooth, carunculate; testa crustaceous; albumen copious; cotyledons flat.

Ovary covered with stellate scales or tomentum:—

Inflorescence scaly:—

Leaves covered on under-surface, often also above, with stellate silvery or yellowish scales:—

Leaves entire:—

Leaves elliptic-, ovate-, or linear-lanceolate, long-acuminate, shortly triple-ribbed, up to 8 in. long, 2·5 in. broad; petiole up to 1·5 in. long; stamens many, filaments glabrous; capsule 5 in. long.....1. *reticulatus*.

Leaves ovate or rhombic-ovate, acuminate, cuneate at base; up to 6 in. long, 3 in. broad, petiole to 5 in. long; stamens 10—12, filaments villous; capsule about 1 in. long.....2. *malabaricus*.

Leaves crenate, ovate or orbicular, obtuse or slightly acute, cordate at base, tawny or silvery scaly on both surfaces, 3—5 ribbed, up to 4·5 in. long, 3 in. broad, petiole up to 1 in.; stamens 10—12, filaments glabrous; capsule to 5 in. long.....3. *scabrosus*.

Leaves glabrous when old, scaly when quite young, oblong-lanceolate, acute, narrowed at base, crenate-serrate, up to 10 in. long, 3.5 in. broad, petiole to 2 in.; stamens 12, filaments villous below; capsule about .25 in. long.

4. *oblongifolius*.

Inflorescence stellate-tomentose; leaves 3—5-ribbed at base, base and margin with stalked glands:—

Capsule under .5 in. long, subglobose:—

Leaves membranous, broadly ovate or orbicular, cordate, crenulate and glandular, nearly glabrous, but scaly on the nerves beneath, up to 4.5 in. long, 3 in. broad, petiole to 6.5 in., tawny-tomentose, racemes slender, the flowers mostly solitary, stamens about 30.....5. *aromaticus*.

Leaves chartaceous, ovate or lanceolate, acuminate, rounded at base, subentire, fulvous stellate-tomentose beneath, up to 6 in. long, 2.5 in. broad, petiole to 2 in.; racemes elongate, stamens about 20.....6. *lacciferus*.

Capsule .75—1 in. long, globose or oblong; leaves ovate or orbicular cordate, acute or acuminate, irregularly crenate-serrate, scabrous above, stellate-tomentose beneath, up to about 4 in. diam.; racemes slender, flowers in fascicles.

7. *caudatus*.

Inflorescence glabrous or nearly so; leaves 3—5-ribbed at base:—

Side ribs of leaves inconspicuous; leaves membranous, elliptic-ovate or oblong, acute, stellate-hairy only when quite young, entire or serrulate, up to 3.5 in. long, 1.5 in. broad, petiole to 1 in.; racemes slender, to 3 in. long; capsule .25 in. in diam., nearly glabrous, smooth.....8. *Klotzschianus*.

Side ribs of leaves prominent; leaves membranous, ovate, acuminate serrate, glabrous, up to 6 in. long, 3 in. broad, petiole to 2 in.; racemes 3 in. long; capsule .75—1 in., obovoid, smooth.....*Tiglitum*.

Ovary glabrous; sepals much enlarged in fruit; leaves chartaceous, prominently 3—5-ribbed at base, ovate, long-acuminate, glabrous when old, up to 5 in. long, 2 in. broad; racemes short; capsule .7 in. in diam., rugose, glabrous.

9. *Lawianus*.

1. *CROTON RETICULATUS*, Heyne; F. B. I. v. 386; Bedd. Ic. t. 233.
W. Gháts, S. Canara to the Anamalais and Travancore and Tinnevely Hills, in evergreen forests at 3,000—5,000 ft.
A shrub or small tree, the leaves with stalked glands at their base. Vern. *Mar.* Panduray.
2. *CROTON MALABARICUS*, Bedd. Ic. t. 181; F. B. I. v. 386.
W. Gháts in all Western Districts, in evergreen forests at 3,000—4,000 ft.
A medium-sized tree reaching 30 or even 60 ft. in height, the glands sessile, obscure. Vern. *Tam.* Thavatta polavu; *Mal.* Kóla Vacchi.
3. *CROTON SCABIOSUS*, Bedd. Fl. t. 283; F. B. I. v. 386.
Deccan, on dry stony hills in Cuddapah and Kurnool at 1,000—4,000 ft.
A small, often gregarious tree, the leaf-glands sessile. Bark dark brown, rough; wood yellowish white, hard and close-grained. Vern. *Tel.* Yerri chillā.
4. *CROTON OBLONGIFOLIUS*, Roxb.; F. B. I. v. 386.
N. Circars and Deccan, very scarce; W. Gháts, S. Canara to Nilgiris, in rather dry forests, not common, but usually in scrub near villages.
A small or medium-sized, deciduous, often gregarious tree, the leaves turning red before falling. Bark grey or brownish; wood yellowish white, moderately hard. Vern. *Tel.* Bhutankusam; *Tam.* Millakumari.

5. *CROTON AROMATICUS*, Linn.; F. B. I. v. 338 *in part*.
Carnatic? (Wight)—Mission Garden, Tranquebar (Wall. Cat. 7773c). A shrub with thin leaves, the capsule 3 in. in diam., glabrous except for scabrid hairs.
6. *CROTON LACCIFERUS*, Linn.; Wt. Ic. t. 1915. *C. aromaticus*, Linn.; F. B. I. v. 338 *in part*.
W. Gháts, in rather dry open and Shola forests of the Nilgiris, Anamalais and hills of Travancore and Tinnevely, usually at 4,000—7,000 ft., sometimes lower; Kollimalai Hills of Trichinopoly; Babubudan Hills of Mysore.
A shrub or small tree, slightly aromatic, the leaves turning red before falling, the capsule very scabrid, 4—5 in. in diam. Vern. *Tam. Teppaddi*.
7. *CROTON CAUDATUS*, Geisel; F. B. I. v. 388.
W. Gháts, Wynaad, Anamalais and hills of S. Travancore, up to 3,000 ft., scarce and usually near streams.
A subscandent shrub with long branchlets and large thick-shelled capsules.
8. *CROTON KLOTZSCHIANUS*, Thw.; F. B. I. v. 392. *Tigilium Klotzschianum*, Wt. Ic. t. 1914.
Carnatic, Kambakam Hills of Chingleput; Deccan, hills of Cuddapah and Kurnool, in dry evergreen forest; W. Gháts, hills of Tinnevely at 1,000—3,000 ft. on E. side.
A shrub or small tree, most usually straggling among other bushes.
9. *CROTON LAWIANUS*, Nimmo; F. B. I. v. 394.
Babubudan Hills of Mysore (Law).
A small tree with slender branches.

C. Tigilium, Linn. (Vern. *Hind. Jaipal*; *Tam. Nirvalam*) is a North Indian small tree, frequently found in cultivation in the Madras plains. It is the source of the powerful medicine Croton oil. *C. sparsiflorus*, Morong, is an introduced American weed, which, having first arrived in Bengal (Burkill in 'As. Soc. Pro.', 1910), has now wandered south along the Coromandel Coast even to Tinnevely (Rangachari).

28. *Chrozophora*, Neck.

Coarse herbs, less often undershrubs, usually clothed with stellate tomentum. *Leaves* alternate, petioled, sinuate-toothed or -lobed, plicate, rugose or bullate or nearly flat, often biglandular at the apex of the petiole. *Flowers* monoecious, in short dense racemes in the upper leaf-axils, the ♂ crowded near the top, subsessile, the ♀ below, pedicelled. *Calyx* 5-lobed, in the ♂ closed in bud, afterwards spreading, in the ♀ much narrower, nearly setaceous. *Petals* 5, alternate with and like the calyx-lobes, but smaller. *Disk* of 5 glands alternate with the petals. *Stamens* 5—15, the filaments connate, at least below, in a column; anther-cells oblong, parallel. *Ovary* 3-celled; ovule 1 in each cell; styles 3, each bifid; pistillode in ♂ 0. *Fruit* a 3-lobed capsule of 3 hispid tomentose or scaly 2-valved cocci. *Seeds* without caruncle, globose; testa shining; albumen fleshy; cotyledons flat.

Stems prostrate; racemes short; capsules 1—2 in. in diam., nearly black with grey stellate tomentum, not tinctorial:—

Leaves not glandular at base, ovate or suborbicular, 5—1 in. in diam., usually strongly wrinkled and bullate, the large stellate hairs stalked; anthers short, under 1 in. long.....1. *prostrata*.
Leaves 2-glandular at base, ovate or lanceolate, 1 to nearly 2 in. long, only slightly bullate, the stellate hairs sessile; anthers longer, about 1 in. long.

2. *parvifolia*.

Stems erect; racemes elongate; capsules 3 in. in diam., reddish, with dense stellate tomentum, tinctorial when wetted; leaves broadly ovate-orbicular, 3-lobed, undulate crenate, with sessile stellate hairs, 2—4 in. in diam., petiole to 2 in.; anthers over 1 in. long.....3. *Rotleri*.

1. *CHROZOPHORA PROSTRATA*, Dalz.; Prain in Kew Bull. 1918, 90. *C. plicata* 3; F. B. I. v. 410.

N. Circars and Carnatic in damp places as on the edge of rivers and tanks and dried-up irrigated fields.

An annual herb with prostrate branches, yellow petals, orange stigmas and capsules not giving a colour when wetted.

2. *CHROZOPHORA PARVIFOLIA*, Klotzsch; Prain l.c. 91. *C. plicata* 2; F. B. I. v. 410.

N. Circars, banks of the Godavari (Barber); Carnatic, near Madras; Deccan, in Anantapur (Gamble).

A prostrate herb with rather thin leaves.

3. *CHROZOPHORA ROTTLEI*, Klotzsch; Prain l.c. 95. *C. plicata* 1; F. B. I. v. 410.

N. Circars, Deccan and Carnatic, West to the E. slopes of the Ghâts, in dry places, and on road-sides.

An erect herb or undershrub with large leaves, yellow petals and red stigmas, the capsules giving a blue colour when wetted.

29. *Agrostistachys*, Dalz.

Shrubs or small trees. *Leaves* alternate, entire or serrate, pinninerved. *Flowers* dioecious, in axillary or supra-axillary bracteate racemes or spikes, ♂ solitary or clustered within the bract, ♀ solitary. *Calyx* globose, splitting into 2—5 valvate lobes. *Petals* usually 5, shorter than the calyx-lobes in ♂, longer in ♀ but caducous. *Disk* large, of 5 glands alternate with the petals. *Stamens* 8—13 on a convex receptacle, filaments nearly free; anthers versatile, the cells pendulous from a thickened connective. *Ovary* 3-celled; ovule 1 in each cell; styles short, thick, spreading; pistillode in ♂ usually large. *Fruit* a capsule, of 3 2-valved cocci. *Seeds* globose; testa crustaceous; albumen fleshy; cotyledons flat.

Leaves strongly serrate, elliptic-oblong or lanceolate, acute at both ends, up to 15 in. long, 4 in. broad; ♂ racemes small, catkin-like, in axillary clusters; ♀ flowers solitary; stamens clustered within the disk.....1. *indica*.
Leaves entire, oblanceolate, very coriaceous, up to 15 in. long; flowers in elongate spiciform racemes; stamens 10, 5 within the disk, 5 outside it; capsule 5 in. broad.....2. *Meeboldii*.

1. *ACROSTISTACHIYS INDICA*, Dalz.; F. B. I. v. 406; Bedd. Ic. t. 241.

W. Ghâts, in evergreen forests in all districts, up to 6,000 ft., usually on the banks of streams.

A shrub or small tree.

2. *AGROSTISTACHYS MEEBOLDII*, Pax and K. Hoffm., in Engl. Pflzreich. iv. 147, vi. 100. *A. longifolia*, Benth.; F. B. I. v. 407 in part. *Sarcoclinium longifolium*, Wt. Ic. tt. 1887, 1888.

W. Ghâts, in Wynaad, Anamalais and hills of Travancore and Tinnevely, in evergreen forest at 2,000—5,000 ft.

A small tree with large thick leaves. Bark thin, dark; wood pale brown, moderately hard, not durable. Vern. *Tam.* Man charei; *Mal.* Mulimpala.

30. *Aleurites*, Forst.

Trees, often stellately pubescent or lepidote. *Leaves* alternate, long-petioled, entire or lobed, digitately 3—7-nerved at the base; petiole 2-glandular at apex. *Flowers* monoecious or subdioecious, in lax terminal paniced cymes. *Calyx* subglobose in bud, bursting irregularly into 2—3 valvate lobes. *Petals* 5, elongate and conspicuous. *Stamens* many, on a conical receptacle, the outer 5 alternating with the small disk-glands; filaments free; anthers erect, adnate, the cells parallel. *Disk* of 5 small glands, obscure in ♀. *Ovary* 2—5-celled; ovule solitary in each cell; styles with 2 stout linear arms. *Fruit* a large drupe with a hard, 1—5-celled stone. *Seed* with a thick woody testa; albumen thick, hard; cotyledons broad, flat.

ALEURITES MOLUCCANA, Willd.; F. B. I. v. 384; Bedd. Fl. t. 276.

Introduced from Malaya, now found run wild in some places, especially the Wynaad; often planted. Belgaum Walnut. A handsome tree with large long-petioled leaves of various shapes, chiefly deltoid or rhomboid and often 3—7-lobed. The flowers are in large tomentose cymes with white petals and the drupe is fleshy, ovoid, pointed, giving edible kernels full of a drying oil.

31. *Trewia*, Linn.

Trees. *Leaves* opposite, entire, broadly ovate or orbicular; 3—5-ribbed at base. *Flowers* dioecious, appearing before the leaves, ♂ in drooping racemes, ♀ long-peduncled, solitary or racemose. *Calyx* in ♂ globose in bud, then splitting into 3—4 concave, often reflexed, imbricate lobes; in ♀ of 3—5 imbricate caducous lobes. *Petals* 0. *Disk* 0. *Ovary* 2—4-celled; ovule 1 in each cell; styles 3—5, connate below, very long, papillose. *Fruit* a 2—4-celled drupe, indehiscent or sometimes dehiscent, with usually fleshy pericarp and crustaceous endocarp. *Seeds* ovoid; testa hard; albumen fleshy; cotyledons broad, flat.

End branchlets usually cottony-tomentose; leaves cordate at base, rarely truncate; racemes in ♂ long, in ♀ with few flowers, usually 1 only; drupe with thick pericarp, indehiscent 1—1.5 in. in diam. 1. *nudiflora*. End branchlets usually glabrous; leaves truncate at base, rarely slightly cordate, sometimes slightly cuneate; racemes in ♂ short, in ♀ many-flowered; drupe with thin loculicidally dehiscing pericarp, about .5 in. in diam. 2. *polycarpa*.

1. *TREWIA NUDIFLORA*, Linn.; F. B. I. v. 423; Wt. Ic. t. 1870 ♂.

N. Circars, up to 3,000 ft. in the hills, and chiefly in wet places and along streams, rare elsewhere, and perhaps usually only cultivated.

A deciduous tree with large leaves rather like those of *Gmelina arborea*. Bark smooth, grey; wood white, soft, used for drums and for the carved images in Roman Catholic Churches (Bourdillon). Vern. *Hind.* Gambhar; *Ur.* Mondu.

2. *TREWIA POLYCARPA*, Benth.; F. B. I. v. 424. *T. nudiflora*, Wt. Ic. t. 1871 ♀; Bedd. Fl. t. 281.

W. Coast and W. Ghâts, in Malabar and Travancore, at low levels, in wet places and along streams.

A tree reaching 50 ft. in height, with white wood, used as that of the former species. Vern. *Tam.* Ana thuvarci; *Mal.* Pambara Kumbil.

32. *Mallotus*, Lour.

Trees or shrubs. *Leaves* opposite or alternate, entire toothed or lobed, 3–7-ribbed or penninerved, sometimes peltate, often gland-dotted beneath, sometimes with glandular areas near the base above; stipules often present. *Flowers* dioecious or monoecious, in axillary or terminal simple or branched spikes or racemes, bracteate. *Calyx* in ♂ at first globose or ovoid, later separating into 3–5 valvate lobes; in ♀ spathaceous or valvately 3–5-lobed. *Petals* 0. *Disk* 0. *Stamens* 20–30 or more, central filaments free; anthers parallel, separated by a wide connective. *Ovary* 2–4-celled; ovule 1 in each cell; styles free or connate below, above spreading and plumose or papillose; pistillode in ♂ 0. *Fruit* a capsule of 2–3 cocci, each 2-valved, smooth, tubercled or echinate with hard or soft spines, usually very glandular. *Seed* ovoid or globose; testa crustaceous; albumen fleshy; cotyledons flat.

Leaves nearly or quite as broad as long, usually deltoid, ribbed from the base:—

Climbing or straggling shrub; leaves broadly deltoid-ovate, entire or sinuate, 3-ribbed, about 3 in. long, softly stellate-pubescent and glandular; capsules 2-valved, fulvous-tomentose, .5 in. in diam.; seeds black.....1. *repandus*. Tree with thick grey or tawny tomentose branches; leaves narrowly (broadly when young) peltate, broadly ovate, orbicular or deltoid, entire or shortly lobed, 3–5-ribbed, up to 10 in. in diam., densely white or fulvous stellate-tomentose; capsules 3–4-valved, .5 in. in diam., echinate with soft woolly spines and fulvous-tomentose; seeds black.....2. *albus*.

Leaves longer than broad:—

Leaves 3-ribbed at the base, very narrowly or not peltate:—

Leaves opposite, the petioles of the pairs unequal in length, ovate, acuminate, reticulate, entire or slightly sinuate, up to 10 in. long, 5 in. broad, pale when dry, and not glandular beneath; capsule 3-valved, .5 in. in diam., fulvous stellate-tomentose; seeds brown.....3. *distans*.

Leaves opposite and alternate, ovate-oblong or lanceolate, acute, the transverse nervules prominent, entire or slightly sinuate, up to 7 in. long, 2.5 in. broad, brown when dry, and yellow-glandular beneath; capsule 3-valved, .3 in. in diam., minutely pale brown stellate tomentose; seeds brown.....4. *rharnifolius*.

Leaves alternate, ovate or ovate-lanceolate, acuminate, the transverse nervules prominent, entire or shortly serrate, up to 8 in. long, 4.5 in. broad, greyish-pubescent to fulvous tomentose and red-glandular beneath; capsule 3-valved, .5 in. in diam., conspicuously red-glandular; seeds black.....5. *philippinensis*.

Leaves penninerved, or with sometimes a short opposite pair at the base:—

Leaves opposite or alternate, the lowest pair of nerves opposite and short, elliptic obovate or oblanceolate, acute, cuneate at base, entire or distantly dentate, glabrous, up to 7 in. long, 2 in. broad; flowers in slender racemes

6. *atrovirens*.

Leaves opposite, without a short opposite lowest pair of nerves:—

Capsules when mature with hard conical spines:—

Capsules .3 in. in diam., prominently yellow-glandular with few scattered spines; style-column elongate; leaves variable, elliptic-ovate or lanceolate, usually narrowed at both ends, up to 6 in. long, 2 in. broad, entire or sinuate.....7. *stenanthus*.

Capsules .5 in. in diam., sparsely yellow-glandular with many regular spines roughly in lines on the back; style-column very short or 0; leaves rhombic-lanceolate or -oblanceolate, narrowed at both ends, up to 5 in. long, 1.5 in. broad, entire or sinuate-dentate.....8. *muricatus*.

Capsules .5 in. in diam., the cocci somewhat elongate, minutely pubescent and with spines short when mature, elongate and soft when young; style-column short; leaves lanceolate or oblanceolate, long, but bluntly acuminate, reticulate, up to 7 in. long, 2 in. broad, widely sinuate-dentate.....9. *aureo-punctatus*.

Capsules when mature with subulate soft villous processes; leaves elliptic or slightly obovate, long and obtusely caudate-acuminate at apex, slightly attenuate at base, undulate, with prominent nerves and transverse nervules, up to 9 in. long, 3.5 in. broad.....10. *Beddomei*.

1. *MALLOTUS REPANDUS*, Muell. Arg.; F. B. I. v. 442.

N. Circars, Deccan and Carnatic to S. Travancore, at low levels, often in hedges and scrub forests and near the coast.

A large shrub, the trunk with long thorns, the ♂ flowers in panicles, the ♀ in racemes. Vern. *Hind.* Akús; *Tel.* Kanda velu.

2. *MALLOTUS ALBUS*, Muell. Arg.; F. B. I. v. 429. *Rottlera peltata*, Wt. Ic. t. 1873.

Var. *occidentalis*, Hook. f.

W. Gháts, in all Districts, in evergreen and secondary forest up to 4,000 ft.; Shévaroy Hills of Salem; Kollimalai Hills of Trichinopoly.

A moderate-sized tree, the flowers in panicles. Bark thin, grey; wood white and soft, of no value. Vern. *Tam.* Mullu polavú; *Mal.* Vatta kumbil.

3. *MALLOTUS DISTANS*, Muell. Arg.; F. B. I. v. 441; Bedd. Ic. t. 232.

W. Gháts, Anamalais and hills of Tinnevely about Courtallum.

A straggling shrub, the flowers in usually distant fascicles.

4. *MALLOTUS RHAMNIFOLIUS*, Muell. Arg.; F. B. I. v. 440.

W. Gháts, hills of Tinnevely and Travancore.

A shrub or small tree, resembling the next in leaf but at once distinguished by the capsule with nearly separate cocci and not red.

5. *MALLOTUS PHILIPPINENSIS*, Muell. Arg.; F. B. I. v. 442; Bedd. Fl.

t. 289. *Rottlera tinctoria*, Roxb. Cor. Pl. t. 168.

All Forest Districts in N. Circars, Deccan and W. Gháts, also in hills of Carnatic, up to 5,000 ft., common, especially in deciduous forest and open scrub lands.

A small tree, much branching low down. Bark grey; wood grey to light red, smooth and close-grained, a good fuel. The chief product is the red powder (Kamela) on the capsules which affords a bright orange dye. Vern. *Hind.* Raini; *Ur.* Sinduri; *Tel.* Kuunkuma; *Tam.* Kapli; *Mal.* Manjana.

Var. *tomentosus*. Leaves beneath densely fulvous-tomentose, acute to cuspidate-acuminate.

- W. Deccan, hills of Bellary and N. Coimbatore to N. and E. slopes of Nilgiris, common on the Coonoor Ghát up to 6,000 ft., also in Pulneys.
6. *MALLOTUS ATROVIRENS*, Hook. f.; F. B. I. v. 440.
W. Gháts, forests of Cochin and Travancore, at low levels; Anamalais (Beddome).
A shrub (?) the capsules unknown.
7. *MALLOTUS STENANTHUS*, Muell. Arg.; F. B. I. v. 437.
W. Gháts, Anamalais and hills of Travancore and Tinnevely.
A small tree with rough branches and usually flattened branchlets, the leaves narrower and more acuminate at both ends than in Bombay specimens.
8. *MALLOTUS MURICATUS*, Bedd.; F. B. I. v. 436. *Claoxylum muricatum*, Wt. Ic. t. 1886.
Deccan, Horsleykonda in Chittoor, at 3,500 ft. (Fischer); Carnatic, Kollimalai Hills of Trichinopoly (Rangachari); W. Gháts, Anamalais and hills of Travancore and Tinnevely.
A tree with much compressed branchlets and leaves very variable in shape but more or less rhombic.
9. *MALLOTUS AUREO-PUNCTATUS*, Muell. Arg. *M. Lawii*, Hook. f.; F. B. I. v. 438 in part.
W. Gháts, in Cochin (Johnson), Rookwood Estate, Travancore, at 2,000 ft. (Lawson), hills of Tinnevely.
A small tree (Lawson).
10. *MALLOTUS BEDDOMEI*, Hook. f.; F. B. I. v. 438.
W. Gháts, Wynaad, Anamalais and hills of Travancore and Tinnevely, up to 5,000 ft.; Bolampatti Hills of Coimbatore at 4,300 ft. (Fischer).
A shrub (Meebold) with large leaves.

33. *Symphyllia*, Baill.

Trees. *Leaves* alternate, entire or toothed; stipules 2. *Flowers* monoecious, in terminal or axillary spiciform racemes, the ♂ very numerous, clustered, the ♀ few, at the base only. *Calyx* in ♂ at first globular, then breaking into 4–6 valvate lobes; in ♀ of 5–8 unequal linear lobes. *Petals* 0. *Disk* 0. *Stamens* as many as the calyx-lobes, exserted; filaments at first inflexed; anthers dorsifixed, the cells parallel, often glandular at base. *Ovary* 3-celled; ovule 1 in each cell; styles connate below, spreading and bifid above and again divided in plumose arms; pistillode in ♂ columnar. *Fruit* a 3-lobed capsule. *Seeds* globose; testa crustaceous; albumen fleshy; cotyledons flat.

SYMPHYLLIA MALLOTIFORMIS, Muell. Arg. *Adenochlaena indica*, Hook. f.; F. B. I. v. 418. *Cephalocroton indicum*, Bedd. Fl. t. 261.
Deccan, hills of Cuddapah, along streams at about 3,000 ft. (Fischer); W. Gháts, from S. Canara and Coorg to Nilgiris, Anamalais and the hills of Travancore and Tinnevely, in ever-green forests, about 3,500 ft.

A tree with elliptic coriaceous shining entire leaves up to 7 in. long, 3.5 in. broad, very small flowers in close spikes and a grey capsule .75 in. in diam.

34. *Coelodepas*, Hassk.

Trees. *Leaves* alternate, oblong, entire or toothed, penninerved. *Flowers* monoecious or dioecious, in axillary spikes or clusters, the ♂ elongate, slender. *Calyx* in ♂ globose, splitting into 3—4 valvate lobes; in ♀ cupular, often enlarged in fruit, 4—10-lobed, the lobes imbricate. *Petals* 0. *Disk* 0. *Stamens* 4—8, the filaments cuneately dilated from below upwards; anthers didymous. *Ovary* 3-celled; ovule 1 in each cell; styles flattened, spreading, lobed; pistillode in ♂ minute. *Fruit* a capsule of 3, 2-valved, stellately pubescent cocci. *Seeds* subglobose; testa crustaceous; albumen fleshy; cotyledons flat.

COELODEPAS CALYCINUM, Bedd. Fl. t. 320; F. B. I. v. 419.

W. Gháts, hills of Tinnevely near Papanassam (Beddome), Sivagiri Hills (Wight).

A small tree with oblong acuminate crenate leaves reaching 7 in. long, 2 in. broad; ♂ flowers in very slender interrupted spikes of clusters and ♀ flowers in short spikes. The capsule is minutely fulvous tomentose, 4 in. in diam. Wood very hard (Bedd.). Vern. *Tam.* Kattupira.

35. *Alchornea*, Sw.

Trees or shrubs. *Leaves* alternate, entire or toothed, ribbed, usually stippellate at the base and glandular above at the base. *Flowers* dioecious or rarely monoecious, small, in simple or paniced spikes or racemes; ♂ small, clustered, ♀ solitary to a bract. *Calyx* in ♂ globose, closed in bud, splitting into usually 4 valvate lobes; in ♀ the 3—6 lobes, usually 4, imbricate. *Petals* 0. *Disk* 0. *Ovary* 2—3, rarely 4-celled; ovule 1 in each cell; styles distinct usually long and linear, simple or lobed; pistillode in ♂ 0. *Fruit* a capsule of 2—3 2-valved crustaceous cocci. *Seeds* subglobose, not strophiolate; testa crustaceous; albumen fleshy; cotyledons flat.

ALCHORNEA MOLLIS, Muell. Arg.; F. B. I. v. 420.

N. Circars, in the hills, in moist valleys (Roxburgh), at Ettrakonda in Godavari (V. Narayanswami).

A small tree with broadly ovate or suborbicular cuspidate-acuminate villous 3-ribbed stipellate leaves, up to 5 in. long, 3 in. broad, but Roxburgh gives the maximum as 12 and 8, which is quite likely especially with coppice shoots. The capsule is softly grey-pubescent. Vern. *Tel.* Badeki.

36. *Cleidion*, Blume.

Glabrous trees. *Leaves* alternate, toothed, penninerved. *Flowers* monoecious or dioecious, ♂ in long axillary racemes; ♀ single or in pairs on a long axillary peduncle; bracts very small. *Calyx* in ♂ globose at first, splitting into 2—4 valvate lobes; ♀ 3—5-lobed, the lobes imbricate. *Petals* 0. *Disk* 0. *Stamens* numerous, in a globose mass on a conical receptacle; filaments free; anthers dorsifixed, 4-celled or 2-celled, the cells transversely didymous on a broad connective. *Ovary* 2—4-celled; ovule 1 in each cell; styles connate below, with 2—3 long filiform arms; pistillode in ♂ 0. *Fruit* a capsule of

1—3 2-valved cocci. *Seeds* subglobose; testa coriaceous, sometimes with another membranous as well; albumen fleshy; cotyledons flat.

CLEIDION JAVANICUM, Blume; F. B. I. v. 444; Bedd. Fl. t. 272.

W. Gháts, in all Districts, in evergreen forests up to 3,000 ft., but not common.

A moderate-sized evergreen tree with elliptic acuminate long-petioled leaves up to 9 in. long, 4 in. broad, and capsules 1 in. in diam. Bark greenish-white, smooth; wood greyish-white, soft and not durable. Vern. Mal. Yellari.

37. *Macaranga*, Thouars.

Trees or shrubs. *Leaves* alternate, often large and peltate, entire or lobed, usually glandular beneath, 3—many-ribbed at the base; petioles often long and stipules large. *Flowers* usually dioecious, in axillary racemes or panicles, bracteate, the ♂ minute, in clusters, the ♀ one or few, to each bract; bract often large. *Calyx* in ♂ globose or obovoid, splitting into 3—5 valvate lobes; in ♀ 2—4-lobed. *Petals* 0. *Disk* 0. *Stamens* one or more central; filaments short, free; *anthers* 4-celled, or 2-celled and 4-valved. *Ovary* 2—6-celled, rarely by abortion 1-celled; ovule 1 in each cell; styles entire, short or long; pistillode in ♂ 0. *Fruit* a small capsule of 1 or more 2-valved cocci, sometimes echinate, often glandular or waxy. *Seeds* globose; testa crustaceous; albumen fleshy; cotyledons flat.

Leaves in all large and broadly peltate, orbicular-ovate, acuminate, entire or shortly toothed, with usually 9 radiating ribs at the base, the midrib with 7—12 pairs of nerves, the two next nerved on the outer side, the transverse nervules parallel:—

Panicle branches usually zigzag:—

Floral bracts small, usually with a large flat glandular appendage, the panicle branches shortly jointed; style lateral, subulate, stamens usually about 6—8

1. *indica*.

Floral bracts boat-shaped, toothed and acuminate, auricled at base, tomentose, the panicle branches with distant slender joints; stamens usually 4—6

2. *flexuosa*.

Panicle branches not zigzag; floral bracts broad and close, concealing the flowers, cup-like dentate and obtuse, very tomentose; style lateral, sessile, peltate, stamens 2—5, usually 3.....3. *peltata*

1. *MACARANGA INDICA*, Wt. Ic. t. 1883 and t. 1949 ii; F. B. I. v. 446; Bedd. Fl. t. 287, Fig. A.

W. Gháts, Nilgiris, hills of Malabar and Pulneys, at 3,000—6,000 ft. in second-growth forest chiefly.

A quick-growing tree with glaucous branchlets and large stipules, the leaves with round resinous yellow glands beneath, and usually softly tomentose. Bark grey, smooth; wood greyish-red, soft.

2. *MACARANGA FLEXUOSA*, Wt. Ic. t. 1949 iii.

W. Gháts, at Courtallum in Tinnevely (Wight).

A tree with glaucous branchlets and fulvous innovations, the leaves rather thin and greyish beneath with prominent large peltate glands.

3. *MACARANGA PELTATA*, Muell. Arg. *M. Roxburghii*, Wt. Ic. t. 1949 iv; F. B. I. v. 448. *M. tomentosa*, Wt. Ic. t. 1949 i; Bedd. Fl. t. 287 *Mappa* ? *peltata*, Wt. Ic. t. 817.

N. Circars, in hill valleys, especially in Rampa; Deccan, hills of Cuddapah; W. Gháts, in most Districts, in second-growth forest up to 3,000 ft.

A small resinous quick-growing tree with glaucous branchlets, large stipules and leaves glandular and more or less villous beneath. Bark pale, with lenticels; wood pale brown, soft, of no value. The red gum can be used for taking impressions. Vern. *Tam.* Vattakanni; *Mal.* Vatta.

38. *Claoxylon*, A. Juss.

Trees or shrubs, the buds not perulate. *Leaves* alternate, petioled, entire or glandular-dentate, stipules minute, early caducous. *Flowers* dioecious, rarely monoecious, in elongate racemes, often fascicled; bracts in ♂ usually 1—many, in ♀ 1-flowered. *Calyx* in ♂ closed in bud, subglobose, splitting valvately in 2—4 lobes; in ♀ usually 3-lobed. *Petals* 0. *Disk* in ♂ 0, in ♀ of hypogynous glands, free or connate in a cup. *Stamens* 10 or many, usually 20—30; filaments short or long; anthers erect, the cells distinct, connate at the base; often many glands or ciliate scales between the filaments. *Ovary* 2—4-celled; ovule 1 in each cell; styles free or connate only at the base, sometimes fringed. *Fruit* a capsule of 2—3 cocci dehiscing loculicidally. *Seeds* globose, not carunculate, arillate or not; testa crustaceous; albumen fleshy; cotyledons flat.

CLAOXYLON ANOMALUM, Hook. f.; F. B. I. v. 412.

Evergreen forests of Tinnevely about Courtallum (Wight), about Strathmore in Travancore at 3,500 ft. (Bourdillon).

A shrub with soft branches, oblong-lanceolate acuminate leaves with long petioles, flowers in rather dense spikes having no scales between the stamens and a white-pubescent capsule.

39. *Micrococca*, Benth.

Herbs or undershrubs, the buds not perulate. *Leaves* alternate, the lower rarely opposite, membranous, dentate, petioled; stipules minute. *Flowers* dioecious or monoecious, minute, in distant clusters on axillary racemes, the clusters often catkin-like with many imbricate bracts; the racemes solitary or fascicled, usually unisexual and various in arrangement; ♂ flowers pedicelled. *Calyx* of ♂ closed in bud, apiculate, splitting into 3 lobes; of ♀ 3—4, larger, imbricate. *Petals* 0. *Disk* in ♀ hypogynous, of linear glands. *Stamens* 3—30, central on a receptacle; filaments erect; anthers erect, the cells distinct obovoid, connate at base; glands or ciliate scales between the filaments. *Ovary* 3-celled; ovules 1 in each cell; styles free, plumose-laciniate. *Fruit* a capsule of 3 cocci dehiscing loculicidally and also septically. *Seeds* subglobose with a very thin arillus; testa crustaceous; albumen fleshy; cotyledons flat.

Perennial undershrubs:—

Racemes elongate-filiform, about 4 in. long, glabrous or hispid, the flower-clusters distant; leaves glabrous, elliptic-lanceolate, coarsely dentate or entire, acuminate at both ends, up to 7 in. long, 1.5 in. broad, long-petioled

1. *Beddomei*.

Racemes short, under 2 in. long, hairy, the flower-clusters fairly close; leaves sparsely softly white- or fulvous-silky, lanceolate, entire or crenate, acute at both ends, up to 3 in. long, 1 in. broad (in the var. larger), petioles short...2. *Wightii*.

Annual herbs; racemes erect, androgynous, filiform, up to about 3 in. long, hispid; leaves ovate, acute, usually rounded at base, crenate, up to 2.5 in. long, 1.25 in. broad, the petioles slender.....3. *Mercurialis*.

1. *MICROCocca BEDDOMEI*, Prain in Ann. Bot. xxv. 630. *Claoxylon Beddomei*, Hook. f.; F. B. I. v. 413. *C. indicum*, Bedd. Ic. t. 231, not of Hassk.

W. Ghâts, Anamalais and hills of Travancore and Tinnevely, up to 6,000 ft.

An undershrub, nearly glabrous or sparsely hispid on the racemes and branchlets, the capsule glabrous or strigose-hispid.

2. *MICROCocca WIGHTII*, Prain l.c. *Claoxylon Wightii* Hook. f.; F. B. I. v. 413.

W. Ghâts, hills of Tinnevely (Wight, Beddome).

A slender undershrub with narrow leaves up to 1 in. broad.

Var. *hirsutum*, Prain. *Claoxylon hirsutum*, Hook. f.; F. B. I. v. 413, leaves larger, densely yellowish-silky with long spreading soft hairs, as is the capsule. Hills of Tinnevely, Singampatti at the Snake falls 2,500 ft. (Beddome).

3. *MICROCocca MERCURIALIS*, Benth. *Claoxylon Mercurialis*, Thw.; F. B. I. v. 412.

Most plains Districts, a weed of cultivated land and roadsides.

An annual herb, reaching 2 ft. in height, the capsule glabrous or sparsely hispid.

40. *Acalypha*, Linn.

Herbs or shrubs. *Leaves* alternate, usually serrate or crenate, rarely entire, penninerved or 3—5-ribbed; petioles often long. *Flowers* usually monoecious, in axillary or terminal spikes or racemes; ♂ very minute, sometimes separate, sometimes lower, more usually upper, with or without small bracts; ♀ bracteate, the bracts generally leafy and concave; bracteoles very small. *Calyx* in ♂ of 4 minute valvate membranous lobes, at first combined; in ♀ of 3—4 minute imbricate lobes. *Petals* 0. *Disk* 0. *Stamens* many, often 8, on a convex receptacle; filaments short, free; anther-cells distinct, divaricate, often at length twisted or flexuous. *Ovary* 3-celled; ovule solitary in each cell; styles filiform, often very long and lacinate; pistillode in ♂ 0. *Fruit* a small capsule of 3 small, 2-valved, crustaceous cocci. *Seeds* subglobose; testa crustaceous; albumen fleshy; cotyledons flat.

Flowers of ♀ pedicelled, with minute bracts, in terminal lax panicles; those of ♂ in very slender axillary spikes; leaves membranous long-petioled, ovate, acuminate, rounded truncate or even cordate at base, strongly serrate, sparsely hairy, up to 4 in. long, 2.5 in. broad.....1. *paniculata*.

Flowers of ♀ sessile with fairly large or small bracts:—

Flowers of ♀ in terminal short spikes, of ♂ axillary, in slender spikes; bracts of ♀ broad and dentate, enclosing the capsule; leaves ovate, acute, rounded or cordate at base, crenate, pubescent, up to 2 in. long, 1.25 in. broad...2. *alnifolia*.

Flowers of both ♂ and ♀ in axillary spikes, the ♂ uppermost and few:—

Bracts rather large, .2—3 in. long, leafy, dentate, folded, alternate on erect spikes; ♂ flowers minute, followed by a tuft of sterile flowers; leaves long-petioled, ovate or rhombic ovate, acute, cuneate at base, crenate-serrate, up to 3 in. long, 2 in. broad, glabrous.....3. *indica*.

Bracts moderate-sized, longer than the capsules, .15—3 in. long; spikes short, rarely 1 in. long.—

Bracts deeply 3—5-lobed, 3 longer lobes strap-shaped, long-ciliate; leaves membranous, long-petioled, ovate, acuminate, cordate at base, crenate, hispid, up to 3 in. long, 1.5 in. broad; capsules hispid.....4. *brachystachya*.

Bracts campanulate, with many nerves ending in long subulate hispid teeth; leaves membranous, long-petioled, ovate, cuspidate-acuminate, rounded or cuneate at base, serrate, glandular, up to 3.5 in. long, 1.5 in. broad; capsules glabrous.....5. *ciliata*.

Bracts folded, shortly toothed, the teeth with gland-tipped hairs, otherwise glabrous; leaves ovate or lanceolate, acute, crenate-serrate, hispid, up to 1.5 in. long, .75 in. broad; capsules hispid.....6. *malabarica*.

Bracts small, shorter than the capsules, .5 in. long, dentate, hispid; spikes elongate, more than 1 in. long; leaves membranous, long-petioled, ovate or lanceolate, acute, cuneate at base, crenate-serrate, up to 2.5 in. long and nearly as broad, but usually smaller; capsules hispid with glandular-based hairs.....7. *lanceolata*.

Flowers of ♀ few, sessile at the base of slender many-flowered ♂ spikes about 1 in. long; bracts folded, cuneate, villous and glandular, .15 in. long; leaves ovate, obtusely acuminate or acute, cuneate at base, crenate, glabrous, glandular beneath, up to 3 in. long, 1.5 in. broad; capsules tomentose with large yellow glands in the sinuses.....8. *fruticosa*.

1. *ACALYPHA PANICULATA*, Miq.; F. B. I. v. 415.
Carnatic, hills of S. Arcot; W. Gháts, in all Districts from the Wynaad southwards, in shady moist places up to 4,000 ft.
A small branching undershrub.
2. *ACALYPHA ALNIFOLIA*, Klein ex Willd.; F. B. I. v. 415.
Deccan and Carnatic, westwards to the E. slopes of the W. Gháts, up to about 3,000 ft.
A small shrub, the stems usually with long soft shining hairs, the stems and leaves sometimes grey-tomentose.
3. *ACALYPHA INDICA*, Linn.; F. B. I. v. 416; Wt. Ic. t. 877.
All plains Districts and in the lower hills, a weed of gardens, roadsides and cultivated land.
An erect annual herb. Vern. *Tam.* Kupamani.
4. *ACALYPHA BRACHYSTACHYA*, Hornem.; F. B. I. v. 416.
W. Gháts, Mysore, Nilgiris, Anamalais and Pulneys, usually above 3,000 ft. in shade of Shola forests.
A slender flaccid annual herb, 1 ft. or little more in height.
5. *ACALYPHA CILIATA*, Forsk.; F. B. I. v. 417.
Deccan, hills of Kurnool; W. Gháts, in all Districts, in forest undergrowth, at 1,000—4,000 ft.
An erect annual herb up to 2 ft. in height.
6. *ACALYPHA MALABARICA*, Muell. Arg.; F. B. I. v. 416.
S. Canara and Mysore.
A rather stout leafy annual herb, up to 1 ft. in height.

7. ACALYPHA LANCEOLATA, Willd. *A. fallax*, Muell. Arg.; F. B. I. v. 416.
N. Circars, Deccan and Carnatic to S. Travancore, on waste land and in fields.
An annual herb, reaching 18 in. in height, the stems often clothed with long silky deciduous hairs, the leaves variable in shape.
8. ACALYPHA FRUTICOSA, Forsk.; F. B. I. v. 415.
Deccan and Carnatic, West to the E. slopes of the W. Gháts, in dry localities.
A strong-smelling shrub with many yellow waxy glands, much branching.

A. Wilkesiana, Muell. Arg., is a shrub from the Fiji Islands very commonly grown in gardens for its coloured highly ornamental leaves and flower-spikes.

41. *Tragia*, Linn.

Perennial herbs, usually climbing, hispid with stinging hairs. *Leaves* alternate, simple or palmately 3-lobed, serrate, 3—5-ribbed at the base; stipules prominent at first, early deciduous. *Flowers* monoecious in terminal or leaf-opposed androgynous racemes, the ♂ uppermost, the ♀ below and few. *Calyx* in ♂ globose or obovoid, valvately 3—5-partite; in ♀ of 6 imbricate, usually pinnatifid, lobes, enlarged, hardened, and spreading stellately in fruit. *Petals* 0. *Disk* 0. *Stamens* 1—3, rarely more, usually 3; filaments free or connate; anthers with contiguous parallel cells. *Ovary* 3-celled; ovule 1 in each cell; styles united in a column, spreading above. *Fruit* a capsule of 3 2-valved cocci; endocarp crustaceous. *Seeds* globose; testa crustaceous; albumen fleshy; cotyledons broad, flat.

Leaves simple:—

Leaves not cordate at base, acute in uppermost or younger, rounded in lower or older ones, the large ones broadly ovate, abruptly acuminate, coarsely serrate, up to 4 in. long, 3 in. broad, longer and much narrower in the var.; fruiting calyx-lobes with narrow glabrous midrib and 4—6 pairs of short hispid teeth

1. *involutrata*.

Leaves cordate at base:—

Fruiting calyx-lobes oblong with 4—8 pairs of teeth, long and stiffly strigose:—

Upper branchlets and leaves densely fulvous-tomentose, the leaves (at any rate young ones) pale on the lower surface; lower leaves ovate-cordate, acuminate, regularly serrate, up to 5 in. long, 3 in. broad; midrib of fruiting calyx-lobes hispid within, teeth fulvous-hispid.....2. *bicolor*.

Upper branchlets and leaves sparsely greyish hispid; lower leaves broadly ovate-cordate, membranous, nearly glabrous, serrate, up to 5 in. long, 3 in. broad; midrib of fruiting calyx-lobes glabrous within, the teeth slender, white-hispid.....3. *hispidula*.

Fruiting calyx-lobes broadly ovate with many small teeth, glabrous on the middle of both sides, densely white-strigose on the margins; leaves membranous, green, nearly glabrous, broadly ovate-cordate, acuminate, coarsely serrate, up to 6 in. long, 4 in. broad.....4. *Muelleriana*.

Leaves palmately 3-partite, the middle lobe the longest and sometimes alone, the lobes pinnatifid, hispid and grey, about 3 in. long; fruiting calyx-lobes rather narrow, with 8—10 straight teeth, sparsely white-strigose.....5. *cannabinia*.

1. *TRAGIA INVOLUCRATA*, Linn.; F. B. I. v. 465.

N. Circars, Deccan and Carnatic to S. Travancore.

An evergreen climbing hispid herb with stinging bristles, variable in foliage, the leaves rather thick. Vern. *Hind.* Barhanta.

Var. *angustifolia*, Hook. f. Leaves long and narrow, up to 6 in. long, .5–.75 in. broad; fruiting calyx-lobes with very short teeth. Hills of N. Coimbatore at 4,000 ft. (Fischer); Pulney Hills (Bourne, van Malderen).

2. *TRAGIA BICOLOR*, Miq.; F. B. I. v. 465.

W. Gháts, Nilgiri and Pulney Hills, at 5,000–6,000 ft., in Shola forests.

A slender climbing stinging herb, hispid below, bright golden-tomentose on the innovations.

3. *TRAGIA HISPIDA*, Willd. *T. involucrata*, Linn.; F. B. I. v. 465 in part.

W. Coast, S. Canara and Malabar.

A slender climbing stinging herb.

4. *TRAGIA MUELLERIANA*, Pax and K. Hoffm. *T. involucrata*, Linn., var. *cordata*, Muell. Arg.; F. B. I. v. 465.

W. Gháts, Wynad to the hills of Cochin, at 3,000–5,000 ft. in evergreen forest.

A slender stinging climbing herb.

5. *TRAGIA CANNABINA*, Linn. f. *T. involucrata* var. *cannabina*, Muell. Arg.; F. B. I. v. 465.

N. Circars, Deccan and Carnatic, in hedges and on waste lands.

A hispid erect or climbing shrub with stinging hairs, the leaves variable, sometimes not tripartite, sometimes with long narrow lobes.

42. *Homonoia*, Lour.

Rigid shrubs. *Leaves* alternate, glandular-scaly beneath; stipules slender, deciduous. *Flowers* dioecious, in axillary or lateral spikes, bract 1, bracteoles 2. *Calyx* in ♂ globose in bud, splitting valvately in 3 lobes; in ♀ of 5–8 small imbricate caducous lobes. *Petals* 0. *Disk* 0. *Stamens* very numerous, in a dense globose cluster of repeatedly branching filaments; anthers with 2 subglobose divaricate cells. *Ovary* 3-celled; ovule 1 in each cell; styles 3 spreading and very papillose. *Fruit* a capsule of 3 2-valved cocci. *Seeds* ovoid; testa crustaceous with an outer fleshy coat; albumen fleshy; cotyledons flat.

Leaves linear or linear-oblong, acute or rarely obtuse, entire or more or less serrulate towards the apex, glabrous above, very glandular-scaly beneath, up to 7 in. long, .5 in. broad; spikes in both ♂ and ♀ elongate.....1. *riparia*. Leaves obovate or oblanceolate, emarginate, cuneate at base, serrate-dentate, glabrous above, sparsely glandular-scaly beneath, 1–1.5 in. long, .5–.7 in. broad; spikes in both ♂ and ♀ short.....2. *retusa*.

1. *HOMONOIA RIPARIA*, Lour.; F. B. I. v. 455. *Adelia neriiifolia*, Roth.; Wt. Ic. t. 1868.

All Districts, at lower levels, in the beds of rivers and streams, especially among rocks.

An evergreen shrub. Bark brown; wood grey or greyish-brown, moderately hard, close-grained. Vern. *Tel.* Taniki; *Mal.* Katallári.

2. *HOMONOIA RETUSA*, Muell. Arg.; F. B. I. v. 456. *Adelia retusa*, Wt. Ic. t. 1869.

N. Circars from the Godavari southwards; Deccan and Carnatic in places, in river beds, not common.
A small shrub.

43. *Lasiococca*, Hook. f.

Small trees. *Leaves* alternate opposite or subverticillate, entire, penninerved, eglandular, shortly petioled; stipules deciduous. *Flowers* monoecious or dioecious, ♂ in racemes, ♀ solitary, axillary or lateral; bracts small. *Calyx* of ♂ flower globose, splitting valvately in 3 lobes; of ♀ of 5—7 unequal lobes, persistent and accrescent in fruit. *Petals* 0. *Disk* 0. *Stamens* numerous, in a much-branched column of filaments; anthers many, cells globose, divaricate with arching connectives. *Ovary* 3-celled; ovule 1 in each cell; styles 3, filiform, erect, with papillose stigmatic surfaces. *Fruit* a capsule of 3 cocci, deciduous from a 3-cornered columella, covered with bristles or conical tubercles. *Seeds* subglobose, smooth; testa crustaceous; albumen fleshy; cotyledons thin, subcordate.

LASIOCocca COMBERI, Haines in Kew Bull. 1920, 70.

N. Circars, hills of Vizagapatam, at 3,000—4,000 ft. (A. W. Lushington).

A small tree with obovate, or somewhat panduriform leaves obtusely abruptly acuminate at apex, narrowed and then cordate at base, up to 6 in. long, 2 in. broad. The ♀ flowers are long-peduncled and the capsules covered with conical tubercles ending in a hair.

44. *Ricinus*, Linn.

A tall glabrous glaucous annual shrub. *Leaves* alternate, palmately lobed with 7 or more serrate lobes. *Flowers* monoecious, in terminal paniculate racemes, the upper ♂, crowded, the lower ♀. *Calyx* in ♂ membranous, splitting into 3—5 valvate lobes; in ♀ spathaceous, caducous. *Petals* 0. *Disk* 0. *Stamens* very many, the filaments connate and repeatedly branched; anthers with distinct distant subglobose divergent cells. *Ovary* 3-celled; ovule 1 in each cell; styles entire 2-fid or 2-partite, papillose. *Fruit* a capsule of 3 2-valved cocci, prickly without. *Seeds* oblong; testa crustaceous, marbled; albumen fleshy; cotyledons broad.

RICINUS COMMUNIS, Linn.; F. B. I. v. 457.

Cultivated and found run wild in the fields and gardens, by roadsides and on waste land. Castor-oil plant.

Often almost a small tree with a thin greyish-brown bark and soft white wood. It is cultivated for the oil which is expressed from the seeds and used for burning, as a lubricant and in medicine. Vern. *Hind.* Arend; *Tam.* Sittamunuk; *Tel.* Amadam; *Kan.* Haralu.

45. *Dalechampia*, Linn.

Shrubs or undershrubs, often climbing. *Leaves* alternate, entire or 3—5-lobed or foliolate. *Flowers* monoecious, in dense axillary peduncled heads, with a pair of large leafy usually coloured bracts; ♂ central with an involucl of smaller bracts and sometimes processes representing sterile flowers; ♀ lateral and basal also with an involucl of smaller bracts. *Calyx* in ♂ globose splitting into 4—6 valvate lobes; in ♀ of 5—12 fimbriate or lacerate imbricate lobes. *Petals* 0. *Disk* 0. *Stamens* many, 20—30, the filaments connate below in a column inserted on the convex receptacle; anthers with parallel cells. *Ovary* 3—4-celled; ovule 1 in each cell; styles connate in a stout thickened column with a terminal entire or slightly lobed stigma. *Fruit* a deeply lobed capsule splitting into 3—4 2-valved cocci, the valves hard. *Seeds* globose, not caruncled; testa crustaceous; albumen fleshy; cotyledons broad, flat.

Leaves 3-foliolate, the leaflets sessile or very shortly petiolulate, the 2 lower with rounded and often lobed blades enlarged below, the mid-lobe ovate, acuminate, 2—3 in. long, all glabrous; outer bracts 3-lobed, about 1 in. long, inner also lobed; calyx of ♂ of 4 entire lobes, of ♀ of 8—12 nearly linear lobes with stalked marginal glands; anthers not apiculate.....1. *indica*.
Leaves 3-lobed, the 2 lower enlarged below, the midlobe ovate, acute, up to 4 in. long, all tomentose; outer bracts 3-fid, about 1.5 in. long, inner entire; calyx of ♂ of 6 entire lobes, of ♀ of 8—10 pinnatifid long strigose lobes; anthers apiculate.....2. *velutina*.

1. *DALECHAMPIA INDICA*, Wt. Ic. t. 1882; F. B. I. v. 467.

Carnatic, from the Nellore Veligondas (Heyne) and the Kam-bakam Hills of Chingleput (Rangachari) southwards and westwards to the E. slopes of the W. Ghâts.

A slender twining undershrub with large yellow involuclal bracts and slender short fruiting calyx, very glandular.

2. *DALECHAMPIA VELUTINA*, Wt. Ic. t. 1881; F. B. I. v. 467.

W. Ghâts, Nilgiri Hills, above 5,000 ft. (Wight, King, Bidie, Fischer).

A slender twining undershrub with large bracts and conspicuously strigose fruiting calyx.

46. *Ostodes*, Blume.

Trees or shrubs. *Leaves* alternate, entire or serrate, usually penninerved, stipular. *Flowers* dioecious or monoecious, in lax terminal and lateral paniced usually pendulous racemes, ♂ in fascicles, ♀ in separate racemes or solitary in ♂ ones. *Calyx* of 5 broad unequal imbricate lobes. *Petals* 5—6, larger, longer than calyx-lobes. *Disk* of 5 glands or annular. *Stamens* numerous, on a convex or columnar receptacle; filaments free; anthers dorsifixed, connective broad. *Ovary* 3-celled; ovule 1 in each cell; styles short, 2-cleft. *Fruit* a large subglobose 6-ribbed capsule, the exocarp separable from the hard endocarp, breaking up into 3 2-valved cocci. *Seeds* ovoid; testa crustaceous with a fleshy outer layer; albumen fleshy; cotyledons broad, flat.

OSTODES ZEYLANICUS, Muell. Arg.; F. B. I. v. 400; Bedd. Fl. t. 274.

W. Ghâts, Wynaad, Anamalais, Atapadi Hills of Malabar and hills of Travancore, up to 3,000 ft.

A large tree with large long-petioled oblong or oblanceolate distantly serrate leaves, up to 12 in. long, 4 in. broad. Wood white, soft and perishable.

Var. *minor*, Thw. Leaves smaller, up to 7 in. long, fewer-nerved and nearly entire, the racemes shorter, the capsule smaller and tomentose.

W. Ghâts, Wynaad (Lawson) to Travancore.

47. *Dimorphocalyx*, Thw.

Glabrous trees. *Leaves* alternate, entire, penninerved, stipulate. *Flowers* dioecious, ♂ usually in axillary cymes or racemes or solitary, ♀ solitary or 2—3 together and terminal or leaf-opposed. *Calyx* in ♂ cup-shaped with 5 small lobes; in ♀ large, of 5 oblong obtuse imbricate lobes, enlarged and spreading in fruit. *Petals* 5, erect, imbricate. *Disk* in ♂ of glands, in ♀ annular. *Stamens* 10—20, usually in 2 rows, on a short column; filaments thick; anthers dorsifixed, the cells adnate to the thick connective, parallel or divergent. *Ovary* 3-celled; ovule 1 in each cell; styles 3, connate at the base, bifid. *Fruit* a capsule of 3 2-valved crustaceous cocci surrounded at the base by the persistent calyx-lobes. *Seeds* ovoid, testa crustaceous; albumen fleshy; cotyledons flat.

Fruiting calyx obovate, obtuse, .25—.5 in. long, with a glandular pit on back near the tip; leaves elliptic or lanceolate, obtuse or acute, up to about 5 in. long, 2 in. broad; capsule .5 in. long, slightly hispid-villous, shortly lobed...1. *glabellus*. Fruiting calyx elliptic-oblong or lanceolate, emarginate, .5—1 in. long, the lobes unequal; leaves elliptic-oblong or lanceolate, usually long-, but obtusely-acuminate, up to 7 in. long, 2.5 in. broad; capsule .5—7 in. long, villous, scarcely lobed

2. *Lawianus*.

1. DIMORPHOCALYX GLABELLUS, Thw.; F. B. I. v. 403; Trimen Fl. Ceyl. t. 84.

N. Circars, coast scrub near the sea, Vizagapatam (W. Elliot, Gamble); W. Ghâts, Anamalais and hills of Tinnevely.

A small much-branched tree, the leaves reddish brown when dry and rather thin, the branchlets nearly white.

2. DIMORPHOCALYX LAWIANUS, Hook. f.; F. B. I. v. 404; *Trigonostemon Lawianus*, Bedd. Fl. t. 273.

W. Ghâts, in all Districts, western side, in evergreen forests, up to 4,000 ft.

A small or moderate-sized tree with nearly white branchlets. Wood white, hard, close-grained.

48. *Blachia*, Baill.

Glabrous shrubs or small trees. *Leaves* alternate or sub-opposite, petioled, entire, penninerved. *Flowers* monoecious or subdioecious, ♂ terminal, umbellate or racemose, on filiform pedicels, ♀ solitary or fascicled, on thickened pedicels. *Sepals* in ♂ 4—5, membranous, concave, imbricate; in ♀ lanceolate or oblong, in fruit sometimes accrescent, sometimes caducous. *Petals* in ♂ 4—5, small, rounded, hyaline; in ♀ 0. *Disk* in ♂ of scale-like glands alternating with the

petals; in ♀ annular. *Stamens* 10—20, on a convex receptacle; filaments free; anther-cells on the margin of the connective, at length confluent. *Ovary* 3—4-celled; ovule 1 in each cell; styles distinct, filiform, 2-partite. *Fruit* a capsule of 3 2-valved cocci. *Seeds* oblong, estrophiolate; testa crustaceous, often mottled, shining; albumen fleshy; cotyledons broad, flat.

Flowers of ♂ in umbels:—

Calyx of ♀ scarcely enlarged in fruit, the lobes reflexed; leaves ovate or obovate, obtuse or cuspidate-acuminate, up to 3 in. long, 1.5 in. broad; capsule 4 in. long, not deeply lobed, smooth.....1. *reflexa*.
Calyx of ♀ enlarged in fruit, the lobes erect; leaves ovate or obovate, acuminate, narrowed at base, up to 7 in. long, 3 in. broad; capsule 6 in. long, deeply lobed.....2. *umbellata*.

Flowers of ♂ in racemes:—

Calyx of ♀ enlarged in fruit, the lobes spreading, leaves lanceolate or elliptic-rhomboid, acuminate, cuneate at base, up to 5 in. long, 2 in. broad; capsule 4 in. long, with shallow lobes.....3. *calycina*.
Calyx of ♀ deciduous after flowering; leaves oblong-lanceolate or ovate, unequal-sided, up to 5 in. long, 2 in. broad; capsule 3—5 in. long, prominently lobed.....4. *denudata*.

1. *BLACHIA REFLEXA*, Benth.; F. B. I. v. 402.
W. Gháts—"Nilgiris and Coorg" (G. Thomson), Travancore (Bourdillon) in evergreen forests, about 1,000 ft.
A shrub.
2. *BLACHIA UMBELLATA*, Baill.; F. B. I. v. 402.
W. Gháts, Coorg, Wynaad and hills of Travancore and Tinnevely, in evergreen forests, at 1,000—3,000 ft.
A shrub or small tree.
3. *BLACHIA CALYCINA*, Benth.; F. B. I. v. 402. *Croton umbellatum*, Wt. Ic. t. 1874.
W. Gháts, hills of Travancore and Tinnevely, in evergreen forests, at 1,000—2,000 ft.
A shrub.
4. *BLACHIA DENUDATA*, Benth.; F. B. I. v. 403.
W. Gháts, S. Canara (Beddome); Bababudan Hills of Mysore (Law).
A shrub or small tree, the specimens probably right but a little uncertain, as the leaves are so variable.

49. *Jatropha*, Linn.

Herbs, shrubs or trees, often glandular or prickly. *Leaves* alternate, entire or palmately-lobed or -partite; stipules often ciliate. *Flowers* monoecious, in terminal cymes; the central flowers of the cyme or its forks usually ♀. *Calyx* of 5 often coloured imbricate lobes. *Petals* 5, contorted, free or connate, sometimes absent in ♀. *Disk* entire or of 5 glands. *Stamens* numerous; filaments connate or those of the outer series free; anthers erect, ovate or oblong, the cells parallel, contiguous. *Ovary* 2—4-celled; ovule solitary in each cell; styles connate below, 2-fid above, the lobes entire or again bifid. *Fruit* a capsule of 2—4 2-valved cocci; endocarp crustaceous or bony. *Seeds* ovoid or oblong; testa crustaceous; albumen fleshy; cotyledons broad, flat.

Petals free or nearly so:—

Leaves without glands, 3-lobed to below the middle, sometimes simple, sometimes 5-lobed, the lobes long and narrow, the base cuneate, length up to 8 in., stipules capillary; capsule 3—7 in. long, often pustulate.....1. *heterophylla*.

Leaves glandular, palmately 3—5-lobed to below the middle:—

Leaves serrate, each tooth ending in a gland-tipped bristle, lobes obovate, shortly acuminate; stipules very long with many filiform glandular-tipped divisions; capsule 4—5 in. long; rugose.....2. *glandulifera*.

Leaves entire, the margins with a close row of shortly stipitate viscid glands which occur, though longer and branched, on the petioles and short stipules, lobes obovate, shortly acute; capsule 4 in. long, reticulate-rugose

3. *gossypifolia*.

Petals connate to the middle or above it:—

Glabrous, the leaves not peltate, orbicular-cordate, entire or 3—5-lobed or -angled, up to 6 in. in diam.; capsule subglobose or ellipsoid, about 1 in. long, rugose.....4. *Curcas*.

Branchlets and leaves beneath fulvous-tomentose, the leaves peltate, suborbicular, obtusely 5—7-lobed, up to about 6 in. in diam.; capsule globosely oblong, up to 1 in. long.....5. *Wightiana*.

1. *JATROPHA HETEROPHYLLA*, Heyne; F. B. I. v. 382.

Deccan, from Nellore and Cuddapah westwards to Coimbatore and the N. side of Nilgiris, on dry stony ground.

A small low glabrous shrub branching from a tuberous rootstock, the flowers greenish.

2. *JATROPHA GLANDULIFERA*, Roxb.; F. B. I. v. 382.

Deccan and Carnatic, from the Kistna river southwards, often on black cotton soil.

A shrub with stout thick branches with a smooth papery pale bark, the flowers greenish-yellow.

3. *JATROPHA GOSSYPIFOLIA*, Linn.; F. B. I. v. 383.

All plains Districts, on roadsides and in waste places, a common weed, introduced from Brazil, and quite naturalized.

A small dark-coloured shrub with soft wood and reddish flowers. Vern. *Tam.* Atalai; *Tel.* Nela-amida.

4. *JATROPHA CURCAS*, Linn.; F. B. I. v. 383.

All plains Districts, about villages and in hedges, an American plant, cultivated and naturalized. Physic Nut.

A shrub or small tree with yellowish-green flowers. Bark greenish-white, smooth, peeling off in thin flakes; wood white, very soft. The seeds give a medicinal oil. Vern. *Hind.* Bagberenda; *Tel.* Nepalam; *Tam.* Kaat-amunak.

5. *JATROPHA WIGHTIANA*, Muell. Arg.; F. B. I. v. 383. *J. peltata*, Wt. Ic. t. 1169 (*J. villosa* in text).

W. Deccan, Mysore and Coimbatore, in dry stony scrub. A low branching shrub with pale yellowish flowers.

J. multifida, Linn., the Coral Plant, is a glabrous shrub, native of America, which is commonly cultivated in gardens. It has handsome leaves of orbicular outline very much cut palmately into narrow lobes, while the peduncles and flowers are bright red. Some other species of the genus are also occasionally found in gardens in cultivation.

50. *Tritaxis*, Baill.

Trees or shrubs. *Leaves* alternate, entire or toothed, penninerved. *Flowers* usually monoecious in terminal dichotomous cymes, the central flower of each cyme subsessile ♀, surrounded by many ♂ pedicelled. *Calyx* 5-lobed. *Petals* 5, longer than the calyx-lobes. *Disk* of 5 glands. *Stamens* in 2—3 whorls, the inner or all forming a central column; anthers of the outer whorl erect, of the inner horizontal, the cells parallel, introrse. *Ovary* 3-celled; ovule 1 in each cell; styles 2-fid. *Fruit* a capsule of 3 2-valved cocci.

TRITAXIS BEDDOMEI, Benth.; F. B. I. v. 384.

W. Ghâts, hills of Tinnevely and Travancore (Beddome).

A small tree with slender terete branches, thinly coriaceous leaves reaching 4 in. in length, and terminal branching cymes.

51. *Trigonostemon*, Blume.

Evergreen trees or shrubs. *Leaves* alternate, penninerved. *Flowers* monoecious, in axillary or terminal spikes, racemes or cymes. *Calyx* of 5 imbricate lobes. *Petals* 5, sometimes 0 in ♀. *Disk* of 5 glands, often united in a lobed cup. *Stamens* 3 or 5, connate in a short column with free spreading tips; anthers erect or horizontal, the cells united by their bases. *Ovary* 3-celled; ovule 1 in each cell; styles bifid or twice bifid, rarely entire. *Fruit* a capsule of 3 2-valved cocci. *Seeds* ovoid or globose; testa crustaceous, mottled; albumen fleshy; cotyledons broad, flat.

TRIGONOSTEMON NEMORALIS, Thw.; F. B. I. v. 398; Bedd. Ic. t. 182.

W. Ghâts, Wynaad (Beddome), hills of Tinnevely, in evergreen forests, at 2,000—3,000 ft., often on river banks.

A shrub or small tree with elliptic-oblong or lanceolate sinuate-lobed leaves reaching 6 in. long, the young parts and inflorescence strigose-hairy, the flowers red.

52. *Givotia*, Griff.

A tree, conspicuously softly white-stellate-tomentose on branchlets, inflorescence and undersurface of leaves. *Leaves* alternate, broadly ovate or orbicular, cordate, coarsely dentate, palmately ribbed, long-petioled. *Flowers* dioecious, in axillary or subterminal racemose or paniculate cymes; pedicels jointed; bracts linear, conspicuous. *Calyx* of 5 oblong imbricate lobes. *Petals* 5, longer than the calyx-lobes, cohering in a campanulate corolla. *Disk* of ♂ of orbicular glands, of ♀ cupular. *Stamens* 13—25, on a villous receptacle; filaments erect, connate below; anthers ovate, dorsifixed, the cells parallel. *Ovary* 2—3-celled; ovule 1 in each cell; styles short, spreading, 2-fid. *Fruit* a sub-globose drupe, 1 seeded. *Seed* globose or ellipsoid; testa bony; albumen fleshy; cotyledons flat.

GIVOTIA ROTTLEIFORMIS, Griff.; F. B. I. v. 395; Wt. Ic. t. 1889; Bedd. Fl. t. 285.

Deccan, hilly country in Hyderabad and the Ceded Districts to Coimbatore; hills of the Carnatic to S. Travancore; E. slopes of W. Ghats, in dry deciduous forests chiefly.

A moderate-sized tree conspicuous for its large leaves densely white-tomentose beneath reaching a diameter of up to 10 in. The flower-panicles are usually more fulvous-tomentose, with distant clusters, the drupe 1 in. long. Bark brown, smooth, peeling off in circular scales; wood white, very light and soft, used for carved images, toys, lacquered articles and catamarans. The seeds give an oil. Vern. *Tel.* Tella puliki; *Tam.* Vendalai.

53. *Baliospermum*, Blume.

Erect shrubs or undershrubs. *Leaves* alternate, minutely lobed, palminerved or penninerved, biglandular at base. *Flowers* small, monoecious or dioecious, in fascicles, panicles or racemes. *Calyx* in ♂ globose, opening in 4–5 membranous concave imbricate lobes; in ♀ of 5–6 lanceolate entire or toothed lobes sometimes accrescent in fruit. *Petals* 0. *Disk* in ♂ of 4–6 glands, in ♀ annular. *Stamens* numerous, 10–30, on a central receptacle; filaments slender, free; anthers terminal, the cells adnate to the broad connective. *Ovary* 3-celled; ovule 1 in each cell; styles stout, 2-fid or 2-partite with smooth stigmatic surfaces. *Fruit* a capsule of 3 2-valved crustaceous cocci. *Seeds* ovoid, caruncled; testa crustaceous; albumen fleshy; cotyledons flat.

BALIOSPERMUM MONTANUM, Muell. Arg. *B. axillare*, Blume; F. B. I. v. 461. *B. polyandrum*, Wt. Ic. t. 1885.

N. Circars, Deccan and W. Coast, in shady places, at low levels. A stout leafy undershrub from 3–6 fr. high with leaves very variable in shape and size, the large ones ovate oblong or rounded, often 12 in. long and long-petioled, the small upper ones lanceolate. The seeds give a medicinal oil. Vern. *Hind.* Danti.

54. *Gelonium*, Roxb.

Evergreen glabrous trees or shrubs, the branches with stipular lines at the nodes. *Leaves* alternate or sometimes opposite, pellucid-punctate, entire or serrate; stipules connate, sheathing, caducous. *Flowers* small, dioecious, in axillary cymes or clusters. *Calyx* in ♂ of 5 concave orbicular imbricate lobes, in ♀ of 5–6 narrower lobes. *Petals* 0. *Disk* in ♂ 0, in ♀ cupular, the glands large, peripheric. *Stamens* 10–60, free, central on a convex receptacle, often mixed with rugose glands; filaments filiform; anthers oblong, dorsifixed, the cells parallel. *Ovary* 2–4-celled; ovule 1 in each cell; styles minute, reniform semilunate or bifid, depressed. *Fruit* a globose or obscurely lobed usually fleshy or crustaceous capsule. *Seeds* subglobose, arillate; testa crustaceous; albumen fleshy; cotyledons flat.

Flowers rather large, many, in cymes or clusters; leaves elliptic or elliptic-oblong, acute, up to 7 in. long; capsule rough, obscurely lobed, 5–75 in. in diam.

1. *multiflorum*.

Flowers small, rather few, in fascicles; leaves obovate or oblanceolate, obtuse, up to 4 in. long, but usually less; capsules smooth, deeply lobed, keeled on the lobes, 3–4 in. in diam. 2. *lanceolatum*.

1. *GELONIUM MULTIFLORUM*, A. Juss.; F. B. I. v. 459.
N. Circars, in evergreen forests and shady places; Travancore, but perhaps cultivated.
A small evergreen tree with coriaceous shining leaves. Bark grey, wood yellowish-white, close-grained. Vern. *Ur*. Khakra.
2. *GELONIUM LANCEOLATUM*, Willd.; F. B. I. v. 459; Wt. Ic. t. 1867.
N. Circars and Deccan, in hilly country; W. Gháts, Cochin and Travancore, at low levels, in evergreen forest. A small evergreen tree with shining pale coriaceous leaves Vern. *Tel*. Suragada; *Tam*. Kakaipalai.

55. *Sebastiania*, Spreng.

Herbs or shrubs. *Leaves* alternate, penninerved. *Flowers* minute, monoecious, in slender racemes, the ♂ 1—3 to each bract, the ♀ solitary or at the base of the raceme. *Calyx* of ♂ minute, membranous, unequally 5-lobed or -partite, of ♀ 3-lobed or -partite. *Petals* 0. *Disk* 0. *Stamens* 2—4; filaments short, free or nearly so; anther-cells distinct, contiguous, parallel. *Ovary* 3-celled; ovule 1 in each cell; styles free or connate at base, entire, revolute or spreading. *Fruit* a capsule of 3 cocci separating from a columella. *Seeds* oblong or subglobose, carunculate; testa smooth, albumen fleshy; cotyledons flat.

SEBASTIANIA CHANAELEA, Muell. Arg.; F. B. I. v. 475.

All plains Districts, a weed of cultivated land, and forest undergrowth.

A glabrous annual herb with linear leaves up to 3 in. long and a capsule with two rows of spines on the cocci.

56. *Excoecaria*, Linn.

Glabrous trees or shrubs with acrid milky juice. *Leaves* alternate or opposite, entire or subserrate. *Flowers* monoecious or dioecious, very small, in bracteate spikes or racemes, the ♂ 1—3 to each bract, 2-bracteolate, the ♀ at the base or in separate inflorescences; rhachis with large glands beneath or at the sides of the bracts. *Calyx* in ♂ of 3 small subequal lobes, in ♀ 3-lobed or -partite. *Petals* 0. *Disk* 0. *Stamens* 3, filaments free, anthers didymous, the cells parallel. *Ovary* 3-celled; ovule 1 in each cell; styles 3, stout, spreading or recurved. *Fruit* a capsule of 3 cocci separating from a columella, the valves crustaceous, twisting elastically. *Seeds* subglobose, not carunculate; testa crustaceous; albumen fleshy; cotyledons flat.

Leaves alternate, ovate-elliptic or orbicular, shortly acuminate, entire or sinuate-crenate, glabrous, up to 3 in. long, 2 in. broad; ♂ spikes very catkin-like, slender, up to 5 in. long, filaments long; capsule deeply lobed, 3 in. in diam., smooth

1. *Agollocha*.

Leaves opposite, serrate or crenulate; filaments short:—

Leaves chartaceous, lanceolate or oblanceolate, acuminate at both ends, up to 6 in. long, 1.5 in. broad, main nerves regular, 10—16 pairs; ♂ spikes slender, about 2 in. long, the bracteoles subulate; capsule deeply lobed, 5 in. in diam.

2. *crenulata*.

Leaves coriaceous, linear-oblong to oblong-lanceolate or -oblanceolate, abruptly acuminate, up to 10 in. long, 3 in. broad, main nerves regular, 15—20 pairs; ♂ spikes stout, 2—6 in. long, the bracteoles broadly ovate; capsules shallowly lobed, up to 1 in. in diam.

3. *robusta*.

1. EXCOECARIA AGALLOCHA, Linn.; F. B. I. v. 472; Wt. Ic. t. 1865 B.
Tidal forests and swamps on both coasts.
An evergreen tree with a poisonous milky juice. Bark grey, smooth, shining, with prominent lenticels; wood white, very soft, but apparently little used. Vern. *Hind.* Gangwa; *Tel.* Thilla; *Tam.* Tilai; *Mal.* Komatti.
2. EXCOECARIA CRENULATA, Wt. Ic. t. 1865; F. B. I. v. 473.
W. Ghâts, Nilgiris, Anamalais and hills of Travancore and Tinnevely, in Shola forests above 5,000 ft.
A small evergreen tree or shrub.
3. EXCOECARIA ROBUSTA, Hook. f.; F. B. I. v. 474.
W. Ghâts, Coorg, Nilgiris, Anamalais and hills of Travancore and Tinnevely; Kolimalai Hills of Trichinopoly; in evergreen forests at 2,000—5,000 ft.
A shrub with stout branches.

E. bicolor, Hassk., is a pretty shrub, common in gardens, having the under-surface of the leaves red.

57. Sapium, P. Br.

Trees or shrubs with milky juice. *Leaves* alternate, entire or toothed, penninerved; petiole often 2-glandular at top. *Flowers* monoecious, in terminal, simple or paniced, spikes or racemes; ♂ several to each bract, ♀ solitary, lower down or separate. *Petals* 0. *Disk* 0. *Stamens* 2—3; filaments free; anther-cells distinct, parallel. *Ovary* 2—3-celled; ovule 1 in each cell; styles free or connate at the base, spreading or recurved. *Fruit* a crustaceous fleshy or pulpy rarely woody capsule, at length loculicidally 3-valved. *Seeds* globose, not carunculate, usually long-persistent on the columella; testa crustaceous; alhumen fleshy; cotyledons flat.

Evergreen; ♂ and ♀ flowers on the same spike, the ♀ lowest, the styles long and slender; leaves lanceolate, acuminate, crenate-serrate, 3—5 in. long, 1—1.5 in. broad, main nerves very many and parallel; capsule large, depressed globose, 1—1.25 in. in diam., shining, very hard and woody.....1. *indicum*.
Deciduous; ♂ and ♀ flowers on separate spikes, the styles very short; leaves crowded at the ends of the branchlets, elliptic-ovate or obovate, acute, attenuate at base, crenate-serrate, 6—9 in. long, 3 in. broad, main nerves 12—20 pairs; capsule fleshy, 3 in. in diam., ovoid.....2. *insigne*.

1. SAPIUM INDICUM, Willd.; F. B. I. v. 471; Wt. Ic. t. 1950.
West Coast, along backwaters in Malabar and Travancore. A small tree with acrid milky juice. Bark smooth, grey; wood white with small brown heartwood.
2. SAPIUM INSIGNE, Benth.; F. B. I. v. 471. *Falconeria malabarica*, Wt. Ic. t. 1866.
Deccan, hills of Kurnool, Cuddapah and Nellore, Kambakam Hill in Chingleput, W. Ghâts and W. Coast, usually in rocky places, up to 6,000 ft.
A deciduous tree, usually small, but sometimes of a fair size, the branchlets thick and fleshy, the juice acrid and poisonous. Bark grey, smooth, shining; wood white or grey, soft and spongy. Vern. *Hind.* Lendwa.

S. sebiferum, Roxb., is the Chinese Tallow tree, occasionally found in cultivation. It is the white wax round the seeds that can be used for candles.

Pedilanthus tithymaloides, Poit, is a fleshy American shrub with red or orange flowers, often found in gardens or planted as a hedge plant. *Cicca disticha*, Linn., is the Star Gooseberry, a small tree allied to *Emblica*, whose fruits are cooked and eaten or made into preserves. The chief tree grown in plantations to produce india-rubber is *Hevea braziliensis*, the Pará rubber tree of Brazil, while the less cultivated Ceará rubber is given by *Manihot Glaziovii*, Muell. Arg.

Manihot utilisima, Pohl, is the Cassava plant, occasionally cultivated for its tubers, which are edible, and from which also the starch known as Tapioca is prepared.

The common garden shrubs with curiously shaped and variegated leaves known as "Crotons" are species of the genus *Codiaeum*, especially *C. variegatum*, Linn., from the islands of the Pacific.

PREFACE TO REPRINTED EDITION

When the Botanical Survey of India was reorganised in 1954 the Government of India decided on the advice of the eminent Botanists of the country that the important Floras of the country which had gone out of print should be reprinted in order to provide immediate facilities of work on Systematic Botany of Phanerogams by students and Botanists of the country. The reprints are now being issued accordingly.

One particular point needs a special mention here. The Government of India, while recognising fully the need for bringing the Floras of the country upto date after a thorough revision, cannot overlook the fact that such work is possible only on an extensive and thorough exploration of both regions already explored and those hitherto unexplored and a proper rating of the information thus obtained with the materials in the already published Floras. For this reason alone, there is ample justification for a reprint of the old Floras; the present effort is therefore the starting point in the greater project of the review of the Flora of our country. It is hoped that these publications should thus meet the long-felt requirement of the Botanists of the country.

Owing to the necessity to conform to certain printing stipulations and using the same size of paper for all the reprinted Floras, the paginations in the reprinted volumes differ from the original. But the index, which is correspondingly corrected, would, it is hoped, enable reference without inconvenience.

The corrections mentioned in the corrigenda have been incorporated and some of the printing mistakes in the original flora have been corrected in this publication.

The reprint is being bound in three volumes as suggested in the original publication.

FLORA
OF THE
PRESIDENCY OF MADRAS

BY
C. E. C. FISCHER
LATE OF THE INDIAN FOREST DEPARTMENT

PART VIII
ULMACEAE TO XYRIDACEAE.

PUBLISHED UNDER THE AUTHORITY
OF THE GOVERNMENT OF INDIA

CALCUTTA

1956

polygamous, cymose, ♂ and ♀ usually at the base of the shoots, ♀ in upper axils. *Calyx*-lobes 4 or 5, imbricate. *Petals* 0. *Stamens* 4 or 5, inserted round a woolly torus. *Ovary* sessile; ovule pendulous; style-arms simple or lobed. *Fruit* a small ovoid or globose drupe; endocarp hard, smooth or rugose. *Seed* with membranous testa; albumen scanty or 0; embryo curved; cotyledons broad, inflexed flat or replicate, surrounding the upcurved radicle.

Leaves with one or more strong primary nerves above the basal ribs, membranous, very oblique, usually sharply serrate nearly to the base, acutely acuminate or caudate

1. *tetrandra*.

Leaves without strong primary nerves above the basal ribs:—

Twigs reddish-brown, lenticellate; mature leaves chartaceous or subcoriaceous, reticulations coarse, indistinct; pubescence ferruginous; sepals ciliate

2. *cinnamomea*.

Twigs grey-brown, not lenticellate; mature leaves rigidly coriaceous, reticulations fine, distinct; pubescence grey; sepals ciliate.....3. *Wightii*.

1. *CELTIS TETRANDRA*, Roxb.; F. B. I. v. 482. *C. serotina*, Planch. Wt. Ic. t. 1970.

All forest Districts from 2,500—7,500 ft. The Nilgiri Elm. A handsome medium-sized tree. Bark grey; wood greyish-white, not hard; not used in South India. Vern. Tel. Jabjabal; Tam. Kuviya; Bad. Aduva; Pul. Oma.

2. *CELTIS CINNAMOMEA*, Lindl.; F. B. I. v. 482. *C. trinervia*, Bedd. Fl. t. 312 (not of Roxb.).

All forest Districts from 500—4,500 ft.; common in dry forests and also at low elevations in evergreen forests; Rampa (Gamble).

A small tree. Bark pale green, covered with small lenticels; wood dull white with a small dark hard core, with a disgusting smell when freshly cut; not used except medicinally. Vern. Tel. Koti-bira, Yemika-bira, Kaki-mushti; Tam. Kalluviri, Pinar, Kodalimuriki; Mal. Butha.

3. *CELTIS WIGHTII*, Planch.; F. B. I. v. 483; Wt. Ic. t. 1969.

In the same localities as the last species; very similar to it and not easily distinguished from it. The same vernacular names apply.

3. *Gironniera*, Gaud.

Evergreen, unarmed trees or shrubs. *Leaves* alternate, penninerved, entire; stipules sheathing the buds, deciduous. *Flowers* dioecious, in axillary cymes or the ♀ solitary. *Perianth* simple, calycine, 5-partite, obtuse in ♂, narrower and acute in ♀. *Stamens* 5, filaments erect. *Pistillode* a tuft of hairs. *Ovary* glabrous; style central with 2 filiform, brown-tomentose arms. *Drupe* ovoid, slightly compressed, stoutly beaked, about 75 in. long including the beak. *Seed* subglobose; albumen 0, scanty or copious; embryo contorted.

GIRONNIERA RETICULATA, Thw.; F. B. I. v. 486; Bedd. Fl. t. 313.

E. and W. Ghats up to 3,000 ft. Coorg, Mysore (Meebold), hills of Vellore and Trichinopoly (Barber) and of Tinnevely and Travancore (Beddome). Not common.

A very large timber tree with buttressed base. Wood red-brown, hard, heavy, valuable for engineering (Beddome), planking, rafters, etc. Vern. *Tam. Koditani*.

4. *Trema*, Lour.

Small trees. *Leaves* alternate, serrate, oblique and 3-ribbed at the base; stipules lateral, caducous. *Flowers* dioecious, monoecious or polygamous, in axillary cymes. *Perianth* simple, calycine, 4—5-partite, induplicate-valvate or subimbricate, minute in the males. *Stamens* 4—5, erect in bud; pistillode small. *Ovary* sessile; style central with 2 linear arms. *Drupe* ovoid or subglobose, usually tipped by the style. *Seed* small, testa membranous; albumen fleshy; cotyledons narrow; radicle ascending.

TREMA ORIENTALIS, Bl.; F. B. I. v. 484. *Celtis orientalis*, L.; Wt. Ic. t. 602 and 603. *Sponia Wightii*, Planch.; Wt. Ic. t. 1971; Bedd. Fl. t. 311.

Common in all districts in dry and evergreen forests from near sea-level to 8,000 ft. The Charcoal Tree.

A small rapid-growing tree, quickly appearing in forest clearings. Bark greyish-brown with numerous lenticels; wood light reddish-grey, soft, excellent for charcoal for gun-powder, otherwise useless. The tree is useful for the rapid reclothing of cut-over areas and as a shade-plant. Vern. *Ur. Jivani*; *Tel. Gada-nelli*; *Tam. Ambaratthi*, Oman, Mudalei, Mini, Yerralai; *Mal. Ratthi*, Arni, Amathalai; *Kan. Gurklu*; *Bad. Womai*.

Family CXXXVII. CANNABINACEAE.

Shrubs or herbs, sometimes climbing, often aromatic. *Leaves* opposite and alternate, palmately nerved or palmately compound; stipules free, persistent. *Flowers* dioecious, axillary, males cymose or paniced, females in small cymes or heads with large bracts. *Perianth* inferior, 5-sepalous, imbricate in the males, reduced and entire in the females. *Stamens* 5, erect in bud. *Pistillode* 0. *Ovary* sessile, 1-celled, 1-ovuled; stigmas 2, large, feathery. *Fruit* an achene. *Seed* pendulous; embryo curved or spiral.

Cannabis, Tourn.

Erect herbs. *Leaves* usually opposite below and alternate above, upper palmately 3—1 foliate, passing into bracts, lower 3—8 foliate, serrate. ♂ *flowers* in short pendulous cymose panicles; ♀ crowded with leafy bracts, perianth 0 or hyaline. *Style* arms 2, filiform, caducous. *Achene* compressed, crustaceous. *Seed* flattened, albumen unilateral.

CANNABIS SATIVA, Linn.; F. B. I. v. 487.

Not indigenous but occasionally cultivated. Pulneys (Bourne). The Hemp Plant.

A large aromatic resinous herb. Not grown for its fibre in tropical regions but as the source of the drugs *Ganja* and *Bhang*.

Vern. *Hind.* Ganja, Bhang, Charas, Siddhi; *Tel.* Ganjari-chettu, Ganja-chettu, Bangi-aku; *Tam.* Ganja-chedi; *Mal.* Kancháva-chetti; *Kan.* Bhangigida.

Family CXXXVIII. MORACEAE.

Trees, shrubs or herbs, often with milky juice. *Leaves* usually alternate, rarely opposite, simple, frequently dotted (cystoliths); stipules deciduous, often sheathing and leaving an annular scar. *Flowers* small, monoecious or dioecious, usually cymose but sometimes becoming capitate or spiciform, the ♀ sometimes solitary. *Perianth* single, calycine, usually 4-merous, free or connate, often accrescent in fruit. *Stamens* isomeric and opposite the sepals or reduced in number. *Ovary* superior, 1-celled; styles 1 or 2, simple or 2-partite; ovule solitary, pendulous. *Fruit* an achene or drupe or sub-2-valvate, often aggregate into fleshy pseudocarps or anthocarps. *Embryo* usually curved; cotyledons often unequal, the larger enfolding the smaller.

Thorny trees or shrubs:—

Leaves more or less toothed; base narrowed, emarginate, upper surface minutely pustular; ♀ flowers solitary with accrescent, foliaceous sepals; fruit simple, ultimately valvate.....1. **Phyllochlamys**.

Leaves quite entire; base not emarginate, usually narrowed into the petiole, not pustular; ♀ flowers capitate, sepals connate into a fleshy head; fruit a fleshy anthocarp with several immersed achenes.....2. **Plecosperrum**.

Thornless trees, shrubs or herbs:—

Plants with milky juice:—

♂ flowers in pedunculate heads; stamens inflexed in bud, anthers reversed.....3. **Streblus**.

♂ flowers on the interior or exterior surface of a receptacle; stamens and anthers straight in bud:—

All the flowers crowded on the inner surface of a fleshy receptacle with a small mouth more or less completely closed by bracts.....4. **Ficus**.

♂ flowers crowded on the exterior surface of a fleshy receptacle:—

♂ flowers crowded on the upper surface of a disciform receptacle, ♀ solitary.....5. **Antiaris**.

All the flowers crowded around an oblong or globose receptacle

6. **Artocarpus**.

Plants with watery juice:—

Trees; flowers spicate or subcapitate; ♀ perianth fleshy.....**Morus**.

Herbs; flowers crowded on the upper surface of a flat receptacle; ♀ sunk in the receptacle.....7. **Dorstenia**.

1. **Phyllochlamys**, Bureau.

Thorny small trees or shrubs with milky juice. *Leaves* alternate, usually toothed, penninerved. *Flowers* dioecious, axillary, ♂ sessile in short bracteate spikes or heads; ♀ solitary, long-peduncled. *Perianth* of 3—4 sepals, imbricate, accrescent and foliaceous in ♀. *Stamens* 4. *Pistillode* dilated at the apex. *Ovary* 1-celled, 1-ovuled; style 2-partite. *Fruit* obliquely ovoid or globose, included in the persistent perianth; pericarp sub-fleshy below, thin above and finally 2-valved. *Seed* oblique, testa membranous; albumen 0; embryo large, subglobose, one cotyledon larger and enfolding the other.

PHYLLOCHLAMYS SPINOSA, Bur.; F. B. I. v. 488. *Epicarpurus spinosus*, Wt. Ic. 1962 (upper and right-hand figures).

Circars; Cuddapah (Beddome); Coromandel (Macé); Courtallam (Wight, Beddome); Travancore (M. Rama Rao). Not common.

A small evergreen gnarled tree or large shrub; spines terminating the branchlets, strong, sometimes leafy. Vern. *Tel.* Sukali.

2. *Plecosperrum*, Tréc.

Thorny small trees or shrubs with milky juice. *Leaves* quite entire, penninerved. *Flowers* dioecious, both sexes in axillary, 1—3-nate, pedunculate heads. *Perianths* of ♂ 4-lobed, concave, imbricate, of ♀ fleshy, 4-toothed, connate into a fleshy head. *Stamens* 4. *Pistillode* minute, hairy. *Ovary* straight, sunk deep in the fleshy head with the long, simple style protruding. *Fruit* an irregularly-shaped anthocarp enclosing a few coriaceous achenes adnate to the perianths. *Albumen* 0; embryo large, subglobose; one cotyledon larger, enfolding the other.

PLECOSPERMUM SPINOSUM, Tréc.; F. B. I. v. 491; Wt. Ic. t. 1963.

Common in the drier districts, and in the Nilgiri, Anamalai and N. Coimbatore Hills up to about 4,000 ft.

A large rambling shrub often climbing by means of its thorns, which are stout, long and straight or shorter and deflexed or slightly curved. Bark thin, orange-coloured; wood greyish-white with a small, very hard, bright orange-yellow heart-wood which gives a yellow dye. Vern. *Ur.* Bana-bana; *Tel.* Koriti, Kodiari, Daya-mulla; *Tam.* Achingudi, Daiyal; *Kan.* Bendaka.

3. *Streblus*, Lour.

Trees or shrubs with milky juice. *Leaves* alternate, penninerved or sub-3-ribbed, usually very scabrid; stipules small, ensiform. *Flowers* dioecious, rarely monoecious, axillary, ♂ in peduncled heads or spikes, ♀ solitary or 2—4 together, peduncled, bracteate at the base. *Perianth* of 4 imbricate sepals. *Stamens* 5. *Pistillode* dilated at the apex. *Ovary* straight, embraced by the sepals; style central with 2 very long arms. *Fruit* subglobose, pericarp thinly coriaceous, enclosed in the fleshy, persistent perianth. *Seed* globose; testa membranous; albumen 0; embryo globose, one cotyledon larger than and enfolding the other.

STREBLUS ASPER Lour.; F. B. I. v. 489. *Epicarporus orientalis*, Bl.; Wt. Ic. t. 1961.

Common in all but the wettest tracts up to about 2,000 ft.

A small, often gnarled, evergreen tree with usually small, wedge-shaped leaves. Bark soft, light grey, irregularly ribbed; wood white, moderately hard, tough and elastic; very difficult to cut and little employed. The rough leaves are used to polish ivory and wood. Vern. *Ur.* Sahada; *Tel.* Pakki; *Tam.* Pura, Pirasu; *Mal.* Pareukeu, Parava; *Kan.* Mitli, Punjai.

4. *Ficus*, Linn.

Trees and shrubs, sometimes scandent, often epiphytic in early life. Juice always more or less milky. *Leaves* alternate, rarely opposite, usually entire but sometimes toothed or lobed; stipules sheathing the

bud, caducous and leaving annular scars. *Flowers* minute, inserted on the inner walls of a fleshy receptacle with an apical mouth which is more or less completely closed by small imbricating bracts, of four kinds: ♂, ♀, gall and neuter, which may all occur in a species or one or both of the last two may be wanting; variously arranged in the same or separate receptacles, often mixed with scales or hairs; when androgynous the fewer ♂ are usually segregated near the mouth. *Perianth* of ♂ 2-fid or partite, imbricate, of ♀ as in the male or reduced. *Stamens* usually 1 or 2, rarely 3-6, erect in bud. *Ovary* straight or oblique; style excentric; ovule solitary, pendulous; *Gall-flowers* similar to ♀ but the ovary containing the larva or pupa of an insect; neuter perianth usually 3-fid, without trace of sexual organs. *Fruit* an achene or fleshy, small, included in the accrescent, fleshy syncarp. *Albumen* scanty; embryo curved, cotyledons equal or unequal.

Leaves all alternate:—

Leaves neither scabrid nor hispid above:—

Erect trees though often epiphytic at first:—

Leaves with not more than 16 pairs of primary nerves:—

Receptacles sessile (rarely shortly pedunculate in 6. *Tjakela*, 7. *insectoria*,

10. *Arnottiana*):—

Leaves not caudate:—

Leaves pubescent or tomentose below, at least when young:—

Leaves persistently grey-tomentose below with a gland at the base of the midrib (sometimes concealed by the tomentum), elliptic-ovate, obovate or subrotund; apex rounded or bluntly apiculate; base rounded, emarginate or cordate, 2-7.5 in. long, 1.5-5 in. broad, 3-7-ribbed; primary nerves 5-8 pairs; receptacles in axillary pairs, subglobose, tomentose, .25-.5 in. in diam.

1. *tomentosa*.

Leaves glabrescent, glandless:—

Leaves obtuse, elliptic to broadly ovate, base rounded, subcordate or slightly narrowed, 4-8.5 in. long, 2-5.5 in. broad, 3-7-ribbed, primary nerves 4-6 pairs; receptacles in axillary pairs, globose, puberulous, about .5 in. in diam. with 3 large rounded basal bracts, red when ripe.....2. *bengalensis*.

Leaves shortly abruptly acuminate, ovate to ovate-elliptic; base rounded, emarginate or cordate, 4-9.5 in. long, 2.5-6.5 in. broad, 3-5-ribbed; primary nerves 9-13 pairs, very prominent below, regular, parallel; receptacles in axillary pairs, oblong to subovate, about 1 in. long, nearly glabrous and orange-red when ripe

3. *mysorensis*.

Leaves glabrous:—

Petioles rarely over .5 in. long; leaves elliptic, ovate to obovate-rotund; apex rounded, slightly emarginate or bluntly apiculate; base narrowed, 1.5-4 in. long, .75-3 in. broad, 3-ribbed; primary nerves 5-6 pairs, appearing numerous because not much stronger than the secondary; receptacles in axillary pairs, depressed-globose, glabrous, about .3 in. in diam., yellowish or reddish when ripe

4. *retusa*.

Petioles 1 in. or more long:—

Basal bracts minute, scarious; leaves coriaceous, broadly ovate or ovate-lanceolate; apex acute or shortly bluntly cuspidate; base narrowed or rounded, 2-5.5 in. long, 1.3-3 in. broad; margin thick, cartilaginous, 3-ribbed; primary nerves 6-10 pairs (indistinct in fresh leaves), petioles 1.5-3 in. long; receptacles in axillary pairs, globose, about .5 in. in diam., smooth, purple when ripe.....5. *Tsiela*.

Basal bracts patent, not scarious:—

Receptacles 2—6 together on short tubercles in the axils of present or fallen leaves, basal bracts bifid; leaves coriaceous, very glossy above, oval or ovate; apex rounded, shortly abruptly acuminate; base rounded, rarely narrowed, 4—10 in. long, 1.75—5 in. broad, 3—5-ribbed, primary nerves 6—10 pairs, petioles 1.75—3 in. long; receptacles depressed-globose, .2 in. in diam., whitish-yellow and dotted when ripe, rarely very shortly peduncled.....6. *Tjakela*.
 Receptacles in axillary pairs, not on tubercles, basal bracts entire; leaves membranous, not or hardly glossy, ovate or oblong-ovate; apex rather abruptly shortly acuminate; base usually rounded, emarginate or subcordate, 3—6 in. long, 1.5—3.5 in. broad, 3-ribbed; primary nerves 5—7 pairs; petioles 1.1—2.75 in. long; receptacles globose, .25 in. in diam., whitish flushed with red and dotted when ripe.....7. *infectoria*.

Leaves caudate:—

Petioles 1.25 in. or less long; leaves narrowed at base, narrow-elliptic to broad-ovate; apex shortly, acutely caudate, 2—5 in. long, .5—2.5 in. broad, the caudicle up to .6 in. long and often curved, 3—5-ribbed, primary nerves 6—9 pairs, fairly prominent, petioles .5—1.25 in. long; receptacles in axillary pairs, obovoid, smooth up to .25 in. in diam.

8. *Talboti*.

Petioles 2 in. or more long; leaves broad at base:—

Cusp of leaf 1—3.5 in. long; base usually truncate; primary nerves usually 8 pairs; coriaceous, ovate-rotund; apex narrow and caudate; cusp linear or linear-lanceolate, often curved; base sometimes rounded, very rarely narrowed, up to 11 in. long including the cusp, up to 6.5 in. broad, 5—7-ribbed; margins usually strongly waved; petioles slender, 2—5 in. long; receptacles in axillary pairs, depressed globose, smooth, .5 in. in diam., with 3 broad, spreading basal bracts, dark purple when ripe.....9. *religiosa*.
 Cusp of leaf .5—1 in. long; base usually deeply cordate; primary nerves 5—7 pairs, broadly ovate; apex finely caudate; base seldom emarginate or truncate, never narrowed, up to 9 in. long, 3.5 in. broad, 7-ribbed; margins subundulate; petioles 2—3.5 in. long; receptacles sessile or very shortly peduncled in pairs or clusters on tubercles usually in the axils of fallen leaves, depressed-globose, .25—.5 in. in diam., purple with greenish dots when ripe

10. *Arnottiana*.

Receptacles distinctly peduncled:—

Receptacles axillary on the twigs:—

Petioles less than 1 in. long; leaves elliptic to oblanceolate; apex narrowed or rounded and narrowly, acutely caudate; base narrowed, rarely rounded, slightly inequilateral, 2.5—6.5 in. long, 1—2.75 in. broad, the cusp up to .6 in. long, 3—5-ribbed; primary nerves 5—10 pairs; receptacles in pairs, without basal bracts, sub-globose, smooth or slightly verrucose, glabrous, .25—1 in. in diam., peduncle up to .6 in. long.....11. *nervosa*.

Petioles more than 1 in. long:—

Receptacles solitary; leaves more or less scabrid below, rigid, coriaceous, elliptic to broad-ovate; apex rounded or shortly bluntly acuminate; base broad, rounded (rarely narrowed, and then the leaf is nearly obovate), 4—9 in. long, 3—4.5 in. broad, 3—5-ribbed; primary nerves 5—12 pairs; margins slightly recurved; petioles 1—2.5 in. long; receptacles pubescent-scabrid, subglobose, narrowed into a short stalk, about 1 in. in diam., with 3 broad-ovate basal bracts, yellow when ripe; peduncles about .8 in. long.....12. *callosa*.

Receptacles twin; leaves not at all scabrid:—

Leaves minutely white-pubescent below, ovate-elliptic to broad-ovate; apex acute or acuminate; base more or less deeply cordate, up to 12 in. long and 9 in. broad, 3—7-ribbed; primary nerves 10—13 pairs, prominent below; petioles up to 4 in. long; receptacles

obovoid, pubescent, about .5 in. in diam., with 3 broadly triangular, densely hairy, sometimes bifid, spreading basal bracts

13. *Dalhousiae*.

Leaves glabrous below:—

Basal bracts 3, free or connate at base, persistent; leaves ovate, abruptly acuminate; base broad, truncate to slightly emarginate, or sometimes rounded and then suddenly contracted into the petiole, 6—12 in. long, 3—5 in. broad, 3-ribbed; primary nerves about 12 pairs, nearly horizontal; margin somewhat sinuate; petioles stout, 2—4.5 in. long; receptacles ovoid or slightly obovoid with several vertical ridges; umbilicus prominent, 1 in. long; peduncles stout, .2—75 in. long.....14. *Beddomei*.

Basal bracts 2, connate at base, caducous, leaving an annulus; leaves coriaceous, brownish below, elliptic-lanceolate to broadly elliptic; apex narrowed, obtuse; base narrowed, 3.5—5 in. long, 1.75—2.75 in. broad, 3-ribbed; primary nerves about 15 pairs; petioles stout, 2—3.5 in. long; receptacles subglobose, somewhat ribbed, dotted, about .6 in. long; peduncles stout, .5—75 in. long.....15. *Angladei*.

Receptacles on short, leafless branchlets from the main stem or larger branches:—

Leaves entire, elliptic-lanceolate, ovate or obovate-oblong, sometimes slightly inequilateral; apex narrowed, blunt or acute; base narrowed, obtuse or acute, glabrous, 2.75—6 in. long, 1.5—2.5 in. broad, 3-ribbed; primary nerves 4—8 pairs; secondary nerves irregular and indistinct; petioles .3—1.75 in. long; receptacles on scariously bracteolate, tubercled and warted branchlets, subglobose, smooth, about 1.25 in. in diam., reddish when ripe; peduncles up to .75 in. long...16. *glomerata*. Leaves coarsely, remotely toothed, lanceolate or ovate to broadly elliptic, apex acute or acuminate; base subcuneate, rounded or emarginate, never cordate, puberulous on the nerves below, eventually glabrous above, minutely papillose below, 5—9 in. long, 3—4.5 in. broad, 3—5-ribbed; primary nerves 4—8 pairs; secondary nerves subregular, transverse between the primaries, distinct below; petioles 1.5—3.5 in. long; receptacles on tubercles on leafless branchlets, subglobose or pear-shaped, 1 in. or a little more in diam., reddish when ripe; peduncles 1—2.5 in. long.....17. *pomifera*.

Leaves with very many primary nerves:—

Receptacles over .5 in. in diam.; leaves elliptic to broadly ovate-elliptic, shortly abruptly acuminate or shortly caudate; base rounded or subacute, 2—4.5 in. long, .5—2 in. broad, indistinctly 3-ribbed; petioles .4—1 in. long; receptacles sessile in axillary pairs, globose, about .75 in. in diam.

18. *comosa*.

Receptacles less than .5 in. in diam.:—

Petioles 1—2.5 in. long; stipule single, subpersistent, about half the length of the leaf; leaves thick, leathery, oblong-elliptic, with a short abrupt caudicle; base rounded or narrowed, 3—12 in. long, 1.5—5.5 in. broad; 3—5-ribbed; midrib prominent, thick; receptacles sessile in axillary pairs, ovate-oblong, smooth, about .5 in. long, greenish-yellow when ripe.....*elastica*.

Petioles .4—1 in. long; stipules deciduous, about .5 in. long; leaves thinly coriaceous, ovate-elliptic, bluntly acuminate; base rounded or subacute, 2—4.5 in. long, 1—2 in. broad, 3-ribbed; receptacles sessile in axillary pairs, globose or ovoid, smooth, about .33 in. in diam., blood-red when ripe.....*Benjamina*.

Scandent shrubs:—

Leaves lanceolate; apex acuminate, base acute, 4.5—8 in. long, 1.5—2.5 in. broad, 3-ribbed, primary nerves 10—12 pairs, margins subundulate, petioles .5—1 in. long; receptacles in axillary pairs, globose, glabrous, .25—5 in. in diam.; basal bracts 3, deciduous, peduncles about .25 in. long

19. *travancorica*.

Leaves broadly ovate:—

Twigs nearly glabrous; leaves membranous, broadly ovate, sometimes inequilateral; apex shortly acuminate; base rounded or very shallowly cordate, pubescent or subglabrous below, 4—7 in. long, 2·5—4·5 in. broad, 3—5-ribbed; primary nerves 3—4 pairs; petiole glabrescent, 75—2·5 in. long; receptacles fascicled on the naked branches below the leaves, globose, pubescent or nearly glabrous, 1—2·5 in. in diam., without basal bracts, spotted when ripe; peduncles about 33 in. long, with several bracteoles at the base.....20. *macrocarpa*.

Twigs tomentose; leaves subcoriaceous, broadly ovate to rotund-ovate; apex usually shortly, abruptly caudate, base usually shallowly cordate, usually thinly tomentose below, 3·75—6·75 in. long, 2·5—5 in. broad, 3—5-ribbed; primary nerves 3—4 pairs; petioles rusty-tomentose, 75—2 in. long; receptacles in fascicles on tubercles on the branches or stem, subglobose, pubescent, 1—2 in. in diam., blotched; basal bracts 3, broadly ovate, caducous; peduncles stout, rusty-tomentose, up to 5 in. long

21. *guttata*.

Leaves more or less scabrid or hispid above (smooth in var. *cuspidifera* of 22. *gibbosa*):—

Leaves not semi-sagittate:—

Leaves acute or cuneate at base, very rarely rounded, usually inequilateral with one side more or less gibbous, elliptic-ovate to lanceolate or oblanceolate, very rarely nearly orbicular; apex obtuse, acute or cuspidate, minutely hispid below (glabrous on both sides in var. *cuspidifera*), 1·5—5·5 in. long; 6—3 in. broad, 3-ribbed; primary nerves 3—7 pairs; receptacles shortly peduncled in pairs or fascicled on the twigs, subglobose, scabrid, 2—3 in. in diam., yellow when ripe.....22. *gibbosa*.

Leaves not acute or cuneate at base:—

Weak shrubs, often creeping; leafy twigs pithy and more or less hollow; leaves very variable, entire or 2-many-lobed, outline from narrow-lanceolate to rotund-ovate; apex rounded or more or less acuminate, base rounded or cordate; both surfaces scabrous or the lower (sometimes the upper also), tomentose, 2—6·5 in. long, 5—2·5 in. broad, 3—5-ribbed; primary nerves 4—8 pairs, margins irregularly and coarsely toothed or repand; receptacles axillary, solitary, rarely twin, globose to elongate pear-shaped, umbilicus always prominent, more or less scabrid-hispid, 5—1 in. long, dark-orange when ripe; peduncles 5—1 in. long

23. *heterophylla*.

Erect shrubs or small trees; twigs soon woody and solid:—

All parts very scabrid; leaves elliptic, ovate or obovate, rarely 3—5-lobed, often inequilateral; apex rounded or acuminate; base rounded, rarely narrowed; upper surface with short, stiff hairs from bulbous bases, 2·5—7·5 in. long, 1·25—3·25 in. broad, 3-ribbed; primary nerves 3—5 pairs, prominent below, as are the ultimate reticulations; petioles 5—3·5 in. long; receptacles axillary, solitary, globose with a prominent umbilicus, scabrous-hispid, 5—75 in. in diam., yellow or purple with yellowish dots when ripe; peduncles 2—4 in. long

24. *asperima*.

Shoots softly tomentose; leaves subscabrid-tomentose, orbicular-ovate, entire or obtusely 3—5-lobed, acute or apiculate, 1·5—5 in. in diam., 3-ribbed; primary nerves 3—6 pairs; petiole 1—2 in. long; receptacles axillary, solitary, subglobose to pyriform; base constricted, 5—1 in. in diam., yellow when ripe; peduncles 5—1 in. long.....25. *palmata*.

Leaves semi-sagittate, one side with a large 3—4-ribbed lobe, the other cuneate or with a small 1—2-ribbed lobe, elliptic to oblong-lanceolate; apex acuminate, 4—9 in. long, 1·5—3·5 in. broad; primary nerves 9—14 pairs; petioles scabrid, 2—6 in. long; receptacles shortly peduncled in pairs on usually leafless branchlets from the stem or larger branches, globose or pear-shaped, warted, hispid, often bearing irregular bracts on the sides, 4—7 in. in diam., reddish-brown when ripe.....26. *unia*.

Leaves opposite, very rarely alternate, membranous, elliptic-ovate, oblong, obovate or obovate-oblong; sometimes inequilateral; apex acute, acuminate or cuspidate; base cuneate, rounded or emarginate, both surfaces hispid-pubescent, up to 14 in.

long and 6 in. broad, 3—5-ribbed; primary nerves 5—6 pairs, some at least branching about halfway to the margin; secondary nerves regular and straight, petioles .5—2.5 in. long; receptacles fascicled on the stem or leafy branchlets, obovoid or turbinate, sometimes with scattered bracts on the sides, hispid, .5—1 in. in diam., yellowish when ripe; peduncles up to .6 in. long.....27. *hispida*.

1. *FICUS TOMENTOSA*, Roxb.; F. B. I. v. 501; King Ann. Calc. i. t. 18 and 81g; Wt. Ic. t. 647.

In all districts from sea-level to 5,000 ft., usually in dry rocky places. Rampa Hills (Narayanswami).

A small or fairly large tree throwing out small aërial roots from the branches; often epiphytic. Bark greenish-white; wood white, useless. Vern. *Tel.* Jivi, Juvi, Kaljuvi; *Tam.* Ichchi, Kal-ichchi; *Mal.* Kal-al; *Kan.* Kallatti.

2. *FICUS BENGALENSIS*, Linn.; F. B. I. v. 499; King Ann. Calc. i. t. 13 and 81c. *Urostigma bengalense* Gasp.; Wt. Ic. t. 1989.

In all districts from sea-level to 4,000 ft. in deciduous and semi-evergreen forest. Much planted in avenues and for shade, for which purposes it is admirably suited. The Banyan.

A very large tree throwing out numerous large aërial roots from the main trunk and large branches, which descend to the soil and form supports, and are then capable of separate existence when severed from the parent tree. Held in reverence by the Hindus. Bark greyish-white; wood greyish-white, moderately hard, without heartwood, durable under water and used for well-curbs, also for tent and yoke poles. Vern. *Hind.* Bor, Bar, Ber; *Ur.* Boru; *Tel.* Mari, Pedda-mari; *Tam.* and *Mal.* Ala, Per-al; *Kan.* Alada.

3. *FICUS MYSORENSIS*, Heyne; F. B. I. v. 500; King Ann. Calc. i. t. 14 and 81d.

From Central Mysore southwards in moderately wet forests from 500—3,500 ft. Saklaspur (Barber, Meebold), Attapadi Valley (Fischer), Pulneys (Rodriguez).

A large, handsome, shady tree with few aërial roots; occasionally epiphytic. Sometimes planted in avenues. Wood soft, useless. Vern. *Tam.* Kal-ala, Sonnai-ala; *Kan.* Goni-mara.

Var. *pubescens*, Roth, has smaller leaves with fewer primary nerves, denser tomentum, which is a deep ferruginous red on the younger parts. In the same localities as the type but less frequent.

4. *FICUS RETUSA*, Linn.; F. B. I. v. 511; King Ann. Calc. i. t. 61 and 84p.

In all districts from sea-level to about 4,000 ft. Sometimes planted in avenues. Rampa Hills (V. Narayanswami), Ganjam (Barber).

A large, evergreen tree with few aërial roots; sometimes epiphytic. Bark brown, fairly smooth; wood light reddish-grey, moderately hard, one of the best of the fig woods. Vern. *Tel.* Juvi, Konda-juvi, Yerra-juvi; *Tam.* Pon-ichchi, Kal-ichchi, Kal-atthi; *Mal.* Itival; *Kan.* Pilala, Kirugoli.

Var. *nitida*, Thunb.; F. B. I. v. 511; King Ann. Calc. i. t. 62; *Ficus nitida*, Roxb.; Wt. Ic. t. 642, is a similar tree with the leaves narrowed at the base. The range of the type.

5. *FICUS TSIELA*, Roxb. ; F. B. I. v. 515 ; King Ann. Calc. i. t. 73, 74 and 84z2 ; Wt. Ic. t. 668 ; Bedd. Fl. t. 314.

From Kurnool southwards, in deciduous and evergreen forests from 1,000—3,500 ft. Frequently planted in avenues, and for shade.

A large, spreading tree with few or no aerial roots ; often epiphytic. Bark greenish-grey, smooth ; wood grey, soft to moderately hard. Vern. *Ur.* Jori ; *Tel.* Pedda-juvi ; *Tam.* Kal-ichchi ; *Mal.* Kirgali ; *Kan.* Billibasari.

6. *FICUS TJAKELA*, Burm. ; F. B. I. v. 514 ; King Ann. Calc. i. t. 70 and 84x.

In the forests of the West Coast from sea-level to about 4,000 ft., extending to the Javadi Hills (Barber). Sometimes planted as a shade tree in coffee plantations.

A very tall tree without aerial roots. Bark dark-brown, rather rough ; wood brown, soft. Vern. *Mal.* Kar-al ; *Kan.* Karibasari.

7. *FICUS INFECTORIA*, Roxb. ; F. B. I. v. 515 ; King Ann. Calc. i. t. 75 and 84y2 ; Wt. Ic. t. 665.

In all districts from near sea-level to 7,000 ft. Not common wild, but frequently planted near and in villages.

A large deciduous tree without aerial roots ; frequently epiphytic. Bark greenish-grey, smooth ; wood grey, moderately hard. Vern. *Hind.* Pakri ; *Ur.* Pakodo ; *Tel.* Jati, juvi ; *Tam.* Malai-ichchi ; *Mal.* Cherla ; *Kan.* Basari.

Var. *Lambertiana*, Miq. ; F. B. I. v. 516 ; King Ann. Calc. i. t. 76, has leaves with bases broad, rounded, emarginate or subcordate, rarely narrowed ; receptacles 3—4 in. in diam. on pubescent peduncles 2—3 in. long.

Var. *Wightiana*, Wall. ; F. B. I. v. 516 ; King Ann. Calc. i. t. 77, has smaller leaves narrowed at the base ; receptacles large in proportion to the leaves, on glabrous or pubescent peduncles about 2 in. long.

8. *FICUS TALBOTI*, King Ann. Calc. i. 51, t. 63 and 84q ; F. B. I. v. 512.

In the evergreen forests of the W. Ghâts from 500—4,500 ft. Not common.

A large, evergreen tree with few or no aerial roots ; usually epiphytic in youth. Bark green, very smooth ; wood very white when fresh, turning yellow ; useless. Vern. *Tam.* Itthi, Kal-ithi.

9. *FICUS RELIGIOSA*, Linn. ; F. B. I. v. 513 ; King Ann. Calc. i. t. 67a and 84u ; Bedd. Fl. t. 314. *Urostigma religiosum*, Gasp. ; Wt. Ic. t. 1967.

Not wild in Southern India, except, possibly, in the North East bordering on the Central Provinces, but widely planted on village sites and in avenues. The Pipul Tree.

A large tree with few or no aerial roots ; often epiphytic. Venerated by the Hindus. Bark grey, smooth ; wood whitish, moderately hard, used for packing-cases. Vern. *Hind.* Pipal ; *Ur.* Jori, Usto ; *Tel.* Rai, Ragi, Ravi ; *Tam.* Arasa, Arasu ; *Mal.* Arasu, Arei-al ; *Kan.* Arali.

10. *FICUS ARNOTTIANA*, Miq. ; F. B. I. v. 513 ; King Ann. Calc. i. t. 68 and 84v.

In all districts in rocky places in the hills, up to 4,500 ft.

A small tree or large shrub without aerial roots. Bark pale, smooth; wood white, useless. Vern. *Tel.* Kondaravi; *Tam.* Kal-arasu; *Mal.* Ama-kannian; *Kan.* Kadarasai.

Var. *courtallensis*, King Ann. Calc. i. 56, t. 68b; F. B. I. v. 514, with smaller and less cordate leaves.

11. *FICUS NERVOSA*, Roth; F. B. I. v. 512; King Ann. Calc. i. t. 65. *Ficus angustifolia*, Roxb.; Wt. Ic. t. 660.

In the hills of most districts except the driest, from 200—4,500 ft. Rampa Hills (Gamble), Vizagapatam Hills (A. W. Lushington). Usually found near streams.

A moderate-sized to large tree. Bark brown mottled white; wood white, soft. Vern. *Tam.* Nir-al; *Mal.* Eechamaram.

Var. *minor*, King, with all parts smaller and more puberulous. Nilgiri Hills (Gamble).

12. *FICUS CALLOSA*, Willd.; F. B. I. v. 516; King Ann. Calc. i. t. 84v2 and 85.

In evergreen and secondary forests in the W. Gháts from sea-level to 2,500 ft.

A large tree with verrucose, canescent twigs. Bark grey, smooth; wood white, useless. Vern. *Tam.* Koli-al.

13. *FICUS DALHOUSIAE*, Miq.; F. B. I. v. 499; King Ann. Calc. i. t. 11 and 81a.

In hill forests from Cuddapah southwards from near sea-level to 4,500 ft.

A small tree usually growing in rocky ravines. Vern. *Tam.* Pei-al, Kal-al; *Mal.* Kalalai.

14. *FICUS BEDDOMEI*, King Ann. Calc. i. 26, t. 24 and 81m; F. B. I. v. 502.

In the evergreen forests of the W. Gháts from 1,000—5,000 ft. Nilgiris (Gamble), Anamalais (Barber, Fischer), Travancore (Bourdillon), Tinnevely (Beddome).

A large tree, often epiphytic in youth. Bark pale-brown, smooth; wood white, useless. Vern. *Mal.* Thavatta-al.

15. *FICUS ANGLADEI*, C. Fischer in Kew Bull. 1925, 332.

In the lower Pulney Hills at about 2,700 ft. (Anglade, Saulière). A tree.

16. *FICUS GLOMERATA*, Roxb. Cor. Pl. ii, t. 123; F. B. I. v. 535; King Ann. Calc. i. t. 218a; Wt. Ic. t. 667; Brand. For. Fl. t. 49.

Common in all districts from sea-level to about 6,000 ft. in evergreen forests, and near streams in deciduous forests.

A large, deciduous tree with few and short aerial roots. Bark grey- to reddish-brown; wood greyish-brown, soft. Vern. *Ur.* Dimiri; *Tel.* Atti; *Tam.* Atthi; *Mal.* Atthi, Atthi-al; *Kan.* Atti.

17. *FICUS POMIFERA*, Wall.; F. B. I. v. 535; King Ann. Calc. i. t. 215.

Rampa Hills in the Godavari District at 2,000 ft. (Gamble). Not hitherto found elsewhere in Southern India.

A medium-sized tree. Bark grey; wood soft, spongy.

18. *FICUS COMOSA*, Roxb. Cor. Pl. ii, t. 125; Wt. Ic. t. 658. *Ficus Benjamina*, Linn., var. *comosa*, Kurz; F. B. I. v. 508; King Ann. Calc. i. t. 52b.

Vantala in the Vizagapatam Hills at 4,000 ft. (A. W. Lushington). Not found wild, hitherto, elsewhere in Southern India, but sometimes planted.

A large, handsome tree. Bark grey, smooth; wood grey, moderately hard.

19. *FICUS TRAVANCORICA*, King Ann. Calc. i. 28, t. 26 and 82o; F. B. I. v. 503.

In the hill tracts of N. Travancore and the Anamalais (Barber), in the Coimbatore District from 3,000—5,000 ft., in evergreen forest.

A straggling or scandent shrub (middle-sized tree, *fide* Meebold).

20. *FICUS MACROCARPA*, Wight; F. B. I. v. 534; King Ann. Calc. i. t. 208. *Pogonotrophe macrocarpa*, Miq.; Wt. Ic. t. 1965.

In the evergreen forests of the Nilgiri and Pulney Hills from 4,000—5,000 ft.

A scandent shrub.

21. *FICUS GUTTATA*, Kurz; F. B. I. v. 534; King Ann. Calc. i. t. 209. *Covellia guttata*, Wt. Ic. t. 1966.

In evergreen forest in the W. Gháts from 3,500—7,200 ft.

A scandent shrub, often creeping over rocks. Very like the last.

22. *FICUS GIBBOSA*, Bl., var. *PARASITICA*, Koen.; F. B. I. v. 497; King Ann. Calc. i. t. 2ba. *Ficus ampelos*, Roxb.; Wt. Ic. t. 652.

Common in all districts from sea-level to about 6,000 ft.

A fair-sized tree; usually epiphytic at first, often embracing other trees, and eventually completely surrounding and killing them. Bark greyish- or yellowish-green; wood brownish-grey, soft, useless. Vern. *Ur.* Korotosani; *Tel.* Konda-juvi, Pakki; *Tam.* Kal-itthi, Kal-perukam; *Mal.* Itthi, Kal-itthi; *Kan.* God-dumtite.

Var. *cuspidifera*, Miq.; King Ann. Calc. i. t. 2a, with the leaves elongate and gradually narrowed to the apex; less scabrid, sometimes quite smooth on both surfaces. Range of the type.

Var. *tuberculata*, Roxb.; King Ann. Calc. i. t. 2bb. *Ficus tuberculata*, Roxb.; Wt. Ic. t. 651; with narrower leaves which are sometimes irregularly serrate. Rare.

23. *FICUS HETEROPHYLLA*, Linn. f.; F. B. I. v. 518; King Ann. Calc. i. t. 94. *Ficus repens*, Roxb.; Wt. Ic. t. 636. *Ficus scabrella*, Roxb.; Wt. Ic. t. 661.

In all districts from sea-level to about 3,000 ft., usually near water.

A weak, very variable shrub, creeping or erect. Vern. *Ur.* Gonthi-sahada; *Tel.* Buroni; *Tam.* Kodi-atthi.

24. *FICUS ASPERRIMA*, Roxb.; F. B. I. v. 522; King Ann. Calc. i. t. 100; Wt. Ic. t. 633.

In all hilly tracts up to 4,500 ft., and down to sea-level on the West Coast. The Sand-paper Tree.

A small or medium-sized tree without aerial roots. Bark pale,

smooth; wood whitish, soft, useless; leaves used as sand-paper in sandalwood carving. Vern. *Ur.* Korotosano; *Tel.* Karakaboddu; *Tam.* Irambarattam, Maramthinni-Atthi; *Mal.* Theragam; *Kan.* Garagatti.

25. *FICUS PALMATA*, Forsk.; F. B. I. v. 530; King Ann. Calc. i. t. 185. *Ficus virgata*, Roxb.; Wt. Ic. t. 649.

Simli in the Vizagapatam Hills at 3,000 ft. (A. W. Lushington); not reported from elsewhere in Southern India.

A bush or small tree. Bark grey, smooth; wood white, even-grained, moderately hard.

26. *FICUS CUNIA*, Ham.; F. B. I. v. 523; King Ann. Calc. i. t. 126; Wt. Ic. t. 648; *Ficus conglomerata*, Roxb.; Wt. Ic. t. 669.

In the hills of the Godavari and Ganjam Districts (Barber). Rare.

A small or medium-sized tree without aerial roots; the leaves are very distinctive. Bark thick, reddish-brown, rough; wood greyish-brown, moderately hard, useless. Vern. *Ur.* Godima; *Tel.* Bommamari.

27. *FICUS HISPIDA*, Linn. f.; F. B. I. v. 522; King Ann. Calc. i. t. 154 and 155. *Ficus oppositifolia*, Roxb. Cor. Pl. ii. t. 124; Wt. Ic. t. 638. *Ficus daemonum*, Koen.; Wt. Ic. t. 641.

Common in all districts in evergreen forests and elsewhere in damp localities from sea-level to about 4,000 ft.

A small, weak tree, generally with hollow internodes, all parts very hispid; without aerial roots. Bark grey, rough; wood dirty-grey, soft, useless. Vern. *Hind.* Kagsha; *Ur.* Bhai-dimiri; *Tel.* Brammadi, Boddamari, Bemmadu, Bommamedu; *Tam.* Pei-atthi, Chona-atthi, Pollaparakam; *Mal.* Erumanakku, Parakam; *Kan.* Kad-Atthi.

- Ficus elastica*, Roxb.; F. B. I. v. 508; King Ann. Calc. i. t. 54; Wt. Ic. t. 663.

A large tree occasionally planted. The sap yields indian-rubber. The Rubber Fig.

- Ficus Benjamina*, Linn.; F. B. I. v. 508; King Ann. Calc. i. t. 52a and 83h.

A large, handsome tree with numerous aerial roots. Often planted in avenues and as an ornamental tree. The Java Fig.

Ficus pumila, Linn.; King Ann. Calc. i. t. 158, is a scandent or creeping shrub with dimorphic leaves, grown ornamentally on walls.

5. *Antiaris*, Leschen.

Gigantic trees. *Leaves* alternate, bifarious, penninerved; stipules small, connate, caducous. *Flowers* monoecious; ♂ crowded on the surface of an axillary, pedunculate receptacle, surrounded by confluent, imbricating bracts, with 3—4 spathulate, imbricate sepals; ♀ minute, solitary in an involucre of many confluent bracts, without perianth. *Stamens* 3—8. *Pistillode* 0. *Ovary* adnate to the involucre; ovule pendulous; style-arms 2, subulate, recurved. *Fruit* fleshy, the pericarp confluent with the receptacle. *Seed* exalbuminous, testa hard; embryo subglobose; cotyledons equal; radicle small, superior.

ANTIARIS TOXICARIA, Leschen.; F. B. I. v. 537. *A. saccidora*, Dalz.; Wt. Ic. t. 1958. *A. innoxia*, Bl.; Bedd. Fl. t. 307.

Evergreen forests of the West Coast up to 2,000 ft. The Upas Tree.

The largest tree of South India, attaining 250 ft. in height (Beddome). Bark brownish-grey, smooth, inner bark fibrous, making good cordage and also used in sections for making into sacks; wood white, soft, perishable. The milky juice is poisonous, but not so virulent in the Indian examples as in the Malayan. Vern. *Tam.* Aranthelli, Mara-uri; *Mal.* Arei-anjili, Aranjelli.

6. *Artocarpus*, Forst.

Trees. *Leaves* alternate, coriaceous, entire, lobed or pinnatifid, penninerved. *Flowers* monoecious, crowded on globose, oblong or cylindrical, solitary, usually axillary receptacles. *Perianth* in ♂ 2—4-lobed or -partite, in ♀ tubular and confluent below with the receptacle. *Stamen* 1. *Pistillode* 0. *Ovary* straight; ovule pendulous; style exserted; stigma undivided. *Fruit* a large, fleshy, globose or oblong receptacle covered with the enlarged fleshy anthocarps, which are smooth, tubercled or spiny according as they are completely or partially connate and have flat or attenuate apices. *Seed* with a membranous testa; exalbuminous; embryo straight or incurved; cotyledons fleshy, equal or unequal; radicle short, superior.

Quite glabrous; leaves oblong to obovate-oblong, base acute, entire (of young plants occasionally 3-lobed), dark-green and glossy above; lateral nerves 7—8 pairs, 4.5—7 in. long, 2—3.5 in. wide; stipules 2—3 in. long, spathaceous; fruit tubercled, oblong or cylindric, 12—24 in. long.....1. *integrifolia*.

Branchlets, leaves below and stipules pubescent or hairy; leaves not acute at base, entire (of young plants often more or less pinnatifid), not dark green nor glossy above; lateral nerves 8—12 pairs; stipules not spathaceous:—

Evergreen; young parts strigose with tawny hairs; leaves broadly ovate, obovate or elliptic, subacute or very shortly acuminate, base rounded or somewhat narrowed; tawny hairy on the midrib above and the nerves below, 5—12 in. long, 3—6 in. wide; stipules yellow-hairy; fruit spinous, oblong or cylindrical, 2—3 in. long.....2. *hirsuta*.

Deciduous; young parts densely grey- or rusty-tomentose; leaves ovate or oblong, shortly, finely acuminate or cuspidate; base truncate or subcordate, densely grey-downy below and on the midrib above, 4—12 in. long, 2—8 in. wide; stipules small, grey-pubescent; fruit smooth, globose, 2—3 in. in diam

3. *Lakoocha*.

1. *ARTOCARPUS INTEGRIFOLIA*, Linn.; F. B. I. v. 541; Wt. Ic. t. 678; Roxb. Cor. Pl. t. 250.

Evergreen forests of the W. Gháts from 1,500—4,000 ft.; cultivated nearly everywhere. The Jack Tree.

A large evergreen tree. Bark black mottled green, smooth (deeply cleft when old); sapwood pale, heartwood bright yellow, darkening on exposure, moderately hard, does not warp or split, easily worked, used for carpentry. Vern. *Hind.* Kanthal; *Úr.* and *Tel.* Panása; *Tam.* and *Mal.* Pila, Pilavu; *Kan.* Alasa.

2. *ARTOCARPUS HIRSUTA*, Lamk.; F. B. I. v. 541; Wt. Ic. t. 1957; Bedd. Fl. t. 308; King Ann. Calc. ii. t. 5.

Evergreen forests of the West Coast from sea-level to 3,500 ft.; Coorg, Mysore (Meebold), Wynad, Anamalais to Travancore. A very large evergreen tree. Bark grey, smooth; sapwood white; heartwood yellowish-brown, moderately hard, durable; seasons and polishes well, does not warp nor crack, not eaten by white ants; valuable for panelling, flooring and boat-building. Vern. *Tam.* Anjili, Pepla, Katupila, Tellai-kori mara; *Mal.* Aini, Ayani; *Kan.* Halasu.

3. *ARTOCARPUS LAKOOCHA*, Roxb.; F. B. I. v. 543; Wt. Ic. t. 681; King Ann. Calc. ii. t. 13.

Hill forests up to 3,500 ft.; Coorg, Mysore, West Coast, Ganjam (Gamble), Vizagapatam Hills (A. W. Lushington).

A large deciduous tree. Bark rough, dark-grey or purplish; sapwood large, white, soft and perishable; heartwood yellowish-brown, fairly hard, not eaten by white ants, used for house- and boat-building. Fruit edible, sometimes cultivated for that reason; wood and fruit yield a yellow dye. Vern. *Hind.* Dahu, Lakuch; *Tel.* Nakkarenu; *Mal.* Chima, Thitti-pilavu; *Kan.* Wonta.

7. *Dorstenia*, Linn.

Herbs or small shrubs. *Leaves* alternate or radical, entire or lobed; stipules lateral. *Flowers* monoecious, crowded on a flat, simple or lobed receptacle. *Perianth* of ♂ more or less connate and adnate to the receptacle, obscurely 2-lobed or toothed, of ♀ deeply immersed in the receptacle, mouth almost closed. *Stamens* 1—3, inflexed in bud. *Pistillode* 0. *Ovary* included; ovule pendulous; style excentric or lateral, with 2 subulate arms. *Fruit* a minute, crustaceous achene. *Albumen* 0; cotyledons subequal, contorted, embracing the upcurved radicle.

DORSTENIA INDICA, Wight; F. B. I. v. 494; Wt. Ic. t. 1964.

In the hills from the Nilgiris and Shevaroy's southwards; in cool and damp localities, from 1,800—6,000 ft.

A succulent herb 4—18 in. high. Leaves lanceolate, undulate to serrate, variable in size; receptacles peltate, obconic, with 5—12 linear arms.

Morus alba, Linn., the mulberry, is cultivated for its fruit, and with *M. indica*, Linn., for leaves for feeding silk-worms, in several localities. The two species are not easily separated, the chief points of distinction being the obovate ♀ sepals and the styles connate below in *M. indica*.

Family CXXXIX. URTICACEAE.

Herbs, shrubs or small trees, some with stinging hairs. *Leaves* opposite or alternate, 3-ribbed or penninerved, entire or lobed. *Flowers* small, greenish, monoecious or dioecious, in open or capitate cymes or spikes or aggregated on a fleshy receptacle, sometimes involucrate. *Perianth* of 4—5 (rarely 2—3) free or united sepals, usually united in ♀ and sometimes accrescent and fleshy in fruit. *Stamens* as many as the sepals, usually inflexed in bud with reversed anthers, later

elastically reflexed. *Pistillode* usually present, various. *Ovary* superior, 1-celled; style simple or 0; stigma papillose, plumose or penicillate; ovule single, basal, erect. *Fruit* a drupe or an achene, usually enclosed in and often adnate to the perianth. *Seed* with a membranous testa; embryo straight.

Plants with stinging hairs, at least on the inflorescence:—

Flowers clustered on cymes or spikes:—

Slender annual flexuous herbs; stipules small or 0; stinging hairs weak; flower clusters small.....1. *Fleurya*.

Coarse perennial erect herbs or undershrubs; stipules large, foliaceous; stinging hairs stout; flower clusters large.....2. *Girardinia*.

Flowers not clustered.....3. *Laportea*.

Plants without stinging hairs:—

Herbs or undershrubs:—

Flowers, at least ♀, aggregated on a fleshy receptacle:—

Normal leaves opposite; receptacles long-peduncled.....4. *Lecanthus*.

Normal leaves alternate; receptacles sessile or short-peduncled (long-peduncled in two species of *Elatostemma*):—

♂ and ♀ flowers aggregated on a fleshy receptacle.....5. *Elatostemma*.

♂ flowers cymose, ♀ aggregated on a fleshy receptacle.....6. *Procris*.

Flowers not aggregated on a fleshy receptacle:—

Flowers not enclosed in a campanulate involucre:—

Leaves stipulate:—

Flowers cymose; cystoliths of leaves linear:—

Leaves opposite, serrate.....7. *Pilea*.

Leaves alternate, entire.....8. *Pellionia*.

Flowers in sessile clusters; cystoliths of leaves punctiform:—

Leaves serrate; stigma ovate, persistent.....9. *Chamabaina*.

Leaves usually entire; stigma filiform, deciduous.....10. *Pouzolzia*.

Leaves exstipulate.....11. *Parietaria*.

Flowers enclosed in a campanulate involucre.....12. *Droguetia*.

Small trees or large shrubs:—

Inflorescence in clusters on long spikes; fruiting perianth dry.....13. *Boehmeria*.

Inflorescence in clusters on short cymes or on panicles; fruiting perianth more or less fleshy:—

Leaves not white-tomentose below; stigma discoid, ciliate-fimbriate

14. *Villebrunea*.

Leaves white-tomentose below; stigma sessile, penicillate.....15. *Debregeasia*.

1. *Fleurya*, Gaud.

Annual herbs with stinging hairs. *Leaves* alternate, toothed, 3-ribbed, with linear cystoliths; stipules narrow, connate in pairs or 0. *Flowers* monoecious or dioecious, clustered on axillary, unisexual or androgynous, spikes or cymes. *Perianth* of ♂ of 4–5 ovate-lanceolate sepals, of ♀ of 4 sepals free or united into a 4-lobed cup. *Stamens* 4–5, inflexed in bud. *Pistillode* globose or clavate. *Ovary* oblique; style obliquely ovoid or linear, ultimately hooked with sometimes 2 basal arms. *Achene* oblique, compressed, membranous, exserted. *Seed* nearly exalbuminous; cotyledons broad.

FLEURYA INTERRUPTA, Gaud.; F. B. I. v. 548; Wt. Ic. t. 1975. *Urtica interrupta*, Linn.; Wt. Ic. t. 692.

In the hills, mainly south of Mysore, from 500–6,000 ft. Rampa Hills (V. Narayanswami).

A nettle-like herb with ovate, acuminate, coarsely-toothed leaves.

Fruiting spikes sometimes a foot long.

2. *Girardinia*, Gaud.

Strong herbs or undershrubs with long stinging hairs. *Leaves* alternate, 3-ribbed, entire or lobed; stipules connate, foliaceous. *Flowers* monoecious or dioecious, clustered on simple or panicked spikes or heads, armed with numerous stinging hairs. *Perianth* of ♂ of 4—5 free, valvate sepals, of ♀ a 2—3-lobed, ventricose tube eventually split down one side. *Stamens* 4—5, inflexed in bud. *Pistillode* globose or cupular. *Ovary* straight, ovule erect; stigma subulate, papillose. *Achene* broad, compressed. *Seed* nearly exalbuminous; cotyledons broad.

Leaves entire or 3—7-lobed, margins inciso-serrate, acuminate, base narrowed, truncate or cordate, 3-ribbed, appressed hairy and with stout stinging hairs on the ribs and nerves; stipules 1.5—3 in. long, cordate at base; flowers dioecious in long simple or branched spikes, often very long in fruit.....1. *Leschenaultiana*.

Leaves 3—7-lobed, margins inciso-serrate, acuminate, base usually truncate or cordate, 3-ribbed, more or less appressed-hairy, with or without rather slender stinging hairs on the ribs and nerves; stipules 3—6 in. long, cordate or truncate at base; flowers monoecious, usually in simple spikes, ♀ usually aggregated in heads along the rhachis.....2. *zeylanica*.

1. *GIRARDINIA LESCHENAUTIANA*, Dcne.; Wt. Ic. tt. 1976. *Girardinia heterophylla*, Dcne., var. *palmata*, Gaud.; F. B. I. v. 551.

Mountains of the W. Gháts from 4,000—7,000 ft. The Nilgiri Nettle.

A strong stinging-nettle, often growing gregariously near habitations.

2. *GIRARDINIA ZEYLANICA*, Dcne. *Girardinia heterophylla*, Dcne., var. *zeylanica*, Dcne.; F. B. I. v. 551. *Urtica heterophylla*, Wt. Ic. t. 687.

Hills of Southern India and on the West Coast from 1,000—5,000 ft. The Nilgiri Nettle.

A stinging-nettle not easily distinguished from the last species.

3. *Laportea*, Gaud.

Herbs, shrubs or trees with stinging (sometimes minute) hairs. *Leaves* alternate, entire or toothed, 3-ribbed or penninerved; stipules free or connate. *Flowers* monoecious or dioecious, in paniculate, usually unisexual, cymes or racemes. *Perianth* of ♂ of 4—5 subvalvate sepals, of ♀ of 4 subequal segments or one outer smaller or absent. *Stamens* 4—5, inflexed in bud. *Pistillode* clavate or subglobose. *Ovary* eventually oblique; ovule erect; style linear, papillose on one side. *Achene* oblique, compressed, membranous or fleshy, seated on the perianth. *Seed* nearly exalbuminous; cotyledons broad.

Herbs; leaves broadly ovate to elliptic, acuminate; base usually rounded, rarely narrowed, 3-ribbed, 2.5—8 in. long, 1.5—5 in. wide, coarsely toothed, smooth, pubescent or scabrous, variable in the amount of stinging hairs on both surfaces; ♂ cymes slender, mostly axillary, ♀ cymes stout, subterminal, the pedicels broadly winged.....1. *terminalis*.

Soft stemmed shrubs or small trees; leaves narrow-lanceolate to broadly elliptic, shortly acuminate, base narrowed, rarely rounded, penninerved, 5—12 in. long, 2—5.5 in. wide, entire or crenulate in the upper half, glabrous or nearly so, shining above, the petioles sometimes with many stinging hairs; cymes axillary, pedicels of ♀ cylindric.....2. *crenulata*.

1. *LAPORTEA TERMINALIS*, Wt. Ic. t. 1972; F. B. I. v. 549.
W. Gháts in evergreen forests, 5,000—7,000 ft.
A slender nettle. The sting is not very virulent.
2. *LAPORTEA CRENULATA*, Gaud.; F. B. I. v. 550; Bedd. Fl. t. 306.
Urtica crenulata, Roxb.; Wt. Ic. t. 686.
W. Gháts from 1,000—5,000 ft. Rampa Hills, 2,500 ft. (Gamble).
The Elephant Nettle, Fever Nettle, Devil Nettle.
A stout shrub or small tree. Bark white, smooth, very thin; wood pale-brown, very soft, useless; the fibre yields a strong, useful cordage. The sting of the hairs is very painful and lasting, particularly during the flowering season, when it may bring on violent sneezing and fever. Vern. *Tam.* Otta-pilavu; *Mal.* Ana-choriya.

4. *Lecanthus*, Wedd.

Herbs, more or less succulent; stems often decumbent and rooting at the base. *Leaves* in opposite, petioled, unequal pairs, subrotund, ovate or elliptic, acute; base 3-ribbed, narrowed, often oblique, serrate, or sometimes the small ones nearly entire, cystoliths linear; stipules small, scarious. *Flowers* monoecious or dioecious, crowded or solitary, axillary, long-peduncled, bracteate, saucer-shaped, unisexual or androgynous fleshy receptacles, the ♀ often mixed with sterile flowers. *Perianth* of ♂ of 4—5 (usually 4) free, equal, usually narrowly hooded sepals, of ♀ of 3—6 (usually 4) free unequal sepals, one larger than the others and usually more deeply and broadly hooded, of sterile flowers irregular, often with 8 segments in 2 series. *Stamens* 4—5 (usually 4). *Pistillode* 0. *Staminodes* in fertile ♀ 4, minute, quadrate. *Ovary* narrowly ellipsoid, shortly stipitate; stigma sessile, penicillate. *Achene* ellipsoid, muriculate. *Albumen* fleshy; cotyledons elliptic, radicle conical.

LECANTHUS WIGHTII, Wedd.; F. B. I. v. 559. *Elatostemma ovatum*, Wt. Ic. t. 1985.

In moist and shady places in the hills from 4,000—7,000 ft. Mahendragiri (Fischer), Mysore, Nilgiris, Anamalais (Fischer), Pulneys (Bourne).

A variable herb, 2—18 in. high. Leaves and capitula equally variable in size (up to 6 in. long and .5 in. diam. respectively). ♂ flowers with slender pedicels 3 times longer than the calyx, ♀ sessile and pedicelled up to the length of the longest sepal in the same capitulum.

5. *Elatostemma*, Forst.

Herbs or undershrubs. *Leaves* alternate or sometimes with a small or minute leaf subopposite to the normal one, distichous, sessile or shortly petioled, usually inequilateral and more or less oblique, 3-ribbed from the base or a little above it; stipules lateral or intrapetiolar. *Flowers* minute, monoecious or dioecious, crowded on sessile or peduncled, 1-sexual, usually involucrate receptacles, the outer bracts often spurred, their bases free or more or less confluent into a fleshy

circular or lobed disk, the florets often in clusters in the heads and mixed with bracteoles. *Perianth* of ♂ of 4–5 free sepals, 2 or more usually tuberculate or spurred on the back, of ♀ of 3–5 free, persistent sepals, usually minute or shorter than the ovary. *Stamens* 4–5, inflexed in bud. *Pistillode* minute. *Ovary* straight; ovule erect; stigma sessile, penicillate. *Achene* minute, ellipsoid or fusiform, usually ribbed. *Seed* usually exalbuminous; testa membranous; cotyledons ovate or semiterete.

Normal leaves alternate without (very rarely with) subopposite small ones:—

♂ receptacles sessile or very shortly peduncled (unknown in 4. *cuneatum*):—

Large herbs, usually over 1 ft. high; leaves acuminate or caudate:—

Leaves with large conspicuous cystoliths:—

Leaves sessile or shortly petioled, obliquely lanceolate, oblanceolate or oblong, caudate, coarsely sharply serrate from the base or just above; base inequilateral, narrowed or the lower side rounded, 1·3–6 in. long, ·5–2·2 in. wide, glabrous or with scattered hairs above, more or less pilose on the nerves below; lateral ribs rather indistinct, the lower one arched, cystoliths abundant, obscure below; stipules lanceolate, acute, glabrous; receptacles sessile or very shortly peduncled, solitary or 2–3 in an axil.....1. *sessile*.

Leaves subsessile, very variable, linear, linear-lanceolate or obliquely lanceolate, acuminate or caudate; base acute, nearly equilateral, ·8–7 in. long, 1–2 in. wide; margins entire (in the narrow forms) or coarsely, subacutely serrate in the upper half, the inner margin often toothed for a shorter distance than the outer, glabrous above, glabrous or hairy on the nerves below; lateral ribs distinct, the lower nearly straight; cystoliths crowded and conspicuous; stipules lanceolate, usually hairy; receptacles sessile, small, solitary or crowded in the axils.....2. *lineolatum*.

Leaves without cystoliths or cystoliths minute and inconspicuous, subsessile, obliquely oblong or oblong-lanceolate, caudate, coarsely crenate-toothed in the upper two-thirds, usually over a greater distance on the outer side; base acute or subacute, ribs distinct, 1·5–6 in. long, 4–1·5 in. wide, quite glabrous; receptacles sessile, small, solitary.....3. *acuminatum*.

Dwarf herbs, 3–8 in. high, more or less pubescent; leaves sessile or shortly petioled, falcately cuneate or hatchet-shaped; apex rounded or subacute, base inequilateral, subauricled on the lower side, very rarely with a minute opposite leaf, the uppermost 3–5 leaves coarsely crenate above the middle, ·5–1·3 in. long, 4–75 in wide, those below much smaller and often entire; cystoliths numerous on both sides; receptacles solitary; ♀ bracts confluent below into a fleshy disk, the tips produced beyond the florets, acute, ciliate.....4. *cuneatum*.

♂ receptacles long-peduncled; leaves sessile, subfalcately oblong-lanceolate, subcaudately acuminate, coarsely subserrately toothed from above the lower one-third, usually for a shorter distance on the upper margin; base inequilateral, subacute, sometimes subauricled, 2–7 in. long, 6–1 in. wide, the lowest much reduced; ribs distinct, rather broad; cystoliths numerous; stipules short, broad; receptacles solitary or twin; sometimes the 2 sexes from the same axil, ♂ with a long, succulent peduncle, 1–1·8 in. long, glabrous, up to 4 in. in diam. with rounded membranous bracts; ♀ sessile, much smaller, silvery.....5. *Wightii*.

Normal leaves subtended by small filiform, linear, lanceolate or oblong, subopposite, usually deflexed, very small ones, very variable, sessile or shortly petioled, subfalcately lanceolate or ovate, acuminate or the lower rounded; base inequilateral, acute or subauricled on the lower side, 4–3·5 in. long, 2–1·3 in. wide, crenate-serrate in the upper half or sometimes with only 2 teeth on either side of the apical one; glabrous, ribs distinct, rather broad; cystoliths numerous above, obscure below; ♂ receptacles very long- or short-peduncled, the outer bracts usually horned; ♀ smaller, sessile.....6. *surculosum*.

1. *ELATOSTEMMA* SESSILE, Forst.; F. B. I. v. 563.

W. Ghâts in evergreen woods, 5,000–7,000 ft.

A herb 1–2 ft. high, usually prostrate and rooting below.

Var. *cuspidata*, Wedd.; F. B. I. v. 564. *E. cuspidata*, Wight Ic. t. 1983 (not 2091, fig. 1). Leaves glabrous or setose above, pubescent on the nerves beneath.

Var. *pubescens*, Hook. f.; F. B. I. v. 564. Stem and leaves more or less substrigosely tomentose.

2. *ELATOSTEMMA LINEOLATUM*, Wt. Ic. t. 1984 and 2091, fig. 1; F. B. I. v. 565.

W. Gháts in evergreen forests from 1,800—7,500 ft. Vizagapatam Hills at 4,000 ft. (A. W. Lushington).

A herb or undershrub, very variable in foliage and habit.

Var. *falcigera*, Thw. Branchlets more or less fuscous or tawny-tomentose; leaves falcately linear-lanceolate, entire or with one or two teeth.

Var. *linearis*, Thw. Leaves linear, entire or with 1—2 large teeth, ribs and nerves obscure.

3. *ELATOSTEMMA ACUMINATUM*, Brongh.; F. B. I. v. 566.

Nilgiri and Anamalai (Beddome, Fischer) Hills at about 4,000 ft. Rare.

A much branched undershrub, woody below.

4. *ELATOSTEMMA CUNEATUM*, Wt. Ic. t. 2091, fig. 3; F. B. I. v. 568.

Rampa District at 2,000 ft. on Peddakonda near Maradumalli (V. Narayanswami). The only record for the area.

A small, slender herb.

5. *ELATOSTEMMA WIGHTII*, Hook. f.; F. B. I. v. 570.

At Avalanche in the Nilgiri Hills (Wight), Anamalai Hills (Beddome).

A succulent herb.

6. *ELATOSTEMMA SURCULOSUM*, Wt. Ic. t. 2091, fig. 4; F. B. I. v. 572.

W. Gháts in evergreen forests, 5,000—7,000 ft.

A small rather succulent herb, often growing on rocks and tree-trunks in cool, shady places.

6. *Procris*, Juss.

Succulent herbs or shrubs. *Leaves* alternate or, as in *Elatostemma*, with a very small leaf opposite or subopposite to the normal one; base unequal, cystoliths linear. *Flowers* monoecious, axillary, mostly in the axils of fallen leaves, ♂ in small cymes or clusters, ♀ aggregated on a fleshy, peduncled receptacle. *Perianth* of ♂ 5-partite, lobes ovate, fleshy, of ♀ of 3—5 obovate, cucullate, fleshy sepals. *Stamens* 5. *Staminodes* 0. *Pistillode* rudimentary, globose or obovate. *Ovary* ovate; stigma sessile. *Achene* ovate or ellipsoid, subacute, striolate. *Embryo* turbinate; albumen 0 or scanty; cotyledons broadly elliptic; radicle long, conical.

PROCRIS WIGHTIANA, Wall. ex Wedd. *P. laevigata*, Bl. in part; F. B. I. v. 575.

W. Gháts and hills of the Carnatic in evergreen forest and in cool moist places from 4,000—6,500 ft.

A succulent, branched herb. Normal leaves shortly petioled, lanceolate or oblanceolate, acuminate or caudate; base tapering,

2·5–7 in. long, 1·6–1·5 in. wide, crenate-serrate from a little above the base or higher, rarely nearly entire, quite glabrous, primary nerves 5–7 pairs, distinct. ♀ receptacles small, usually several in each axil.

7. *Pilea*, Lindl.

Herbs. *Leaves* in opposite equal or unequal pairs, 3-ribbed, serrate, usually with numerous, minute linear (in our species) cystoliths which look like appressed hairs when the leaf is dry; stipules connate, intrapetiolar. *Flowers* minute, monoecious or dioecious, in axillary, peduncled, dichotomous cymes; bracts small or 0. *Perianth* of ♂ of 2–4 free or connate sepals, often gibbous or spurred, of ♀ of 3 (rarely 4) unequal sepals, the dorsal longest, sometimes gibbous or spurred. *Stamens* 2–4. *Pistillode* minute, conic or oblong. *Staminodes* minute or 0. *Ovary* straight; ovule erect; stigma sessile, penicillate. *Achene* ovoid, oblong or suborbicular, compressed, smooth or granulate. *Seed* erect; albumen scanty; cotyledons broad.

Stipules caducous, small, ovate, acute; lateral ribs of nerves curved and more or less converging towards the apex:—

Lateral ribs of leaves evanescent before reaching the apex, primary nerves not numerous, nor regular and parallel; petioles glabrous; achenes smooth or very slightly granular:—

Leaves ovate or rotund-ovate, usually about 1 in. long (up to 2 in. long, 1·25 in. wide), acuminate; base subcordate, sharply, narrowly serrate to just below the apex; lateral ribs evanescent a short distance below the apex, quite glabrous, usually punctate below; petioles 3–1·25 in. long; cymes peduncled, open; sepals spurred; achenes ovoid, apex narrowed, smooth.....1. *Wightii*. Leaves ovate-lanceolate to subrotund, 1–6 in. long, terminating in a narrow, entire cusp; base never emarginate; lateral ribs evanescent about $\frac{2}{3}$ of the way up; marginal teeth broad, blunt or subacute; upper surface with scattered hairs, not punctate below; petioles 4–3·2 in. long; cymes peduncled, open, sepals rounded, not spurred; achenes suborbicular, apex rounded, smooth or slightly granular.....2. *Kingii*.

Leaves narrowly lanceolate to broadly ovate, sometimes falcate, acuminate or finely caudate, 2·25–10 in. long, 1·75–4·25 in. wide, sharply serrate; lateral ribs prolonged right into the apex; primary nerves numerous, regular, nearly straight, parallel between the ribs; petioles 1·3–5 in. long, often hairy at least just below the blade; cymes peduncled, open; achenes granular.....3. *trinervia*.

Stipules subpersistent, large, linear-oblong to oblong, 1 in. long or more; apex rounded; leaves elliptic, acuminate, 3–5 in. long, 1·5–2·5 in. wide; lateral ribs nearly straight, not converging towards the apex, crenate-serrate; petioles 1·3–1·75 in. long; peduncles short, cymes shorter than the petioles, aggregated; achenes smooth.....4. *stipulosa*.

1. *PILEA WIGHTII*, Wedd.; F. B. I. v. 554. *P. radicans*, Wt. Ic. t. 1974.

Evergreen forests of the W. Gháts, 4,000–7,500 ft.

A flaccid herb.

2. *PILEA KINGII*; C. Fischer in Kew Bull. 1927, 76. *P. Wightii*; Wedd var. *macrophylla*, Hook. f.; F. B. I. v. 555.

Evergreen forests of the W. Gháts, 5,000–7,000 ft.

A glabrous herb similar to the last species but more robust.

3. *PILEA TRINERVIA*, Wt. Ic. t. 1973; F. B. I. v. 557.

Evergreen forests of the W. Gháts, 2,000–8,000 ft. Kollimalais of Trichinopoly District (Barber).

A robust succulent herb up to 7 ft. high with swollen internodes.

4. *PILEA STIPULOSA*, Miq.; F. B. I. v. 555.

Pulney Hills; Gundattu Shola (Bourne).

A stout herb at once recognized by the large stipules which, like the leaves, bear innumerable linear cystoliths, these, however, here are black (at least when dry).

Pilea microphylla, Liebm. *P. muscosa*, Lindl.; F. B. I. v. 551, the Gunpowder or Artillery Plant, is a small prostrate species with very small rotund or spatulate, entire leaves which is grown in borders in gardens and has run wild in many places. The ripe pollen is ejected in clouds when the plant is jolted.

8. *Pellionia*, Gaud.

Herbs. *Leaves* distichous, alternate or subopposite, but appearing alternate by the suppression or excessive reduction of one of each successive pair, inequilateral, entire or serrate, 3-ribbed or penninerved, with numerous linear cystoliths; stipules usually large. *Flowers* monoecious or dioecious, in open or contracted, sometimes capituliform, bracteate, peduncled, axillary cymes (not seated on a receptacle). *Perianth* of ♂ 5-partite, segments acute, with a membranous margin, mucronate on the back, of ♀ deeply 5-partite; segments equal or unequal, mucronate below the apex. *Stamens* 5. *Pistillode* conical. *Staminodes* 5, scale-like. *Ovary* elliptic. *Achene* broadly ovate, more or less compressed. *Seed* subexalbuminous; radicle conical.

PELLIONIA HEYNEANA, Wedd.; F. B. I. v. 561.

In evergreen woods in the W. Ghâts, 1,500—6,000 ft.

A herb; stem woody and creeping below; the tips hairy. *Leaves* alternate or subopposite, with one of the pair very small, falcate, linear-lanceolate to broadly lanceolate, acuminate or caudate, base 3-ribbed, narrowed and unequally cordate, 2—9 in. long, .75—3.5 in. wide, quite glabrous or the ribs beneath pilose, quite entire; petiole short; stipules narrow-ensiform, aristate, up to .5 in. long. Peduncles short or long, glabrous or hairy.

9. *Chamabaina*, Wight.

Diffuse herbs. *Leaves* opposite, equal or nearly so, 3-ribbed, serrate; cystoliths punctiform; stipules paired, free, conspicuous, persistent, enclosing the young flower-clusters. *Flowers* monoecious (or dioecious?), in axillary, bracteolate clusters; ♂ shortly pedicelled in the upper axils, ♀ clusters dense. *Perianth* of ♂ valvately 4-lobed, lobes mucronate, hairy, of ♀ tubular, compressed, minutely 4-toothed, hirsute. *Stamens* 4. *Pistillode* rudimentary, clavate. *Ovary* included; ovule erect; stigma ovate, fimbriate, spreading. *Achene* compressed, ovate, acute, enclosed in the persistent perianth; pericarp crustaceous. *Seed* albuminous; cotyledons ovate.

CHAMABAINA CUSPIDATA, Wt, Ic. t. 1981; F. B. I. v. 580.

Nilgiri Hills at about 6,000 ft., in moist woods and on wet ground near streams; not common.

A small diffuse, pubescent herb. Leaves ovate to subrotund, acute, base rounded or acute, 3—1.25 in. long, .2—7 in. wide, bluntly or acutely serrate; stipules scarious, 4 to each node.

10. *Pouzolzia*, Gaud.

Herbs or undershrubs. Leaves alternate, opposite or ternate, 3-ribbed, usually entire, often reduced in size upwards and passing into bracts; cystoliths punctiform; stipules free, often persistent. Flowers minute, usually monoecious, in 1-sexual or androgynous, usually sessile clusters in the axils of the leaves or the bracts, never spicate, but sometimes appearing so by the reduction of the upper leaves; bracteoles small; florets pedicelled. Perianth of ♂ 4—5 (rarely 3-) partite or -lobed, the lobes either concave or transversely plicate and abruptly inflexed making the bud truncate, of ♀ tubular, mouth contracted, 2—4-toothed. Stamens 4—5 (rarely 3). Pistillode clavate or oblong. Ovary included; ovule erect; stigma filiform, jointed to the top of the ovary, deciduous. Achene enclosed in, but usually free from, the winged or wingless, persistent perianth. Seed with a membranous testa; albumen very scanty or 0; cotyledons ovate.

The species are, for the most part, very variable in habit, foliage, flowers and indumentum, so that their classification into species and varieties is a matter of considerable difficulty.

♂ perianth lobes convex or gibbous, buds rounded or acute:—

Leaves opposite or alternate, linear, lanceolate, elliptic, ovate-lanceolate or broadly ovate, apex blunt or acute, base narrowed or rounded and then abruptly, shortly acute, hoary-pubescent, hirsute or glabrate, 4—3.5 in. long, .2—1.5 in. wide, primary nerves 1 pair, lateral ribs not forked; flowers usually strigose, ♂ 4 (rarely 5-) merous; fruit 2—4-winged or not.....1. *indica*.
Lateral ribs of leaves forked, ♂ flowers 5-merous:—

Leaves alternate, ovate-lanceolate to rotund-ovate, acute or acuminate, base narrowed or rounded, .6—5.5 in. long, .2—2.3 in. wide, glabrous or pubescent above, and if the latter also on the sub-prominent ribs and nerves, pubescent or villous below; petioles .1—3 in. long; flowers in sessile clusters in the axils, strigose or hirsute usually with whitish hairs; fruit strigose, winged or not

2. *auriculata*.

Leaves opposite, lanceolate to rotund-ovate, acute or acuminate; base rounded, truncate or subcordate, .8—3 in. long, .4—1.8 in. wide, more or less pubescent above except on the impressed ribs and nerves, pubescent below, at least on the ribs and nerves; petioles up to .5 in. long; flowers axillary, cymose, hirsute; fruit smooth or strongly ribbed, not winged.....3. *cymosa*.

♂ perianth lobes plicate and abruptly inflexed at about the middle; buds truncate:—

Stems running out into terminal or axillary spikes:—

Spikes all axillary; leaves ternate, sessile, lanceolate, acuminate, base rounded or cordate, 2—7 in. long, .4—1.2 in. wide, glabrous; flowers in sessile clusters on solitary or binate, flexuous, bracteolate, scabrid-puberulous spikes up to 9 in. long; ♂ 4-merous, nearly glabrous; fruit winged or not.....4. *Meeboldii*.

Spikes terminal, sometimes also a few from the upper axils:—

Leaves ternate, opposite or alternate, linear to narrowly lanceolate, acute or acuminate; base rounded or narrowed, shortly petioled or sessile, up to 6 in. long, 1 in. wide, reduced upwards and merging into the floral bracts, glabrous or somewhat pubescent and usually hispidulous on the ribs below; flowers in the axils of leaves or bracts in sessile clusters; ♂ 5-merous, ciliate at the flexure, ♀ hirsute, fruit winged.....5. *pentandra*.

Leaves ternate, opposite or alternate, very variable in shape, size and indumentum, up to 6 or 7 in. long, reduced upwards and merging into the floral

bracts; flowers in sessile clusters in the axils of leaves or bracts; ♂ 3—4 (rarely 5-) merous; fruit winged or not.....6. *Wightii*.
 Stem not running out into a bracteate spike, upper leaves not reduced to bracts or markedly smaller; leaves very variable, from ovate to narrow-lanceolate, usually acuminate, base acute, rounded or subcordate, 3—5-ribbed, up to 7 in. long and 2.5 in. wide; flowers in sessile, axillary clusters; ♂ 5- (rarely 4-) merous; fruit winged or not.....7. *Bennettiana*.

1. *POUZOLZIA INDICA*, Gaud. ; F. B. I. v. 581; Wt. Ic. tt. 1980, fig. 1, 2100, fig. 40. *P. procumbens*, Wt. Ic. t. 2099, fig. 35. *P. diffusa*, Wt. Ic. t. 2099, fig. 36. *P. tetraptera*, Wt. Ic. t. 2100, fig. 42, excl. ♂ bud. *P. minor*, Wt. Ic. t. 2100, fig. 43. *P. pilosa*, Wt. Ic. t. 2101, fig. 46. *P. Johnsoniana*, Wt. Ic. t. 2101, fig. 47. *P. pyramidata*, Wt. Ic. t. 2101, fig. 48. *Urtica alienata*, Linn.; Wt. Ic. t. 693. *U. tuberosa*, Roxb.; Wt. Ic. t. 697.

In all districts, sea-level to 6,000 ft.

A very variable, slender, erect or procumbent, hirsute or pubescent herb.

2. *POUZOLZIA AURICULATA*, Wt. Ic. tt. 1980, fig. 2, 2099, fig. 37; F. B. I. v. 582. *P. rostrata*, Wt. Ic. tt. 1980, fig. 3, 2099, fig. 34. *P. rotundifolia*, Wt. Ic. t. 2098, fig. 31, excl. ♂ bud. *P. elliptica*, Wt. Ic. t. 2098, fig. 32. *P. bicuspidata*, Wt. Ic. t. 2098, fig. 33, excl. ♂ bud. *P. Rheedii*, Wt. Ic. t. 2099, fig. 38. *P. scabrida*, Wt. Ic. t. 2100, fig. 41. *Urtica vesicaria*, Roxb.; Wt. Ic. t. 695.

In all districts, near sea-level to 6,500 ft.

A flaccid or stout, usually tall herb.

3. *POUZOLZIA CYMOSA*, Wt. Ic. t. 1979, fig. 2. *P. auriculata*, Wight, var. *cymosa*, Hook. f.; F. B. I. v. 582.

In the Nilgiri, N. Coimbatore, Shevaroy and Kollimalai Hills, 4,000—6,000 ft.

A herb.

4. *POUZOLZIA MEEBOLDII*; W. W. Smith et Ramas.

At Kavalay in Cochin (Meebold), Anamalais (Wight?), Peermade in Travancore (Venkoba Rao).

An erect undershrub.

5. *POUZOLZIA PENTANDRA*, Benn.; F. B. I. v. 583; Wt. Ic. t. 2096, fig. 20. *Urtica pentandra*, Roxb.; Wt. Ic. t. 696.

W. Gháts in Mysore (Meebold), S. Kanara, Nilgiri District, Palghat and N. Coimbatore (Fischer).

An erect, rigid herb, 2—3 ft. high. Apparently not common.

6. *POUZOLZIA WIGHTII*, Benn.; F. B. I. v. 584; Wt. Ic. t. 2093, fig. 8. *P. ternata*, Wt. Ic. t. 2093, fig. 7. *P. concinna*, Wt. Ic. t. 2093, fig. 9. *P. ambigua*, Wt. Ic. t. 2095, fig. 19. *P. trialata*, Wt. Ic. t. 2096, fig. 22. *P. longifolia*, Wt. Ic. t. 2093, fig. 6.

All districts, about 1,000—7,000 ft.

A very variable, usually tall and robust herb, with many varieties, of which only the following seem to be really distinguishable from the type.

Var. *nilghirensis*, Hook. f.; F. B. I. v. 584. *P. neilgherrensis*, Wt. Ic. t. 2097, fig. 26. *P. ovata*, Wt. Ic. t. 2096, fig. 24. *P. oblongifolia*, Wt. Ic. t. 2096, fig. 25.

Stem harshly tomentose or scabrid; leaves coriaceous broadly ovate, elliptic or oblong-lanceolate, up to 6 in. long, 3 in. wide, scabrid above, tomentose below; ♂ sepals hirsute above the flexure. Range of the type.

Var. *Wallichiana*, Hook. f.; F. B. I. v. 584. *P. Wallichiana*, Wt. Ic. t. 2096, fig. 23.

Very like the last, but leaves usually narrower; floral leaves closer and longer; ♂ sepals glabrous. A very doubtfully valid variety. I have seen only two specimens collected by Wight in the Iyamalai Hills near Coimbatore.

Var. *Lawsoniana*, Fischer.

Stem terete and glabrous, rhachis of spike more or less quadrangular and hirsute; cauline leaves subrotund to elliptic, mucronate or acuminate, 1–6 in. long, .75–2.25 in. wide, glabrous; petioles .1–.5 in. long; floral leaves sessile, ovate-lanceolate to broadly cordate, glabrous; ♂ sepals glabrous.

Naduvattam in the Nilgiri Hills (Lawson, ex Herb. Gamble, No. 12933), Shevaroy (Bourne), Anamalais (Beddome), Pulneys (Saulière, Bourne, Barber), Travancore (Barber).

Var. *scabra* Fischer. *P. scabra*, Wt. Ic. t. 2097, fig. 29; F. B. I. v. 584. *P. aspera*, Wt. Ic. t. 2095, fig. 18.

Everywhere scabrid; spikes sometimes axillary as well as terminal and sometimes paniced. W. Ghâts, 1,000–7,000 ft. Horsleykonda in the Chittoor District.

Var. *caudata* Fischer. *P. caudata*, Benn.; F. B. I. v. 585; Wt. Ic. t. 2097, fig. 27. *P. courtallensis*, Wt. Ic. t. 2093, fig. 10.

Stem slender, glabrous; cauline leaves lanceolate to ovate-lanceolate, acuminate, up to 6 in. long and 1.5 in. wide, sessile or nearly so, glabrous; spikes (sometimes paniced) slender, pubescent; bracts becoming very small, cordate, glabrous. ♂ sepals glabrous. W. Ghâts.

7. *POUZOLZIA BENNETTIANA*, Wt. Ic. t. 1978; F. B. I. v. 585. *P. heterocarpa*, Wt. Ic. t. 2094, fig. 14.

W. Ghâts.

An erect, variable herb with several fairly well-defined varieties.

Var. *macrophylla*, Hook. f.; F. B. I. v. 586.

Stems stout and, like the leaves below, tomentose or villous; leaves up to 8 in. long and 2.5 in. wide, scaberulous above; ♂ sepals villous above the flexure.

Var. *tomentosa*, Hook. f.; F. B. I. v. 586. *P. tomentosa*, Wt. Ic. t. 2094, fig. 11.

Everywhere villously tomentose; leaves up to 2.5 in. long and .8 in. wide.

Nilgiri and Pulney Hills above 6,000 ft.

Var. *Gardneri*, Hook. f.; F. B. I. v. 586. *P. Gardneri*, Wt. Ic. t. 2092, fig. 5.

Shrubby, prostrate or decumbent, sparsely hairy; branches, leaves above and ribs below dark brown when dry; leaves ternate or opposite; ♂ sepals more or less hispid above the flexure.

Nilgiri and Pulney (Fischer) Hills at high elevations; Mahendragiri in Ganjam (Fischer) at 4,500 ft.

Var. *ovalifolia*, Hook. f.; F. B. I. v. 586. *P. ovalifolia*, Wt. Ic. t. 2092, fig. 3.

Stem prostrate, slender, glabrous; leaves elliptic-ovate, up to 3 in. long, petioled, scaberulous above, smooth below; ♂ sepals glabrous.

Nilgiri, Pulney (Bourne) and Sirumalai (Bourne) Hills.

Var. *quadrialata*, Hook. f.; F. B. I. v. 586. *P. quadrialata*, Wt. Ic. t. 2094, fig. 12.

Stem prostrate or decumbent, woody below, tomentose above; leaves softly pubescent above, tomentose below, up to 3 in. long; ♂ sepals tomentose or villous above the flexure.

Var. *mysorensis*, Hook. f.; F. B. I. v. 586. *P. mysorensis*, Wt. Ic. t. 2092, fig. 4, excluding the magnified leaves.

Stem slender, 4-angled; leaves flaccid, long-petioled; ribs prominent; ♂ sepals quite glabrous.

Var. *acuta* Fischer. *P. acuta*, Wt. Ic. t. 2092, fig. 2. *P. heterocarpa*, Wt. var. Ic. t. 2094, fig. 13.

Erect; stems sparsely pubescent upwards; leaves ternate or opposite, elliptic, long-acuminate, up to 4 in. long and 1.5 in. wide, sparsely pubescent; ♂ sepals ciliate on the flexures.

11. *Parietaria*, Tourn.

Herbs, rarely undershrubs. *Leaves* alternate, 3-ribbed, entire, exstipulate, cystoliths globose. *Flowers* polygamous in bracteate, cymose clusters. *Perianth* of ♂ (appearing ♂ through the early fall of the stigma) of 3—4 valvate sepals, of ♀ tubular, 4-fid. *Stamens* 3—4, inflexed in bud. *Ovary* straight; ovule erect; stigma recurved, penicillate. *Achene* enclosed in the persistent perianth. *Seed* with copious albumen; cotyledons oblong.

PARIETARIA DEBILIS, Forst.; F. B. I. v. 593.

Nilgiri Hills in the sholas at high elevations.

A small, diffuse, flaccid, pubescent herb. *Leaves* broadly ovate or suborbicular, narrowed to a blunt apex, base rounded, .25—1 in. long; petioles .1—5 in. long. *Flowers* minute, in 3—7-flowered, axillary cymes.

12. *Droguetia*, Gaud.

Slender herbs. *Leaves* alternate or opposite, serrate, cystoliths punctiform; stipules lateral, free. *Flowers* in small, androgynous or 1-sexual, axillary, campanulate, scabrid involucres. *Perianth* of ♂ tubular-clavate, 3—5-fid, of ♀ 0. *Stamen* 1. *Pistillode* 0. *Ovary* straight, woolly; ovule erect; stigma filiform, hispid, persistent. *Achene* ovoid, compressed, woolly. *Seed* with scanty or no albumen; cotyledons broad.

DROGUETIA DIFFUSA, Wedd.; F. B. I. v. 593. *Forskohlia urticoides*, Wt. Ic. t. 1982.

Nilgiri, Pulney and Travancore (Meebold) Hills in shady places, 6,000—7,000 ft.

A small, diffuse herb. Leaves opposite, ovate, acuminate, coarsely serrate, .5—2.3 in. long, .3—1.3 in. wide, hispidly hairy above and on the ribs and nerves below; petioles .2—1 in. long. Flowers minute, in 1- or more-flowered axillary involucre.

13. *Boehmeria*, Jacq.

Shrubs or small trees. Leaves opposite or alternate, toothed, 3-ribbed, cystoliths punctiform; stipules usually free. Flowers monocious or dioecious, in 1-sexual (rarely androgynous) clusters sessile in the axils or in axillary spikes, racemes or panicles. Perianth of ♂ valvately 3—5-lobed or -partite, of ♀ tubular, 2—4-toothed, sometimes angled, winged or swollen. Stamens 3—5, inflexed in bud. Pistillode clavate or globose. Ovary included; ovule erect; stigma filiform, persistent. Achene at first closely invested by the perianth, later free. Seed albuminous; cotyledons ovate.

Leaves alternate, equal or alternately large and small, narrowly or broadly ovate, acuminate or finely caudate, base rounded or subacute, rarely subcordate, crenulate or serrulate, with small, bluntish teeth, sometimes nearly entire, 2—8 in. long, 1—4 in. wide, glabrous or rarely with a few hairs above, pubescent below; petioles .5—4 in. long; flowers in small axillary clusters.....1. *malabarica*. Leaves opposite, rarely alternate, subequal, very variable, suborbicular to ovate, acuminate or finely caudate, base rounded or cordate, coarsely, triangularly, acutely serrate with large teeth, 3—10 in. long, 1.5—8 in. wide, more or less hairy above, with hairs often with bulbous bases, pubescent below (tomentose in one variety); petioles up to 7 in. long; flowers in clusters on long axillary spikes

2. *platyphylla*.

1. *BOEHMERIA MALABARICA*, Wedd.; F. B. I. v. 575.

Evergreen forests of the W. Gháts, 1,000—4,000 ft.

A large shrub or small tree. Bark thin, greyish-brown.

2. *BOEHMERIA PLATYPHYLLA*, Don.; F. B. I. v. 578.

Hills of the Northern Circars, 2,000—4,000 ft. Darangabadi in Ganjam (Barber), Mahendragiri (Fischer), Rampa (Gamble, Narayanswami).

A spreading shrub.

Var. *tomentosa*, Wedd.; F. B. I. v. 578. Leaves softly tomentose or villous on both sides, the young shoots shaggy; spikes stout.

Endrika in the Vizagapatam Hills at 5,000 ft. (A. W. Lushington).

Var. *longissima*, Hook. f.; F. B. I. v. 579. *Splitgerbera macrostachya*, Wt. Ic. t. 1977.

Leaves ovate; spikes very long and fine, usually much longer than the leaves, up to 20 in. long, drooping. Clusters and spikes rarely androgynous.

B. nivea, Hook. & Arn.; F. B. I. v. 576. *Urtica tenacissima* Roxb.; Wt. Ic. t. 688.

A shrub cultivated ornamentally or for its fibre. The Rhea Plant.

Leaves orbicular or broadly ovate, acuminate, scabrid above, white with cobwebby pubescence below; flowers in clusters in axillary panicles.

14. *Villebrunea*, Gaud.

Trees or large shrubs. *Leaves* alternate, penninerved or 3—5-ribbed, entire or crenulate; cystoliths punctiform; stipules bifid. *Flowers* monoecious or dioecious, clustered, clusters axillary, sometimes in short cymes or panicles, bracts minute. *Perianth* of ♂ 3—5 (usually 4) fid, of ♀ tubular, ovoid, narrowed to a minute, toothed mouth. *Stamens* 3—5, usually 4. *Pistillode* obovate-clavate, pilose below. *Ovary* adnate to the perianth; ovule erect; stigma discoid, ciliate-fimbriate. *Achene* free or adnate to the perianth, embraced below by the marcescent, fleshy bracteoles. *Seed* amply albuminous; cotyledons broad.

VILLEBRUNEA INTEGRIFOLIA, Gaud.; F. B. I. v. 589.

W. Gháts, 900—4,500 ft.

A small, evergreen tree. *Leaves* lanceolate or oblanceolate, acuminate or subcaudate, base narrowed, 2·5—10 in. long, ·9—2·5 in. wide, penninerved, primary nerves 8—9 pairs, entire or somewhat crenulate, glabrous above, pubescent on the nerves below; petioles ·25—1·25 in. long, usually pubescent. *Flowers* in globose clusters in shortly peduncled, dichotomous, hispid cymes, usually from the axils of fallen leaves.

15. *Debregeasia*, Gaud.

Trees or shrubs. *Leaves* alternate, 3-ribbed, serrate or entire, petioled, cystoliths punctiform; stipules connate, intrapetiolar, 2-fid. *Flowers* monoecious or dioecious, in dense, globose, paniced or spicate sessile clusters. *Perianth* of ♂ of 3—5, usually 4, valvate sepals, of ♀ tubular, ovoid or obovoid, mouth contracted and minutely toothed. *Stamens* 3—5, usually 4. *Pistillode* ellipsoid, glabrous or woolly at the base. *Ovary* straight, included; ovule erect; stigma sessile, penicillate. *Achene* at first adnate to the persistent, fleshy perianth. *Seed* with copious or scanty albumen; cotyledons short, broad.

Branchlets slender, pilose; leaves linear- to oblong-lanceolate, acute or acuminate, base rounded, 2—9 in. long, ·4—2·5 in. wide, closely serrulate, rugose, pubescent or scabrid above, below white- or ashy-tomentose and lacunose and pilose on the ribs and nerves; petioles ·3—1·2 in. long, pilose; flowers in small heads in short, dichotomous cymes from the axils along the branchlets.....1. *velutina*.

Branchlets thick, nearly glabrous; leaves rotund or sometimes rotund-ovate, apex suddenly and finely cuspidate, base rounded or subcordate, 4—9 in. in diam., quite entire, glabrescent and dark above, white or ashy tomentose below, primary nerves 3—4 pairs above the lateral ribs; petioles 1·7—9 in. long, thinly woolly or glabrous; flowers in larger heads in long-peduncled, paniced cymes from the axils of the terminal leaves; peduncles 2—4 in. long.....2. *ceylanica*.

1. DEBREGEASIA VELUTINA, Gaud.; F. B. I. v. 590. *Conocephalus niveus*, Wt. Ic. t. 1959.

W. Gháts, 1,000—6,000 ft.; fairly common.

A small tree, the branches rough with warty excrescences and the scars of fallen leaves. Bark greyish-brown; wood reddish-brown, used only for charcoal; the fibre useful for fishing-lines. Fruit yellow when ripe. Vern. *Tam. Katunochchi*.

2. DEBREGEASIA CEYLANICA, Hook. f.; F. B. I. v. 592.

Anamalai Hills of Coimbatore (Fischer) and hills of Travancore (Rama Rao, Venkoba Rao), 2,000—3,500 ft.

A small tree, very little known in South India.

Family CXL. CASUARINACEAE.

Trees or shrubs with cylindric, jointed branchlets. *Leaves* reduced to subulate scales, connate at the base to form short sheaths at the nodes. *Flowers* minute, monoecious or dioecious, ♂ in slender terminal spikes, ♀ in ovoid or globose bracteate and 2-bracteolate heads. *Perianth* of ♂ of 1—2 scarious sepals, of ♀ 0. *Stamen* 1, inflexed in bud; anther large. *Ovary* minute, 1-celled (or 2-celled with one suppressed); ovules 2, collateral; stigmas 2, long, filiform. *Carpophore* forming a cone with the achenes enclosed in the enlarged, coriaceous or woody bracteoles. *Seed* with a terminal wing, tipped by the style; albumen 0; embryo straight; cotyledons flat, equal; radicle very short, superior.

Casuarina, Forst.

The only genus with the characters of the family.

CASUARINA EQUISETIFOLIA, Forst.; F. B. I. v. 598.

Extensively planted on the sea-shore sands along both coasts and to a certain extent inland and up to about 4,000 ft. The Casuarina or Beefwood Tree.

A fast-growing, erect, tall tree. Bark brown, rough, fibrous, peeling in vertical stripes; wood yellowish-pink to reddish-brown, very hard; useful for scaffolding poles and an excellent fuel. Scales in whorls of 6—8, usually 7; teeth acute or setaceous; internodes rarely exceeding .25 in long, rather prominently ribbed. Valves of the cone pubescent outside. Vern. *Ur. Jhabuko*; *Tel. Savuku*, Chavukku; *Tam. Chauku*, Chavukku; *Mal. Sampirani*; *Kan. Kasrike*.

Other species, e.g. *C. quadrivalvis*, Labill., *C. suberosa*, Ott. & Diet., *C. glauca*, Sieb., have been planted in the Nilgiri Hills.

Family CXLI. SALICACEAE.

Trees or shrubs. *Leaves* alternate, simple, stipulate. *Flowers* dioecious (rarely monoecious), in close bracteate spikes (catkins), one flower to each bract, ebracteolate. *Perianth* 0. *Disk* cupular or of 1 or more scales or glands. *Stamens* 2 or more; filaments free or connate. *Ovary* sessile or stalked, 1-celled; ovules few-many, erect; style short or 0; stigmas short, notched or lobed. *Capsule* ovoid or lanceolate, 2—4-valved. *Seed* with a pencil of long, silky, deciduous hairs; albumen 0; cotyledons plano-convex; radicle short, inferior.

Salix, Linn.

Characters of the family. *Stamens* 2—12 (usually 2). *Disk* of 2 fleshy or glandular scales. *Ovules* 4—8.

SALIX TETRASPERMA, Roxb. Cor. Pl. t. 97; F. B. I. v. 626; Wt. Ic. t. 1954; Bedd. Fl. Syl. t. 302; Brand. For. Fl. t. 58. *S. ichnostachya*, Lindl.; F. B. I. v. 628; Wt. Ic. t. 1953.

In all Districts up to 8,000 ft.; usually near streams. The Indian Willow.

A small or fairly large tree. Bark rough with deep, vertical fissures, greyish-brown; wood red, soft, porous, not much used, makes good gunpowder-charcoal; the twigs are woven into baskets. Leaves linear- to ovate-lanceolate, acuminate, base narrowed or rounded, 2—6 in. long, 4—2.25 in. wide, entire or serrate; petioles up to 1 in. long. Flowers in lax or dense-flowered catkins, which are nearly glabrous, pubescent, villous or densely tomentose. Vern. *Hind.* Bains; *Ur.* Baisi; *Tam.* Vanji, Nirvanji; *Mal.* Vanji; *Kan.* Baiché.

Family CXLII. CERATOPHYLLACEAE.

Slender, submerged water-herbs. *Leaves* whorled, dichotomously cleft into filiform minutely-toothed lobes; stipules 0. *Flowers* minute, monoecious, solitary, axillary, sessile. *Perianth* (or involucre) of both sexes of 6—12 narrow subvalvate, 2-fid segments. *Stamens* 12—30; filaments very short; anthers erect, extrorse, connective truncate or 2—3-toothed at the apex. *Ovary* sessile, ovoid, 1-celled; ovule 1, pendulous, straight; style subulate, stigmatic on one side. *Fruit* a small coriaceous, ovoid or ellipsoid, somewhat compressed nutlet terminating in the persistent long style and furnished on either side with a long subulate spur projecting from a little above the base, sometimes narrowly winged. *Seed* exalbuminous; embryo straight; cotyledons thick; radicle short, inferior.

Ceratophyllum, Linn.

The only genus, with the characters of the family.

CERATOPHYLLUM DEMERSUM, Linn.; F. B. I. v. 639. *C. tuberculatum*, Cham.; Wt. Ic. t. 1948, fig. 3. *C. muricatum*, Cham.; Wt. Ic. t. 1948, figs. 1 and 2. *C. missionis*, Wall.; Wt. Ic. t. 1948, fig. 4.

In all Districts, in still water.

A fragile alga-like herb 6 in.—3 ft. long. *Leaves* 5—1 in. long. *Fruit* up to 2 in. long, smooth, muricate or minutely tubercled.

Family CXLIII. GNETACEAE.

Trees or shrubs, sometimes climbing; branches jointed at the nodes. *Leaves* opposite, large and green or minute and scale-like; stipules 0. *Flowers* monoecious or dioecious, in axillary or terminal bracteate spikes or cones. *Perianth* of ♂ tubular, entire or valvately 2—4-lobed or spathaceous, of ♀ 0. *Stamens* connate in a column; anthers 2—8, globose, 1—3 celled, sessile or subsessile on the apex of the column. *Ovule* naked, erect, with a styliiform tube with a discoid

mouth. *Seed* dry or drupaceous; albumen copious or scanty; embryo straight; cotyledons appressed; radicle long, superior.

***Gnetum*, Linn.**

Evergreen trees or climbing shrubs. *Leaves* large, entire, penninerved. *Flowers* monoecious, whorled in the axils of cupular bracts in solitary or paniced spikes. *Perianth* of ♂ narrowly clavate, entire or valvately 2-fid. *Staminal column* adnate to the base of the perianth, apex exserted; anthers of 2 distinct cells, sessile, opening by terminal slits. *Ovule* ovoid or globose; styliform tube exserted, mouth often toothed or fimbriate. *Seed* drupaceous.

GNETUM SCANDENS, Roxb.; F. B. I. v. 642. *G. funiculare*, B. Sm.; Wt. Ic. t. 1955.

In the Ghâts of both sides of the Peninsula, 500—5,000 ft.

A large, robust climber. Bark thick, brown, rough with scales. Leaves ovate-oblong or elliptic, obtusely acuminate, shining, 3—7 in. long, 1·75—4 in. wide; petioles 3—5 in. long. Fruit ellipsoid, pointed or blunt, 1—1·5 in. long, reddish-orange when ripe. Vern. *Tam.* Ana-pendu.

Family CXLIV. CONIFERAE.

Trees or shrubs; resin-canals in the wood frequent. *Leaves* usually alternate or fascicled, rarely opposite, usually rigid, linear or subulate, rarely broad. *Flowers* monoecious or dioecious, ♂ in deciduous catkins, ♀ solitary or in cones. *Perianth* absent in both sexes. ♂ of many 1- or more-celled anthers seated on the scales of the catkin, sessile or with connate filaments; ♀ of 1 or more naked sessile ovules seated on scales usually forming a cone, rarely solitary. *Seeds* often winged; albumen densely fleshy; embryo axile, straight; cotyledons 2 or more; radicle terete.

***Podocarpus*, L'Hérit.**

Evergreen trees or shrubs. *Leaves* opposite or alternate, linear or broad with a midrib or with many parallel nerves. ♂ *flowers* solitary, fascicled or spicate, with imbricate bracts; anthers sessile, spirally crowded, 2-celled, connective with an apical claw or appendage. ♀ *flowers* solitary or few and spicate, bract fleshy, forming a peduncle to the fleshy ovuliferous scale to which the reflexed ovule is adnate. *Seed* small, globose or ovoid, seated on the enlarged fleshy scale and bract; cotyledons 2.

PODOCARPUS WALLICHIANA, Presl. *P. latifolia*, Wall. Pl. As. Rar. t. 30; F. B. I. v. 649; Bedd. Fl. Syl. t. 257.

W. Ghâts from the Nilgiris southwards, 3,000—5,000 ft.

A tall evergreen, glabrous tree. Bark smooth, mottled brown and white; wood grey, aromatic, moderately hard. Leaves opposite or subopposite, coriaceous, lanceolate, tapering at both ends, 3—7 in. long, 1·75—2 in. wide; petiole very short, flat. *Seed*

solitary, ovoid, 1 in. long, seated on a fleshy receptacle. Vern. *Tam.* Nirambali, Narambali; *Kad.* Karunthumbi.

Several conifers have been successfully planted in the Nilgiri and Pulney Hills, e.g. *Cupressus torulosa*, Don, *Pinus radiata* (*insignis*), Don, *Cryptomeria japonica*, Don, *Callitris* (*Frenela*) *rhomboidea*, R. Br.

Family CXLV. CYCADACEAE.

Shrubs or small branchless but sometimes forked trees with a terminal crown of leaves, or stemless with the leaves arising from a tuberous simple or branched rootstock. *Leaves* in alternate series of short coriaceous scales and palm-like pinnate (rarely 2—3-pinnate) leaves with membranous or coriaceous leaflets, often spinous. *Flowers* dioecious, in both sexes naked on scales or modified leaves more or less arranged in cones. *Anthers* sessile and crowded on the undersides of fleshy flat or peltate scales, 1-celled. *Ovules* on the margins of carpellary leaves (*carpophylls*) crowded round the apex of the stem, or on flat or thickened peltate scales arranged in cones, large, sessile. *Seeds* large, drupaceous; albumen copious, fleshy or horny, with 1 or more embryonic cavities; embryo usually single by abortion, slender; radicle superior; cotyledons 2.

Cycas, Linn.

Shrubs or trees; trunk clothed with the woody bases of the petioles. *Leaves* pinnate, linear-oblong in outline; leaflets numerous linear, 1-nerved, quite entire, lower often reduced to spines. ♂ *cones* apparently terminal, peduncled; scales cuneate, closely imbricate, the apex often long-acuminate. *Anthers* ellipsoid in groups of 3—5. *Carpophylls* numerous, crowded round the apex of the stem, at first appressed into an apparently terminal cone, later spreading, elongate, flattened, expanded apically into an entire, crenate or pectinate blade, densely woolly. *Ovules* 1—5 on either side of the carpophyll below the blade, distant, alternate in notches along the margins. *Seeds* ellipsoid or globose.

Small palm-like trees. Leaves 5—9 ft. long; petioles 1·5—2 ft. long with short distant spines at right angles to the petioles or slightly deflexed, to near the glabrous base; leaflets 6—12 in. long, 3—5 in. wide, blunt or acute, not spinous-acuminate, margins flat; acumen of all the antheriferous scales upturned; blade of carpophyll ovate-lanceolate, long-acuminate, margins pectinate; ovules 3—5 on either side; seeds ovoid-oblong, 1—1·5 in. long.....1. *circularis*. Low shrubs, stem only a few inches high. Leaves about 3 ft. long; petioles about 6 in. long, the upper one-third with a few minute spines, base clothed with tufted tomentum; leaflets 4—7 in. long, about 1·5 in. wide, spinous-acuminate, margins strongly revolute; acumen of the antheriferous scales of the upper half of the cone strongly deflexed; blade of carpophyll usually narrow-lanceolate, long-acuminate; margins dentate-lobate; ovules 2 on either side; seeds globose, 1·5 in. in diam.....2. *Beddomei*.

1. *CYCAS CIRCINALIS*, Linn.; F. B. I. v. 656.

In all Districts in deciduous forests, sea-level to 4,000 ft.

A small evergreen palm-like tree up to 25 ft. high. Bark brown, smooth below, tessellated above by the small diamond-shaped

scars of fallen leaves. The leaves are used for plaiting into mats. Vern. *Ur.* Oruna, Rengua; *Tel.* Per-ita, Pairi-ita; *Tam.* Madana-kaman, Katu-thuvai; *Mud.* Pei-ithu; *Mal.* Kalanga, Intha. *Kan.* Goddu-ichel.

2. *CYCAS BEDDOMEI*, Dyer in Trans. Linn. Soc. ii, 5, 85, t. 17; F. B. I. v. 658.

So far only found in the hills of the Cuddapah District, 1,000—3,000 ft.

A small shrub. Bark brown, exfoliating in rectangular scales exposing a yellow under-surface. Vern. *Tel.* Perita.

C. Rumphii, Miq., much resembling *C. circinalis*, is grown in gardens.

MONOCOTYLEDONES.

Family CXLVI. HYDROCHARITACEAE.

Aquatic herbs, usually submerged. *Leaves* undivided. *Flowers* monoecious or dioecious, rarely 2-sexual, enclosed in an entire or 2-leaved spathe; ♂ 1-many, ♀ solitary. *Calyx* of 3 green or petaloid sepals. *Petals* membranous or 0. *Stamens* 3—12; anthers 2-celled. *Ovary* inferior, 1-celled, placenta parietal, intruded and sometimes almost meeting; ovules numerous; styles or style-arms 3—12. *Fruit* globose or ovoid, membranous or fleshy, rarely dehiscent. *Seeds* exalbuminous; embryo various.

Fresh-water herbs; leaves tufted, whorled, opposite or alternate:—

Stems branched, leafy:—

Leaves mostly whorled; perianth double, styles undivided.....1. **Hydrilla**.

Leaves mostly alternate; perianth single; styles notched.....2. **Lagarosiphon**.

Stemless or with stolons, leaves tufted, radical:—

Leaves without a distinct petiole, linear, grass-like; flowers very slender; spathe not winged:—

Perianth single; peduncle of ♀ spathe spirally coiled.....3. **Vallisneria**.

Perianth double; peduncle not coiled.....4. **Blyxa**.

Leaves distinctly petioled, mostly broad, not grass-like; flowers large and broad; spathe winged.....5. **Ottelia**.

Salt-water herbs; leaves 2 at each node from the axil of a scarious or hyaline scale.....6. **Halophila**.

1. **Hydrilla**, Rich.

Submerged leafy fresh- or brackish-water herbs. *Leaves* short, 3—4-nately whorled or the lower opposite entire or toothed. *Flowers* monoecious or dioecious. ♂ *flowers* minute, shortly pedicelled, solitary in a sessile subglobose muricate spathe. *Sepals* 3, ovate to orbicular, concave, green. *Petals* 3, oblong or cuneiform. *Stamens* 3, anthers large, reniform. *Pistillode* minute. ♀ *flowers* sessile, solitary in a cylindric 2-toothed spathe, produced into a long filiform neck above the ovary. *Sepals* and *petals* as in the ♂, but narrower. *Ovary* shorter than the spathe, 1-celled; ovules many, anatropous; styles 2—3, linear, entire; stigmas fimbriate. *Fruit* subulate, smooth or muricate. *Seeds* 2—3, minute, oblong; testa shortly produced at both ends.

HYDRILLA VERTICILLATA, Royle; F. B. I. v. 659. *Serpicula verticillata*, Linn. f.; Roxb. Cor. Pl. t. 164.

In still waters in all Districts from the coast up to high levels.

A slender submerged weed up to 18 in. long, with fibrous roots.

2. Lagarosiphon, Harv.

Submerged fresh-water herbs. *Leaves* alternate or sometimes fascicled and subverticillate and the lower opposite, serrulate or entire. *Flowers* dioecious; ♂ minute, numerous in an axillary, sessile, ovoid, 2-fid spathe; ♀ solitary sessile in a narrow oblong spathe. *Sepals* 3, petaloid, broadly oblong, pink. *Petals* 3, rather shorter. *Stamens* 2 or 3, often with 2 or 3 staminodes added; filaments short, anthers ovate. *Pistillode* 0. *Staminodes* 0 in ♀. *Ovary* oblong, produced into a long filiform beak; ovules many, orthotropous; styles 3, notched, stout. *Fruit* ovoid, oblong or linear. *Seeds* numerous, testa with a mucous coat.

LAGAROSIPHON ALTERNIFOLIA, Druce. *L. Roxburghii*, Benth.; F. B. I. v. 659. *Vallisneria alternifolia*, Roxb.; Wt. Ill. t. 11.

In tanks in all Districts.

Very similar to the last species.

3. Vallisneria, Linn.

Submerged tufted, stemless, stoloniferous fresh-water herbs. *Leaves* very long, linear. *Flowers* dioecious; ♂ minute, very many together in a shortly peduncled, ovoid, 3-lobed spathe; ♀ solitary in a tubular 3-toothed spathe at the end of a very long filiform spirally coiled scape. *Sepals* 3. *Petals* 0. *Stamens* 1—3; anthers didymous. *Pistillode* 0. *Staminodes* in ♀ 3, 2-fid. *Ovary* narrow, not produced upwards; stigmas 3, broad, notched. *Fruit* linear, included in the spathe. *Seeds* numerous, oblong, testa membranous.

VALLISNERIA SPIRALIS, Linn.; F. B. I. v. 660; Wt. Ill. tt. 23 and 24.

A common weed rooting at the bottom of pools and tanks in all Districts.

4. Blyxa, Noronha ex Thouars.

Submerged stemless, tufted, scapigerous herbs. *Leaves* linear, acute, entire or minutely serrulate. *Flowers* dioecious or 2-sexual, on long or short scapes; ♂ pedicelled, several in a tubular 2-toothed spathe ♀ and ♂ sessile, solitary in a 2-toothed spathe. *Sepals* 3, linear. *Petals* 3, linear, longer. *Stamens* 3—9, 1 or more rudimentary; anthers narrow, erect. *Pistillodes* 3, slender. *Staminodes* in ♀ 0 or minute. *Ovary* very slender, beaked; style very short; stigmas 3, filiform. *Fruit* linear, very slender, included in the narrow, ribbed spathe. *Seeds* numerous, oblong; testa membranous, smooth, tubercled or echinate, often tailed at both ends.

Leaves as broad at the base as in the middle or broader:—

Flowers dioecious; stamens 8. Leaves 8—24 in. long, .25—5 in. wide. Fruit 2—4 in. long, about .15 in. wide. Seeds small, tubercled, shortly tailed at each end.....1. *octandra*.

Flowers 2-sexual; stamens 3:—

- Leaves 6—48 in. long, .12—5 in. wide. Fruit 2—3 in. long, about .1 in. wide. Seeds spinescent with a long tail at each end, sometimes .5 in. long, including the tails.....2. *echinosperma*.
 Leaves 3—24 in. long, .2—5 in. wide. Fruit 1.5—2 in. long, about .12 in. wide. Seeds smooth or obscurely tubercled, tailless.....3. *ceylanica*.
 Leaves narrowed from the middle downwards, 4—6 in. long, .12—4 in. wide. Flowers dioecious. Fruit 1—2 in. long, .12 in. wide. Seeds echinate with a short tail at each end.....4. *Talboti*.

1. *BLYXA OCTANDRA*, Planch. *B. Roxburghii*, Rich.; F. B. I. v. 660.
Vallisneria octandra, Roxb. Cor. Pl. t. 165.
 In still waters in all Districts.
2. *BLYXA ECHINOSPERMA*, Hook. f.; F. B. I. v. 661.
 In still water on the West Coast; S. Kanara (Barber), Cochin (Meebold).
3. *BLYXA CEYLANICA*, Hook. f.; F. B. I. v. 661.
 In still water at Udumanparai, Anamalai Hills (Barber), Poombari Valley, Pulney Hills (Bourne).
4. *BLYXA TALBOTI*, Hook. f.; F. B. I. v. 661.
 In still water; Sadras, S. Kanara (Fischer), N. Malabar (Barber).

5. *Ottelia*, Pers.

Submerged fresh-water herbs. *Leaves* radical, crowded, the submerged ones usually different from and narrower than the floating; length of petiole depending on the depth of the water. *Flowers* 2-sexual, solitary, sessile in a tubular, long-peduncled spathe. *Sepals* 3, linear. *Petals* 3, larger. *Stamens* 6—15 in 3—5 whorls, often unequal, some often rudimentary; anthers erect. *Ovary* oblong or fusiform, beaked, sometimes almost 6-celled by the intrusion of the walls; ovules numerous, scattered on the placentæ and walls; styles 6—9, linear. *Fruit* oblong, enclosed in the spathe. *Seeds* numerous.

OTTELIA ALISMOIDES, Pers.; F. B. I. v. 662. *Damasonium indicum*, Willd.; Roxb. Cor. Pl. t. 185.

Common in tanks and sluggish streams in all Districts, sea-level to 3,500 ft.

A flaccid water-herb varying in height with the depth of the water. Leaves of 2 kinds; submerged shortly petioled and usually narrow or oblong and tapering to the base, the floating ones oblong or orbicular, cordate or rounded at the base and then narrowed into the angled petiole, up to 7 in. in diam., 7—11-nerved, margins undulate. Spathe 5—6-toothed, with 5—6 wavy crisped wings, attenuate or caudate at the base, 1—1.5 in. long, about .75 in. in diam. Petals obovate or orbicular with fleshy basal appendages, white. Ovary oblong, beaked; styles 2-fid. Fruit 6-valved. Seeds oblong with a pulpy testa. Vern. *Tel. Nir-veneki*.

6. *Halophila*, Thouars.

Submerged marine plants. *Leaves* in pairs at each node from the axil of a scarious or hyaline scale. *Flowers* solitary or 2 together in a sessile spathe of 2 bracts from between the petioles. *Sepals* 3.

Petals 0. *Stamens* 3; anthers nearly sessile, alternate with the sepals, linear-oblong. *Pistillode* 0. *Ovary* ovoid, long-beaked; ovules many on 2 parietal placentæ; styles 3, filiform, papillose all over. *Fruit* subglobose, beaked, included in the spathe. *Seeds* many, subglobose, testa membranous; embryo thick, with the spiral cotyledons in a cavity at the side.

HALOPHILA OVATA, Gaud.; F. B. I. v. 663.

Along the coast and in back-waters.

A slender, creeping herb. Leaves linear-oblong to ovate, penninerved, up to 3 in. long and .75 in. wide; petiole long, slender.

♂ flowers pedicelled; ♀ sessile. Sepals minute.

Family CXLVII. BURMANNIACEAE.

Small erect herbs. *Leaves* chiefly radical, linear, entire or reduced to scales or 0. *Flowers* 2-sexual, regular, solitary or spicate or racemose on one side of a forked cyme, each opposite a bract. *Perianth* superior, persistent, corolline, 6- or 3-lobed, lobes valvate. *Anthers* 3 or 6, included, 2-celled, sessile or subsessile on the perianth. *Ovary* inferior, 3-celled or 1-celled with 3 parietal placentæ; ovules numerous; style 1, short; stigmas various. *Fruit* capsular, sometimes dehiscent irregularly. *Seeds* numerous, minute, testa reticulate; albumen scanty; embryo minute.

Burmattia, Linn.

Annual herbs. *Leaves* ensiform, acuminate, radical, often reduced to scales or 0. *Flowers* 1, few or many, unilateral on the branches of a forked cyme. *Calyx-tube* winged or angled, wings narrow or obcordate, 3-lobed. *Petals* smaller or 0. *Anthers* 3, sessile or subsessile, cells short, separated by a broad connective, dorsally crested. *Ovary* 3-celled; style 3-lobed.

Plant leafy, robust; radical leaves many, ensiform, acute, 1—3 in. long, .25—.5 in. wide; flowers .5—.75 in. long, secund on the branches of an erect, forked cyme

1. *disticha*.
Plant leafless or nearly so, slender; radical leaves, when present, scale-like, .2—.7 in. long; flowers .25—.5 in. long, solitary or 2—6 together.....2. *coelestis*.

1. *BURMANNIA DISTICHA*, Linn.; F. B. I. v. 664.

Vizagapatam District at Ventala, 4,500 ft. (A. W. Lushington).

Up to 18 in. high; leaves radical and clothing the stem, gradually reduced upwards to lanceolate bracts .65—1.5 in. long; flowers bright blue.

2. *BURMANNIA COELESTIS*, Don.; F. B. I. v. 665. *B. pusilla*, Thw.; F. B. I. 665. *B. candida*, Griff. MSS. ex Hook. f. F. B. I. v. 665.

Mahendragiri (Fischer) and on the West Coast from low elevations (Nedungayam in S. Malabar at 150 ft.—Fischer) up to about 7,000 ft. in the W. Ghâts from Mysore to Travancore.

A slender variable herb 3—15 in. high with 1—5 or 6 small blue flowers and with or without small ensiform radical leaves. The variation appears to be due greatly to the conditions under which it grows, especially the degree of moisture.

Family CXLVIII. ORCHIDACEAE.

Epiphytic or terrestrial herbs, rarely shrubby, sometimes scandent; often tuberous rooted; leafy or leafless. *Leaves* various. *Inflorescence* lateral or terminal. *Flowers* hermaphrodite, from minute to large and showy, solitary or more usually spicate or racemose, sometimes paniced. *Perianth* superior, irregular, of 6 free or variously combined segments in 2 alternating whorls. *Calyx* of 3 similar or dissimilar sepals, 1 dorsal and 2 lateral, the latter often united and forming a basal sac or spur (*mentum*). *Petals* 3, the 2 lateral alike, the third (*lip*) dissimilar. *Stamens* and *style* united into a long or short column opposite the lip, the top sometimes produced towards the lip in a beak (*rostellum*). *Anther* usually single (2 in *Paphiopedilum*) on the front, top or back of the column, 2- or 4-celled, pollengrains usually cohering in each cell into 1, 2 or 4 pairs of oblong, globose or pyriform, waxy or powdery masses (*pollinia*), which are free or adnate in pairs or fours, with or without a stalk (*caudicle*) to a gland. *Ovary* inferior, usually linear and twisted half a turn so that the lip appears inferior, 1-celled; ovules minute; stigma one or two viscid spots on the top or concave face of the column facing the lip and below the anther, sometimes stalked. *Capsule* usually opening by 3 or 6 longitudinal fissures, fruit rarely fleshy and indehiscent. *Seeds* very many, minute; testa lax, enclosing a homogeneous nucleus.

(This key is adapted for use only for the genera and species included in this flora.)

Epiphytic plants:—

Leaves equitant:—

Stem very short, leaves tufted; scape terminal; spike elongate, many-flowered
1. **Oberonia**.

Stem elongate, leaves imbricating throughout; spike short, terminal and lateral,
few-flowered.....37. **Podochilus**.

Leaves not equitant:—

Flowers 2 in. long or longer.....13. **Thunia**.

Flowers 1.5 in. long or shorter:—

Lip not spurred, though base sometimes saccate:—

Flowers with a mentum:—

Mentum formed by the lateral sepals and the foot of the column:—

Column short, straight, not winged:—

Rhizome long, annulate, stem nodose, bearing uninodal pseudobulbs

4. **Desmotrichum**.

Rhizome short, stemless with a single pseudobulb or pseudobulbs

plurinodal.....5. **Dendrobium**.

Column rather long, incurved, more or less winged

8. **Chrysoglossum**.

Mentum formed by the lip and the foot of the column...26. **Kingiella**.

Flowers without a mentum:—

Column with a distinct foot:—

Lip clawed, jointed to the foot and more or less mobile:—

Scape lateral, flowers not paniced:—

Sepals subequal.....6. **Bulbophyllum**.

Dorsal sepal much shorter than the lateral (rarely half as long)

7. **Cirrhopetalum**.

Scape terminal, flowers paniced.....23. **Polystachya**.

Lip sessile, not jointed or mobile:—

Pseudobulbs discoid; sepals connivent at the base, lateral, at least,
connate.....9. **Porpax**.

Pseudobulbs not discoid; sepals free.....10. **Eria**.

Column without a foot:—

Bracts imbricating, convolute, almost concealing the flowers

17. *Pholidota*.

Bracts not imbricate nor concealing the flowers:—

Lip not lobed:—

Leaves flat:—

Scape terminal; column long.....3. *Liparis*.

Scape lateral; column very short.....38. *Thelasis*.

Leaves terete.....24. *Luisia*.

Lip more or less 3-lobed:—

Stem very short or 0; leaves basal or from the apex of a

pseudobulb:—

Flowers paniced.....15. *Josephia*.

Flowers simply racemed:—

Apex of leaves entire.....16. *Coelogyne*.

Apex of leaves 2-lobed.....21. *Cymbidium*.

Stem elongate; leaves distichous.....25. *Cottonia*.

Lip-spurred:—

Lip with a single conical or saccate spur:—

Plant leafless, at least when flowering:—

Column with a distinct foot bearing the lateral sepals

28. *Chilochista*.

Column without a foot.....35. *Taeniophyllum*.

Plant leafy:—

Foot of column distinct, usually long.....29. *Aerides*.

Foot of column 0 or indistinct:—

Spur vertically septate almost to the mouth.....33. *Sarcanthus*.

Spur not septate:—

Spur distant from the base of the lip.....27. *Rhynchostylis*.

Spur at the base of the lip:—

Mouth of the spur open:—

Sepals and petals distinctly narrowed to the base.....30. *Vanda*.

Sepals and petals not distinctly narrowed to the base:—

Slender plants; leaves not thickly coriaceous; spur as long

as or longer than the rest of the lip.....31. *Saccolabium*.

Robust plants; leaves thickly coriaceous; spur shorter than

the rest of the lip.....32. *Acampe*.

Mouth of the spur almost closed by a horizontal plate from

the back wall.....34. *Cleisostoma*.

Lip with 2 small collateral spurs.....36. *Diplocentrum*.

Terrestrial plants:—

Leafy plants:—

Climbing, fleshy plants.....39. *Vanilla*.

Not climbing plants:—

Flowers without spur or mentum:—

Inflorescence lateral from the stem:—

Racemes few-flowered, flowers gibbously jug-shaped, yellow and red;

column short, foot long.....12. *Acanthophippium*.

Panicles many-flowered, flowers not gibbous nor jug-shaped, greenish-

white; column long, foot short.....40. *Corymborchis*.

Inflorescence terminal on the stem or direct from the rhizome or

pseudobulb:—

Lip superior:—

Spike glabrous:—

Column very short, entire.....2. *Microstylis*.

Column long, margined or winged towards the apex.....3. *Liparis*.

Spike glandular-pubescent.....48. *Hetaeria*.

Lip inferior:—

Spike conspicuously spirally twisted.....44. *Spiranthes*.

Spike straight:—

Leaf single, often appearing after the flowers:—

Leaf narrow, flowers glandular-pubescent

11. *Pachystoma*.

- Leaf cordate or orbicular, flowers glabrous 50. *Nervilia*.
- Leaves 2 or more, appearing with the flowers:—
- Flowers 1 in. long or longer:—
- Flowers red, glabrous; lip triangular-ovate, disk with 3—5 lamellae.....19. *Arundina*.
- Flowers greenish, pubescent; lip narrowly oblong below, lanceolate above, base warted, not lamellate.....53. *Epipactis*.
- Flowers not more than .5 in. long:—
- Lip entire:—
- Scape from the rootstock, raceme decurved 22. *Geodorum*.
- Scape terminating the leafy stem, raceme erect 47. *Goodyera*.
- Lip lobed:—
- Lip saccate at the base:—
- Sepals connate to the middle in a tube 45. *Cheirostylis*.
- Sepals free.....46. *Zeuxine*.
- Lip not saccate at the base, T- or Y-shaped 59. *Disperis*.
- Flowers spurred or with a mentum:—
- Lip not large nor shoe-shaped:—
- Spur 0 or single:—
- Scape lateral:—
- Spur longer than the sepals, lip adnate to the top of the column 18. *Calanthe*.
- Spur 0 or shorter than the sepals, lip adnate to the base of the column:—
- Lateral sepals connate into a mentum with the base of the lip:—
- Column 2-auricled or lobed about the middle 8. *Chrysoglossum*.
- Column not auricled nor lobed.....14. *Tainia*.
- Lateral sepals free, not connate with the lip.....20. *Eulophia*.
- Raceme or spike terminal:—
- Lip superior.....41. *Tropidia*.
- Lip inferior:—
- Lip lobed:—
- Root not tuberous:—
- Lateral sepals free, spur exerted beyond the bases of the sepals.....42. *Anoechtochilus*.
- Lateral sepals connate, concealing the small spur 43. *Odontochilus*.
- Root of 1 or 2 simple or lobed tubers:—
- Sepals subequal and more or less connivent.....55. *Peristylus*.
- Sepals unequal, the lateral spreading or reflexed:—
- Flowers less than 1.3 in. in diameter, stigmas distinctly stalked.....54. *Habenaria*.
- Flowers 2 in. in diameter or more; stigma sessile 56. *Platanthera*.
- Lip entire, obcordate.....57. *Phyllomphax*.
- Spurs 2 from the back of the superior lip.....58. *Satyrion*.
- Lip large, shoe-shaped.....60. *Paphiopedilum*.
- Leafless plants without chlorophyll:—
- Lip clawed.....49. *Aphyllorchis*.
- Lip sessile:—
- Lateral sepals connate.....51. *Didymoplexis*.
- Lateral sepals free.....52. *Epipogon*.

1. *Oberonia*, Lindl.

Small tufted epiphytes. *Leaves* distichous, equitant, coriaceous or fleshy, usually ensiform. *Flowers* minute in dense or interrupted

subcylindric spikes or racemes. *Sepals* subequal, ovate or oblong. *Petals* smaller. *Lip* sessile, concave, entire or 2—4-lobed, sometimes erose. *Column* very short. *Anther* terminal, incumbent; pollinia 4, waxy, cohering by a viscus.

Lip of corolla toothed. Leaves broadly ensiform, 3—8 in. long; spikes slender up to 12 in. long, flowers and capsules sessile; lip more or less quadrate, tip broadly 2-fid.....1. *iridifolia*, var. *denticulata*.

Lip not toothed, subentire or 3-lobed:—

Petals broad, elliptic-oblong or ovate:—

Lip truncate, not lobed. Leaves ensiform, acute, 1—2.5 in. long; racemes about twice as long; flowers numerous, sunk in pits in the rhachis; sepals and petals reflexed on the ovary; lip subquadrate with an obscure rounded auricle at each side of the base.....2. *Proudlockii*.

Lip obcordate or 3-lobed:—

Side lobes of lip undeveloped:—

Lip twice as long as the sepals, obcordate with rounded lobes separated by a narrow sinus, side lobes absent. Leaves narrow-ensiform, acute or acuminate, 2—5.5 in. long; racemes slender, long; flowers pedicelled, usually whorled.....3. *verticillata*.

Lip only slightly longer than the sepals, oblong with 2 short, narrow, acute lobes separated by a broad sinus; side lobes small, rounded or tooth-like. Leaves broadly ensiform, acute, 1—3 in. long; racemes rather stout; flowers shortly pedicelled, not whorled.....4. *Falconeri*.

Side lobes of lip broad or long:—

Leaves 6—18 in. long, coriaceous, acuminate; spike dense-flowered, shorter than the leaves; lip broad, rounded, mid-lobe obcordate.....5. *ensiformis*.

Leaves 1—2 in. long, acuminate; spike dense-flowered, 2—3 in. long; lip erose, lateral lobes rounded, midlobe 2-fid.....6. *recurva*.

Petals linear:—

Lip quadrate, entire or obscurely lobed at the outer angles. Leaves linear-ensiform, obtuse, up to 6 in. long; scape about as long as the leaves, flattened, usually with a small adnate leaf about the middle; flowers shortly pedicelled, loosely imbricated.....7. *zeylanica*.

Lip distinctly lobed:—

Scape adnate to the upper leaf:—

Lip orbicular with a 2-lobed apical auricle. Leaves ensiform, up to 12 in. long, acute; spike stout, flattened, flowers sessile, densely imbricated; lip with a concave disk.....8. *Brunoniana*.

Lip with broad rounded lateral lobes and a short 2—3-fid midlobe. Leaves ensiform, up to 12 in. long; scape flat, very broad, adnate to the upper leaf to the top; flowers sessile, about 2 in. in diam. (the largest of the genus in India), densely imbricated.....9. *platycaulon*.

Scape not adnate to the upper leaf:—

Midlobe of lip much smaller than the lateral lobes, broad. Leaves ensiform, obtuse, 3—6 in. long; scape stout, flattened; flowers sessile, densely imbricated; lip broadly 3-lobed, crenate, gland-dotted.....10. *Lindleyana*.

Midlobe of lip much longer than the lateral, narrow. Leaves linear-oblong or narrow-ensiform, acute, 1.5—5 in. long; scape terete, racemes slender, longer than the leaves; flowers shortly pedicelled, whorled or loosely imbricated; lateral lobes of lip large, oblong or rounded; midlobe narrow with diverging lobes, sometimes minutely toothed at the ends

11. *Wightiana*.

1. OBERONIA IRIDIFOLIA, Lindl. var. DENTICULATA, Hook. f.; F. B. I. v. 676. *O. denticulata*, Wt. Ic. t. 1625.

W. Gháts; Rampa Hills (Gamble).

Flowers dull-orange.

2. OBERONIA PROUDLOCKII, King & Pantl.

Nilgiri Hills near Gudalur (Proudlock).

Flowers reddish-brown.

3. *OBERONIA VERTICILLATA*, Wt. Ic. t. 1626; F. B. I. v. 677.
W. Gháts; Salem Hills (Bourne).
Sepals pale-green, petals and lip dull-orange.
4. *OBERONIA FALCONERI*, Hook. f.; F. B. I. v. 678; Duthie Ann. Calc. ix. 2. t. 94.
Mysore Hills at 3,500 ft. (Meebold); Rampa Hills at 2,000 ft. (V. Narayanswami), Vizagapatam Hills at 2,400 ft. (A. W. Lushington).
Flowers greenish-yellow.
5. *OBERONIA ENSIFORMIS*, Lindl.; F. B. I. v. 679; King & Pantl. Ann. Calc. viii. t. 9.
W. Gháts; Rampa Hills (Gamble, V. Narayanswami), Vizagapatam Hills, 2,500—4,000 ft. (A. W. Lushington).
Flowers orange-yellow.
6. *OBERONIA RECURVA*, Lindl.; F. B. I. v. 680.
Travancore (M. Rama Rao).
Flowers green.
7. *OBERONIA ZEYLANICA*, Hook. f.; F. B. I. v. 680.
Anamalai Hills at 4,000 ft. (Fischer).
Flowers pale.
8. *OBERONIA BRUNONIANA*, Wt. Ic. t. 1622; F. B. I. v. 681.
W. Gháts.
Sepals and lip dark-brownish, petals pale-yellowish.
9. *OBERONIA PLATYCAULON*, Wt. Ic. t. 1623; F. B. I. v. 682.
Nilgiri and Pulney Hills.
Flowers whitish or pale-yellow.
10. *OBERONIA LINDLEYANA*, Wt. Ic. t. 1624; F. B. I. v. 681.
W. Gháts.
Flowers straw-coloured, lip dull-orange.
11. *OBERONIA WIGHTIANA*, Lindl.; F. B. I. v. 683; Wt. Ic. t. 1627. *O. Arnotiana*, Wt. Ic. t. 1628.
W. Gháts.
Flowers pale yellowish-green.

2. *Microstylis*, Nutt.

Terrestrial or epiphytic herbs, pseudo-bulbous or not. *Leaves* 1 or more, continuous with their sheaths. *Flowers* small, in terminal racemes, resupinate. *Sepals* spreading or recurved. *Petals* as long as but narrower than the sepals. *Lip* adnate to the base of the column, usually flat, sides often produced upwards beyond the column. *Column* very short with short spreading apical arms. *Anther* subterminal; *pollinia* 4.

Sides of lip produced upwards into large acute or obtuse auricles, apex notched. Herb 3—12 in. high; stem 1—3 in. long; leaves several, ovate or lanceolate, acute, 2—6 in. long; bracts shorter than the ovary.....1. *Wallichii*.

Sides of lip not produced upwards into auricles, apex pectinate:—

Lip obovate or reniform:—

Stem stout, 3—6 in. long; root without pseudobulb; leaves 3—5, petioled, broadly ovate or elliptic, acute, 3—7 in. long.....2. *versicolor*.

Stem slender, short, root pseudobulbous; leaves 2, rarely 3, sessile or nearly so, ovate to lanceolate, acute or obtuse, 1—3 in. long; racemes dense-flowered

3. *densiflora*.

Lip widely fan-shaped. Stem stout or slender, 2—4 in. long; leaves 2—3, shortly petioled, broadly ovate or ovate-lanceolate, acute or acuminate, 1·5—4 in. long; flowers comparatively large; lip rather deeply pectinate.....4. *Stocksii*.

1. *MICROSTYLIS WALLICHII*, Lindl.; F. B. I. v. 686; Hook. f. Ann. Calc. v. t. 2; King & Pantl. Ann. Calc. viii. t. 18.

W. Ghâts; Pykara, Nilgiris (Barber), Anamalais (Beddome).

A terrestrial herb; flowers purplish or yellowish.

2. *MICROSTYLIS VERSICOLOR*, Lindl. *M. Rheedii*, Wt. Ic. t. 902; F. B. I. v. 690.

W. Ghâts from 6,000 ft. upwards.

A terrestrial herb; flowers greenish-yellow or purplish.

3. *MICROSTYLIS DENSIFLORA*, Fischer n. comb. *M. versicolor*, Wt. Ic. t. 901; F. B. I. v. 691. *M. luteola*, Wt. Ic. t. 1632; F. B. I. v. 691.

W. Ghâts at high elevations.

Very like *M. versicolor*, Lindl., but smaller and more slender and the root always bulbous.

4. *MICROSTYLIS STOCKSII*, Hook. f.; F. B. I. v. 691.

W. Ghâts at high elevations.

A terrestrial herb; flowers yellow.

3. *Liparis*, L. C. Rich.

Terrestrial or epiphytic herbs, often pseudobulbous. *Leaves* 1 or more, often jointed on the sheath or pseudobulb. *Flowers* small or minute, in terminal racemes, resupinate. *Sepals* spreading, recurved or revolute, margins often revolute. *Petals* as long, very slender. *Lip* adnate to the base of the column, usually broad, deflexed from a very short base, or recurved. *Column* long, usually incurved, margined or winged towards the tip. *Anther* terminal; pollinia 4.

Leaves membranous, continuous with the sheath or pseudobulb:—

Stems slender, short:—

Lip broad, entire:—

Lip orbicular-obovate, column short, thick. Leaves 2, ovate or ovate-lanceolate, acute, 4 in. long, 3 in. wide; scape and raceme up to 12 in. long; bracts lanceolate, acuminate, as long as the pedicel; lip shortly clawed, margin crenulate; column short, thick, with long, narrow, obtuse wings.....1. *platyphylla*.

Lip orbicular or orbicular-oblong; column long, slender, sigmoidally incurved:—

Leaves 2, ovate-lanceolate, acuminate, 1·5—2 in. long; scape and raceme 2—4 in. long; bracts lanceolate, $\frac{3}{4}$ the length of the pedicel and ovary; lip with 2 minute calli, margin entire; column very obscurely winged

2. *Wightiana*.

Leaves 2, ovate-lanceolate, acuminate, 1 in. long, $\frac{1}{2}$ in. wide; scape and raceme slender, 2 in. long; bracts minute, $\frac{1}{4}$ length of pedicel and ovary; column very slender, arcuate, minutely winged.....3. *Beddomei*.

Lip cuneate, 2-lobed; leaves 2—3, ovate, acute, 1 in. long, $\frac{1}{2}$ — $\frac{3}{4}$ in. wide, they and the stem often purple; scape and raceme about 1·5 in. long; lip shortly clawed, with 2 basal tubercles, lobes oblong or lanceolate, obtuse; column slender, curved, with small obtuse wings.....4. *biloba*.

Stems stout, 2—5 in. long:—

Leaves 2—5, lanceolate or elliptic-lanceolate, acuminate, 2·5—5 in. long, $\frac{1}{2}$ —1·75 in. wide; stem slightly bulbous at the base; scape angular, with the raceme 4—10 in. long; flowers about $\frac{1}{3}$ in. across; lip cuneately obovate or subquadrate, usually recurved, tip truncate or slightly obcordate

with a minute apiculus, with 2 basal calli; column incurved with 2 small rounded wings.....5. *nervosa*.

Leaves ovate or orbicular, lip not cuneate:—

Leaves 2—3, acute or acuminate, 2—7 in. long, 1·5—4 in. wide, base equilateral; scape and raceme 3—6 in. long; flowers about ·25 in. across; lip orbicular, recurved, crenulate, base contracted, 2-tubercled; column incurved with hooked wings.....6. *Walkeriae*.

Leaves 3—4, acute or acuminate, 2—7 in. long, 1·5—4·5 in. wide, base very oblique, one side rounded or auricled and the other acute; scape and raceme 4—9 in. long; flowers about ·33 in. across, lip orbicular-obovate, recurved, crenulate, base contracted and with 2 large tubercles; column very slender, curved, with rounded wings.....7. *atropurpurea*.

Leaves usually coriaceous, jointed on the sheath or pseudobulb:—

Leaf solitary on the pseudobulb:—

Leaf linear-lanceolate, acute, 2—4 in. long, ·2—5 in. wide; scape and raceme 3—6 in. long; flowers about ·12 in. across; lip broadly oblong, recurved, rounded, entire or notched, base 2-auricled; column short, stout, obscurely winged.....8. *pusilla*.

Leaf elliptic or linear-lanceolate, acute, ·75—2 in. long, ·15—25 in. wide; scape and raceme 1—2 in. long, flowers ·06 in. across; lip quadrately-oblong, recurved, truncate-crenate, base hardly auricled; column short, curved, obscurely winged.....9. *Duthiei*.

Leaves 2—4:—

Leaves 2; lip as long as the lateral sepals or nearly so:—

Leaves narrowly obovate-oblong or oblanceolate, acute or acuminate, 4—12 in. long, ·7—1·25 in. wide; scape and raceme 6—10 in. long, naked below or with 1 or 2 ensiform bracts; flowers about ·08 in. across; lip broadly ovate, subacute, recurved; column with rounded, unappendaged wings.....10. *longipes*.

Leaves narrowly elliptic-lanceolate or oblanceolate, 2—5 in. long, ·6—9 in. wide; scape and raceme 4—6 in. long, with several filiform bracts on the scape; pedicels recurved; flowers about ·15 in. across; lip orbicular-ovate, recurved, subacute, very obscurely 3-lobed; column short, incurved, unappendaged.....11. *viridiflora*.

Leaves 3—4; lip minute, much shorter than the sepals; pseudobulbs tufted, 0·5—1 in. long; leaves linear-lanceolate, acuminate, 1·3—5 in. long, ·2—4 in. wide; scape and raceme up to 9 in. long, with many bracts about ·33 in. long on the scape; flowers ·25—·35 in. across; lip broadly ovate-oblong, basal lobes rounded, 2-tubercled, tip broad, rounded; column broadly winged, wings with a capillary tail.....12. *resupinata*.

1. LIPARIS PLATYPHYLLA, Ridl.; F. B. I. v. 695.
Anamalai Hills, 3,500 ft. (Beddome).
A small terrestrial herb.
2. LIPARIS WIGHTIANA, Thw.; F. B. I. v. 695. *L. atropurpurea*, Wt. Ic. t. 904.
Pulney Hills, 6,000 ft. (Wight, Anglade); Travancore (Beddome); High Wavy Mountains (Blatter & Hallberg).
A small, delicate, pseudobulbous, terrestrial herb; flowers white, lip dull-purple, or whole flower purple.
3. LIPARIS BEDDOMEI, Ridl.; F. B. I. v. 695.
Shembaganur, Pulney Hills at 5,000 ft. (Beddome).
Lip green with a purple disk spot.
Very like and doubtfully separable from the last species.
4. LIPARIS BILOBA, Wt. Ic. t. 1633; F. B. I. v. 699.
Nilgiri Hills (Wight, King).
A small, pseudobulbous, terrestrial herb. The whole plant often purplish; flowers very dark purple.

5. *LIPARIS NERVOSA*, Lindl. *L. paradoxa*, Reichb. f.; F. B. I. v. 697 and vi. 181; King & Pantl. Ann. Calc. viii. t. 34.
 Nilgiris and Anamalai Hills at 3,000 ft. (Beddome).
 A pseudobulbous terrestrial herb 6—15 in. high; flowers green, tinged with pink or yellow-brown.
6. *LIPARIS WALKERIAE*, Grah.; F. B. I. v. 698.
 W. Gháts, 6,000—7,500 ft.
 A pseudobulbous, terrestrial herb; flowers pale- to dark-purple, lip with a yellowish margin.
7. *LIPARIS ATROPURPUREA*, Lindl.; F. B. I. v. 698. *L. olivacea*, Wt. Ic. t. 903. *L. Walkeriae*, Wt. Ic. t. 905.
 W. Gháts at high elevations.
 A pseudobulbous terrestrial herb; flowers dark vinous-purple.
8. *LIPARIS PUSILLA*, Ridl.; F. B. I. v. 701; King & Pantl. Ann. Calc. viii. t. 41.
 Anamalai Hills (Beddome); Peermade in Travancore at 4,500 ft. (Meebold).
 A small, pseudobulbous, epiphytic herb; flowers white.
9. *LIPARIS DUTHIEI*, Hook. f.; F. B. I. v. 701; King & Pantl. Ann. Calc. viii. t. 42.
 Nilgiri Hills (Proudlock).
 A very small, pseudobulbous, epiphytic herb; flowers yellowish.
10. *LIPARIS LONGIPES*, Lindl.; Wall. Pl. As. Rar. t. 196; F. B. I. v. 703; Wt. Ic. t. 906; King & Pantl. Ann. Calc. viii. t. 37.
 Courtallam (Wight); Cochin (Johnson); Peermade at 4,500 ft. (Meebold); Shevaroy Hills (Bourne); Tinnevely Hills (Beddome); Coorg (Bourne).
 A pseudobulbous, epiphytic herb; flowers white, lip yellow.
11. *LIPARIS VIRIDIFLORA*, Lindl.; F. B. I. v. 704; King & Pantl. Ann. Calc. viii. t. 47. *L. elliptica*, Wt. Ic. t. 1735.
 Nilgiri Hills (Wight); Pulney Hills (Bourne); High Wavy Mountains (Blatter & Hallberg).
 A pseudobulbous, epiphytic herb; flowers white, yellowish or green.
12. *LIPARIS RESUPINATA*, Ridl.; F. B. I. v. 705; King & Pantl. Ann. Calc. viii. t. 48.
 Nilgiri Hills (Wight).
 A small epiphytic herb; flowers yellow.

4. *Desmotrichum*, Blume.

Epiphytic herbs with annulate creeping rhizomes and pendulous nodose stems bearing narrowly fusiform uninodal pseudobulbs at irregular intervals. *Leaves* sessile, terminal on the pseudobulbs, solitary or paired. *Flowers* fugacious, 1—3 together from near the base of the leaf. *Bracts* scarious. *Lateral sepals* adnate to the foot of the column to form a mentum. *Lip* narrowed at the base, lobed; apex expanded, more or less fimbriate or sinuate.

DESMOTRICHUM FIMBRIATUM, Blume. *Dendrobium Macraei*, Lindl.; F. B. I. v. 714; Ann. Calc., King & Pantl. viii. t. 86.
 W. Gháts.

Stems smooth and polished, up to 3 ft. long; pseudobulbs 1—2·5 in. long, shining; leaves linear-oblong, obtuse, 2—8 in. long; flowers 75—1 in. long, white or pinkish and speckled with red, the midlobe of the lip greenish-yellow.

5. *Dendrobium*, Swartz.

Epiphytic herbs. Stems elongate nodose or of pseudobulbs; pseudobulbs basal or on the stem, uni- or pluri-nodal. *Leaves* sessile, never plicate; bases sheathing, arising from the top of the pseudobulb or from the nodes of the stem. *Flowers* solitary, fasciated or in racemes from the top of the pseudobulbs or axillary, often large. *Sepals* subequal, the lateral adnate to the foot of the column to form a mentum. *Petals* similar. *Lip* sessile, contracted at the base, rarely clawed, adnate to and incumbent on the foot of the column; side lobes, if present, embracing the column or spreading; terminal lobe various, its disk often lamellate. *Column* short, angled or 2-toothed at the top, foot usually long. *Anther* 2-celled; pollinia 4, free or nearly so, ovoid or oblong, compressed, waxy.

Stemless; leaves from the top of a uninodal pseudobulb:—

Pseudobulb ovoid, 5—7·5 in. long; leaves usually 2, rather thick, oblong-lanceolate, acute, 2—3 in. long, 25—7 in. wide; flowers 4—10 in a raceme from the top of the pseudobulb; scape slender, 1—3 in. long; bracts equalling the pedicel and ovary combined; lip suborbicular, 3-lobed, side lobes small, subacute, midlobe truncate or slightly emarginate, crenulate, disk 2-keeled; keels fleshy, apiculate.....1. *microbulbon*.

Pseudobulb ovoid, 25—5 in. long; leaves 2—4, elliptic-lanceolate, obtuse or subacute, 1—2·5 in. long, 2—5 in. wide; flowers 8—10 in a raceme; scape slender, 1·5—3 in. long from the top of the pseudobulb; bracts shorter than the pedicels; lip long-clawed, limb suborbicular, serrulate, side lobes small, midlobe rounded, disk with a broad, depressed, fleshy, truncate ridge

2. *nanum*.

Stems elongate, plurinodal; pseudobulbs 0 or on the stem; leaves from the nodes:—

Flowers in elongate, few- to many-flowered racemes:—

Racemes very slender, usually few-flowered:—

Rhizome small, stem flexuous; leaves linear-lanceolate, acute, 2—4 in. long; sheaths usually broad and lax; racemes mostly axillary, flexuous, usually longer than the leaves; flowers 5 in. long; side lobes of lip acute, midlobe rounded, crenate, disk with a channelled ridge ending in a fleshy callus

3. *Heyneanum*.

Rhizome slender, creeping; stem slender, straight; leaves narrowly linear, acute, 1—3 in. long; sheaths narrow, closely embracing the stem; racemes all terminal, usually straight and shorter than the leaves; flowers 3—5 in. long; side lobes of lip small, spreading, midlobe oblong, crenate, disk flat

4. *graminifolium*.

Racemes stout, many-flowered:—

Leaves lanceolate or oblong-lanceolate, acute, 2—4 in. long, 25—5 in. wide; flowering shoots leafless; racemes lateral and terminal; flowers 4—6 in. long; bracts ovate, acute, scarious; lateral sepals oblong-lanceolate, subacute, dorsal oblanceolate, obtuse, mentum acute, 2 in. long, lip flat, side lobes small, rounded, midlobe large, subquadrate, disk with a channelled ridge, pubescent.....5. *ovatum*.

Leaves lanceolate, acute, 3—4 in. long, 5 in. wide; flowering shoots leafless; racemes lateral and terminal; flowers about 1 in. long; bracts very small, lanceolate, scarious; lateral sepals lanceolate, acute, slightly falcate, dorsal

linear-lanceolate, acute, mentum acute, .33 in. long, lip flat, 3-lobed, side lobes obtuse, midlobe rhomboid-ovate, acute or apiculate, bearded at the base with yellow hairs.....6. *barbatulum*.

Flowers solitary, fascicled or in very short racemes:—

Flowers racemed:—

Stems pendulous, copiously branched, polished and shining, naked below; branchlets leafy; leaves narrowly linear-lanceolate, acute or subobtusely, 1—4.5 in. long, .2—5 in. wide; racemes terminal, rarely reaching 1 in. long, 2—3-flowered; bracts very small, scarious; flowers .25 in. long, sepals oblong-lanceolate, subacute, mentum minute, lip oblong, side lobes 0 or very narrow, midlobe ovate, entire, subacute.....7. *herbaceum*.

Stems simple, tufted; racemes lateral:—

Stems erect, clavate or swollen above:—

Stems clavate or narrowly fusiform, elongate; leaves elliptic-oblong to elliptic-lanceolate, acute, apex minutely obliquely bifid, 1.5—3.5 in. long, .4—1 in. wide; sheaths glabrous; flowers .3—4 in. long, crowded, capitate on a short lateral rhachis or in a subterminal raceme; peduncle short, sheathed; bracts as long as and sheathing the short pedicel and the ovary; sepals and petals subequal, concave, mentum urceolate, lip small, fleshy, concave, broad-triangular, 3-lobed, side lobes triangular, acute, erect, midlobe very small, truncate.....8. *bicameratum*.

Stems slender below, slightly swollen above; leaves coriaceous, linear-lanceolate to linear-oblong, acute or obtuse, more or less deeply cleft at the apex, 1—3 in. long, .2—4 in. wide; sheaths (at least the upper) nigro-hirsute; flowers .7—1.3 in. long, 2—4, in short leaf-opposed racemes; peduncle not sheathed; bracts minute, much shorter than the filiform pedicel; sepals and petals linear-lanceolate, acute, mentum conical, half as long as the sepals, lip fleshy, as long as the sepals, linear-oblong, side lobes small, midlobe elongate, margins crisped.....9. *nutans*.

Stems many, pendulous, terete, usually slender; leaves membranous, linear-lanceolate to ovate-lanceolate, acute, 2—4 in. long, .4—9 in. wide; flowers .7—1 in. long, in short 2—4-flowered lateral racemes; bracts small, ovate, scarious; pedicels long, slender; sepals and petals equal in length, acute, sepals oblong-lanceolate, petals linear-lanceolate, lip longer, ovate-oblong, long-clawed, finely pubescent, margins crenulate, side lobes small, rounded or nearly absent, mid-lobe quadrately ovate, obtuse...10. *macrostachyum*.

Flowers fascicled or solitary:—

Flowers 2—4 from a leaf-opposed tubercle bursting through the sheath below the mouth; stem pendulous, slender, leafy above the base; leaves rigidly papery, linear; apex oblique, obtuse, 3—5 in. long, .2—35 in. wide; sheaths tight, striate; flowers .3—4 in. long, excluding the ovary; pedicels slender, bracts small, cupular; petals as long as, but broader than the sepals, lip tongue-shaped, entire, acute, undulate.....11. *haemoglossum*.

Flowers not on tubercles:—

Lip narrower than long; stems subclavate, suberect, ribbed except the slender polished 1 or 2 lowest internodes; leaves narrowly oblong-lanceolate, apex oblique, subacute, 3—5 in. long, .5—9 in. wide; flowers 1—3 on a very short peduncle, axillary on the leafless stems, 1.2—1.4 in. long; sepals linear-oblong, acute, petals ovate-lanceolate, acuminate, mentum long, conical, truncate, lip ovate-lanceolate, acute, sides incurved at the base, disk pubescent.....12. *heterocarpum*.

Lip as broad as or broader than long:—

Stems slender, pendulous, leafy below the flowers, usually naked above; leaves lanceolate, acuminate, 2—4 in. long, .5—1.2 in. wide; flowers 2—3 on short peduncles from the node, 1—1.3 in. long; sepals oblong-lanceolate, subacute, petals broader, oblong, mentum conical, lip orbicular, cucullate, pubescent and ciliate, base tubular by the incurving sides.....13. *aphyllum*.

Stems subclavate, compressed, rather thick, decumbent, leafy throughout; leaves ovate-lanceolate, acuminate, 2.5—7 in. long, .5—1.75 in. wide; flowers 2—3 from the leaf axils, 1—1.3 in. long; sepals ovate, subacute, petals obovate, mentum short, obtuse, lip rhombic, pubescent, crose, side lobes small, incurved, midlobe broadly triangular...14. *aqueum*.

1. *DENDROBIUM MICROBULBON*, A. Rich.; F. B. I. v. 716. *D. humile*, Wt. Ic. t. 1643.
W. Gháts.
A small epiphyte 2—4 in. high; sepals and petals white, lip pink with darker veins.
2. *DENDROBIUM NANUM*, Hook. f.; F. B. I. v. 717.
Hills of Mysore and Coorg (Bourne), Nilgiris, Anamalais at 7,500 ft. (Fischer), Shevaroy's (Bourne), High Wavy Mountains (Blatter & Hallberg).
Very similar to the last species; "lip green, turning yellow with age, with 2 median pink-purple patches" (Bourne).
3. *DENDROBIUM HEYNEANUM*, Lindl.; F. B. I. v. 718; Wt. Ic. t. 909.
W. Gháts: Nilgiris, Bolampatti Hills at 4,800 ft. (Fischer), Courtallam (Wight), Tinnevely Hills (Barber).
Stem 4—8 in. high; flowers white.
4. *DENDROBIUM GRAMINIFOLIUM*, Wt. Ic. t. 1649; F. B. I. v. 718.
Anamalai (Beddome), Nilgiri (Wight), Travancore and Tinnevely Hills, near sea-level to 2,000 ft.
Very like the last species. Growing on rocks as well as on trees; flowers white.
5. *DENDROBIUM OVATUM*, Krzl. *D. chlorops*, Lindl.; F. B. I. v. 719. *D. barbatulum*, Wt. Ic. t. 910.
W. Gháts and the West Coast from 150—5,000 ft.
4—20 in. high, the stem sometimes very stout; flowers cream-coloured, lip greenish.
6. *DENDROBIUM BARBATULUM*, Lindl.; F. B. I. v. 719.
W. Gháts from Mysore to Travancore.
6—15 in. high; flowers white, often suffused with pink.
7. *DENDROBIUM HERBACEUM*, Lindl.; F. B. I. v. 719. *D. ramosissimum*, Wt. Ic. t. 1648.
W. Gháts from 2,000—4,000 ft.
Stems 2—3 ft. long; flowers yellow.
8. *DENDROBIUM BICAMERATUM*, Lindl.; F. B. I. v. 729; King & Pantl. Ann. Calc. viii, t. 56.
Mahendragiri in Ganjam at 4,500 ft. (Gamble).
Stems 3—18 in. long; flowers yellow, marked with red.
9. *DENDROBIUM NUTANS*, Lindl.; F. B. I. v. 734; Hook. f. Ann. Calc. v. t. 18. *D. Jerdonianum*, Wt. Ic. t. 1644; F. B. I. v. 734.
Throughout the W. Gháts, 2,000—6,000 ft.
Stems 5—18 in. long; flowers yellow.
Var. *rubrilabris*, Blatter. Flowers white; lip pink, spotted purple, mid-lobe very strongly crisped. High Wavy Mountains (Blatter and Hallberg).
10. *DENDROBIUM MACROSTACHYUM*, Lindl.; F. B. I. v. 735; Wt. Ic. t. 1647.
W. Coast and W. Gháts, up to 7,000 ft.
Leafy stems 1—2 ft. long, flowering stems often much longer; flowers pale-green or yellow often tinged with pink.
11. *DENDROBIUM HAEMOGLOSSUM*, Thw.; F. B. I. v. 727.
Malabar (Jerdon), Wynaad. Rare.
Stems 12—18 in. long; flowers yellow, tip tinged with dark red.

12. *DENDROBIUM HETEROCARPUM*, Wall. Pl. As. Rar. t. 196; F. B. I. v. 737. *D. aureum*, Lindl.; Wt. Ic. t. 1646.
W. Ghâts from 3,000—5,500 ft.
Stems 9—18 in. long; flowers white or straw-coloured, disk of lip with 2 red or purple blotches.
13. *DENDROBIUM APHYLLUM*, Fischer n. comb. *D. Picardi*, Roxb.; F. B. I. v. 738; Wt. Ic. t. 908; King & Pantl. Ann. Calc. viii. t. 72. *Limodorum aphyllum*, Roxb.; Cor. Pl. t. 41.
Coromandel (Roxb.), Coorg (Lancaster).
Stems 2—3 ft. long; flowers pale-rose, the lip yellow.
14. *DENDROBIUM AQUEUM*, Lindl.; F. B. I. v. 739. *D. album*, Wt. Ic. t. 1645.
W. Ghâts, 3,000—7,000 ft.
Stems 10—20 in. long; flowers white, the lip suffused with pale-yellow.

6. *Bulbophyllum*, Thouars.

Epiphytic herb with 1- (rarely 2-) leaved pseudobulbs on a creeping (rarely lacking) rhizome. *Scapes* from the rhizome, usually close to the pseudobulb. *Flowers* solitary, capitate, umbellate, spicate or racemose. *Sepals* subequal or the lateral slightly longer than the dorsal, not cohering together, adnate to the foot of the column. *Petals* usually distinctly smaller than the dorsal sepal. *Lip* usually tongue-shaped, sessile or clawed, jointed on the foot, mobile, usually small and much recurved. *Column* short, often 2-aristate at the top. *Anther* 2-celled, pollinia 4 (rarely 2).

Flowers umbellate:—

Rhizome stout, pseudobulbs broadly ovoid, .5—7 in. long; leaf elliptic-oblong, 1—3 in. long, obtuse, emarginate, narrowed into a short petiole; scape rather stout, sheaths 2—3; flowers 4—8, .6—7.5 in. long; sepals lanceolate, acuminate, dorsal $\frac{1}{2}$ shorter, petals elliptic-oblong, rounded, lip clawed, basal angles acute

1. *albidum*.

Rhizome stout; pseudobulbs distant, quadrangular ovoid, .75—1 in. long; leaf linear-oblong, obtuse, 3—4 in. long; scape slender, 3—4 in. long, 4—5-flowered; sepals narrow-lanceolate, long acuminate, .5—6 in. long, dorsal a little shorter, petals elliptic-oblong, about $\frac{1}{2}$ as long as the dorsal sepal.....2. *mysorensis*.

Flowers racemose:—

Lip glabrous with recurved lateral basal auricles:—

Flowers 1 in. or more long; sheaths and bracts large, coloured. Rhizome stout; pseudo-bulbs ovoid, 1—1.5 in. long; leaf oblong, obtuse, 2—7 in. long; scape stout, longer than the leaf; raceme few-flowered, drooping; sepals subequal, ovate-oblong, acuminate, petals very small, ovate, tipped with a capillary awn clavate at the tip, lip sessile, broad, papillose.....3. *pusco-purpureum*. Flowers .4 in. or less long; sheaths and bracts small, hyaline. Rhizome stout, pseudobulbs ovoid, 1—2 in. long; leaf narrowly elliptic to broadly oblong, 2—6 in. long, rounded or subacute, base narrowed; scape stout, shorter or longer than the leaf; racemes many-flowered, erect; sepals oblong, dorsal broad-ovate, petals triangular-ovate, lip with entire or toothed auricles

4. *neilgherrensis*.

Lip linear-oblong fringed with long hairs, without auricles. Rhizome slender; pseudobulbs subglobose, .4—5 in. in diam.; leaf sessile, ovate-lanceolate, acute or obtuse, 1.5—2 in. long, base rounded; scape slender, very much longer than the leaf; bracts small, narrow; flowers 6—10, about .5 in. long; sepals subequal, linear-lanceolate, ciliate, petals very small, fringed.....5. *tremulum*.

1. *BULBOPHYLLUM ALBIDUM*, Hook. f.; F. B. I. v. 757. *Cirrhopetalum albidum*, Wt. Ic. t. 1653.
W. Gháts.
Flowers cream-coloured, freckled with pale-brown.
2. *BULBOPHYLLUM MYSORENSE*, J. J. Smith.
Hills of Mysore.
Flowers nearly white, the lip purple.
3. *BULBOPHYLLUM FUSCO-PURPUREUM*, Wt. Ic. t. 1651; F. B. I. v. 760.
W. Gháts.
Flowers dark purple.
4. *BULBOPHYLLUM NEILGHERRENSE*, Wt. Ic. t. 1650; F. B. I. v. 761.
W. Gháts.
Flowers brownish-yellow or greenish-purple.
5. *BULBOPHYLLUM TREMULUM*, Wt. Ic. t. 1749 (excluding insertion of scape on the apex of the pseudobulb); F. B. I. v. 763.
Coorg (Jerdon), Agalhatti in Mysore at 3,500 ft. (Meebold), Nilgiri and Anamalai Hills (Beddome).
Flowers yellow passing to purple at the tips, lip purple.

7. *Cirrhopetalum*, Lindl.

Epiphytic herbs with 1-leaved pseudobulbs from a usually creeping rhizome. *Scapes* from the rhizome close to the pseudobulb. *Flowers* umbelled or very shortly racemed. *Sepals* markedly unequal, dorsal concave, ovate, acute, lateral rarely less than twice as long, acuminate, twisted to bring the outer margins together and usually coherent, at least towards the apex even though separated below, bases adnate to the sides of the column or its foot. *Petals* shorter or longer than the dorsal sepal. *Lip* short, tongue-shaped, recurved, jointed to the foot and very mobile. *Column* very short, 2-aristate at the top, foot upcurved.

Flowers umbelled, rarely reduced to 1 or 2 flowers:—

Dorsal sepal and petals fimbriate. Rhizome short; pseudobulbs clustered, ovoid, angular, about .5 in. long; leafless when flowering; leaf oblong-lanceolate, acute, 3—5 in. long, scape slender, 2.8 in. long, sheaths 2—3; flowers numerous; lateral sepals linear, acute, 1—1.25 in. long, cohering, dorsal .25 in. long, ovate with a long tail, petals .12 in. long.....1. *fimbriatum*.

Dorsal sepal and petals glabrous, quite entire:—

Umbel reduced to 2 flowers. Rhizome slender, pseudobulbs distant, ovoid, .6 in. long; leaf linear-oblong, 1.5—2 in. long; scape slender, shorter than the leaf; pedicels long; lateral sepals ovate-oblong, subacute, .66 in. long, at first cohering, later separate, dorsal sepal suborbicular, .22 in. long, petals oblong, obtuse, as long as the dorsal sepal.....2. *aureum*.

Umbel more than 2-flowered:—

Lateral sepals linear-lanceolate, acuminate, .75—1 in. long. Rhizome slender; pseudobulbs distant, ovoid, .75—1 in. long; leaf linear-oblong, obtuse, 3—4 in. long; scape slender, 2—4 in. long, many-flowered; dorsal sepal ovate, acute, $\frac{1}{2}$ as long as the lateral, petals broadly oblong, shorter than the dorsal sepal.....3. *neilgherrense*.

Lateral sepals less than .6 in. long:—

Lateral sepals linear-oblong or falcate-lanceolate, .5 in. long, cohering throughout, puberulous near the base. Rhizome slender; pseudobulbs distant, ovoid, about .5 in. long; leaf linear-oblong, 1—3 in. long; scape very slender, 1—3 in. long; dorsal sepal broadly ovate, $\frac{1}{2}$ as long as the lateral, petals broadly oblong.....4. *Gamblei*.

Lateral sepals linear-lanceolate, $\frac{1}{4}$ in. long, cohering above, free below.
Pseudobulb ovoid, $\frac{3}{4}$ —1 in. long; dorsal sepal oblong, obtuse, nearly $\frac{1}{2}$
as long as the lateral, petals orbicular, oblong, obtuse, minute

5. *elegantulum*.

Flowers shortly racemed:—

Lateral sepals $\frac{1}{2}$ in. long or less:—

Rhizome rather stout, pseudobulbs ovoid, $\frac{1}{2}$ —1 in. long; leaf oblong, obtuse or emarginate, 1—2.5 in. long; leaves with the flowers; scape slender, as long as or longer than the leaf, 6—8-flowered; sheaths 2—3; lateral sepals linear-lanceolate, acuminate, 2—3 times longer than the falcately ovate-lanceolate, long-acuminate dorsal, petals broadly oblong, obtuse, $\frac{1}{4}$ as long as the dorsal sepal.....6. *acutiflorum*.

Rhizome slender; pseudobulbs crowded, subglobose or broadly ovoid, $\frac{1}{2}$ in. long; leafless when flowering (leaf unknown); scape slender 1—2.5 in. long, 6—10-flowered; sheaths 1—2; lateral sepals oblong, obtuse, in contact but not cohering, twice as long as the oblong, subacute dorsal, petals triangular, aristate, much shorter than the dorsal sepal.....7. *Proudlockii*.

Lateral sepals linear-lanceolate, cohering except at the base, 1—1.2 in. long. Rhizome very stout, slightly swollen at the nodes; pseudo-bulbs oblong or ovate-oblong, 1.75—2 in. long; leaf linear-oblong, obtuse, base attenuate, 5—6 in. long; scape 3—4 in. long, 6—7-flowered; dorsal sepal ovate-oblong, acute, minutely denticulate, $\frac{1}{3}$ in. long, petals broadly ovate, subacute, erose, $\frac{1}{5}$ in. long.....8. *nodosum*.

1. CIRRHOPETALUM FIMBRIATUM, Lindl. ; F. B. I. v. 774 ; Wt. Ic. t. 1655.
Coorg (Jerdon).
Flowers green or cream-coloured with darker lines and red cilia ;
lip red.
2. CIRRHOPETALUM AUREUM, Hook. f. ; F. B. I. v. 777.
Wynaad (Jerdon).
Flowers golden-yellow.
3. CIRRHOPETALUM NEILGHERRENSE, Wt. Ic. t. 1654 ; F. B. I. v. 778.
Nilgiri (Wight, Gamble) and Anamalai Hills at 4,000—5,000 ft.
(Beddome).
Flowers yellow, mottled with red.
4. CIRRHOPETALUM GAMBELI, Hook. f. ; F. B. I. v. 778. *C. Thomsoni*,
Hook. f. ; F. B. I. v. 778.
Nilgiri, Anamalai, Pulney Hills and High Wavy Mountains
(Blatter & Hallberg).
Flowers yellow, variously tinged and mottled with red or purple.
5. CIRRHOPETALUM ELEGANTULUM, Rolfe.
Coorg.
Flowers yellow with maroon-purple stripes.
6. CIRRHOPETALUM ACUTIFLORUM, A. Rich. ; F. B. I. v. 779.
W. Ghâts.
Flowers greenish-white or cream-coloured.
7. CIRRHOPETALUM PROUDLOCKII, King. & Pantl.
Nilgiri Hills, Gudalur Ghât at 4,000 ft. (Proudlock).
Flowers pale straw-coloured.
8. CIRRHOPETALUM NODOSUM, Rolfe.
Nilgiri Hills.
Flowers reddish-brown, densely speckled in a darker tint.

8. *Chrysoglossum*, Blume.

Terrestrial or epiphytic herbs. *Pseudobulbs* narrow or 0, 1-leaved. *Leaves* elliptic-lanceolate, plaited. *Scapes* lateral on the rhizome, long, erect, sheathed. *Flowers* laxly racemed. *Sepals* subequal, lateral connate with the base of the lip into a mentum. *Petals* subequal to the sepals. *Lip* erect, broadly 3-lobed, sometimes auriculate at the base; disk 3-lamellate. *Column* incurved, margins 2-auricled or -lobed about the middle; foot short. *Anther* 2-celled; *pollinia* 2, free.

Terrestrial; rhizome stout; leaf 6—14 in. long, 1·5—4 in. wide, acuminate, tapering into a 1—5 in. petiole which thickens into a narrow pseudobulb, 1—3 in. long; scape and raceme usually longer than the leaf, up to 20 in. long, many-flowered; sheaths loose, ·5—1 in. long; bracts ·5 in. long; flowers ·75—1 in. long; sepals and petals oblong, falcate, subacute.....1. *maculatum*. Epiphytic; rhizome slender; leaf 7 in. long, 2 in. wide, narrowed into the 3—4 in.-long petiole, which thickens into a narrow 1—1·5 in.-long pseudobulb; scape and raceme as long as the leaf, about 12-flowered; sheaths 3, loose; bracts linear, ·5 in. long, longer than the pedicel and ovary; flowers about ·33 in. long; sepals and petals obovate-lanceolate to lanceolate, acute, the petals broader...2. *Hallbergii*.

1. *CHRYSOGLOSSUM MACULATUM*, Hook. f.; F. B. I. vi. 784.

Pulney Hills (Bourne); Agastirmalai in Tinnevely (Barber).

Flowers green with purple markings, lip white with purple spots.

2. *CHRYSOGLOSSUM HALLBERGII*, Blatter in Journ. Bomb. Nat. Hist. Soc. xxxii, 519.

High Wavy Mountains (Blatter & Hallberg).

9. *Porpax*, Lindl.

Very small epiphytic herbs. *Pseudobulbs* subdiscoid or button-like, clothed with reticulate sheaths. *Leaves* 2, membranous. *Flowers* 1—3, subsessile on the top of the pseudobulb. *Sepals* connivent at the base, all connate into a tube or the dorsal free, lateral sepals oblique below and adnate to the long foot of the column. *Petals* small, free, usually shorter than the sepals. *Lip* sessile on the foot of the column, incumbent. *Column* short, wingless. *Pollinia* usually 8, attached in fours.

Pseudobulbs ·75 in. in diam.; leaves caducous, broadly oblong, under 1 in. long; flowers solitary from between the leaves with sheaths and an orbicular parchment-like bract at the base, ·4—·5 in. long; sepals all connate into a 3-lobed subcampanulate tube, petals included, spatulate, lip panduriform, crenulate, shortly clawed, with a basal, erect, tooth-like process.....1. *reticulata*. *Pseudobulbs* ·4—·6 in. in diam.; leaves persistent, suborbicular, ·4—1·25 in. long, minutely ciliate; flowers 1—3 from between the leaves with many sheaths and a broad ciliate bract at the base, 2-lipped, 33 in. long; lateral sepals connate to above the middle, concave, pubescent, dorsal sepal nearly free, broadly oblong, petals linear-spatulate, very small, lip minute, shortly clawed, ovate-cordate, toothed, apiculate.....2. *Jerdoniana*.

1. *PORPAX RETICULATA*, Lindl. *Eria reticulata*, Benth.; F. B. I. v. 786.

Aggeianthus marchantioides, Wt. Ic. t. 1737.

Iyamalai Hills (Wight), Donipoya in South Malabar at 700 ft. (Fischer).

Pseudobulbs aggregated on wet rocks or on tree-trunks; flowers purple-brown.

2. PORPAX JERDONIANA, Reichb. *Eria Lichenora*, Lindl.; F. B. I. v. 787. *Lichenora jerdoniana*, Wt. Ic. t. 1738.

Bababudan Hills (Law), Hills of Malabar (Jerdon), Travancore (Johnson).

Pseudobulbs aggregated on branches of trees; flowers yellowish.

10. *Eria*, Lindl.

Epiphytic herbs, usually pseudobulbous. *Pseudobulbs* often elongate and stem-like. *Flowers* never very large nor bright coloured, 1 or 2 or racemed or spicate. *Sepals* free, adnate to the foot of the column to form a short or long and spur-like or saccate mentum. *Petals* subsimilar to the lateral sepals. *Lip* sessile on the foot, rarely shortly clawed, incumbent. *Column* short and straight or long and little curved. *Anther* imperfectly 4- or 8-celled; pollinia usually 8, pyriform.

Pseudobulbs simple, plant stemless or stems short, unjointed:—

Flowers solitary, .75—1 in. long. *Pseudobulbs* depressed-globose, enclosed in a net-like sac; leaves 2, oblong- or elliptic-lanceolate, acute, .75—3 in. long; scape slender, 1—1.75 in. long; bract below the flower suborbicular, strongly nerved, .33 in. long; lateral sepals falcate, acute, dorsal oblong-lanceolate, slightly longer, petals like the lateral sepals, lip as long as the lateral sepals, 3-lobed

1. *braccata*.

Flowers racemed:—

Small plants less than 4 in. high; leaves less than 3 in. long; scapes slender:—

Pseudobulbs globose or ovoid; flowers not secund, .1 in. or less long:—

Leafless when in flower (leaves unknown); scape capillary, flexuous, glabrous; bracts boat-shaped; lateral sepals decurved, bill-hook-shaped, obtuse, dorsal oblong, obtuse, slightly longer, petals linear-obovate, shorter than the lateral sepals, lip minute.....2. *exilis*.

Leafy when in flower; leaves oblong-lanceolate, acute, base attenuate, 1—2.5 in. long; scape not flexuous, brown-pubescent, as are the pedicels and ovaries; bracts oblong-lanceolate, acute; lateral sepals obliquely semi-ovate, subacute, dorsal lanceolate-oblong, subobtuse, petals linear-lanceolate, lip rhomboid-suborbicular.....3. *albiflora*.

Pseudobulbs depressed-ovoid; flowers secund, .25 in. or more long:—

Leaves 2, oblanceolate-oblong, subobtuse, 1—2.7 in. long; scape few-flowered, up to 5 in. long; bracts lanceolate; flowers under .3 in. long; sepals lanceolate, acute, dorsal slightly longer, petals subsimilar, lip very small, ovate-lanceolate.....4. *Dalzellii*.

Leaves 2—3, elliptic-lanceolate, obtuse or acute, 1—2.5 in. long; scape 2—6-flowered, often flexuous, up to 5 in. long; bracts ovate; flowers .4—6 in. long; sepals linear-lanceolate, acuminate, petals subsimilar, lip shortly clawed, ligulate.....5. *nana*.

Larger plants exceeding 4 in. high; leaves 4—8 in. long; scapes comparatively stout:—

Pseudobulbs ovoid, thick, 2—4 in. long; leaves 3—5, linear-, elliptic- or oblong-lanceolate, acute; scapes 2—4 on a pseudo-bulb, 2—4 in. long, many-flowered, with the pedicels and flowers externally more or less fuliginose-pilose; flowers .25—.3 in. long; lateral sepals and petals subequal, lanceolate, slightly falcate, dorsal sepal slightly longer, lip entire, ovate-subpanduriform, subacute.....6. *polystachya*.

Pseudobulbs thick, ovoid, 1—1.5 in. long; leaves 1—4, linear- to oblong-lanceolate, subacute or obtuse; scapes 4—5 in. long, many-flowered, slightly pubescent; flowers .5—.75 in. long, glabrous; sepals lanceolate, dorsal a little longer, petals linear-lanceolate, about as long as the lateral sepals, lip ovate-subcordate, acute.....7. *pubescens*.

Pseudobulbs pluri-articular or developed into a plurinodal stem:—

Internodes 1 in. or less long:—

Stem 3—6 in. high from a creeping rootstock, slender below, clavate above; internodes 5—1 in. long; leaves 2—3 from the apex of the stem, linear-oblong, 1.5—5 in. long, obtuse or subacute; scape from between the leaves, slender, 1—1.5 in. long, 1—3-flowered; pedicels slender with 2—3 oblong bracteoles; flowers 4—5 in. long; sepals and petals subequal, lateral sepals triangular, slightly falcate, dorsal oblong, petals narrow-oblong, lip cuneately oblong, lobes obscure.....8. *pauciflora*.

Stem 2—3 ft. high, robust, terete; internodes about 1 in. long; leaves numerous from the upper nodes, narrowly elliptic-oblong, acuminate, 4—8 in. long; racemes axillary, as long as or longer than the leaves, many-flowered, rusty pubescent; bracts sub-orbicular, apiculate, 2 in. long; flowers 5—6 in. long, rusty-pubescent outside; sepals subequal, broadly elliptic, the lateral falcate, spreading, petals narrower, lip ovate-oblong, obtuse, side lobes small

9. *bambusifolia*.

Internodes 2 in. or more long. Stems tufted, up to 8 in. long; leaves 3, oblong-lanceolate, acute, about 7 in. long and 1.75 in wide; peduncle from between the leaves up to 8.5 in. long; flowers 2-bracteate; bracts olive, oblong, acute, half amplexicaul; flowers about 6 in. long, dorsal sepal elliptic-oblong, lateral triangular-falcate from a broad base, petals falcate-oblong, lip much shorter than the sepals, broadly ovate, subequally 3-lobed, lobes slightly crisped, midlobe minutely white-puberulous.....10. *pseudoclavicaulis*.

1. ERIA BRACCATA, Lindl.; F. B. I. v. 787. *E. reticosa*, Wt. Ic. t. 1637; F. B. I. v. 787.

W. Ghâts from the Bababudan to the Nilgiri Hills at about 6,000 ft.; High Wavy Mountains (Blatter & Hallberg).

Flowers white, lip edged with purple, column yellow.

2. ERIA EXILIS, Hook. f.; F. B. I. v. 788.

Travancore (Johnson).

A very small, delicate herb.

3. ERIA ALBIFLORA, Rolfe.

Nilgiri Hills.

Flowers pure white.

4. ERIA DALZELLII, Lindl.; F. B. I. v. 789. *Dendrobium filiforme*, Wt. Ic. t. 1642 (central and top left-hand figs.).

W. Ghâts.

Flowers white or yellowish.

- Var. *fimbriata*, Hook. f.; F. B. I. v. 789.

Petals and sepals fringed with translucent gland-tipped hairs.

5. ERIA NANA, A. Rich.; F. B. I. v. 789. *Dendrobium filiforme*, Wt. Ic. t. 1642 (right-hand bottom fig.).

W. Ghâts, 5,000—8,000 ft.

Flowers white.

6. ERIA POLYSTACHYA, A. Rich.; F. B. I. v. 792. *E. mysorensis*, Lindl.; F. B. I. v. 793. *E. pubescens*, Wt. Ic. t. 1635.

W. slopes of the Nilgiri Hills.

Flowers white.

7. ERIA PUBESCENS, Wt. Ic. t. 1634; F. B. I. v. 793.

W. slopes of the Nilgiri Hills (Wight, Barber).

Flowers white, tipped with pink.

8. ERIA PAUCIFLORA, Wt. Ic. t. 1636; F. B. I. v. 799.

Nilgiri, Anamalai (Davidson), Kollimalai (Barber), Tinnevely

(Barber) Hills and High Wavy Mountains (Blatter & Hallberg).
Flowers pure white.

9. *ERIA BAMBUSIFOLIA*, Lindl.; F. B. I. v. 805; King & Pantl., Ann. Calc. viii, t. 163.

Mahendragiri in Ganjam at 4,500 ft. (Gamble).

Flowers pale-brown with darker markings, lip with 3 pale-green ridges, column yellow.

10. *ERIA PSEUDOCLOVICAULIS*, Blatter in Journ. Bomb. Nat. Hist. Soc. xxxii, 518.

High Wavy Mountains (Blatter & Hallberg).

Flowers white, tinged with pink.

11. *Pachystoma*, Blume.

Terrestrial herbs; rhizome nodose. *Leaves* 1 or 2, long, narrow, appearing after flowering-time. *Scape* pale, with many sheaths. *Flowers* racemed, pendulous, moderate-sized. *Sepals* and *petals* sub-equal; lateral sepals adnate to the base of the column. *Lip* sessile at the base of the footless column. *Column* slender, clavate upwards. *Anther* dorsal, 4-celled; pollinia 8, pyriform.

PACHYSTOMA SENILE, Reichb. f.; F. B. I. v. 812; King & Pantl. Ann. Calc. viii. t. 140. *Apaturia Lindleyana*, Wt. Ic. t. 1662.

Western Ghâts, 3,000—5,000 ft.

Leaf solitary; scape with raceme 8—30 in. long; sheaths 5—2 in. long; flowers about 5 in. long, glandular pubescent, white, greenish or pinkish; bracts scarious, longer than the flowers, strongly nerved.

12. *Acanthophippium*, Blume.

Terrestrial herbs with 2—9-leaved pseudobulbs. *Leaves* petioled, broad, plicate. *Flowers* few, large, on short, lateral racemes. *Sepals* broad, cohering into a ventricose tube with recurved tips, lateral adnate to the foot of the column to form a large, saccate mentum. *Petals* erect, narrow, included. *Lip* small, stipitate on the foot of the column, inflexed, lateral lobes broad, mid-lobe recurved, entire, disk with a complex callus. *Column* short, stout; foot very long, inflexed. *Anther* 2-celled; pollinia 8, erect, cohering by a granular mass.

ACANTHOPHIPPIUM BICOLOR, Lindl.; F. B. I. v. 815.

Nilgiri Hills (Proudlock); Machur Shola in the Lower Pulney Hills (Bourne); Shevaroy Hills (Bourne). Very rare.

A robust plant. Pseudobulb oblong-ovate, corrugated, 1—2 in. long, clothed in the remains of old leaves; stem 3—8 in. long; leaves 2 or 3, oblong-lanceolate, acuminate, tapering into a sheathing petiole, 6—18 in. long, 1.5—4.5 in. wide. *Scape* sheathed, 3—7-flowered; bracts ovate-lanceolate, 1 in. long; flowers 1.5 in. long, resembling broad gibbous-based jugs, yellow tipped or spotted with red; side lobes of lip hatchet-shaped, midlobe short, tongue-shaped, disk 3-keeled.

13. *Thunia*, Reichb. f.

Epiphytic or terrestrial herbs; stems not pseudobulbous, leafy with foliaceous sheaths below. *Leaves* distichous. *Flowers* in racemes terminating the stem, large; bracts large, scarious. *Sepals* erectopate, subequal, lanceolate, acute. *Petals* similar. *Lip* adnate to the base of the column, shortly spurred, side lobes short, embracing the column, midlobe fringed. *Anther* narrow, pendulous, incompletely 4-celled; pollinia 8, waxy, attached in fours to a granular membrane.

THUNIA VENOSA, Rolfe. *Phajus albus*, Lindl. in part; F. B. I. v. 818. Travancore (Calder and Ramaswami).

An epiphytic herb, stem 6—18 in. long; leaves linear-ensiform, 3—9 in. long; raceme drooping, 3—5 in. long; flowers few, white, 2 in. long; lip 1·2 in. long, side lobes involute, crisped, midlobe spreading, waved, often ciliate, palate with 5 longitudinal rows of long, erect, flat, purple papillæ which sometimes unite into membranes, column long, winged, broadening to the denticulate apex.

14. *Tainia*, Blume.

Terrestrial herbs with 1-leaved pseudobulbs. *Flowers* racemose, small or medium-sized. *Sepals* narrow, the lateral falcate, adnate to the saccate base of the lip to form a mentum or inserted above it. *Lip* adnate only by its base to the base of the slender column, hastately 3-lobed, rarely entire, disk lamellate. *Anther* with a simple or 2-lobed boss or 2-horned; pollinia 4 or 8, free or united by a viscus.

TAINIA BICORNIS, Benth.; F. B. I. v. 820. *Ainia latifolia* Wt. Ic. t. 914.

W. Ghâts, rare.

Pseudobulb fusiform, 1—3 in. long. Leaf terminal on the pseudobulb, oblong-lanceolate to broadly elliptic, acuminate, base rounded, 4—7 in. long, 1·5—3·5 in. wide; petiole as long or longer; scape lateral, usually longer than the leaf; bracts lanceolate, acuminate, about ·75 in. long; flowers about 1 in. long, purplish or greenish with a reddish flush, lip and column yellow; sepals linear-lanceolate, acute, petals subequal, side lobes of lip small midlobe, broad, retuse, disk 3-lamellate, the middle one short, almost confined to the midlobe.

15. *Josephia*, Wight.

Practically stemless, tufted, epiphytic herbs with stout root-fibres. *Leaves* radical, coriaceous. *Flowers* small, on the branches of panicked spikes. *Sepals* subequal, concave, connivent. *Petals* as long but narrower. *Lip* erect, fleshy, adnate to the base of the column, concave, side lobes small, incurved, midlobe small, entire, papillose, with a basal callus uniting the side lobes. *Column* erect, broad, nearly as long as the sepals, shortly 2-winged upwards; foot 0. *Anther* acuminate, 2-celled; pollinia 4, oblong, parallel, subcaudate, attached to the rostellum by a viscus.

Leaves linear-oblong or lanceolate, subacute or obtuse, 2—5 in. long, .8—1.2 in. wide; petioles .5—2 in. long, plicate, moderately wide; scapes 3—12 in. long, slender; flowers white, tinged with purple.....1. *lanceolata*.
 Leaves broadly oblong or subrotund; apex rounded, 1.8—3.5 in. long, .9—1.5 in. wide; nearly sessile or petiole up to 1.5 in. long, plicate, wide; scapes 3—12 in. long, slender; flowers yellow with purple stripes.....2. *latifolia*.

1. JOSEPHIA LANCEOLATA, Wt. Ic. t. 1742; F. B. I. v. 823.

W. Gháts.

2. JOSEPHIA LATIFOLIA, Wt. Ic. t. 1743; F. B. I. v. 823.

W. Gháts.

The two are very doubtfully separable.

16. Coelogyne, Lindl.

Epiphytic herbs; rhizome creeping; pseudobulbs 2- (rarely 1-) leaved. *Leaves* coriaceous or thin and plaited. *Flowers* usually racemed, rarely 1 or 2; bracts long, sheathing. *Sepals* subequal, lateral more or less saccate at the base. *Petals* narrower. *Lip* sessile at the base of the column, erect and embracing it, base concave or saccate. *Column* long, erect, winged, apex hooded, membranous; foot 0. *Anther* more or less 2-celled; pollinia 4, cohering in pairs by a granular viscus.

Flowers solitary. Pseudobulbs crowded, ovoid, with loose fibrous sheaths at the base, .6—1.2 in. long; leaves 2, linear to narrowly oblong, acuminate, narrowed into a short petiole, 3—7 in. long, .2—5 in. wide; scape short, sheathed in large scarious imbricate bracts; flowers .6—7 in. long; lip oblong, lateral lobes small, acute, midlobe ovate.....1. *uniflora*.
Flowers racemed:—

Sheaths of the scape not becoming foliaceous:—

Lip 2-keeled:—

Sepals .4 in. long, lip as long or longer. Pseudobulbs crowded, narrowly conical, 1—1.5 in. long; leaves 2, linear to linear-oblong, acute, tapering into a channelled petiole, 4—6 in. long, .4—7 in. wide; scape short, tightly clasped at the base by the short sheaths; bracts large, persistent, scarious, ovate-lanceolate; lip with small, blunt side lobes, midlobe broadly obovate, rounded, apiculate or retuse, keels undulate.....2. *breviscapa*.

Sepals 1 in. long, lip shorter. Pseudobulbs ovoid, 1.25—3 in. long; leaves 2, oblong-lanceolate, acute, 6—8 in. long, 1—1.75 in. wide; bracts .75—1.25 in. long; lip with short triangular-ovate, blunt side lobes, midlobe, elliptic, subobtusely, keels entire.....3. *Mossiae*.

Lip 3-keeled. Pseudobulbs ovoid, about 1 in. long; leaves 2, lanceolate, acute, 4—6 in. long, .6 in. wide, petiole short, channelled; bracts narrow; lip with narrowly ovate, subfalcate side lobes, midlobe suborbicular, retuse or apiculate, keels undulate.....4. *angustifolia*.

Inner sheaths of scape more or less foliaceous:—

Pseudobulbs crowded, subglobose, under 1 in. long; leaves 2, hardly coriaceous, elliptic lanceolate, acute, 1.5—4 in. long, .3—5 in. wide; petiole channelled; scape slender, as long as or longer than the leaves, 2—3 flowered; bracts persistent, lanceolate, .5—6 in. long; flowers .6—7 in. long; lip with small oblong-falcate, obtuse side lobes, midlobe suborbicular; disk with 3 crenulate ridges.....5. *odoratissima*.

Pseudobulbs over 1 in. long; flowers 1 in. or more long:—

Midlobe of lip triangular-lanceolate, acute, keels 3—5, crenulate. Pseudobulbs crowded, ovoid, corrugated; leaves 2, lanceolate to broadly elliptic-oblong, acute, 1.5—5 in. long, .5—1.4 in. wide; petiole channelled; bracts persistent, broadly lanceolate up to 1.3 in. long; sepals elliptic-lanceolate, acute.....6. *nervosa*.

Midlobe of lip ovate-oblong or suborbicular, rounded, keels 3, entire, sometimes glandular towards the apex. Pseudobulbs crowded or distant, ovoid,

curved, not corrugate; leaves 2, oblong to lanceolate, acute or subacute, 3·5—12 in. long, 1—2 in. wide; petiole stout, channelled; bracts persistent, ovate-lanceolate, up to 1·5 in. long; sepals elliptic-oblong, rounded

7. *glandulosa*.

1. *COELOGYNE UNIFLORA*, Lindl.; F. B. I. v. 842; King & Pantl. Ann. Calc. viii. t. 192.

Nilgiri Hills (Proudlock).

Flowers pale ochraceous.

2. *COELOGYNE BREVISCAPA*, Lindl.; F. B. I. v. 833 (*in part*).

Mysore (Meebold), Nilgiri Hills (Wight, G. Thomson).

Flowers white.

3. *COELOGYNE MOSSIAE*, Rolfe.

Nilgiri and Pulney (Fyson, Anglade) Hills; 7,000—8,000 ft.

Flowers white.

4. *COELOGYNE ANGUSTIFOLIA*, Wt. Ic. t. 1641. *C. breviscapa*, Hook. f. (*not Lindl.*) F. B. I. v. 833 (*in part*).

Nilgiri Hills (Wight, Bourne).

Flowers white, tinged with yellow.

5. *COELOGYNE ODORATISSIMA*, Lindl.; F. B. I. v. 834; Wt. Ic. t. 1640.

Nilgiri Hills, 7,000—8,000 ft.

Often aggregated in very large patches; flowers white, tinged with yellow.

Var. *angustifolia*, Lindl. Pseudobulbs and leaves more slender; midlobe of lip elliptic, long acuminate. Nilgiri Hills.

6. *COELOGYNE NERVOSA*, A. Rich. *C. corrugata*, Wt. Ic. t. 1639; F. B. I. v. 835.

W. Ghâts from Mysore to Tinnevely, 3,000—7,000 ft.

Flowers white, lip yellowish.

7. *COELOGYNE GLANDULOSA*, Lindl.; F. B. I. v. 835. *C. nervosa*, Wt. Ic. t. 1638.

W. Ghâts.

Flowers white, lip white and yellowish-brown.

17. *Pholidota*, Lindl.

Epiphytic herbs; stem of single, often aggregated pseudobulbs or jointed and sometimes branching. *Leaves* in pairs or solitary. *Scape* terminal or from the base of the pseudobulb, usually drooping, often flexuous; bracts distichous, rigid. *Flowers* small, globose or subglobose. *Sepals* concave. *Petals* flat, broad or narrow. *Lip* sessile on the base of the column, erect, saccate, subentire or lobed. *Column* very short, apex hooded or winged; foot 0. *Anther* 2-celled, more or less globose; pollinia 4, waxy, subglobose or clavate, free or cohering in pairs by a viscus or membrane.

PHOLIDOTA IMBRICATA, Lindl.; F. B. I. v. 845; Wt. Ic. t. 907; King & Pantl. Ann. Calc. viii. t. 201.

E. and W. Ghâts, 2,000—3,500 ft.

A pendent herb; pseudobulbs aggregated, narrowly ovate-cylindric, 1—2·5 in. long; leaf solitary, elliptic-lanceolate or oblanceolate, 4—14 in. long, 8—2·1 in. wide, acute, tapering into a short, stout petiole, 3-ribbed; scape arising from the top of

the pseudobulb; raceme drooping, with the scape up to 26 in. long; bracts persistent, convolute, subrotund, acute, pale-brown, striate, .33 in. long; flowers numerous, close-set, .25 in. long, white with a pinkish or yellowish-brown tinge; lateral sepals with a winged keel, dorsal orbicular, 3-nerved, petals linear-oblong, subacute, lip subequally 3-lobed, midlobe 2-lobulate with a broad sinus between.

18. *Calanthe*, Br.

Terrestrial herbs, often pseudobulbous with a short or tall, leafy stem. *Leaves* plaited. *Scape* axillary, terminal or lateral from a leafy pseudobulb. *Flowers* medium-sized, racemed. *Sepals* subequal, spreading, rarely connivent. *Petals* broad or narrow. *Lip* adnate to the top or base of the column, 3-lobed, midlobe often 2-fid, disk lamellate or tubercled, with or without a spur. *Column* long or short, obliquely truncate; foot 0. *Anther* conical or convex, 2-celled; pollinia 8, waxy, cohering in pairs by a granular viscus.

Stem short, stout; leaves elliptic-ovate to lanceolate, acuminate, 10—20 in. long, 3—6 in. wide, sessile, or base tapering into a usually short petiole, usually sparsely pubescent, at least below, sometimes glabrescent; scape lateral, stout, with the lax-flowered raceme up to 3 ft. long, sparsely puberulous; bracts large, ovate-lanceolate, herbaceous, puberulous; flowers puberulous, .75—1 in. long; lip hardly exceeding the sepals, side lobes short, falcate-oblong, mid-lobe much larger, broadly or cuneately reniform, spur linear-subspathulate, longer than the sepals

1. *Masuca*.

Stem short; leaves elliptic-ovate to lanceolate, acuminate, 8—14 in. long, 3—5 in. wide, quite glabrous, tapering into a usually long petiole; scape stout, with the dense-flowered raceme up to 2 ft. long, sparsely puberulous; bracts large, ovate-lanceolate, puberulous; flowers puberulous, .5—8 in. long; lip longer than the sepals, side lobes large, oblong, obtuse, midlobe more or less deeply cleft into 2 oblong segments with an acute sinus, spur linear, slender, longer than the lip

2. *veratrifolia*.

1. *CALANTHE MASUCA*, Lindl.; F. B. I. v. 850; King and Pantl. Ann. Calc. viii. t. 234.

W. Ghâts, 3,000—6,000 ft.

Flowers usually pale- or dark-purple, sometimes pale-rose or white with a purple lip; lip always bright coloured.

2. *CALANTHE VERATRIFOLIA*, Br.; F. B. I. v. 851. *C. Perrottetii*, A. Rich.; Wt. Ic. t. 1664—5.

W. Ghâts, 6,000—8,000 ft.

Flowers white or pale-like. Very like *C. Masuca*, but smaller and more slender.

19. *Arundina*, Blume.

Terrestrial erect plants; stem simple, rigid, terete, sheathed. *Leaves* distichous, narrow and grass-like. *Flowers* large in terminal, erect, stiff, simple or branched racemes or panicles. *Sepals* free, spreading, lanceolate, acuminate, flat, many-nerved. *Petals* broader, many-nerved. *Lip* large, broad, sessile on the base of the column and embracing it. *Column* long, slender, narrowly winged; foot 0. *Anther* 4-celled; pollinia 8, in 2 superposed rows attached by fours to one membrane.

ARUNDINA GRAMINIFOLIA, Hochr. *A. bambusifolia*, Lindl.; F. B. I. v. 857; Wt. Ic. t. 1661; King. & Pantl. Ann. Calc. viii. t. 156.

W. Gháts, 3,000—6,000 ft.

A stout, almost woody, reed-like plant reaching 5—6 ft. in height and 1 in. in diameter; leaves linear to linear-lanceolate, acute or acuminate, 5—10 in. long, $\frac{3}{4}$ —1 in. wide; flowers about 1.5 in. long, pinkish-purple; sepals lanceolate, petals shorter, rhomboid-elliptic, lip 3-lobed, mid-lobe more or less deeply bifid, crisped, with 3—5 lamellate nerves.

20. *Eulophia*, R. Br.

Quite glabrous terrestrial herbs; rhizome tuberous, rarely pseudobulbous. *Leaves* appearing with or after the flowers, usually plicate. *Scape* lateral, erect, sheathed. *Flowers* racemose, rarely panicle. *Sepals* and *petals* free, spreading, usually subequal. *Lip* adnate to the foot of the column, base saccate or spurred or forming a short mentum, lateral lobes erect, embracing the column, rarely 0, mid-lobe spreading or recurved, disk ridged or crested. *Column* short or long, top oblique, entire, rarely lobed, sometimes with winged or lobed margins; foot present or absent. *Anther* terminal, 2-celled; pollinia 2 or 4, sessile or attached by a short strap to a discoid gland.

Column not produced into a foot:—

Pseudobulbs large, emerging above ground:—

Leaves very narrow, grass-like, 1-ribbed; scapes often branched:—

Leaves 6—30 in. long, $\frac{1}{2}$ — $\frac{3}{4}$ in. wide, midrib stout; scape 1—3 ft. or more long; flowers $\frac{1}{2}$ — $\frac{3}{4}$ in. long; sepals linear-oblong, subacute or obtuse, petals elliptic, obtuse, lip obovate-oblong, as long as the sepals, side lobes small, disk with 5-crested nerves, spur short.....1. *epidendraea*.

Leaves 3—6 in. long, $\frac{1}{2}$ — $\frac{3}{4}$ in. wide, midrib not very stout; scape 1—2 ft. long; flowers $\frac{1}{2}$ — $\frac{3}{4}$ in. long; sepals lanceolate acuminate or elliptic-lanceolate acute, petals slightly broader, lip obovate-oblong, side lobes small, disk with 3—5 lamellate or crested nerves, fimbriate on the rounded lobe, spur short.....2. *graminea*.

Leaves elliptic-lanceolate, acuminate, 3-ribbed, 6—10 in. long, $\frac{1}{2}$ — $\frac{3}{4}$ in. wide. Pseudobulbs fusiform, 2—6 in. long; scape stout, unbranched, with the raceme 2—3 ft. long; bracts linear-lanceolate; flowers $\frac{1}{2}$ — $\frac{3}{4}$ in. long; sepals lanceolate acute, petals broader, lip broader than long, side lobes short, obtuse, midlobe revolute, rounded, disk 2-lamellate at the base, spur a rounded 2-lobed sac.....3. *macrostachya*.

Roots tuberous, underground; leaves elliptic-lanceolate; scape unbranched:—

Lip longer than broad, its nerves fringed:—

Stem 3—6 in. long, sheathed; leaves 4—12 in. long, $\frac{1}{2}$ — $\frac{3}{4}$ in. wide; scape 8—15 in. long, with loose ochreate sheaths below; bracts conspicuous, linear acuminate, $\frac{1}{2}$ — $\frac{3}{4}$ in. long, flowers about $\frac{1}{2}$ in. long; sepals linear-lanceolate, acute, petals broadly elliptic, lip broadly ovate, obtuse, side lobes 0.....4. *ochreatea*.

Stem 4—6 in. long, sheathed; leaves 6—12 in. long, $\frac{1}{2}$ — $\frac{3}{4}$ in. wide; scape 1—3 ft. long, with large acuminate sheaths below; bracts up to 1.75 in. long; flowers $\frac{1}{2}$ — $\frac{3}{4}$ in. long; sepals linear-lanceolate, petals oblong-elliptic, shorter, obtuse or acute, lip obovate-oblong, side lobes small, rounded, midlobe oblong or obovate-oblong.....5. *herbacea*.

Lip broader than long; leaves 4—12 in. long, $\frac{1}{2}$ — $\frac{3}{4}$ in. wide; scape 1—3 ft. long; bracts ovate-lanceolate, acuminate; flowers $\frac{1}{2}$ — $\frac{3}{4}$ in. long; sepals and petals elliptic oblong, obtuse, side lobes of lip large, oblong, rounded, midlobe broadly subovate, or suborbicular, disk with 3 crested nerves.....6. *pratensis*.

Column produced into a foot:—

Root tuberous; leaves elliptic-lanceolate, acute, 10—15 in. long; scape 1—3 ft. long; bracts lanceolate, acute; flowers 9—1 in. long; sepals linear-oblong, acute, dorsal slightly narrower, petals oblong, obtuse, shorter and wider than the sepals, lip obovate-oblong, side lobes short, rounded, midlobe obovate-oblong, obtuse or retuse, crisped, disk with many crenulate or tubercled nerves...7. *nuda*. Root tuberous; leaves oblong-lanceolate, acute; scape rather slender, angular, sheathed, with the raceme 1—2 ft. long; bracts ovate-ensiform; flowers about 1 in. long; sepals acute, dorsal narrowly oblanceolate, lateral falcate-lanceolate, petals wider, oblong, obtuse, mentum conical, subacute, lip with the mentum as long as the petals, as broad as long, side lobes large, triangular-falcate, obtuse or subacute, midlobe tongue-shaped, half as long as the whole lip, slightly concave, rounded, disk with 3 tubercled crests.....8. *Cullenii*.

1. *EULOPHIA EPIDENDRAEA*, Fischer, n. comb. *E. virens*, R. Br.; F. B. I. vi. 1; Wt. Ic. t. 913. *Limodorum virens*, Sw.; Cor. Pl. i. t. 38.

In all districts from sea-level to 3,000 ft.

Flowers green, lip white, nerves and crests red.

2. *EULOPHIA GRAMINEA*, Lindl.; F. B. I. vi. 2; King & Pantl. Ann. Calc. viii. t. 238

Travancore (Wight, Bourdillon), Chingleput (Gamble), Cud-dapah Hills (Fischer), sea-level to 2,500 ft.

Very similar to the last in habit and coloration, but smaller in all respects.

3. *EULOPHIA MACROSTACHYA*, Lindl.; F. B. I. vi. 4; Wt. Ic. t. 1667—8. Nilgiris and Courtallam (Wight).

Flowers green, lip yellow with red stripes, spur green.

4. *EULOPHIA OCHREATA*, Lindl.; F. B. I. vi. 2.

Vizagapatam Hills at 3,300 ft. (A. W. Lushington).

5. *EULOPHIA HERBACEA*, Lindl.; F. B. I. vi. 2; Duthie Ann. Calc. ix. t. 106.

Bababudan Hills of Mysore (Law).

Flowers white with purple nerves.

6. *EULOPHIA PRATENSIS*, Lindl.; F. B. I. vi. 4. *E. ramentacea*, Wt. Ic. t. 1666.

W. Gháts.

Flowers yellow.

7. *EULOPHIA NUDA*, Lindl.; F. B. I. vi. 5; Hook. f. Ann. Calc. v. t. 47; King & Pantl. Ann. Calc. viii. t. 243. *Cyrtopera fusca*, Wt. Ic. t. 1690.

W. Gháts, 2,000—7,000 ft.; Vizagapatam Hills at 3,800 ft. (A. W. Lushington.)

Flowers greenish-purple, yellow and white.

8. *EULOPHIA CULLENII*, Fischer n. comb. *Cyrtopera Cullenii*, Wt. Ic. t. 1754; F. B. I. vi. 7 (under *E. flava*, Hook. f.).

Travancore (Cullen), Anamalai and Pulney (Bourne, Saulière and Anglade) Hills, 3,500—7,000 ft.

Flowers yellow (Wight) or purple (Anglade).

Var. *minor* with flowers 6 in. long. Pulney Hills at 6,000 ft. (Van Malderen).

21. *Cymbidium*, Swartz.

Epiphytic, rarely terrestrial herbs; stem short, rarely elongate and pseudobulbous; roots tufted. *Leaves* long, rarely short, narrow, coriaceous. *Scape* from the side of the stem, sheathed. *Flowers* often large, in erect or drooping, few- or many-flowered racemes. *Sepals* and *petals* subequal, free, erect or spreading. *Lip* sessile at the base of the column and embracing it with the erect side lobes, midlobe recurved, disk with 2 median ridges. *Column* long; foot 0. *Anther* 1- or imperfectly 2-celled; pollinia 2 deeply grooved or 4, sessile on a small or large, often strap-shaped gland.

Leaves linear-oblong, subacute, not notched, 24—30 in. long, .75—1 in. wide; *scape* and *raceme* 10—20 in. long, decurved from the base; *flowers* 1.25 in. across, *ovary* .5 in. long; *lip* as long as the *sepals*, side lobes narrow, midlobe oblong, obtuse, emarginate, much decurved, disk with 2 parallel continuous lamellae with clavate apices.....1. *pendulum*.

Leaves linear-oblong, obtuse, shortly obliquely notched, 12—22 in. long, .75—1.5 in. wide; *scape* and *raceme* 8—20 in. long, erect below, decurved above; *flowers* 1.5 in. across, *ovary* nearly 1 in. long; *lip* as long as the *sepals*, side lobes narrow, midlobe ovate-oblongate, much decurved, disk with 2 lamellae, broken and discontinuous near the middle.....2. *aloifolium*.

1. *CYMBIDIUM PENDULUM*, Sw.; King & Pantl. Ann. Calc. viii. t. 251. *C. aloifolium*, Hook. f.; F. B. I. vi. 10 (in part). *Epidendrum pendulum*, Roxb. Cor. Pl. t. 44.

Hills of the Circars (Roxborough).

An epiphytic herb; flowers dark purple-brown, sepals and petals with yellow margins.

2. *CYMBIDIUM ALOIFOLIUM*, Sw.; F. B. I. vi. 10 (in part); Wt. Ic. t. 1687—8; King & Pantl. Ann. Calc. viii. t. 252. *C. bicolor*, Hook. f. F. B. I. vi. 11. *C. erectum*, Wt. Ic. t. 1753.

In all hilly tracts, 100—3,500 ft.

An epiphytic herb; flowers yellowish-red, or brownish-red.

22. *Geodorum*, Jackson.

Terrestrial herbs; rootstock tuberous. *Leaves* elliptic, acute, plicate. *Scape* from the rootstock, stout, erect, sheathed. *Flowers* crowded in decurved racemes; bracts narrow, membranous. *Sepals* and broader *petals* subequal in length, conniving or spreading. *Lip* sessile on the base or short foot of the column, entire, cymbiform, membranous, margins involute, disk with a basal forked callus and with or without ridges ending in calli. *Column* short, stout. *Anther* 2-celled, appendaged after dehiscence; pollinia 2, broad, sessile or subsessile on a broad strap or gland.

- GEODORUM DENSIFLORUM*, Schlechter. *G. purpureum*, R. Br.; F. B. I. vi. 16. *G. dilatatum*, R. Br.; F. B. I. vi. 17; Wt. Ic. t. 912. *Limodorum recurvum*, Roxb. Cor. Pl. t. 39.

In all districts, 200—3,000 ft.

A stout herb; leaves petioled, 4—10 in. long, 2—5 in. wide; scape with raceme up to 2 ft. long; flowers 4 in. long, pale-purple or rose, the lip with darker markings; sepals linear-oblong, acute, lip ventricose at the base, subpandurate, apex rounded,

emarginate or 2-fid, disk with a channelled ridge ending in raised calli or granulate.

23. *Polystachya*, Hooker.

Epiphytic herbs; caulescent or pseudobulbous. *Leaves* few, distichous. *Scape* terminal, sheathed. *Flowers* small, racemose or paniced. *Sepals* free, lateral triangular or triangular-ovate, adnate to the foot of the column. *Petals* much smaller, very narrow. *Lip* superior, clawed and jointed on the foot of the column, erect, 3-lobed, side lobes erect. *Column* short, broad; foot rather long. *Anther* 1- or sub 2-celled; pollinia 4, cohering or connate in pairs, attached to a very short strap or gland.

Pseudobulbs small; leaves 3—4, narrow-lanceolate, acute, 2—7 in. long, 3—1 in. wide; scape compressed; rhachis angular, glabrous or sparingly brown-pubescent; flowers 1 in. long; lateral sepals ovate-triangular, apiculate, lip suborbicular, side lobes obtuse, nearly as large as the semi-circular midlobe.....1. *Wightii*. Pseudobulbs small; leaves 3—4, narrowly oblong or lanceolate, obtuse or subacute, 2—7 in. long, 5—1.1 in. wide; scape compressed; rhachis angular, glabrous or sparingly brown pubescent; flowers 1 in. long, lateral sepals broadly triangular-lanceolate from a broad base, acute or apiculate, lip broadly oblong, side lobes small, obtuse, midlobe much larger, tongue-shaped or broadly ovate-oblong, apex rounded or emarginate.....2. *purpurea*.

1. *POLYSTACHYA WIGHTII*, Reichb. f.; F. B. I. vi. 21. *P. luteola*, Wt. Ic. t. 1678.

W. Gháts, 2,000—4,500 ft. Not common.

Flowers yellow.

2. *POLYSTACHYA PURPUREA*, Wt. Ic. t. 1679; F. B. I. vi. 21.

W. Gháts, 3,000—4,000 ft. Not common.

Flowers purple or deep lilac.

24. *Luisia*, Gaud.

Tufted epiphytic herbs; stems terete, rigid, sheathed, usually erect. *Leaves* fleshy, elongate, terete, obtuse. *Flowers* small, spicate on a short, stout extra-axillary rhachis; bracts short, thick, imbricating, persistent. *Sepals* subequal or the decurved dorsal smaller. *Petals* equal to or longer than the lateral sepals, spreading. *Lip* sessile on the base of the column, basal portion flat or saccate, apical decurved, broad, ridged. *Column* very short, truncate. *Anther* 2-celled; pollinia 2, ovoid or subglobose; caudicle strap-like.

Stem 6—12 in. long, slender or rather thick; leaves spreading, green, spotted with purple, 3.5—7 in. long, .06—13 in. thick; flowers 2—3 in. long; sepals and petals subequal, narrow, lip longer, quadrate and subsaccate at the base, the apical portion rhomboid-ovate, apex entire.....1. *teretifolia*.

Stem 12 in. or more long, slender; leaves spreading, green, 3—7 in. long, sometimes very slender; flowers .5 in. long; petals much longer than the sepals, narrow, lip about as long as the petals, narrowly pandurate, convex, base broad, flat, 2-auricled, apex with 2 divergent lobules.....2. *tenuifolia*.

1. *LUISIA TERETIFOLIA*, Gaud.; F. B. I. vi. 22; King & Pantl. Ann. Calc. viii. t. 271. *Cymbidium tenuifolium*, Wt. Ic. t. 1689.

W. Gháts, 3,000—4,000 ft.; Vizagapatam Hills at 4,000 ft. (A. W. Lushington).

Flowers greenish-yellow or pale-pink, lip purple.

2. *LUISIA TENUIFOLIA*, Bl.; F. B. I. vi. 24. *Cymbidium triste*, Wt. Ic. t. 911.

W. Ghâts, Melpat in South Arcot (Barber), near sea-level to 4,000 ft.

Flowers yellowish with a purple tinge, lip dark purple with a white patch on either side, and pale purple lobes.

25. *Cottonia*, Wight.

Epiphytic herbs; stems leafy, emitting vermiform roots. *Leaves* coriaceous, narrow. *Flowers* in lateral short racemes; peduncles long, simple or branched. *Sepals* subequal, spreading. *Petals* narrower, spreading or reflexed. *Lip* sessile, not jointed, at the base of the column, flat, much longer than the sepals, subpandurate, 2-auricled at the base, side lobes indistinct, mid-lobe rounded, retuse. *Column* short; foot 0. *Anther* short, hemispheric, 2-celled; pollinia 2, pyriform, 2-cleft or 4 with the 2 smaller incumbent on the 2 larger; caudicle long, narrow; gland very small.

COTTONIA MACROSTACHYA, Wt. Ic. t. 1755; F. B. I. vi. 26.

Malabar near Tellicherry (Jerdon); Anamalais Hills at 2,600 ft. (Fischer); Travancore (Johnson, Calder and Ramaswami).

Stem stout, 4—8 in. long; internodes short; leaves strap-shaped, apex more or less unequally 2-lobed, 4—8 in. long, 3—8 in. wide, keeled below; scape slender, erect, up to 30 in. long, bracts minute; flowers somewhat like a humble-bee; sepals ovate-oblong, obtuse, about 25 in. long, petals oblanceolate, all greenish-yellow or orange veined with red, lip purple with a broad golden-villous margin; base with 3 calli, disk with a median pubescent callus.

26. *Kingiella*, Rolfe.

Epiphytic herbs; stems short, leafy. *Leaves* coriaceous, flat. *Scapes* lateral or axillary, simple or branched. *Sepals* and *petals* subequal or unequal, spreading. *Lip* with a saccate or spur-like mentum, 3-lobed, sessile on the foot of the column, side lobes usually with an awned plate, midlobe with a 2-awned plate. *Column* rather long, narrowly winged; foot usually long. *Anther* 2-celled; pollinia 2, sulcate or 2-partite; strap linear or spatulate; gland large or small.

KINGIELLA DECUMBENS, Rolfe. *Doritis Wightii*, Benth.; F. B. I. vi. 32; Hook. f. Ann. Calc. v. t. 59; King & Pantl. Ann. Calc. viii. t. 265.

Circars (Heyne); Quilon (Wight).

A pendulous herb; stem stout, hardly 1 in. long; leaves 1—4, oblong, usually slightly oblanceolate, obtuse; margins subundulate, 3—8 in. long, 9—2 in. wide; scape from the stem below the leaves, up to 16 in. long, slender; flowers small, pale-ochraceous marked with purple; sepals and petals subequal in length, obtuse, the petals broader, lip with a saccate mentum, side lobes large, oblong, obtuse, with a broad plate near the anterior margin, midlobe obovate, emarginate, with a ligulate, forked, 2-awned plate near the base.

27. *Rhynchosstylis*, Blume.

Epiphytic herbs; stem stout, often woody, leafy. *Leaves* very thick, linear or oblong, apex 2-lobed. *Flowers* in erect or pendulous, many-flowered, cylindric, simple or branched racemes. *Sepals* broad, obtuse, spreading. *Petals* similar, smaller. *Lip* adnate to the foot of the column, spur forming a sac, often pubescent within, side lobes 0, epichyle dilated, erect or recurved on the outer rim of the spur. *Column* short, stout; foot short or 0. *Anther* rounded; pollinia 2; caudicle long, slender; gland oblong, small.

Stem 3—8 in. long, woody; leaves linear, deeply channelled, 6—20 in. long, .5—2 in. wide, apex subequally acutely 2-lobed or lobes very unequal, one rounded or acute, the other truncate; racemes simple, as long as the leaves; flowers .6 in. long; spur saccate, laterally flattened, parallel to the pedicel, epichyle flat, widened and cuneate or emarginate at the apex.....1. *retusa*. Stem short; leaves oblong, flat, slightly keeled, 1.5—3 in. long, .6—1 in. wide; apex subequally bluntly 2-lobed; racemes simple or branched, 3—6 in. long; flowers .12 in. long; spur pouch-like, at right angles to the pedicel, epichyle narrow, channelled above and thickened into a vertical cone at the apex.....2. *latifolia*.

1. *RHYNCHOSTYLIS RETUSA*, Bl.; F. B. I. vi. 32; King & Pantl. Ann. Calc. viii. t. 284. *Saccolabium guttatum*, Wt. Ic. t. 1745—6.
Circars (Heyne, A. W. Lushington); Walaiyar (Wight); Malabar Coast (Barber).
Flowers pale pink spotted with darker pink, lip dark pink.
2. *RHYNCHOSTYLIS LATIFOLIA*, Fischer in Kew Bull. 1927. 358.
Mysore at Cardamonai (Barber).

28. *Chilochista*, Lindl.

Epiphytic herbs; stem very short, leafless, scaly; roots slender, long. *Racemes* erect. *Sepals* and *petals* similar, broad, spreading, the lateral sepals inserted on the apical portion of the foot; petals usually running down the foot. *Lip* movable on the foot, 3-lobed, spur saccate, side-lobes erect, midlobe very short, disk with a pubescent callus. *Column* short; foot broad. *Anther* 2-celled; pollinia 2, globose, deeply furrowed; caudicle short.

CHILOCHISTA PUSILLA, Schlechter. *C. usneoides*, Wt. Ic. t. 1741.
Sarcochilus Wightii, Hook. f.; F. B. I. vi. 37.

Cochin (Johnson); Nilgiris (Jerdon).

A small herb; roots green; scape and raceme 1.5—3 in. long; flowers about .2 in. long, white or creamy; ovary puberulous, spur short, broadly conical.

29. *Aerides*, Lour.

Epiphytic herbs; stem leafy, often woody. *Leaves* coriaceous, flat and channelled or terete. *Flowers* generally numerous, showy; in dense or lax spikes, racemes or panicles. *Sepals* and *petals* similar, lateral sepals and sometimes the petals adnate to the foot of the column. *Lip* more or less elastically inserted at the end of the foot, spurred, side lobes small or large, rarely 0, midlobe usually larger than the side lobes or smaller and incurved between them, spur usually curved forward and with calli within. *Column* short; foot usually

long. *Anther* 2-celled, beaked or not; *pollinia* 2, globose, sulcate; *caudicles* long or short.

Leaves terete, acute, 2—6 in. long, .1—2 in. diam. Stems rather slender, elongate; flowers few on a short, stout peduncle, .75 in. long; sepals obovate-oblong, obtuse, petals shorter and broader, side lobes of lip erect, about as long as the shortly cuneiform, fleshy, ridged midlobe, spur narrow, straight or slightly recurved

1. *cylindricum*.

Leaves flat, keeled:—

Side lobes of lip much narrower than the midlobe:—

Lip more than .5 in. long, horizontal or inflexed:—

Stems 1—3 in. long, very stout; leaves linear-oblong, channelled, apex unequally bluntly 2-lobed, 3—10 in. long, .5—1.2 in. wide; flowers in usually paniced racemes longer than the leaves; bracts minute; sepals obovate, .4 in. long, petals as long, narrower, lip quadrate-oblong, .6—8 in. long, side lobes small, rounded, midlobe refuse, spur rather large, strongly incurved

2. *maculosum*.

Stems 2—10 in. long, stout; leaves oblong or linear-oblong, apex unequally bluntly 2-lobed, 2.5—8 in. long, .6—1.75 in. wide; flowers usually in simple (sometimes branched) racemes longer than the leaves; bracts small; sepals oblong, obtuse, petals broader, lip nearly 1 in. long, geniculately incurved at the claw, side lobes oblique, small, midlobe over .5 in. long, ovate, sub-obtuse, somewhat 3-lobed, margin crenulate, with 2 fleshy calli at the base closing the mouth of the spur, spur strongly incurved, the apex often concealed beneath the reflexed edges of the lip.....3. *crispum*.

Lip about .3 in. long, deflexed. Stem 1—7 in. long, stout; leaves linear to linear-oblong, apex unequally bluntly 2-lobed, 2.5—10 in. long, .25—1 in. wide; flowers in simple or branched racemes, shorter or longer than the leaves; bracts minute; sepals suborbicular, petals narrower, side lobes of lip small, midlobe ovate, disk with 2 large basal calli, spur cylindric, obtuse, incurved

4. *ringens*.

Side lobes of the lip broad, midlobe narrowly lanceolate, acute, erose, incurved between the side lobes. Stem 3—12 in. long, stout; leaves linear-oblong or oblong-lanceolate, apex unequally bluntly 2-lobed, 5—10 in. long, .7—1.5 in. wide; flowers in usually simple racemes, as long as or longer than the leaves; bracts rather large; lateral sepals suborbicular, longer and wider than the dorsal sepal and the petals, lip about .5 in. long, longer than the lateral sepals, spur subacute, strongly incurved.....5. *odoratum*.

1. *AERIDES CYLINDRICUM*, Lindl.; F. B. I. vi. 44; Wt. Ic. t. 1744.

W. Gháts.

Flowers white or tinged with red, lip reddish, midlobe yellowish at the base (Wight).

2. *AERIDES MACULOSUM*, Lindl.; F. B. I. vi. 45. *Saccolabium speciosum*, Wt. Ic. tt. 1674—5.

W. Gháts, Ramandrug at 3,500 ft. (Gamble).

Flowers rose-coloured, lip darker.

3. *AERIDES CRISPUM*, Lindl.; F. B. I. vi. 45. *A. Lindleyanum*, Wt. Ic. tt. 1677.

Nilgiri and Pulney Hills, 3,000—6,000 ft.

Flowers sweet-smelling; pinkish white shaded with darker pink.

4. *AERIDES RINGENS*, Fischer n. comb. *A. radicosum*, A. Rich.; F. B. I. vi. 46. *A. lineare*, Hook. f.; F. B. I. vi. 47. *Saccolabium Wightianum*, Lindl.; Wt. Ic. t. 917. *S. rubrum*, Wt. Ic. t. 1673. *S. paniculatum*, Wt. Ic. t. 1676.

W. Gháts, 800—8,000 ft.

Often growing on rocks as well as epiphytic. Flowers from nearly white to deep rose-pink; leaves often mottled with purple.

5. *AERIDES ODORATUM*, Lour.: F. B. I. vi. 47; King & Pantl. Ann. Calc. viii. t. 282.

Circars (Heyne); Vizagapatam (Barber); Rampa Hills at 2,000 ft. (Narayanswami).

Flowers very fragrant; white spotted with pink.

30. *Vanda*, R. Br.

Epiphytic herbs or shrubs; stems often very long and scandent, leafy. *Leaves* very coriaceous or fleshy, flat, keeled or terete. *Flowers* in simple lax or dense racemes, usually showy and rather large. *Sepals* and *petals* subequal, spreading or incurved, narrowed to the base. *Lip* usually saccate or spurred, side lobes large or small, rarely 0, adnate to the foot of the column or to the sides of the sac or spur, midlobe fleshy, disk usually ridged or lamellate. *Column* short, stout; foot very short or 0. *Anther* 2-celled; rostellum small; pollinia 2, didymous, subglobose or obovoid; caudicle short or long and geniculate; gland usually large.

Leaves terete, slender, 3·5–8 in. long. Stem slender up to 8 ft. long; peduncles axillary, suberect, long; raceme 2–6-flowered; flowers 2·5–4 in. in diam.; sepals broadly oblong or obovate, blunt, lateral often with a short spur outside, below the apex, petals larger, subrotund, lip longer than the lateral sepals and with them adnate to the very short foot, side lobes large, elliptic, midlobe clawed, obovate, more or less deeply bifid, spur funnel-shaped.....1. *teres*.

Leaves flat or keeled, not terete:—

Leaves less than 10 in. long:—

Flowers less than 1 in. in diam. Stems stout, 3–6 in. long; leaves conduplicate, keeled, linear, apex unequally obtusely (rarely acutely) 2-lobed, 3–6 in. long, 4–7 in. wide; scapes few-flowered, axillary from the existing or fallen leaves, as long as or often longer than the leaves; bracts small; sepals broadly obovate, spreading, petals spathulate-oblong, lip adnate to the foot of the column, spur narrowly funnel-shaped, slightly curved at the lip, side lobes erect from the edges of the spur, midlobe obovoid, tip dilated, crenulate, truncate or retuse, disk 2-ridged; capsules 1–1·5 in. long.....2. *parviflora*.

Flowers more than 1 in. in diam.; capsules more than 1·5 in. long:—

Stem 2–4 ft. long, scandent; leaves flat or not strongly conduplicate, ovate or linear-oblong obtuse or subacute apex oblique and entire or emarginate, 2–4 in. long, 5–1·25 in. wide; scape leaf-opposed, robust, with the few to many-flowered raceme up to 20 in. long, erect; bracts persistent, ovate-cordate, acute, 3–4 in. long; flowers 1·25 in. in diam.; sepals and petals flat, spathulately oblong, obtuse, lip clawed, as long as the sepals, side lobes small, oblong, midlobe triangular-obovate, obtuse, somewhat 3-lobed, decurrent on the short, conical, acute spur; capsules 1·5–2 in. long.....3. *spathulata*.

Stem 1–2 ft. long, scandent; leaves conduplicate, keeled, linear-oblong, apex praemorse, 3-toothed, all teeth acute or 2-rounded, 3–8 in. long, 5–1·2 in. wide; scapes axillary, stout, with the raceme up to 10 in. long, 6–10-flowered; bracts suborbicular, 0·12 in. long; flowers 1·5–2 in. in diam.; sepals obovate, spreading, petals shorter, side lobes of lip erect, ovate, acute, midlobe twice as long, pandurate, dilated at the apex, lip 2-lobed, disk with fleshy ridges, spur straight, conical, obtuse; capsules 3–4 in. long

4. *tessellata*.

Leaves narrowly ligulate, unequally, acutely 2-lobed, more than 1 ft. long; scapes few-flowered; side lobes of lip subquadrate, midlobe broadly ovate, obtusely 2-lobed, disk with 2 thick ridges, pilose at the base of the ridges and side lobes, spur conical, column slender for the genus.....5. *Wightii*.

1. *VANDA TERES*, Lindl.; F. B. I. vi. 49; King & Pantl. Ann. Calc. t. 285.

Vizagapatam Hills at 3,300 ft. (A. W. Lushington).

Flowers white or rose, lip yellow or reddish-brown, spotted and lined with red and purplish-brown.

2. *VANDA PARVIFLORA*, Lindl. ; F. B. I. vi. 50 ; Wt. Ic. t. 1669 ; King & Pantl. Ann. Calc. viii. t. 286.

In all Districts in hilly tracts, 1,000—4,000 ft.

Flowers yellow, midlobe of lip lilac or whitish with lilac lines.

3. *VANDA SPATHULATA*, Spreng. ; F. B. I. vi. 50 ; Wt. Ic. t. 915.

In most districts, about sea-level (Sriharikota in Nellore [Fischer]) to 3,000 ft. ; usually in rather dry tracts.

Often starting terrestrially, and later attaching itself to shrubs and becoming entirely epiphytic. Leaves and scapes often marked with blood-red spots ; flowers golden-yellow.

4. *VANDA TESSELLATA*, Hook. *V. Roxburghii*, R. Br. ; F. B. I. vi. 52 ; Wt. Ic. t. 916 ; Duthie Ann. Calc. ix. t. 116. *Epidendrum tessellatum*, Roxb. Cor. Pl. t. 42.

In all districts, about sea-level to 2,000 ft.

Sepals and petals tessellated yellow with brown lines and white margins, lip bluish dotted with purple. Vern. *Tel.* Saga.

5. *VANDA WIGHTII*, Reichb. f. ; F. B. I. vi. 54.

Nilgiri Hills (Wight).

A little-known species.

31. *Saccolabium*, Blume.

Epiphytic herbs ; stems leafy. *Leaves* long, linear, sometimes terete. *Flowers* solitary or in simple or branched, few to many-flowered racemes, small or moderate-sized. *Sepals* and *petals* free, spreading, recurved or incurved. *Lip* spurred, 3-lobed, rarely entire, side lobes short, erect, midlobe fleshy, spur saccate, naked within, or with calli on the front wall only. *Column* short and broad ; foot 0 or indistinct. *Anther* 1- or imperfectly 2-celled ; pollinia 2, entire or 2-partite.

Leaves very slender, terete, 2—8 in. long. *Stem* slender, 3—18 in. long ; racemes lateral, up to 3 in. long ; bracts lanceolate, minute ; sepals linear, petals orbicular, all shorter than the cylindric, obtuse spur, limb of lip ovate, acute, deflexed, side lobes erect, rounded.....1. *filiforme*.
Leaves flat:—

Spur of lip 2—3 times longer than the sepals. *Stem* 2—8 in. long ; leaves linear-lanceolate, acuminate, narrowed at the base, 2—4 in. long, .3 in. wide, straight or falcate ; racemes slender, simple, 3—6 in. long ; bracts minute ; flowers .2 in. long ; sepals oblong obtuse, dorsal concave, petals slightly smaller, spur straight, slender, tubular acuminate, mouth oblique, side lobes of lip 0, midlobe minute, acute.....2. *gracile*.

Spur of lip shorter than the lateral sepals:—

Stem 1—7 in. long, slender ; leaves linear, subacute, 1—1.5 in. long, .2 in. wide ; racemes simple or branched, longer than the leaves ; bracts minute, lanceolate, longer than the pedicel and ovary ; flowers .06—1 in. long sepals ovate, petals linear, spur saccate or subglobose, side lobes of lip small, rounded, midlobe oblong, concave.....3. *Jerdonianum*.
Stem short, stout ; leaves linear, apex very unequally bluntly or subacutely 2-lobed, 2—10 in. long, .25—6 in. wide ; racemes lateral, short, stout ; bracts broadly ovate ; flowers .2—3 in. long ; sepals and petals oblong or obovate, strongly incurved, side lobes of lip very small, midlobe broadly ovate, concave, fimbriately crose.....4. *pulchellum*.

1. SACCOLABIUM FILIFORME, Lindl.; F. B. I. vi. 56. *Sarcanthus filiformis*, Wt. Ic. t. 1684. *S. roseus*, Wt. Ic. t. 1685.
Nilgiri (Wight), Anamalai (Cotton), Pulney (Bourne, Saulière) Hills, 3,000—8,000 ft., and High Wavy Mountains (Blatter & Hallberg).
Flowers rose or orange-yellow streaked with crimson, or brick-red with an orange lip (Blatter).
2. SACCOLABIUM GRACILE, Lindl.; F. B. I. vi. 57.
Anamalai Hills; High Wavy Mountains (Blatter & Hallberg).
Rare.
Flowers white.
3. SACCOLABIUM JERDONIANUM, Reichb. f.; F. B. I. vi. 59. *Taenio-phyllum jerdonianum*, Wt. Ic. t. 1756.
Malabar (Jerdon); Travancore, Udambanshola at 5,000 ft. (Meebold); Tinnevely at Naterikal (Barber).
Rare.
4. SACCOLABIUM PULCHELLUM, Fischer n. comb. *S. nilagiricum*, Hook. f.; F. B. I. vi. 60. *Vanda pulchella*, Wt. Ic. t. 1671.
Nilgiri Hills and Quilon (Wight); Travancore (Johnson); Pulney Hills at 6,000 ft. (Anglade, Bourne); Tinnevely Hills (Barber); High Wavy Mountains (Blatter & Hallberg).
Flowers green or yellowish passing into white, dashed with purple.

32. *Acampe*, Lindl.

Epiphytic herbs; stems usually long and stout. *Leaves* thickly coriaceous, keeled, distichous, apex oblique. *Flowers* corymbose, often paniced, fleshy. *Sepals* and *petals* flat, subsimilar, the lateral sepals adnate to the usually small spur, dorsal sepal often slightly larger than the lateral. *Lip* upcurved, saccate or spurred, adnate to the column, often tubercled or pubescent within. *Column* short, thick; foot 0. *Anther* 2-celled; pollinia 2, waxy, globose; caudicle slender, longer than the pollinia; gland small, rotund.

Stem 12—18 in. long, stout; leaves strap-shaped; apex unequally bluntly 2-lobed, 4—9 in. long, .6—1.4 in. wide; peduncles supra-axillary, stout, with several cupular sheaths; flowers .3 in. long, paniced; panicles 1.5—5 in. long; sepals elliptic or obovate-oblong, petals obovate; side lobes of lip small, rounded; midlobe ovate, obtuse, papillose; spur a short rounded sac.....1. *Wightiana*.
Stem short, very stout; leaves narrowly strap-shaped, apex unequally 2-lobed with usually a mucro between, 6—8 in. long; scape 1.5—2 in. long; flowers crowded, .4 in. long; sepals and petals oblong, spur saccate or shortly conical, hairy within, side lobes of lip very small, midlobe rhomboid with acute angles, papillose above.....2. *congesta*.

1. ACAMPE WIGHTIANA, Lindl. *Saccolabium Wightianum*, Hook. f.; F. B. I. vi. 62. *S. praemorsum*, Hook. f. vi. 62. *Vanda Wightiana*, Wt. Ic. t. 1670. *Epidendrum praemorsum*, Roxb.; Cor. Pl. t. 43.
W. Ghâts (Wight); Circars (Roxburgh); Godavari District at Kota (Narayanswami).
Flowers yellow, barred with red; lip white with red stripes.

2. *ACAMPE CONGESTA*, Lindl. *Saccolabium congestum*, Hook. f.; F. B. I. vi. 63. *S. papillosum*, Wt. Ic. t. 1672.

Malabar (Wight).

Flowers white, tinged with yellow and purple.

33. *Sarcanthus*, Lindl.

Epiphytic herbs; stems usually elongate. *Leaves* fleshy, terete or flat. *Flowers* small in extra-axillary racemes or panicles. *Sepals* subequal. *Petals* rather smaller. *Lip* adnate to the base of the column or its foot, spur funnel-shaped, sometimes dilated near the mouth, divided by a longitudinal septum into 2 loculi for part of its length, usually with calli on both walls, side lobes small, midlobe small, triangular or hastate. *Column* short, stout; foot 0, short or long. *Anther* depressed, 2-celled; pollinia 2, bifid.

SARCANTHUS PENINSULARIS, Dalz.; F. B. I. vi. 67. *S. pauciflorus*, Wt. Ic. t. 1747.

W. Ghâts.

Stem slender, pendulous, leafy, 10—12 in. long; leaves linear, straight or falcately curved, obtusely acuminate, narrowed at the base, 2.5—6 in. long, .2—3 in. wide; sheaths ribbed; racemes shorter than the leaves; flowers yellow with red margins, lip white or yellowish, the side lobes often purple, sepals elliptic, obtuse, .16 in. long, petals smaller, spatulate, side lobes of lip small, acute, midlobe incurved, acute, spur conical, subacute, dilated above.

34. *Cleisostoma*, Blume.

Epiphytic herbs; stems usually elongate, leafy. *Leaves* fleshy, flat or terete. *Flowers* in extra-axillary racemes or panicles. *Sepals* and *petals* subequal, rather small, spreading. *Lip* adnate to the foot of the column, usually upcurved, 3-lobed, or the side lobes indistinct, spurred, spur conical or saccate with a callus plate within on the back wall, side lobes of lip erect, midlobe spreading or recurved. *Column* short; foot very short. *Anther* 2-celled; pollinia 2.

Stem 1—2 ft. long, rather slender; leaves scattered, oblong, apex rounded, entire or notched, base cordate, 1—2 in. long, .4—6 in. wide; flowers .3 in. long, on a short, stout, leaf-opposed peduncle; sheaths cupular; bracts cymbiform; sepals and petals oblanceolate, obtuse, side lobes of lip rather large, crenulate, midlobe sub-3-lobed, with a fleshy callus or with 2 ridges on the disk.....1. *tenerum*. Stem 1—2 in. long; leaves distichous, imbricate, linear, apex unequally bluntly 2-lobed, slightly narrowed at the base, 3—9 in. long, .6—1 in. wide; racemes rather stout, simple or branched, 2—5 in. long, sheaths cupular; bracts minute, lanceolate, acuminate; flowers .16 in. long; sepals and petals obovate, obtuse, side lobes of lip indistinct, midlobe orbicular-ovate, spur saccate, slightly inflated at the apex, with a callus plate on the back wall.....2. *Mannii*.

1. *CLEISOSTOMA TENERUM*, Hook. f.; F. B. I. vi. 73. *Oeceoclades tenera*, Wt. Ic. t. 1683.

Nilgiris: Sispara Ghât at 5,000 ft. (Gamble); Pulney Hills: Kodaikanal at 7,000 ft. (Anglade, Bourne); High Wavy Mountains (Blatter & Hallberg).

Flowers yellow or green with red nerves, lip white.

2. *CLEISOSTOMA MANNII*, Reichb. f.; F. B. I. vi. 74; Hook. f. Ann. Calc. v. t. 86.

Vizagapatam: Palkonda Hills at 1,500 ft. (Gamble).

Flowers yellow flushed with red.

35. *Taeniophyllum*, Blume.

Small epiphytic herbs; stem very short or 0, usually leafless. *Flowers* very small, usually in short few to many-flowered spikes. *Sepals* and *petals* subequal, free or united at the base. *Lip* sessile, saccate or spurred, side lobes small, broad, midlobe more or less fleshy, spur naked within. *Column* very short, broad; foot 0. *Anther* 2-celled; pollinia 4; strap short or long; gland small or fairly large.

TAENIOPHYLLUM SCABERULUM, Hook. f.; F. B. I. vi. 77.

Travancore at Kottayam (Johnson). Very rare.

Roots filiform; peduncle .5 in. long, scaberulous; bracts broadly ovate; flowers under .1 in. long; sepals, petals and lip united at the base, lip deeply saccate with a minute incurved lobe.

36. *Diplocentrum*, Lindl.

Epiphytic herbs; stem short, leafy. *Leaves* distichous, narrow, fleshy, subterete or complicate. *Scapes* lateral, simple or branched. *Flowers* rather small, in subspiciform racemes. *Sepals* and *petals* similar, the lateral sepals usually somewhat larger. *Lip* sessile, jointed on the base of the column, spreading, entire, with 2 short spurs, epichyle fleshy. *Column* very short, truncate, 2-auricled; foot 0. *Anther* 2-celled; pollinia 2, ovoid, sulcate or 2-partite; caudicle broad; gland broad.

Stem 2—6 in. long; leaves linear, keeled, apex unequally bluntly 2-lobed, 3—6 in. long, .2—35 in. wide; panicles 5—10 in. long; lateral sepals ovate, slightly falcate, lip with 2 short narrowly conical incurved parallel spurs, epichyle oblong, rounded, disk with a median thick fleshy ridge forking near the apex

1. *recurvum*.
Stem 2—6 in. long; leaves linear, apex unequally bluntly 2-lobed, 2—6 in. long, .2—6 in. wide; panicles 5—10 in. long; lateral sepals broadly ovate, lip with 2 very short saccate-oblong, straight, slightly divergent spurs, epichyle lanceolate truncate, disk naked, somewhat thickened at base on either side.....2. *congestum*.

1. *DIPLOCENTRUM RECURVUM*, Lindl.; F. B. I. vi. 78; Wt. Ic. t. 1680. *D. longifolium*, Wt. Ic. t. 1681.

Hills of South India from Horsleykonda (Gamble, Fischer) and Nundidroog to Tinnevely and Travancore.

Flowers pink and brownish tinged with pink.

2. *DIPLOCENTRUM CONGESTUM*, Wt. Ic. t. 1682; F. B. I. vi. 78.

Western Gháts, not common.

Flowers coloured as those of the last species.

37. *Podochilus*, Blume.

Small epiphytic herbs; stems tufted. *Leaves* many, distichous, small, flat or equitant and laterally compressed. *Peduncles* terminal or leaf-opposed. *Flowers* small or minute, racemed or spicate. *Lateral sepals* adnate to the foot of the column and forming a mentum. *Petals*

free, broad or narrow. *Lip* jointed to the foot, clawed or not, entire or somewhat 3-lobed, erect with a basal appendage. *Column* short; foot well developed; rostellum bifid or 2-partite. *Anther* erect; pollinia 4; caudicle widened upwards; gland small.

PODOCHILUS FALCATUS, Lindl.; F. B. I. vi. 80. *P. malabaricus*, Wt. Ic. t. 1748, fig. 2; F. B. I. vi. 80.

Wynaad (Drew, Barber); Malabar (Jerdon); Kavalay in Cochin at 2,000 ft. (Meebold); Travancore (Johnson).

Stem 3—12 in. long, fleshy; leaves broadly ensiform, obtuse, .5 in. long, imbricating and covering all the stem except the base; spikes slender, terminal, or terminal and lateral up to 1.5 in. long; bracts ovate-lanceolate, acuminate; flowers 5—12, white tipped with pink; lateral sepals ovate-lanceolate, dorsal, and petals lanceolate, mentum small, lip ovate-lanceolate, constricted in the middle, obtuse.

38. *Thelasis*, Blume.

Small epiphytic herbs; pseudobulbous with 1 or 2 leaves or with short compressed stems and several leaves. *Leaves* jointed on the sheath. *Scape* from the base of the pseudobulb or lateral on the stem, with 1—3 sheaths. *Flowers* very small, spicate. *Sepals* and *petals* similar, the latter smaller. *Lip* sessile on the base of the column, entire. *Column* very short; foot 0. *Anther* 2—4-celled; pollinia 8 in 2 groups of 4, minute, globose; caudicles long, filiform; gland small.

THELASIS PYGMAEA, Lindl.; F. B. I. vi. 86; King & Pantl. Ann. Calc. viii. t. 331. *Euproboscis pygmaea*, Griff.; Wt. Ic. t. 1732.

Malabar (Jerdon); Anamalai Hills; Karanir at 1,900 ft. (Fischer). Pseudobulb globose, .3—5 in. in diam.; leaves 1—2, linear, .8—2.5 in. long, .1 in. wide; scape slender, up to 3 in. long, straight or curved; sheaths up to .3 in. long; bracts ovate, acuminate; flowers hardly .1 in. long, greenish; dorsal sepal ovate-lanceolate, lateral linear-oblong, lip ovate, acute, contracted towards the tip.

39. *Vanilla*, Swartz.

Stout, terrestrial climbing, branched herbs; branches emitting adventitious roots; leafy or leafless. *Leaves* when present coriaceous or fleshy. *Racemes* usually axillary, subsessile or peduncled. *Flowers* large. *Sepals* and *petals* subequal, spreading. *Lip* adnate by a claw to the base of the column and embracing it in its concave limb, entire or 3-lobed. *Column* elongate; foot 0. *Anther* incumbent, cells separate; pollen granular. *Capsule* long, fleshy, 1-celled.

Stem very thick; internodes 3—4 in. long; abortive leaves lanceolate, acuminate, .5—1.5 in. long; bracts ovate, acute, .25—4 in. long; flowers 2 in. long; sepals and petals oblong-lanceolate, subobtusate, petals slightly the wider, undulate, lip entire, ovate-oblong, subacute, undulate, disk with 2 median puberulous lines

1 *Walkeria*.

Stem thick; internodes 2—4 in. long; leafless; bracts broadly ovate, subacute, about .2 in. long; flowers 1 in. or less long; sepals and petals oblong-lanceolate, subacute, lip 3-lobed, side lobes broad, rounded, midlobe rotund-ovate, subacute, disk with a median hirsute line and two densely retrorsely barbate crests

2. *Wightiana*.

1. VANILLA WALKERIEAE, Wt. Ic. t. 932; F. B. I. vi. 90.
Travancore near Quilon (Wight); Jirganhalli in North Coimbatore at 3,000 ft. (Fischer).
Flowers white. Vern. *Kan.* Gundunallai.
2. VANILLA WIGHTIANA, Lindl.; F. B. I. vi. 90. *V. aphylla*, Wt. Ic. t. 931.
Travancore (Wight, Calder and Ramaswami).
Flowers white.

40. *Corymborchis*, Thouars.

Tall terrestrial, rigid, leafy herbs. *Leaves* broad, plaited. *Flowers* in axillary, sessile, spreading panicles. *Sepals* and *petals* subequal, linear or spatulate, at first cohering in a tube with spreading tips. *Lip* erect from the base of the column, linear, channelled, tip expanded and recurved. *Column* elongate, terete; apex clavate and 2-lobed or -auricled; rostellum at length 2-fid, foot 0. *Anther* narrow, acuminate, about as long as the rostellum, 2-celled; pollinia 2, clavate; caudicle subulate; gland peltate.

CORYMBORCHIS VERATRIFOLIA, Bl. *Corymbis veratrifolia*, Reichb. f.; F. B. I. vi. 91; King & Pantl. Ann. Calc. viii. t. 354.

Nilgiris (Thomson); Courtallam (Wight); Tinnevely District at Kannikatti (Barber); Cuddapa District (Beddome).

Stem up to 4 ft. high; leaves elliptic-lanceolate, caudate-acuminate, nearly sessile on the sheaths, 12—18 in. long, 3—4 in. wide; panicles 4—6 in. long; flowers 1—1.25 in. long, greenish-white; sepals and petals linear-oblongate, lip linear with the end expanded into an orbicular, apiculate recurved lobe.

41. *Tropidia*, Lindl.

Terrestrial leafy herbs; stems often branched. *Leaves* membranous, sessile, subplicate. *Flowers* small, in axillary or terminal, sessile or peduncled spikes. *Sepals* and *petals* subequal, the lateral sepals more or less connate. *Lip* sessile on the base of the column and parallel to it, cymbiform or spurred, entire, tip acute or reflexed, disk lamellate. *Column* rather short; foot 0; rostellum long, at length 2-fid. *Anther* short, erect, 2-celled; pollinia 2, clavate, 2-cleft; caudicle short or long; gland small.

TROPIDIA ANGULOSA, Bl.; F. B. I. vi. 92; King & Pantl. Ann. Calc. viii. t. 365. *Govindooia nervosa*, Wt. Ic. t. 2090.

Bababudan Hills (Law); Courtallum (Wight).

Stem 8—12 in. long, sheathed below the leaves; leaves 2—3, elliptic to broadly ovate, acuminate, base rounded or cordate, 3—6 in. long, 1.5—3 in. wide; peduncles terminal, slender in flower, up to 2 in. long; spikes many-flowered, 1—2 in. long; bracts linear, slender, spreading, .4—.75 in. long; flowers .5—.75 in. long, white; lateral sepals lanceolate, acuminate, connate nearly to the apex, forming a mentum and enclosing the lip and spur, dorsal sepal narrower, petals ovate-lanceolate, lip oblong, obtuse, spur cylindric.

42. *Anoechtochilus*, Blume.

Terrestrial leafy herbs; stems creeping below. *Leaves* petioled, ovate or lanceolate, often coloured. *Flowers* moderate-sized in erect spikes. *Sepals* and *petals* free, the dorsal sepal forming a hood with the petals, the lateral spreading. *Lip* adnate to the base of the column, base spurred, side lobes small, midlobe contracted above the spur into an entire, toothed or pectinate claw, apex expanded into 2–4 wing-like lobes, spur exserted beyond the bases of the lateral sepals with 2 calli within. *Column* short, with 2 appendages in front which plunge into the spur; foot 0. *Anther* 2-celled; pollinia 2; caudicle long or short.

ANOECHTOCHILUS ELATIOR, Lindl.; F. B. I. vi. 95.

W. Ghâts in or near evergreen forests, 3,000–6,000 ft.

Stem up to 8 in. long; leaves orbicular-ovate, acute, base rounded, 1–3 in. long, often velvety dark-green with golden nerves; petiole above the loose short sheath, .3–.5 in. long; scape slender, glandular pubescent, as are the spike, bracts, pedicels and ovaries, up to 12 in. long, with 2–3 lanceolate sheaths; spike short, 2–12-flowered; bracts ovate-lanceolate, .5 in. long; flowers pink; lip as long as the sepals, claw fimbriate, terminal lobes oblong, shorter than the claw, spur funnel-shaped, acute; appendage of column large, didymous, hatchet-shaped.

43. *Odontochilus*, Blume.

Terrestrial leafy herbs; stem creeping below. *Leaves* petioled. *Flowers* terminal, solitary, or on a few- to many-flowered spike. Dorsal *sepal* forming a hood with the petals, lateral more or less connate at the base and concealing the spur. *Lip* adnate to the base of the column, contracted beyond the spur or sac into a claw, apex lobed. *Column* short; foot 0. *Anther* 2-celled, pointed; pollinia 2, rarely 4.

ODONTOCHILUS ROTUNDFOLIUS, Blatt. in Journ. Bomb. Nat. Hist. Soc. xxxii, 521.

High Wavy Mountains in evergreen forest (Blatter & Hallberg). Stem nodose, 6 in. high, hairy with hairs from bulbous bases; leaves few, almost orbicular, mucronate, up to .4 in. in diam.; petiole about as long, amplexicaul; flower solitary, about .4 in. long; sepals erect, oblong, petals shorter, oblong, acuminate, subfalcate, lip with a minute subsaccate spur, claw broad, entire, limb with 2 rounded side lobes and a clawed apical bifid lobe.

44. *Spiranthes*, L. C. Rich.

Terrestrial herbs; roots fibrous or tuberous; stems erect, leafy, or the flowering leafless. *Leaves* usually narrow. *Flowers* small, in erect, secund, often twisted, many-flowered spikes. *Sepals* subequal, free, the lateral gibbous at the base, and inserted obliquely on the ovary, more or less cohering with the similar petals in an erect hood. *Lip* erect, sessile or clawed, entire or 3-lobed, base concave, disk bearing calli or lamellæ. *Column* short, terete, base often decurrent on the ovary; foot 0. *Anther* erect, 2-celled; pollinia 2, 2-partite, pendulous.

SPIRANTHES SINENSIS, Ames. *S. australis*, Lindl.; F. B. I. vi. 102; Wt. Ic. t. 1724 (middle and right-hand figures); King & Pantl. Ann. Calc. viii. t. 369.

In the hills, 5,000—8,000 ft., in open dry grass-lands and in swampy places.

6—18 in. high; leaves 4—5, usually clustered near the base of the stem, linear-lanceolate to oblanceolate, obtuse or acute, 1·5—5 in. long, 2—5 in. wide, shortly sheathing, sometimes distinctly petioled; flowers 1—2 in. long, white or pink, in glandular-pubescent spikes 1·5—9 in. long; rhachis spirally twisted; sepals ovate-oblong, petals linear, lip sessile, 3-lobed, dilated at base and apex, base subsaccate, 2-glandular, apex subquadrate, truncate, retuse, crenulate.

Var. *Wightiana*, Lindl.; F. B. I. vi. 102; Wt. Ic. t. 1724 (left-hand figure). Stouter, sheaths many, almost imbricating; flowers in a dense cylindric spike.

Nilgiri Hills.

45. *Cheirostylis*, Blume.

Small leafy terrestrial herbs; stems decumbent and succulent at the base. *Leaves* membranous, petioled. *Flowers* small, few, racemed. *Sepals* united to the middle into a ventricose tube. *Petals* shorter, narrow. *Lip* inserted at the base of the column, erect, base saccate or cymbiform, sac with contained calli or setae, epichyle shortly clawed, apex dilated, 2-lobed, margin entire, toothed or fimbriate. *Column* short, with 2 appendages in front; foot 0; rostellum 2-cleft. *Anther* erect, 2-celled; pollinia 2, 2-partite; caudicle short; gland oblong.

CHEIROSTYLIS FLABELLATA, Wt.; F. B. I. vi. 105. *Monochilus flabellatum*, Wt. Ic. t. 1727.

Nilgiri and Pulney Hills at 6,000 ft. and upwards, growing in the humus of shady woods.

A delicate plant 4—9 in. high, probably saprophytic; leaves 4—5, thin, ovate or subrotund, acute, base rounded or subcordate, 3-ribbed, 5—1 in. long, brown tinged with red; sheaths hyaline, truncate, inflated; scape slender, glandular-pubescent; sheaths few, loose, acuminate; racemes short; flowers white, glandular-pubescent, less than 5 in. long; sepals ovate-oblong, petals linear-oblong, lip with a short saccate claw, limb spreading, suborbicular, deeply 2-lobed, the lobes sub 5-fid.

46. *Zeuxine*, Lindl.

Terrestrial herbs; stems creeping below. *Leaves* membranous. *Flowers* small in terminal racemes or spikes. *Sepals* subequal, lateral, free, enfolding the base of the lip, dorsal concave, cohering with the petals in a hood. *Lip* adnate to the base of the column, saccate or cymbiform, with a sessile or clawed entire or 2-lobed limb. *Column* short, with or without 2 processes in front; foot 0. *Anther* membranous, cells 2, contiguous; pollinia 2, pyriform with a common caudicle; gland oblong.

Leaves linear, acuminate, clasping, .75—3 in. long, .08—25 in. wide, sessile or truncate on the sheaths. Stem passing into the peduncle; leaves many passing gradually into linear bracts; racemes dense-flowered, .5—3 in. long; lateral sepals obliquely ovate-oblong, dorsal ovate, petals falcately oblong, lip not longer than the sepals, claw dilated, limb semiorbicular, sac small.....1. *strateumatica*.
Leaves ovate:—

Stem short; leaves few, ovate or ovate-oblong, acute, base rounded, .8—1.75 in. long, .3—6 in. wide, shortly petioled; sheaths short, hyaline, inflated; scape with few-flowered glandular-pubescent spike 4—10 in. long, slender, pubescent; sheaths 2—3, distant, lanceolate; sepals oblong, pubescent, lip twice as long as the sepals, basal sac with 2 spurs within, claw gradually dilated into the deeply 2-lobed, obovate-cuneate limb, lobes crenulate or coarsely toothed

2. *longilabris*.

Stem short; leaves few, ovate or ovate-lanceolate, acute, base rounded, .9—1.75 in. long, .5—75 in. wide; petiole short; sheaths hyaline, inflated; scape slender, pubescent, with the many-flowered, glandular pubescent spike 5—10 in. long; sheaths 2—3, distant, lanceolate, convolute, acuminate; bracts linear-lanceolate, acuminate, as long as the pubescent ovary; dorsal sepal saccate at base, lateral slightly shorter, ovate-lanceolate, lip lightly longer than the dorsal sepal, basal sac naked within, limb sessile, of 2 orbicular entire wings separated by a shallow apical sinus.....3. *Blatteri*.

1. ZEUXINE STRATEUMATICA, Schltr. *Z. sulcata*, Lindl.; F. B. I. vi. 106; King & Pantl. Ann. Calc. viii. t. 381. *Z. brevifolia*, Wt. Ic. t. 1725. *Z. robusta*, Wt. Ic. t. 1726.

Ganjam (Barber); Mysore (Jerdon); Walaiyar at 800 ft. (Fischer).

Stem 2—12 in. long; flowers white.

2. ZEUXINE LONGILABRIS, Benth.; F. B. I. vi. 107. *Monochilus affine*, Lindl.; Wt. Ic. t. 1728.

W. Gháts from the low country (Bourdillon) to 4,000 ft. (Fischer). High Wavy Mountains (Blatter & Hallberg).

Stem under 2 in. long; flowers white or (Blatter) olive with lip white and column orange.

3. ZEUXINE BLATTERI, Fischer in K.B. 1928 ined.

High Wavy Mountains in damp forest (Blatter & Hallberg).

Stem 3—6 in. long, rooting; sepals greenish with pale tips, petals pale pink, sac of lip orange, the limb white.

47. *Goodyera*, R. Br.

Terrestrial leafy herbs; roots fibrous, stem creeping below. Leaves petioled, often coloured. Flowers small, in terminal, sometimes twisted spikes. Sepals subequal, dorsal erect, concave, forming a hood with the narrow petals, lateral sepals free, erect or spreading. Lip inferior, sessile on the base of the column, base cymbiform or saccate, often setose within, limb entire, narrowed or acute at the apex. Column usually short, top cupular; foot 0. Anther 2-celled, cells distinct; pollinia 2, granular, pendulous; caudicle present or absent.

GOODYERA PROCERA, Hook.; F. B. I. vi. 111; Wt. Ic. t. 1729; King & Pantl. Ann. Calc. viii. t. 378.

West Coast and W. Gháts; Seshachalam Hills in the Cuddapah District at 2,500 ft. (Fischer).

Plant up to 30 in. high; leaves lanceolate, acute or obtuse, base narrowed, 1.5—8 in. long, 1—2.5 in. wide; petiole stout, 1—2 in.

long; sheath short, loose; spike 2—9 in. long, dense-flowered; bracts lanceolate, acuminate, .3 in. long, as long as the white, fragrant flowers; sepals broadly ovate, petals spathulate, lip saccate, sac softly setose within, and with 2 large calli, limb recurved, truncate.

48. *Hetaeria*, Blume.

Leafy terrestrial herbs; stem creeping below. *Leaves* petioled. *Flowers* small, in terminal, many flowered spikes, not inverted. *Sepals* free, the dorsal forming a hood with the narrower petals, the lateral embracing the base of the lip. *Lip* superior, adnate to the sides of the column, base cymbiform or subsaccate, warted within, limb usually small. *Column* short, with 2 parallel processes below; rostellum 2-toothed; foot 0. *Anther* short, 2-celled; pollinia 2, 2-lobed.

HETAERIA OVALIFOLIA, Benth.; F. B. I. vi. 115. *Goodyera ovalifolia*, Wt. Ic. t. 1730.

Courtallam in dense forest (Wight).

Whole plant 1—2 ft. high; leaves membranous, broadly elliptic, acute, base rounded, 3- or 5-ribbed, 2—4 in. long, .75—2 in. wide, often tinged with purple; petiole .5—1 in. long; sheath short, loose; scape pubescent; sheaths several, lanceolate, acuminate; spike slender, 3—4.5 in. long; rhachis, pedicels and ovaries glandular-pubescent; bracts linear-lanceolate, acuminate, .25—3 in. long; flowers white tinged with pink; sepals broadly ovate, petals obovate-oblong, lip saccate, obtusely 3-toothed, nerves with toothed calli near the base.

49. *Aphyllorchis*, Blume.

Terrestrial leafless herbs; stem simple, sheathed. *Flowers* moderate-sized, in terminal lax racemes or spikes. *Sepals* and *petals* subequal, the latter narrower. *Lip* sessile or shortly clawed on the base of the column, oblong, entire or 3-lobed. *Column* rather long; foot 0. *Anther* 2-celled, cells centigenuous; pollinia 2, 2-lobed.

APHYLLORCHIS MONTANA, Reichb. f.; F. B. I. vi. 116; King & Pantl. Ann. Calc. viii. t. 349.

Mysore at Cadamanay (Barber); Anamalai Hills; Karianshola in dense evergreen forest at 2,500 ft. (Fischer).

A saprophytic, chlorophyllless plant up to 2 ft. high; sheaths near the base of the stem tubular, loose and close together, becoming smaller, lanceolate, more compact and distant upwards; racemes 4—8 in. long; flowers about .75 in. long, straw-coloured with purple tips; sepals and petals linear-oblong, obtruse, lip narrowly obovate-oblong, narrowed towards the obtuse apex, side lobes rounded at base, claw subsaccate, short, broad, with 2 linear calli.

50. *Nervilia*, Comm. ex Gaud.

Terrestrial tuberous 1-leaved herbs. *Leaf* appearing after the flowers, broadly cordate to orbicular, plicate. *Flowers* solitary or few

to many, racemose. *Sepals* and *petals* subequal, narrow. *Lip* inferior, adnate to the base of the column, sessile or almost clawed, entire, 2-fid or 3-lobed, sometimes slightly saccate at the base. *Column* elongate, broadening upwards; foot 0. *Anther* substipitate; pollinia 2, 2-fid, or 4, powdery; caudicle and gland absent.

Scape 1—3-flowered:—

Lip entire, apex emarginate, base slightly saccate. *Leaf* lying flat on the ground, broadly ovate or suborbicular, obtuse, acute or shortly acuminate, base cordate, many-ribbed, 2—4 in. long, dark-green mottled with purplish-brown, more or less coarsely hairy; scape 3—6 in. long; sheaths 2—3, tubular; flowers 2 or 3, about .65 in. long; sepals and petals linear-lanceolate, acuminate...1. *plicata*. *Lip* obovate, obtuse, 3-lobed about the middle, midlobe emarginate, crisped, not saccate. *Leaf* unknown; flowers 2, about .9 in. long; sepals and petals narrowly oblanceolate, acuminate.....2. *biflora*.

Scape many-flowered:—

Leaf orbicular, apex cuneate, base cordate, 7—9 ribbed, margin entire, 1.5—2.5 in. diam.; sepals and petals oblong-lanceolate, acuminate, about .6 in. long, lip 3-lobed about the middle, not saccate, side lobes small, rounded, midlobe ovate-oblong, subobtuse, crenulate, glabrous.....3. *carinata*. *Leaf* orbicular or subreniform, cuspidate, base cordate, 13- or more-ribbed, margin waved, almost coarsely dentate, 4—10 in. diam; petiole 4—8 in. long; flowers about .66 in. long; sepals linear-lanceolate, acute, petals narrower, obtuse, lip 3-lobed about the middle, side lobes obtuse, midlobe ovate, acute, crisped, hairy.....4. *Aragoana*.

1. *NERVILIA PLICATA*, Schltr. *Pogonia plicata*, Lindl.; F. B. I. vi. 119; King & Pantl. Ann. Calc. viii. t. 358.
Rampa Hills at 1,500—2,000 ft. (Narayanswami); Mysore: Chikkenhalli at 3,000 ft. (Meebold); Travancore (Calder & Ramaswami).
Sepals and petals yellowish-green, lip lilac with a yellow median line and a basal green spot.
2. *NERVILIA BIFLORA*, Schltr. *Pogonia biflora*, Wt. Ic. t. 1758; F. B. I. vi. 119. Wynaad (Jerdon).
Sepals and petals white, lip pale pink.
3. *NERVILIA CARINATA*, Schltr. *Pogonia carinata*, Lindl.; F. B. I. vi. 121; Hook. f. Ann. Calc. v. t. 94; Duthie Ann. Calc. ix. t. 124.
Mysore (Stocks); Pulney Hills (Bourne); Cochin (Wight).
Sepals and petals pale green, lip pale greenish-yellow with purple veins and spots.
4. *NERVILIA ARAGOANA*, Gaud. *Pogonia flabelliformis*, Lindl.; F. B. I. vi. 121; Duthie Ann. Calc. ix. t. 125. *P. carinata*, Wt. Ic. t. 1720.
Rampa Hills (Ramaswami); Pulney Hills (Bourne); Travancore (Calder & Ramaswami).
Sepals and petals pale green veined with purple, lip white, veined with purple, tinged with yellow near the base.

51. *Didymoplexis*, Griffith.

Slender saprophytic, leafless, tuberous, terrestrial herbs; rhizome fleshy. *Scape* simple; flexuous; raceme few-flowered; pedicels greatly elongated in fruit. *Sepals* and *petals* connate into a 2-lipped tube, the dorsal sepal and the petals forming a 3-fid upper lip, the lateral

sepals a 2-fid or entire lower lip and forming a mentum with the foot of the column. *Lip* inserted on the foot of the column, short, broad, entire, base and disk with small calli. *Column* long, broadened upwards into 2 narrow wings and 2-toothed; foot distinct. *Anther* low, shortly stipitate; pollinia 4, reniform; caudicle and gland absent.

DIDYMOPLEXIS PALLENS, Griff.; F. B. I. vi. 122; King & Pantl. Ann. Calc. viii. t. 346. *Apetalon minutum*, Wt. Ic. t. 1758.

Coorg at Sultan's Battery (Jerdon). Rare.

Stem 4—6 in. long; sheaths loose; raceme terminal, 4—8-flowered; flowers dull yellowish-white, .33 in. diam.; lip stipitate, membranous, transversely or obcuneately oblong, disk papillose.

52. Epipogum, Gmelin.

Saprophytic, leafless, brownish, terrestrial herbs; roots tuberous or coralloid; stem erect, sheathed. *Flowers* laxly racemed. *Sepals* and *petals* subequal, narrow, free, erect or spreading. *Lip* sessile at the base of the column, broad, entire or 3-lobed, spurred, disk with rows of papillæ. *Column* short; foot 0. *Anther* thick, dorsally 2-celled; pollinia 2, each with a long, filiform caudicle; gland small.

EPIPOGUM NUTANS, Reichb. f.; F. B. I. vi. 124; King & Pantl. Ann. Calc. viii. t. 335. *Podanthera pallida*, Wt. Ic. t. 1759.

Coorg (Jerdon, Barber); Bolampatti Hills at 4,500 ft. (Fischer); Anamalai Hills (Barber); Pulney Hills at 5,000 ft. (Anglade).

10—24 in. high; root an oblong tuber; stem whitish- or pale-brown; sheaths short, inflated, truncate; raceme terminal, few- to many-flowered; bracts large, membranous, oblong, acute; flowers pale yellow or pinkish-white, speckled and stained with pink; sepals and petals narrowly lanceolate, .5—·7 in. long, lip entire; disk with 2 or 3 glandular ridges.

53. Epipactis, Adans.

Terrestrial, leafy herbs. *Leaves* sessile, plaited. *Flowers* racemose; bracts large, leafy. *Sepals* and *petals* broad, acuminate, strongly nerved. *Lip* sessile on the base of the column, hypochile concave or saccate, epichile contracted at the base, entire. *Column* long or short; foot 0. *Anther* erect, obtuse, 2-celled, cells contiguous; pollinia 2, 2-partite; gland globose.

EPIPACTIS CONSIMILIS, Wall.; F. B. I. vi. 126; King & Pantl. Ann. Calc. viii. t. 364.

Nilgiri Hills at Deva Shola (Lawson). Rare.

Stem 1—2 ft. high; leaves elliptic or lanceolate, obtuse or acuminate, 3—7 in. long, 1—2 in. wide, smaller upwards and passing into the large foliaceous bracts; rhachis of lax-flowered raceme pubescent; flowers, sometimes appearing solitary owing to the leaf-like appearance of the bracts, 1—1.5 in. diam.; lateral sepals falcate ovate, acute, lip nearly as long as the sepals, hypochile trough-shaped, warted within, epichile contracted at the base, then broadly lanceolate, acuminate. Sepals and petals lavender with white hairs without, green striped with brown within, hypochile purple, epichile pale brown, the apex white.

54. *Habenaria*, Willd.

Terrestrial, erect, usually leafy, unbranched herbs; roots of simple or lobed tubers and fleshy radical fibres. *Leaves* 2-many, not plaited, radical or cauline, scattered or clustered. *Flowers* 1-very many, usually terminal in spikes or racemes. *Sepals* unequal, the lateral often much larger, deflexed, dorsal oblong or ovate, more or less arched. *Petals* simple and subequal to the sepals or 2- (rarely 3-) lobed or -partite, segments often filiform. *Lip* entire, 3-lobed or 3-partite. *Spur* long, sometimes very long. *Column* erect, short; foot 0. *Anther* 2-celled, cells parallel or diverging, forming with the sides of the rostellum channels or tubes for the caudicles of the pollinia; pollinia 2, granular, with long or short caudicles and exserted, naked glands. *Stigma* 2-lobed or extended into 2 short or elongate, often clavate, papillose processes.

Petals 2-lobed or -partite:—

Stem leafy upwards:—

Petals entire at the base, 2-lobed above:—

Petals bearded, lip longer than the sepals:—

Plant 10—18 in. high; leaves 5—6 in the middle third of the stem, erect, ovate to narrow-lanceolate, acuminate, 1—3·5 in. long, 3—8 in. wide; raceme few-flowered; bracts foliaceous, sheathing; flowers about 8 in. long (excluding the spur and ovary); sepals ovate, acute or acuminate, lateral falcate, petals broader, pubescent, upper lobe much the longer, tips filiform, sinus not very deep, rounded, lip scabrid-pilose, linear at base, then 3-furcate, segments subulate, spur as long as the ovary

1. *barbata*.

Plant 10—18 in. high; leaves 3—5 in the middle third of the stem, erect, ovate- or elliptic-lanceolate, acute or acuminate, 1·5—3·5 in. long, 5—9 in. wide; raceme 5—10 flowered; bracts sheathing; flowers about 1·3 in. long (excluding the spur and ovary); sepals ovate-lanceolate, acuminate or caudate, petals longer, villose, lobes linear, elongate divaricate, sinus deep, lip glabrous, ligulate at base, then 3-furcate, segments linear, spur slender, as long as the ovary.....2. *Elwesii*.

Petals glabrous, lip not longer than the sepals. Stem 1—2 ft. high; leaves erect, linear-lanceolate, setaceously acuminate, 1—4 in. long, 2—4 in. wide; raceme few- and distant-flowered; bracts large, cymbiform, setaceously acuminate; flowers subsecund; lateral sepals broadly ovate, obtuse, petals longer than the dorsal sepal, upper lobe filiform, twice as long as the subulate lower, lip 3-lobed, lobes broad, fleshy, obtuse, lateral divergent, spur clavate at the apex, slightly shorter than the ovary.....3. *acuminata*.

Petals 2-partite almost to the base:—

Stem 10—18 in. high; leaves oblong- or lanceolate-elliptic, acute narrowed to the base, 2·5—8 in. long, 1—2 in. wide; racemes up to 1 ft. long, many-flowered; bracts sheathing, much shorter than the beaked ovary; lateral sepals ovate-falcate, acute, lobes of the petals elongate-filiform, divaricate, lip 3-partite, segments elongate-filiform, lateral much the longer, all the filiform appendages fantastically contorted, spur much curved, shorter than the ovary, tip slightly clavate, subacute; anther-cells very large

4. *multicaudata*.

Stem 10—18 in. high; leaves ovate-lanceolate, 1—4·5 in. long, 5—1·3 in. wide, acute or acuminate, base narrowed; raceme cylindric, many-flowered, up to 6 in. long; bracts foliaceous, sheathing, as long as the whole flower; sepals ovate, acute, lateral narrower, subfalcate lobes of petals erect, the lower filiform, lip 3-partite, linear, spur about as long as the ovary...5. *digitata*.

Stem leafy only at or near the base:—

Plant 3—10 in. high; leaves 1 or 2, sessile, broadly ovate or suborbicular, obtuse or acute, base cordate, 5—2·5 in. long; scape usually naked, 1—4-flowered; bracts ovate, much shorter than the shortly pedicelled ovary; sepals

ovate, lateral oblique, acute, upper segment of the petals suborbicular, lower elongate-filiform, lip 3-partite, segments subequal, lateral filiform, median linear-lanceolate, spur slender, curved clavate at the tip, longer than the ovary

6. *grandiflora*.

Plant 2—10 in. high; leaves usually 3 or more, linear to linear-oblong, rarely ovate, narrowed to the sheath, sometimes complicate, 1—4.5 in. long, .2—1 in. wide; scape naked or with 1—2 sheaths, 1—4-flowered; bracts much shorter than the long-pedicelled ovary; sepals ovate, lateral slightly narrower, subfalcate, acute, upper lobe of petal obliquely ovate, acuminate, lower linear, longer, lip 3-partite, lateral segments linear, median shorter and broader, spur slender, curved, much longer than the ovary.....7. *rariflora*.

Petals entire:—

Bracts much smaller than the leaves, not concealing the buds:—

Midlobe of the lip entire, lobes not tailed:—

Side lobes of lip broad, midlobe narrower:—

Lip not or hardly longer than the lateral sepals:—

Side lobes of lip longer than or nearly as long as the midlobe, toothed or fimbriate:—

Spur not longer than the ovary:—

Sepals and petals puberulous:—

Stem 3—8 in. high, rather stout; leaves several in the lower third elliptic to broadly ovate, acute, apiculate, base broad, 1.2—3 in. long, .4—1.1 in. wide, decreasing upwards into loose, lanceolate, acuminate sheaths; raceme dense-flowered, 1.5—3 in. long; flowers scurfily pubescent within; lateral sepals obliquely ovate, petals shorter, broader, gibbous, lip cuneately obovate, midlobe linear, side lobes broad, fimbriate, spur shorter than the ovary.....8. *cephalotes*.

Stem up to 8 in. high, rather stout; leaves 3—4 in the lower third, lanceolate, acute, 1.5—2 in. long, decreasing into a few acute sheaths below the flowers; raceme about 2 in. long, lax-flowered; bracts lanceolate, acuminate, as long as the ovary; sepals ovate, acute, petals lanceolate, acute, crenulate-denticulate, lateral lobes of lip angulate, fimbriolate, median ligulate-lanceolate, slightly longer, spur subclavate, slightly shorter than the ovary

9. *denticulata*.

Sepals and petals quite glabrous. Stem 4—8 in. high, slender; leaves 3—5, near the base, linear to linear-oblong, acute or acuminate, 2—4 in. long .2—.5 in. wide; racemes 2—4 in. long, few- and lax-flowered, usually flexuous; sheaths clasping; flowers glabrous; lateral sepals ovate-oblong, subfalcate, acute, lip as broad as long, midlobe linear-lanceolate, side lobes cuneate-rhomboid, obliquely truncate, apical margin undulate or denticulate, spur equalling or shorter than the ovary.....10. *suaveolens*.

Spur much longer than the ovary:—

Ovary under 1 in. long, curved:—

Stem short, rather slender; sheaths lanceolate; leaves often subradial, elliptic to oblong-lanceolate, acute, 1—4 in. long, .3—6 in. wide; spike few- and lax-flowered; bracts lanceolate, usually shorter than the ovary; lip triangular-cuneate, side lobes lanceolate, deeply toothed on the outer margin, midlobe lingulate

11. *Richardiana*.

Stem short, rather stout; sheaths ovate; leaves ovate-lanceolate, acute, 2—3 in. long, .5—1 in. wide; spike many- and dense-flowered; bracts broad, sheathing, as long as the ovary; lip obcordate, side lobes semi-ovate, fimbriate, midlobe ligulate, usually short.....12. *fimbriata*.

Ovary over 1 in. long, straight, long-beaked. Stem 4—16 in. high; leaves cauline, linear-oblong or lanceolate, obtuse, acute or acuminate, 2—6 in. long, .4—1 in. wide; spike 2—8-flowered; bracts shorter than the ovary; lateral sepals ovate, subacute, petals lanceolate or linear-oblong, lip 3-partite, side lobes recurved-cuneate,

apex obliquely truncate, crenate or fimbriate, midlobe linear, slightly shorter, spur twice as long as the sessile ovary, stout, apex clavate.....13. *longicornu*.

Side lobes of the lip much shorter than the midlobe, entire. Leaves 3—6, appressed to the earth, sessile, broadly elliptic or orbicular, rounded or orbicular, rounded or acute, 1·5—5 in. long; scape 4—18 in. long; stout; sheaths many, lanceolate, acuminate; spike dense-flowered; bracts much shorter than the long-beaked ovary; sepals broadly-oblong, petals linear, side lobes of lip small, rounded, midlobe lanceolate, spur slender, clavate at the tip, longer than the ovary

14. *platyphylla*.

Lip distinctly longer than the lateral sepals:—

Lip not exceeding .5 in. Leaves radical, horizontal, lanceolate to oblong-elliptic, acute or obtuse, 1·5—6 in. long, .6—1·5 in. wide; scape 4—20 in. long; sheaths scarious, linear-lanceolate, acuminate; spike lax-flowered; bracts about half as long as the beaked ovary; sepals ovate, petals narrowly lanceolate, lip flabelliform, side lobes semi-ovate, entire or crenulate, midlobe linear, spur slender, as long as or a little longer than the ovary.....15. *plantaginea*.

Lip .7 in. or more long, spur very much longer than the ovary:—

Plant 8—30 in. high; leaves subradical, oblong to elliptic-lanceolate, acute, 1·5—6 in. long, .4—1·3 in. wide; scape with several large, convolute, acuminate sheaths; flowers 1—4; bracts convolute, sheathing the pedicels with the ovaries usually entirely exserted; lateral sepals obliquely ovate, petals linear-oblong, lip .8—1·1 in. long, puberulous, side lobes divaricate, cuneate, apex obliquely truncate, crenate or denticulate, midlobe linear, spur long, slender above, thickened from the middle to the subacute apex, reaching 5·5 in. long

16. *longicalcarata*.

Plant 4—18 in. high; leaves subradical or cauline, linear to elliptic-lanceolate, obtuse or acute, 1·5—5 in. long, .4—1 in. wide; scape with several lanceolate, finely acuminate sheaths; flowers 1—7; bracts lanceolate finely acuminate, shorter than the sessile, beaked ovary; lateral sepals ovate, petals lanceolate, acute, lip .7—·9 in. long, glabrous, side lobes rhomboid-cuneate, apex oblique, fimbriate, midlobe linear, spur long, very variable, slender or rather stout, thickened to the blunt apex, reaching 5 in. long.....17. *decipiens*.

Side lobes of lip filiform or linear, midlobe as broad or broader:—

Stem 2—3 ft. high, sheathed below, leafy above; sheaths below the spike bract-like, lanceolate, caudate; leaves oblong or oblong-lanceolate, finely acuminate, 2·5—6 in. long, .7—1·3 in. wide; spike 4—8 in. long, many-flowered; bracts 1—1·5 in. long, linear-lanceolate, setaceously acuminate, exceeding the body of the ovary without the beak; lateral sepals very gibbous, hatchet-shaped, shortly beaked, nearly .5 in. long, with several arched nerves, dorsal orbicular, hooded, shortly beaked, lip linear at base, then 3-lobed, side lobes filiform, midlobe shorter, linear, spur long, slender, incurved; beak of ovary slender, as long as or longer than the body.....18. *commelinifolia*.

Lateral sepals not gibbous, nerves straight or nearly so; ovary not or very shortly beaked:—

Stem leafy upwards:—

Bracts not cucullate; flowers not or hardly secund. Stem 6—18 in. high; leaves linear to elliptic, acuminate, very narrowly margined, 1—5 in. long, .3—·8 in. wide; spike cylindric, many-flowered, up to 4 in. long; bracts lanceolate, as long as or longer than the ovary; perianth puberulous, sepals broadly oblong, petals triangular-ovate, lip as long as the sepals, wedge-shaped, basal half entire, 3-lobed beyond the middle, lobes linear-lanceolate, outer margins of lateral lobes usually denticulate, spur as long as or slightly longer than the incurved, shortly beaked ovary.....19. *elliptica*.

Bracts cucullate; flowers secund. Plant 4—15 in. high; leaves subimbricate sheathing, ovate to linear, acute, .75—2.5 in. long; spike 2—4 in. long; bracts cymbiform, acuminate, sheathing the flowers, lower 1 in. long, smaller upwards; sepals subequal, obtuse, petals as long, narrower, lip as long, 3-partite, side lobes linear, obtuse, usually shorter than the broader midlobe, spur subclavate, as long as or shorter than the beakless ovary.....20. *Heyneana*.
Leaves radical or clustered at the middle or near the base of the stem :—
Leaves 3 or more, clustered at the middle or near the base of the stem :—

Leaves clustered near the middle of the stem, narrowed to the base :—

Robust plants attaining over 3 ft. in height; sheaths above the leaves many, erect, lanceolate; leaves elliptic-lanceolate to oblanceolate, acute or acuminate, 3—10 in. long, .7—2.5 in. wide; spike cylindric, up to 12 in. long, bracts linear-lanceolate, setaceously acuminate, as long as or longer than the ovary; sepals subequal, ovate-oblong, obtuse, petals as long, lip much longer, side lobes narrow, longer than the linear, obtuse midlobe, spur slender, incurved, usually shorter than the ovary.....21. *affinis*.
Slender or robust plants 1—2 ft. high; sheaths above the leaves few, lanceolate, acuminate; leaves elliptic-lanceolate to oblanceolate, acute or acuminate 3—9 in. long, .9—2.75 in. wide; spike elongate, up to 18 in. long, lax-flowered; bracts ovate-lanceolate, acuminate, usually shorter than the ovary; sepals subequal, lateral ovate, obtuse, petals as large, lip as long as or slightly longer than the sepals, side lobes linear-oblong, incurved, as long as or shorter than the ovate-oblong fleshy midlobe, spur slender, incurved, rather longer than the ovary, apex thickened, acute.....22. *ovalifolia*.

Leaves clustered near the base of the stem, not narrowed to the base :—

Plant 3—12 in. high, rather stout; leaves oblong or linear-oblong, obtuse or acute, 1.75—5 in. long, .4—1.1 in. wide; margins yellow, sheaths lanceolate, acuminate, margined; spike 2—6 in. long, many-flowered; bracts lanceolate, ciliolate, finely acuminate, as long as or longer than the ovary; sepals subequal, lateral oblong-lanceolate, .25 in. long, petals ovate-falcate, lip longer than the sepals, side lobes linear, slender, longer than the linear, obtuse midlobe, spur stout, as long as or shorter than the curved ovary, apex inflated.....23. *marginata*.

Plant 3—15 in. high, slender; leaves linear to linear-lanceolate, acute or acuminate, not margined, 1—4 in. long, .2—5 in. wide; sheaths small, linear, acuminate; spike slender, 2—5 in. long, dense- or lax-flowered; bracts ovate-lanceolate, acute, ciliolate, much shorter than the ovary; lateral sepals broadly oblong, .15 in. long, dorsal and broadly obliquely ovate petals shorter, lip slightly longer than the sepals, lobes slender, subequal, spur slender, as long as the ovary, slightly thickened below

24. *viridiflora*.

Leaves 2, rarely 3, radical :—

Plant 6—21 in. high; stem with many ovate-lanceolate, acuminate, imbricate or subimbricate sheaths; leaves fleshy, broadly ovate to orbicular, sometimes broader than long, rounded or acute, base cordate, 1—4.5 in. long; spike 2—12 in. long, many-flowered; bracts ovate, acuminate, as long as the ovary; sepals subequal, lateral ovate-oblong, obtuse, lip as long as the sepals, lobes linear-lanceolate, subequal or the lateral slightly shorter, spur as long as the beaked ovary.....25. *crassifolia*.

Plant 3—10 in. high; stem slender with distant, short, lanceolate, acute or acuminate sheaths; leaves appressed to the ground, orbicular, rounded or acute, base cordate, .75—2 in. in diam, the pair unequal in size; spike 1.5—4 in. long; bracts ovate, acuminate, shorter than

the ovary; sepals ovate, acute, petals linear, subfalcate, acute, as long as the lateral sepals, lip longer than the sepals, lobes filiform, lateral longer, usually spreading, spur about as long as the ovary, inflated, acute.....26. *diphylla*.

Midlobe of the lip 2-lobed, all the lobes with long filiform tails. Plant 2—21 in. high, leafy near the base; leaves oblong-lanceolate, acute, narrowed to the base, 1.5—6 in. long, .4—1.5 in. wide; spike dense-flowered, 2—4 in. long; bracts ovate-lanceolate, acuminate, about half as long as the ovary; lateral sepals obliquely ovate, dorsal and linear petals shorter, lip 3 times as long as the lateral sepals, side lobes cuneiform, midlobe flabelliform, the 2 segments semi-ovate, with a small mucro in the sinus, outer margin of all 4 segments toothed with the inner angle of each caudate, spur slender, incurved, apex clavate, longer than the beaked ovary.....27. *crinifera*.

Bracts large, foliaceous, imbricating, almost concealing the flowers. Plant 8—30 in. high, very stout; leaves imbricating, ovate or ovate-lanceolate, acute, amplexicaul, 1—3.5 in. long, .5—1 in. wide, gradually passing into the broadly ovate, cymbiform bracts; spike 3—8 in. long; bracts longer than and completely concealing the ovary and spur; sepals erect, ovate-oblong, obtuse, concave, .5—7 in. long, petals as long, linear, obtuse lip as long, coriaceous, 3-lobed, cuneately obovate, obtuse, claw geniculate, side lobes linear-oblong, obtuse, incurved, shorter than the triangular-ovate midlobe, spur subclavate, about as long as the ovary.....28. *Perrottetiana*.

1. *HABENARIA BARBATA*, Wight; F. B. I. vi. 133. *Ate virens*, Lindl.; Wt. Ic. t. 928.

W. Gháts; Venkatagiri Drug in Cuddapah.
Flowers white.

2. *HABENARIA ELWESH*, Hook. f.

Nilgiris (Proudlock); Mysore at Cadamany near Saklasapur (Barber).
Flowers white.

3. *HABENARIA ACUMINATA*, Thw.; F. B. I. vi. 133.

Anamalai Hills at 5,000 ft. and Peermade in Travancore at 4,000 ft. (Beddome).

Sepals and petals yellowish-green, lip purple, petals sometimes purple.

4. *HABENARIA MULTICAUDATA*, Sedgw.

Nilgiri Hills; Anamalai Hills in Karianshola at 2,200 ft. (Beddome, Fischer).

Flowers greenish-white, lip and spur brownish.

5. *HABENARIA DIGITATA*, Lindl.; F. B. I. vi. 134; Hook. f. Ann. Calc. v. t. 95. *H. trinervia*, Wt. Ic. t. 1701.

Hill tracts from the Godavari District and Mysore to Tinnevely, 2,000—6,000 ft.

Flowers green.

Var. *foliosa*, Hook. f.; F. B. I. vi. 135. *H. foliosa*, A. Rich.; Wt. Ic. t. 1700. Smaller; leaves shorter and broader, imbricating; raceme dense-flowered; segments of lip filiform; bracts shorter.

Nilgiri Hills at 7,000—8,000 ft.

Var. *travancorica*, Fischer. *H. travancorica*, Hook. f.; F. B. I. vi. 135. Leaves ovate-oblong; flowers much smaller; sepals pubescent within.

Pulney Hills, 4,000—7,000 ft.

Var. *Gibsoni*, Fischer. *H. Gibsoni*, Hook. f.; F. B. I. vi. 135. More robust; leaves longer and narrower; flowers much larger, fewer; no ligule in the mouth of the spur.

Mysore (Law).

6. *HABENARIA GRANDIFLORA*, Lindl.; F. B. I. vi. 136.
Bababudan (Law) and Shevaroy (Perrottet) Hills.
Flowers white.
7. *HABENARIA RARIFLORA*, A. Rich.; F. B. I. vi. 136; Wt. Ic. t. 924.
W. Ghâts, 2,000—6,000 ft.; Horsleykonda at 4,100 ft. (Fischer);
Kollimalai Hills (Barber).
Flowers white.
8. *HABENARIA CEPHALOTES*, Lindl.; F. B. I. vi. 139; Wt. Ic. t. 1711.
Nilgiri Hills at high elevations.
Flowers white.
9. *HABENARIA DENTICULATA*, Reichb. f.
Nilgiri Hills. Very rare.
10. *HABENARIA SUAVEOLENS*, Dalz.; F. B. I. vi. 140.
Bababudan Hills (Law).
Flowers white, fragrant.
11. *HABENARIA RICHARDIANA*, Wt. Ic. t. 1713; F. B. I. vi. 139.
Nilgiri and Anamalai Hills.
Flowers white.
12. *HABENARIA FIMBRIATA*, Wt. Ic. t. 1712. *H. polyodon*, Hook. f.;
F. B. I. vi. 139.
Nilgiri Hills (Wight, Gamble), 5,000—7,000 ft.
Flowers white.
13. *HABENARIA LONGICORNU*, Lindl.; F. B. I. vi. 139. *H. montana*,
A. Rich.; Wt. Ic. t. 927, fig. 1, and t. 1714, centre fig. only.
W. Ghâts from Mysore to Travancore, 3,000—6,500 ft.;
Horsleykonda at 4,100 ft. (Fischer); Kollimalai Hills (Barber).
Flowers white.
14. *HABENARIA PLATYPHYLLA*, Spreng.; F. B. I. vi. 140; Wt. Ic. t. 1709.
Orchis plantaginea, Roxb. Cor. Pl. t. 37.
In all Districts, near sea-level to 3,500 ft.
Flowers white.
15. *HABENARIA PLANTAGINEA*, Lindl.; F. B. I. vi. 141; Wt. Ic. t. 1710;
Duthie Ann. Calc. ix. t. 132.
In all Districts, 800—4,000 ft.
Flowers white.
16. *HABENARIA LONGICALCARATA*, A. Rich.; F. B. I. vi. 141; Wt. Ic.
t. 925.
Throughout the W. Ghâts; Ramandrug in the Bellary District
(A. W. Lushington).
Flowers white, spur green.
17. *HABENARIA DECIPIENS*, Wight; F. B. I. iv. 197. *H. longicalcarata*,
Hook. f. (not of A. Rich.) in part; F. B. I. vi. 141. *H. montana*,
Wt. Ic. t. 927 and t. 1714, all but the centre fig.
W. Ghâts from the Nilgiri to the Tinnevely Hills, 4,000—7,000
ft., Shevaroy Hills (Bourne).
Flowers white.

18. *HABENARIA COMMELINIFOLIA*, Wall.; F. B. I. vi. 143; Duthie Ann. Calc. ix. t. 134.
Bababudan Hills (Law).
Flowers white.
19. *HABENARIA ELLIPTICA*, Wt. Ic. t. 1706; F. B. I. vi. 147.
Pulney Hills, 7,000—8,000 ft.
Flowers greenish-white.
20. *HABENARIA HEYNEANA*, Lindl.; F. B. I. vi. 148; Wt. Ic. t. 923. *H. subpubens*, A. Rich.; F. B. I. vi. 148.
W. Gháts in grasslands, 5,500—8,000 ft.; Shevaroy Hills (Bourne).
Flowers greenish-yellow.
21. *HABENARIA AFFINIS*, Wt. Ic. t. 1707; F. B. I. vi. 149.
Nilgiri and Anamalai Hills; Rampa Hills (V. Narayanswami), 2,000—4,000 ft.
Flowers green.
22. *HABENARIA OVALIFOLIA*, Wt. Ic. t. 1708; F. B. I. vi. 149.
W. Gháts, 2,000—4,000 ft.
Flowers pale-green.
23. *HABENARIA MARGINATA*, Coleb.; F. B. I. vi. 150; Duthie Ann. Calc. ix. t. 136.
W. Gháts 1,500—3,000 ft.; Nallamalai Hills at 1,500 ft. (Fischer).
Flowers yellow.
24. *HABENARIA VIRIDIFLORA*, R. Br.; F. B. I. vi. 150; Wt. Ic. t. 1705.
Low country, often in rice-fields.
Flowers green.
25. *HABENARIA CRASSIFOLIA*, A. Rich.; F. B. I. vi. 151. *Platanthera brachyphylla*, Lindl.; Wt. Ic. t. 1694.
Nilgiri and Pulney Hills, 6,000—7,000 ft.
Flowers greenish-white, spur green.
26. *HABENARIA DIPHYLLA*, Dalz.; F. B. I. vi. 151; Duthie Ann. Calc. ix. t. 137. *H. Jerdoniana*, Wt. Ic. t. 1715.
W. Coast from Kanara to Travancore at low elevations.
Flowers greenish-white.
27. *HABENARIA CRINIFERA*, Lindl.; F. B. I. vi. 142; Wt. Ic. t. 926.
W. Gháts below 4,000 ft.
Flowers white.
28. *HABENARIA PERROTTETIANA*, A. Rich.; F. B. I. vi. 164. *Platanthera lutea*, Wt. Ic. t. 919.
W. Gháts, 5,500—7,500 ft.
Flowers yellow.

55. *Peristylus*, Blume.

Terrestrial erect, usually leafy, unbranched herbs; roots of simple or lobed tubers and fleshy, radical fibres. *Leaves* not plaited. *Flowers* usually small, in terminal spikes or racemes. *Sepals* and *petals* subequal, more or less connivent, the dorsal sepal forming a hood with the petals, the lateral sepals usually erect. *Lip* entire or 3-lobed. *Spur* usually very short, often scrotiform. *Column* very short; foot 0. *Anther* erect, 2-celled, cells parallel, adnate to the column and not

forming channels or tubes for the caudicles; pollinia 2; caudicles short; glands naked, exserted. *Stigma* sessile.

Leaves scattered or imbricate on the stem, not clustered:—

Spur equalling or longer than the sepals:—

Plant 8—24 in. high, usually rather stout; leaves lanceolate or ovate-lanceolate, acute or acuminate, 1—3 in. long, .2—75 in. wide; spike 2—10 in. long, usually dense-flowered; lateral sepals linear, obtuse, petals as long, elliptic, obtuse, lip with a concave claw, side lobes filiform, recurved over the flower, longer than the sepals and the linear or triangular obtuse midlobe, spur stout, clavate, incurved.....1. *Richardianus*.

Plant 4—20 in. high, usually slender; leaves confined to the lower half or two-thirds of the stem, reduced to small sheaths above, lanceolate or linear-lanceolate, obtuse, acute or acuminate, 1—4 in. long, .15—7 in. wide; spike narrow, 1—6 in. long, lax-flowered; lateral sepals linear, obtuse, petals triangular-ovate or oblong, obtuse, lip excavate at base, side lobes subulate, as long as or slightly longer than the sepals, spreading, longer than the broader, obtuse midlobe, spur slender, straight, not thickened below

2. *stenostachyus*.

Spur much shorter than the sepals:—

Lip 3-partite nearly to the base, side lobes filiform:—

Plant 4—12 in. high; stem with a few loose, subcucullate sheaths below; leaves ovate to lanceolate, acute or acuminate, .9—2.3 in. long, .2—6 in. wide; bracts ovate-lanceolate, as long as or longer than the flowers; lateral sepals linear, obtuse, petals as long, oblong-lanceolate, obtuse, lip to end of the midlobe as long as the sepals, side lobes filiform, much longer than the linear, obtuse midlobe, spur small, globose or ellipsoid

3. *brachyphyllus*.

Plant 6—24 in. high; stem leafy to the base or only in the upper half with loose sheaths below; leaves ovate to elliptic-lanceolate, acute or acuminate, .8—3 in. long, .3—7 in. wide; bracts lanceolate, acuminate, usually shorter than the flowers; sepals linear-lanceolate, petals as long, ovate-oblong, lip to end of midlobe shorter than the sepals, side lobes filiform, much longer than the ligulate, obtuse midlobe, spur saccate, obtuse

4. *lancifolius*.

Lip entire in the lower half, 3-cleft beyond the middle. Plant 6—18 in. high; stem leafy, often flexuous; leaves elliptic to linear-lanceolate, obtuse, acute or acuminate, 1—2.75 in. long, .2—6 in. wide; spike slender, 2—10 in. long, spirally twisted; flowers secund; bracts narrowly lanceolate, finely acuminate, equalling or exceeding the very small flowers; lateral sepals linear, obtuse, falcate, petals as long, linear or ovate-oblong, lip rather longer than broad, lobes linear, lateral acute, spreading narrower than the obtuse midlobe, spur very small, globose.....5. *spiralis*.

Leaves clustered about the middle of the stem:—

Side lobes of lip filiform. Plant 7—18 in. high, very slender; stem above the leaves naked or with very few slender short sheaths; leaves thinly membranous, 3—6, elliptic-ovate to narrowly lanceolate, acute or acuminate, narrowed into the loose sheath, 1.3—4 in. long, .4—1.1 in. wide; spike very slender, 2—6 in. long; flowers distant; bracts lanceolate, as long as or shorter than the ovaries; sepals linear, obtuse, petals as long, oblong, lip much longer than the sepals, midlobe ligulate, obtuse, spur clavate, equalling or shorter than the sepals

6. *aristatus*.

Side lobes of lip not filiform:—

Spur equalling or exceeding the sepals, clavate. Plant 6—18 in. high; stem slender, with several loose sheaths below the leaves; leaves broadly ovate or elliptic or lanceolate, obtuse, acute or acuminate, narrowed to the sheath and usually shortly petiolate, 2—6 in. long, .5—1.6 in. wide; spike narrow, twisted, 2—6 in. long; bracts ovate-lanceolate, acuminate, shorter or longer than the ovary; flowers very small; sepals oblong, obtuse, petals obliquely ovate, obtuse, lip longer than the sepals, obtusely 3-fid, lobes shallow or deep, subequal, linear-oblong.....7. *Stocksii*.

Spur shorter than the sepals, globose or subglobose:—

Plant 1—3 ft. high; stem usually very stout; leaves oblong- or elliptic-lanceolate, acute, narrowed into the broad sheath, 2·5—10 in. long, 1·25—3·25 in. wide; spike 4—12 in. long, very dense-flowered; bracts linear-lanceolate, equalling or exceeding the ovaries; sepals linear to ovate-oblong, obtuse, petals gibbously ovate, lip as long as the sepals, 3-lobed, lobes various, spur minute.....8. *goodyeroides*.

Plant 12—30 in. high; stem rather stout; leaves linear- to oblong-lanceolate, acute, base narrowed into the sheath, 4—9 in. long, 1·1—3·6 in. wide; spike narrow, 4—9 in. long, many-flowered; bracts lanceolate, acuminate, as long as or longer than the very small flowers; sepals oblong, obtuse, petals obliquely orbicular, lip shorter than the sepals, broad, entire or very shortly 3-lobed, spur very small.....9. *plantagineus*.

1. *PERISTYLUS RICHARDIANUS*, Wt. Ic. t. 1697. *Habenaria bicornuta*, Hook. f.; F. B. I. vi. 156.
Nilgiri and Pulney Hills, 5,500—7,500 ft.
Flowers greenish-white.
2. *PERISTYLUS STENOSTACHYUS*, Krzl. *Habenaria stenostachya*, Benth.; F. B. I. vi. 156. *H. peristylodes*, Wt. Ic. t. 1702.
Bababudan and Pulney Hills; High Wavy Mountains (Blatter & Hallberg).
Flowers white.
3. *PERISTYLUS BRACHYPHYLLUS*, A. Rich. *Habenaria malabarica*, Hook. f.; F. B. I. vi. 159.
Bababudan and Nilgiri Hills.
4. *PERISTYLUS LANCIFOLIUS*, A. Rich. *P. robustior*, Wt. Ic. t. 1699. *Habenaria robustior*, Hook. f.; F. B. I. vi. 160.
W. Gháts, 6,000—7,000 ft.
Flowers white or pinkish-white.
5. *PERISTYLUS SPIRALIS*, A. Rich.; Wt. Ic. t. 1696. *Habenaria torta*, Hook. f.; F. B. I. vi. 159.
Bababudan and Nilgiri Hills, 5,000—7,500 ft.; Travancore (Johnson).
Flowers greenish-white.
6. *PERISTYLUS ARISTATUS*, Lindl. *P. exilis*, Wt. Ic. t. 1698. *Habenaria aristata*, Hook. f.; F. B. I. vi. 158; King & Pantl. Ann. Calc. viii. t. 409.
W. Gháts up to 7,000 ft.
Flowers green.
7. *PERISTYLUS STOCKSI*, Krzl. *Habenaria Stocksii*, Hook. f.; F. B. I. vi. 158.
Mysore (Stocks).
Flowers yellowish.
8. *PERISTYLUS GOODYEROIDES*, Lindl. *Habenaria goodyeroides*, Don.; F. B. I. vi. 161; King & Pantl. Ann. Calc. viii. t. 430.
W. Gháts, 2,000—4,000 ft.
Flowers greenish-white.
9. *PERISTYLUS PLANTAGINEUS*, Lindl.; Wt. Ic. t. 921. *Habenaria Wightii*, Trim.; F. B. I. vi. 162. Rampa Hills (V. Narayanswami); Anamalai Hills, 2,000—2,300 ft. (Fischer); Travancore (M. Rama Rao); Malabar.
Flowers white.

56. *Platanthera*, L. C. Rich.

Terrestrial, erect, unbranched, leafy herbs; roots of ovoid-globose, rarely lobed tubers. *Leaves* not plaited. *Flowers* small or large in lax or dense terminal spikes or racemes. *Sepals* unequal, lateral spreading or reflexed, dorsal forming a hood with the narrower petals. *Lip* entire or 3-lobed, spur short or long. *Column* very short, with a warty protuberance on either side; foot 0. *Anther* erect, 2-celled, cells parallel or divergent, adnate to the sides of the rostellum, broad; pollinia 2, granular, widely separated; caudicles short or long, glands naked, exserted. *Stigmas* sessile or subsessile, more or less confluent, often pulvinate.

PLATANTERA SUSANNAE, Lindl.; Wt. Ic. t. 920. *Habenaria Susannae*, R. Br.; F. B. I. vi. 137; Duthie Ann. Calc. ix. t. 129.

Widely distributed from Ganjam to the South, 300–6,000 ft., but never common or gregarious.

A stout herb 1·5–4 ft. high; leafy up to the inflorescence; leaves ovate-oblong to oblong-lanceolate, acute or acuminate, 2–8 in. long, 1·3–2·6 in. wide, decreasing into the large leafy bracts; flowers 3–6, white, fragrant, 2–3 in. in diam.; lateral sepals obliquely subquadrately oblong, dorsal shorter, broadly rhomboid, petals linear, acute, lip as long as the lateral sepals, side lobes cuneately flabellate, deeply pectinate, midlobe linear acute or spatulate, subacute, spur slender, 3·5–5 in. long.

57. *Phyllomphax*, Schlechter.

Terrestrial, erect, unbranched, leafy herbs; roots tuberous. *Leaves* not plaited. *Flowers* medium-sized, in the axils of sheathing leaves. *Sepals* and *petals* subequal, petals entire. *Lip* broad, entire, petaloid, spur short, conical. *Column* short; foot 0; rostellum more or less 2-toothed. *Anther* erect, 2-celled; pollinia 2, granular. *Stigmas* sessile, concave.

PHYLLOMPHAX OBCORDATA, Schltr. *Habenaria galeandra*, Benth.; F. B. I. vi. 163. *Platanthera iantha*, Wt. Ic. t. 1692. *P. affinis*, Wt. Ic. t. 1693.

W. Gháts, 6,000–8,000 ft.; common in grass-lands.

Plant 5–15 in. high, very variable, slender or robust; leafy throughout, or leaves reduced to sheaths below the middle; leaves broadly ovate to lanceolate, acute, amplexicaul, 6–2·3 in. long, 2–1·1 in. wide, usually imbricating but sometimes scattered; bracts leaf-like and but little smaller; flowers white with the lip spotted with purple or the whole flower pale to deep lilac, more or less puberulous; sepals and petals erect, arching over the column, lateral sepals somewhat gibbous, lip much larger, obcordate, truncate or emarginate and with or without a terminal cusp, margins more or less crenulate.

There are 3 or 4 varieties, but they run into one another. The best defined is—

Var. *ianta*, Hook. f. (not of Wight), with much larger flowers, and the lip usually deeply emarginate without a cusp.

58. *Satyrium*, Swartz.

Terrestrial, erect, leafy, unbranched herbs; roots tuberous. *Leaves* not plaited. *Sepals* and *petals* subequal, free, spreading or deflexed. *Lip* superior, sessile at the base of the column, erect, hooded, broad, 2-spurred or -saccate behind. *Column* erect, terete; foot 0. *Anther* dorsal, cells subparallel; pollinia 2, caudicles recurved; glands large, naked. *Stigma* terminal, broad, concave, or forming with the rostellum a 2-lipped body.

SATYRIUM NEPALENSE, Don.; F. B. I. vi. 168; King & Pantl. Ann. Calc. viii. t. 444. *S. Perrottetianum*, A. Rich.; Wt. Ic. t. 1716. *S. albiflorum*, A. Rich.; Wt. Ic. t. 1717. *S. Wightianum*, Lindl.; Wt. Ic. t. 1718.

In hilly tracts from the Bababudan Hills southwards, 4,000—8,000 ft., in grassy, often marshy land.

Plant 6—30 in. high; stem usually stout, sheathed above; leaves few, very variable, lanceolate, ovate, oblong or suborbicular, acute, 2—8 in. long, .8—4.4 in. wide; spikes usually dense- and many-flowered, 1—8 in. long; bracts much larger than the flowers, oblong or lanceolate; flowers white to dark pink fragrant; lip broadly oblong, concave, strongly keeled behind, variable in size in relation to the sepals and petals, spurs variable in length and thickness, about as long as the ovary.

There are several not very well defined varieties.

59. *Disperis*, Swartz.

Small, terrestrial, unbranched herbs; roots tuberous. *Leaves* 1 or more, sessile, cordate. *Flowers* solitary or in few-flowered racemes, terminal. *Sepals* dissimilar, dorsal very narrow, cohering with the petals into a subglobose hood, lateral spreading or deflexed, free or connate at the base, often subsaccate. *Lip* adnate to the column to above the anther. *Column* short, terete below; foot 0. *Anther* oblong, completely 2-celled; pollinia 2, coarsely granular, cuneiform; caudicles rather long, usually twisted; glands large, naked. *Stigmas* on a transverse hyaline membrane, the ends of which form tubular, usually twisted processes sheathing the caudicles and glands.

Plant 2—15 in. high; stem slender or rather stout, usually flaccid, with 1 or 2 basal sheaths; leaves 1—3, ovate to suborbicular, acute, base amplexicaul, .3—1.6 in. long; flowers 1—4; bracts like the leaves, but smaller; lateral sepals oblong, united at the base, concave, each with a fovea near the base, petals demi-lunate, lip T- or Y-shaped, the vertical limb incurved with a dilated conical tip, arms falcately recurved over the anther; caudicles and their tubes twisted

1. *neilgherrensis*.

Plant 2—4 in. high; stem slender, with a single basal sheath; leaf solitary, rarely 2, rotund-cordate, subacute, amplexicaul, .3—7 in. long; flowers 1—3; bracts like the leaves, but smaller; lateral sepals spreading, broadly falcate-ovate, not concave, each with a small saccate spur near the base, petals broadly demi-lunate, lip with the midlobe 3-lobed, side lobes channelled below, strongly recurved; caudicles and their tubes not twisted.

2. *monophylla*.

1. *DISPERIS NEILGHERRENSIS*, Wt. Ic. t. 1719; F. B. I. vi. 169. *D. zeylanica*, Trim.; F. B. I. vi. 169.

W. Ghâts; 4,500—8,400 ft.

Flowers white or reddish with crimson spots.

2. DISPERIS MONOPHYLLA, Blatter in Journ. Bomb. Nat. Hist. Soc. 1928 ined.

High Wavy Mountains (Blatter & Hallberg).

Flowers greenish, white at base, veins purple.

60. *Paphiopedilum*, Pfitzer.

Terrestrial, rarely epiphytic herbs. *Leaves* coriaceous, plicate before expansion, oblong or lorate, keeled below, sulcate above. *Flowers* solitary or few, terminal, large. *Sepals* and *petals* free or lateral connate. *Lip* sessile, side lobes small, spreading or inflexed, midlobe large, saccate, inflated oblong or helmet-shaped. *Column* short, stout; foot 0. *Anthers* 2, subglobose; pollinia 2, granular. *Stigma* disciform, deflexed, concealed with the anthers beneath a large disciform staminode.

PAPHIOPEDILUM DRURYI, Pfitz. *Cypripedium Drurii*, Bedd. Ic. Pl. Ind. Or. t. 112; F. B. I. vi. 172.

Travancore Hills, 5,000—6,000 ft.

Terrestrial herb with thick succulent root-fibres; leaves radical, thickly coriaceous, ligulate, apex oblique, subacute, 7—12 in. long, about 1.5 in. wide; scape 7—12 in. long, purple-pubescent; bract sheathing, ovate acute, about one-third the length of the ovary; flower solitary, about 3 in. in diam., yellowish-green streaked and blotched with reddish-purple, warts and hairs black; dorsal sepal broadly ovate, ciliolate, arched, petals linear-oblong, warted and hirsute towards the base, lip helmet-shaped, as long as the petals.

Family CXLIX. ZINGIBERACEAE.

Perennial herbs, often very large; usually with fleshy rhizomes and thick roots. *Leaves* usually vaginate, the sheaths usually ligulate. *Flowers* moderate- to large-sized, often showy, usually zygomorphic and bracteate, trimerous. *Calyx* tubular or spathaceous, 3-lobed or -toothed, often colourless. *Corolla* funnel-shaped below, 3-lobed above, the dorsal segment usually somewhat cucullate, generally differing from and often larger than the other two. *Stamens* only one (the dorsal of the inner whorl) perfect, the other two combined in a petaliferous lip usually embracing the fertile one; the outer whorl absent or represented by 1, 2 or 3 staminodes more or less petaloid or reduced to teeth. *Anther* of fertile stamen 2-celled, introrse; connective often produced or variously appendaged. *Ovary* inferior, usually 3-, rarely 1—2- or more celled; style long and delicate, often lying in a groove in the stamen; stigma usually funnel-shaped. *Ovules* numerous. *Fruit* usually capsular but sometimes dehiscent late, or indehiscent or breaking up irregularly. *Seeds* more or less arillate, sometimes aromatic, ellipsoid or variously angled; perisperm large and mealy enclosing the endosperm. *Embryo* straight, cylindric or clavate.

Ovary 1-celled, placentas 3, parietal.....1. *Globba*.

Ovary 3-celled, placentas axile:—

Lateral staminodes large and broad:—

Connective of anther spurred at the base; spike crowned by a coma; corolla-tube funnel-shaped.....2. *Curcuma*.

Connective of anther not spurred; spike not crowned by a coma; corolla-tube long and slender:—

Stem absent or very short; filament of anther short, its connective broad and crested.....3. **Kaempferia**.

Stem tall, leafy; filament of anther long, its connective narrow and not crested.....4. **Hedychium**.

Lateral staminodes small and narrow or absent:—

Flowers in dense cone-like spikes:—

Leafy stem straight; filament of anther narrow, free from the connective, anther terminal:—

Filament of anther arcuate, its cells diverging above, connective dilated and crested or 2-lobed, not produced into a beak.....5. **Amomum**.

Filament of anther straight, its cells parallel, connective not crested, produced into a long beak.....6. **Zingiber**.

Leafy stem spirally twisted; filament of anther adnate to the connective, broad and petaloid, anther adnate to its middle.....7. **Costus**.

Flowers in lax spikes, racemes or panicles:—

Scapes leafless, arising direct from the rootstock.....8. **Elettaria**.

Inflorescence terminal on the leafy stem.....9. **Alpinia**.

1. Globba, Linn.

Erect herbs, rhizome creeping. *Leaves* oblong, oblong-lanceolate, elliptic or linear-lanceolate. *Flowers* in terminal spikes or panicles, the buds sometimes replaced by bulbils. *Calyx* funnel-shaped, 3-lobed. *Corolla*-tube slender, longer than the calyx, lobes ovate, subequal. Lateral *staminodes* petaloid, lip deflexed. *Stamen* with a long 2-appendaged filament; anther oblong, connective produced beyond the cells, simple, winged or spurred. *Ovary* 1-celled; placentas 3, parietal; style filiform, lying in the groove of the anther, stigma turbinate. *Fruit* a globose or subglobose, tardily dehiscent capsule. *Seeds* ovoid, often tomentose, aril small, white, lacerate.

Anther not winged; bracts deciduous:—

Stems 1—3 ft. high; leaves oblong or elliptic-oblong, subcaudate, glabrous, 8—10 in. long, 2—4 in. wide; panicles narrow, lowest branches 3-flowered, bulbils never present; corolla-tube about twice the length of the calyx, petals broadly ovate, longer than the staminodes, lip obovate as long as the petals, shallowly 2-lobed; ovary and capsule verrucose.....1. *orixensis*.

Stems 1—3 ft. high; leaves linear- to elliptic- or oblong-lanceolate, usually conspicuously and finely caudate, pubescent below, 5—12 in. long, 1—3 in. wide, panicles narrow, lowest branches 4—6-flowered, a few bulbils sometimes present in the lower axils; calyx, corolla and the back of the anthers covered with darker globose glands, corolla-tube thrice the length of the calyx, petals ovate, shorter than the lanceolate staminodes, lip twice the length of the corolla, very deeply bifid, segments narrow; ovary and capsule smooth.....2. *ophioglossa*.

Anther furnished with spreading bifid wings; bracts persistent; stem 1—2 ft. high; leaves oblong to elliptic-lanceolate, caudate, pubescent below, 3—10 in. long, 1—2.5 in. wide; spikes simple, the flowers in the axils of oblong, acute bracts .5—1 in. long, usually replaced by bulbils in the lower axils; calyx, corolla and the back of the anther covered with globose darker glands, corolla-tube thrice the length of the calyx, petals shorter than the oblong staminodes, lip small, deeply bifid; ovary and capsule smooth.....3. *bulbifera*.

1. GLOBBA ORIXENSIS, Roxb.; F. B. I. vi. 201; Roxb. Cor. Pl. t. 229.

Hills of the Northern Circars (Roxburgh); Mohiri Hills, Ganjam (Fischer).

Flowers orange-yellow.

2. GLOBBA OPHIOGLOSSA, Wt. Ic. t. 2002; F. B. I. vi. 202.
In damp localities from the Rampa Hills (Ramaswami, Narayanswami) to Travancore, 2,000—4,000 ft.
Flowers pale to deep-yellow.
3. GLOBBA BULBIFERA, Roxb.; F. B. I. vi. 206; *G. marantina*, Wt. Ic. t. 2001.
In all districts in damp woods, 300—4,000 ft.
Flowers yellow.

2. Curcuma, Linn.

Stemless herbs; rootstock tuberous, often with accessory stipitate tubers. *Leaves* usually oblong or broadly lanceolate, rarely narrow, often very large. *Flowers* in a dense, bracteate, strobiliform spike terminating in a coma of larger, usually coloured, sterile bracts, the fertile bracts forming pouches enclosing 2—7 bracteate flowers that develop in succession; peduncle clothed in appressed bracts. *Calyx* short, cylindric, usually minutely toothed. *Corolla* funnel-shaped, lobes 3, ovate or narrowly oblong, the upper one longer and hooded. *Lateral staminodes* petaloid, oblong, connate with the short, broad filament of the fertile stamen. *Lip* broad, entire or 2-lobed. *Anther* not crested, cells contiguous, usually spurred at the base. *Ovary* 3-celled; ovules many, axile; style filiform; stigma 2-lipped, lips ciliate. *Fruit* a tardily dehiscent, globose, 3-valved capsule. *Seeds* ovoid or oblong, usually arillate.

Flowering spike lateral, apart from and appearing usually before the leaves:—

Plant small, with the leaves rarely attaining 18 in. in height, often only 2 in. high before the leaves appear; rootstock small, white inside, root-fibres numerous, terminating in small tubers; leaves lanceolate or oblong-lanceolate, shortly petioled, 6—10 in. long, 1.5—2.5 in. wide; spike dense; fertile bracts oblong-lanceolate, acute, 1—1.5 in. long, pale yellowish-green; coma dense, pink; flowers bright yellow; lip broadly ovate or suborbicular.....1. *neilgherrensis*.
Larger plants attaining 3 ft. in height in leaf; rootstock large of large palmately branched tubers, yellow inside:—

Fleshy fibres ending in smaller tubers in addition to the large ones; leaves oblong-lanceolate, finely acuminate, 1—2 ft. long; petioles long; fertile bracts ovate, recurved, cymbiform, 1.5 in. long, green tinged with red, of the coma crimson or purple; flowers yellow; lip suborbicular, obscurely 3-lobed, .5 in. wide.....2. *Zeodaria*.

Root-fibres not ending in small tubers; leaves elliptic- or lanceolate-oblong, caudate-acuminate, 1—2 ft. long; petioles as long or longer; bracts ovate, recurved, cymbiform, obtuse, fertile pale-green, of the coma more or less tinged with red or pink; flowers pink; lip yellow, obovate, subentire or obscurely 3-lobed.....3. *aromatica*.

Flowering spike rising in the centre of a previously formed tuft of leaves:—

Rootstock small with small almond-like tubers, white inside, at the ends of fleshy fibres, no sessile tubers:—

Flowers yellow; leaves lanceolate-oblong, acuminate, tapering to the base, with the petiole reaching over 2 ft. long, 4—6 in. wide; fertile bracts obovate-lanceolate, acute, green with a pink tip, 1.25—1.75 in. long; of the coma oblong-lanceolate, lower purple-edged, upper more or less uniformly mauve-purple.....4. *pseudomontana*.

Flowers purple; leaves broadly elliptic, deltoid-acuminate, base rounded or subcordate, 6—12 in. long, 3—5 in. wide; petioles as long; fertile bracts ovate, obtuse, saccate, 1 in. long, purple; of the coma numerous, oblong, purple; lip obovate, 2-fid, margins crisped.....5. *decipiens*.

Rootstock large, tubers sessile, cylindric, yellow inside:—

Tubers aromatic:—

Tubers pale-yellow within; leafy tuft 2—3 ft. high; leaves oblong-lanceolate, tapering at both ends, up to 18 in. long and 6 in. wide; petiole as long; fertile bracts about 1 in. long, pale-green; of coma tinged with pink; flowers white or pale-yellow; lip semi-cliptic 3-lobed, midlobe emarginate

6. *Amada*.

Tubers bright-yellow within; leafy tuft 4—5 ft. high; leaves oblong, caudate-acuminate, tapering to the base, up to 18 in. long and 8 in. wide; fertile bracts about 1.5 in. long, pale-green; of the coma tinged with pink; flowers pale-yellow; lip obovate subentire.....7. *longa*.

Tubers not aromatic, pale-yellow within; leafy tuft 2—3 ft. high; leaves oblong, acute, tapering to the base, up to 12 in. long and 8 in. wide; petiole about as long; fertile bracts about 1.5 in. long, pale green; of coma pink; flowers pale-yellow; lip suborbicular, entire, slightly notched, margins undulate

8. *montana*.

1. *CURCUMA NEILGHERRENSIS*, Wt. Ic. t. 2006; F. B. I. vi. 210.
W. Gháts at high elevations.
2. *CURCUMA ZEODARIA*, Rosc.; F. B. I. vi. 210. *C. Zerumbet*, Roxb. Cor. Pl. t. 201.
Cultivated in all districts. Vern. *Tel.* Kuchur, Kichchili-gaddala; *Tam.* Kichchilik-kishangu; *Mal.* Kach-churi-kishanna.
3. *CURCUMA AROMATICA*, Salisb.; F. B. I. vi. 210; Wt. Ic. t. 2005.
Wild on the W. Coast, frequently cultivated elsewhere. The Wild Turmeric. Vern. *Tel.* Kasturi-pasupa; *Tam.* Kasturi-manjal; *Mal.* Kattu-mannar; *Kan.* Kasturi-arishina.
4. *CURCUMA PSEUDOMONTANA*, Grah. *C. montana*, Rosc.; F. B. I. vi. 214 *in part*.
Tekkadi forests of the Anamalai Hills at 2,000 ft. (Fischer).
5. *CURCUMA DECIPIENS*, Dalz.; F. B. I. vi. 215.
W. Gháts.
6. *CURCUMA AMADA*, Roxb.; F. B. I. vi. 213.
Cultivated. The Mango-ginger plant. Vern. *Tel.* Mamidiallam.
7. *CURCUMA LONGA*, Linn.; F. B. I. vi. 214.
Cultivated. The Turmeric. Vern. *Tel.* Pasupu; *Tam.* Manjal; *Mal.* Mannal, Marinalu; *Kan.* Arishina.
8. *CURCUMA MONTANA*, Rosc.; F. B. I. vi. 214 *in part*; Roxb. Cor. Pl. t. 151.
Circars (Roxb.).

3. *Kaempferia*, Linn.

Herbs, rootstock often tuberous; stems 0 or very short. *Leaves* few. *Flowers* spicate, scape radical or terminating a leafy stem. *Calyx* short, cylindric, usually splitting down one side. *Corolla*-tube long, lobes 3, equal. *Staminodes* broad, petaloid. *Stamen* short, arcuate; anther 2-celled, on a wide connective produced above into a petaloid crest, not spurred. *Lip* broad, usually 2-fid. *Ovary* 3-celled; ovules many, axile; style long, filiform; stigma turbinate. *Fruit* an oblong capsule. *Seeds* subglobose, aril small, lacerate.

Stemless; leaves 2, spread flat on the ground, orbicular to rotund-ovate, 2.5—6 in. long, 2—6 in. wide; petioles short, channelled; flowers 6—12 from between the leaves; bracts lanceolate, short; calyx as long as the outer bracts, corolla-tube 1 in. long, lobes shorter; lateral staminodes cuneate-obovate; lip longer

than the corolla-tube, obovate; deeply 2-lobed; connective of anther produced into a quadrate, 2-lobed appendage.....1. *Galanga*.
 Stemless; leaves few, erect, oblong, acuminate, up to 12 in. long and 4 in. wide, variegated green above, tinged with purple below; flowers appearing before the leaves on a short, crowded, radical spike; bracts oblong acute, outer short, inner 2—3 in. long; calyx nearly as long as the corolla-tube, minutely toothed, corolla-tube 2—3 in. long, lobes linear, nearly as long as the tube; staminodes oblong, acute, 1·5—2 in. long; lip shorter, 2-fid, segments suborbicular; crest of anther deeply 2-fid.....2. *rotunda*.

1. *KAEMPFERIA GALANGA*, Linn.; F. B. I. vi. 219; Wt. Ic. t. 899.
 W. coast at low elevations (Wight).
 Flowers fragrant; white with a purple or lilac spot on each side of the lip.
2. *KAEMPFERIA ROTUNDA*, Linn.; F. B. I. vi. 222; Wt. Ic. t. 2029.
 W. coast near Trevandrum (Wight). Often cultivated and doubtfully wild.
 Flowers fragrant; white, the lip purple or lilac.

4. *Hedychium*, Koenig.

Herbs, often very tall, rootstock tuberous; stem leafy. *Leaves* distichous, oblong or lanceolate. *Flowers* in terminal, often contracted and more or less strobiliform spikes; bracts coriaceous, 1- or more-flowered. *Calyx* tubular, more or less 3-toothed, often split down one side. *Corolla*-tube long, slender, segments equal, linear. Lateral *staminodes* petaloid. Filament of *stamen* slender; anther-cells contiguous, connective not produced or appendaged. *Lip* large, bifid. *Ovary* 3-celled; ovules many, axile; style long, filiform; stigma subglobose. *Fruit* a globose, 3-valved capsule. *Seeds* many, small, aril lacerate.

Lip broad, lobes rounded:—

- Lip* orbicular-obcordate, base suddenly narrowed. Robust plant 3—6 ft. high; leaves linear- to oblong-lanceolate, acuminate, up to 18 in. long and 4 in. wide, usually appressed-silky below, ligule large; spike usually dense-flowered, sometimes lax; bracts usually imbricate, 3—4-flowered, ovate, obtuse, usually glabrous or nearly so; calyx cylindric, shorter than the bract, glabrous, corolla-tube up to 2·5 in. long; staminodes oblong or oblanceolate; stamen shorter than the lip.....1. *coronaria*.
Lip obcordate, narrowed to the base into a distinct claw. Robust plant up to 8 ft. high; leaves lanceolate, up to 14 in. long and 3 in. wide, caudate, glabrous or pubescent along the midrib below and at the mouth of the sheath, ligule large; spike dense-flowered; bracts imbricate, 3—4-flowered, large, oblong, obtuse, more or less villous at the apex and pubescent on the back; calyx as long as or slightly longer than the bract, apex puberulous, corolla-tube up to 3 in. long; staminodes narrowly oblanceolate, often notched at the apex; stamen longer than the lip.....2. *flavescens*.
Lip narrow, deeply lobed, lobes acuminate. Robust plant up to 6 ft. high; leaves elliptic-oblong or oblong-lanceolate, up to 18 in. long and 5 in. wide, finely acuminate or caudate, silky-pubescent below; ligule short; spike long, lax-flowered; bracts 1-flowered, oblong or oblong-lanceolate, subacute, glabrous; calyx twice as long as the bract, up to 1·5 in. long, corolla-tube less than twice as long as the calyx; staminodes narrow; anther as long as or shorter than the lip.....3. *venustum*.

1. *HEDYCHIUM CORONARIUM*, Koen.; F. B. I. vi. 225; Wt. Ic. t. 2010.
 In moist localities in the hills, 2,000—5,000 ft.
 Flowers fragrant, pure-white or tinged with yellow.

2. *HEDYCHIUM FLAVESCENS*, Carey; Wt. Ic. t. 2008/9. *H. coronarium*, Koen. var. *flavescens*, Carey. F. B. I. vi. 226.
Hills of the W. Gháts; Kollimalais; Bison Hill in the Godavari District (Barber).
Flowers sulphur-yellow. Vern. Kan. Hallushulli-gidda.
- Var. *chrysoleucum*, Hook. Lip narrower; flowers white with yellow bases.
3. *HEDYCHIUM VENUSTUM*, Wt. Ic. t. 2012; F. B. I. vi. 226. *H. cernuum*, Wt. Ic. t. 2011.
W. Gháts, 3,000—5,000 ft.
Flowers white.

5. *Amomum*, Linn.

Herbs, sometimes very tall; rootstock perennial, stem leafy. *Leaves* usually oblong-lanceolate. *Spikes* usually produced directly from the rootstock, very rarely terminating the stem; bracts imbricate. *Calyx* cylindric, 3-toothed. *Corolla*-tube cylindric, usually shorter than the calyx, lobes 3, oblong or linear-oblong, the upper one often broader and more convex. *Lateral staminodes* 0 or minute. *Lip* broad or ligulate. *Stamen* with a short arcuate filament; anther-cells divaricate, sometimes hairy, often with a petaloid crest. *Ovary* 3-celled; ovules many, axile; style filiform; stigma small, subglobose or infundibuliform or large and dorsally gibbous. *Fruit* indehiscent or bursting irregularly, rarely baccate, smooth, winged or echinate, sometimes beaked. *Seeds* globose, truncate, angular or ellipsoid.

Anther not crested. Leafy stem up to 10 ft. high; leaves sessile or shortly petioled, oblong- to linear-lanceolate, acuminate, up to 3 ft. long and 7 in. wide, glabrous or minutely puberulous below, especially on the midrib; ligule linear-oblong, about 1 in. long; peduncle erect from the rootstock, up to 3 ft. long, its bracts oblong or linear oblong, up to 9 in. long, obtuse; spike globose, apex truncate; floral bracts bright red, outer up to 3 in. long, overtopping the flowers, inner shorter; fruit triangular-ovoid, smooth.....1. *involutratum*.
Anther crested:—

Spike 1—3-flowered, ellipsoid; peduncle rarely 8 in. long. Leafy stem up to 4.5 ft. high; leaves long-petioled, oblong-lanceolate or lanceolate, shortly acuminate, base attenuate, up to 20 in. long and 5 in. wide, silvery-silky below; ligule 1.3 in. long, 2-lobed; bracts about 1.2 in. long, oblong, retuse; calyx longer, lobes of corolla oblong, obtuse; lip orbicular, clawed; anther-crest sublunulate; capsule globose, smooth, about 1 in. in diam.....2. *hypoleucum*.
Spike many-flowered:—

Leaves silky-tomentose beneath. Leafy stem 4—5 ft. high; leaves lanceolate or linear-lanceolate, acuminate, base attenuate, up to 2 ft. long and 4 in. wide; petioles 1—7 in. long; ligule linear, subacute, 1—1.5 in. long; exterior bracts few, oblong, glabrous, 1—1.6 in. long; calyx hardly more than half as long, corolla lobes linear-oblong; lip obovate; anther-crest small, orbicular; ovary glabrous; capsule 9-ribbed, echinate.....3. *microstephanum*.
Leaves glabrous or nearly so beneath:—

Lip elliptic, entire, emarginate, pubescent above; anther-crest quadrate, short, crenulate. Leafy stem up to 6 ft. high; leaves lanceolate or linear-lanceolate, finely acuminate or subcaudate, base acute, up to 16 in. long, 1—3 in. wide, subsessile or very shortly petioled; spikes oblong, dense-flowered; peduncle stout with many broadly ovate bracts 6—1 in. long embracing it; outer bracts of the spike oblong-lanceolate, deep pink, about 1 in. long, margins of bracts of the spike usually villous; calyx shorter, corolla-lobes oblong or elliptic; ovary glabrous muricate; capsule globose, densely echinate, 1.2 in. in diam., chestnut coloured.....4. *cannaecarpum*.

Lip broadly obovate, deeply 3-lobed, midlobe emarginate, glabrous; anther-crest lunate, rather large, entire. Leafy stem up to 5 ft. high; leaves elliptic- or oblong-lanceolate, finely acuminate or caudate, 7—16 in. long, 1—4 in. wide, shortly petioled; spikes at first subglobose and dense-flowered; peduncles up to 6 in. long, rather slender with many loose, pink, oblong bracts 6—1 in. long embracing it, rhachis silky; bracts of the spike glabrous, floral bracts thin, tubular, 2—3-lobed; calyx slightly longer; corolla-lobes ovate; ovary glabrous, warted; capsules subtrigynous-globose, apex slightly concave and smooth, about 1 in. in diam., sides densely echinate

5. *muricatum*.

1. *AMOMUM INVOLUCRATUM*, Benth.; F. B. I. vi. 233.
Anamalai Hills at 4,000 ft. (Fischer).
Flowers ochraceous, lip striped pink.
2. *AMOMUM HYPOLEUCUM*, Thw.; F. B. I. vi. 240.
Anamalai Hills, 1,800—3,500 ft. (Beddome).
Flowers white, lip with a yellow disk, tinged with red.
3. *AMOMUM MICROSTEPHANUM*, Baker; F. B. I. vi. 239.
Kalianapandal in the Anamalai Hills at 2,300 ft. (Fischer).
Flowers white.
4. *AMOMUM CANNAECARPUM*, Benth.; F. B. I. vi. 240. *Elettaria cannaecarpa*, Wt. Ic. t. 2007.
W. Ghâts, 4,000—6,000 ft.
Flowers yellow.
5. *AMOMUM MURICATUM*, Beddome.
Anamalai Hills, 2,000—3,000 ft. (Beddome).
Flowers white to yellowish, lip yellow with a broad band of red spots, anther-crest yellow.

6. *Zingiber*, Adans.

Perennial herbs; rootstock horizontal, tuberous, usually aromatic; stem leafy. *Leaves* linear to oblong-lanceolate with stem-clasping sheaths. *Flowers* in spikes; scape radicle or terminating the leafy stem; bracts persistent, usually 1-flowered. *Calyx* cylindric, shortly 3-lobed. *Corolla*-tube cylindric; lobes lanceolate, the upper concave. Lateral *staminodes* 0 or adnate to the lip. Perfect *stamen* with a short filament; anther-cells contiguous, produced into a narrow beak as long as the loculi. *Ovary* 3-celled; ovules many, axile; style filiform; stigma small, subglobose. *Fruit* an oblong, tardily dehiscent capsule. *Seeds* large, globose, arillate.

Spikes produced direct from the rootstock, short and dense; peduncle 0 or short:—

Ligule of leaf membranous, .75 in. or more long. Leafy stem 3—5 ft. high; leaves oblong or oblong-lanceolate, acuminate, sessile, up to 16 in. long and 3.5 in. wide, more or less pubescent below; spikes oblong, dense, about 3 in. long, shortly peduncled; bracts red, exterior ones broadly ovate, interior linear-lanceolate, more or less hairy; lip 3-lobed, midlobe oblong-cuneate, 3-lobulate, margins recurved, crisped, lateral lobes short, broad.....1. *roseum*.

Ligule of leaf coriaceous, less than .5 in. long:—

Leafy stem 4—5 ft. high; leaves nearly sessile, oblong-lanceolate, acuminate, 6—12 in. long, 2—3 in. wide, pubescent beneath; spikes ovate or subglobose, practically sessile; bracts linear-oblong or lanceolate, green streaked with red, inner 2-fid; lip 3-lobed, midlobe rotund-ovate or subovate, scarcely emarginate, lateral small, rounded; capsule ellipsoid, about .8 in. long.....2. *Nimmonii*.
Leafy stem 4—6 ft. high; leaves lanceolate to oblong-lanceolate, acuminate, shortly petioled, 6—18 in. long, 1—4 in. wide, pubescent beneath; spikes

- oblong or subglobose, shortly peduncled; bracts green, outer ovate, inner lanceolate; lip 3-lobed, midlobe obovate, emarginate, lateral small, acute; capsule ellipsoid, 1 in. long.....3. *Wightianum*.
 Spikes terminating elongate peduncles sheathed by scarious bracts :—
 Leaves linear, sessile, gradually acuminate, 5–13 in. long, 4–1 in. wide, glabrous; spikes oblong-cylindric, 1.5–3 in. long, peduncles slender; sheathing scales glabrous, about 1 in. long; lip 3-lobed, midlobe oblong-obovate, lateral short, ovate, obtuse.....4. *officinale*.
 Leaves lanceolate or oblong-lanceolate, usually more than 1 in. wide :—
 Leaves glabrous beneath or nearly so, oblong-lanceolate or oblanceolate, acuminate, sessile, 6–13 in. long, 2–3 in. wide; spikes oblong, peduncle 6–18 in. long; sheathing scales long, obtuse; bracts obovate-oblong or obovate, rounded, green in flower with a pale margin dotted with dark linear glands, red in fruit; lip shorter than the corolla-lobes, 3-lobed, lobes obtuse, midlobe longest; capsules ellipsoid, 1 in. long.....5. *Zerumbet*.
 Leaves pubescent beneath :—
 Leafy stem up to 20 in. high; leaves sessile, linear-to oblong-lanceolate, acuminate, 5–12 in. long, 1–2.5 in. wide; spike cylindric 6–12 in. long, peduncle about as long; sheathing scales large, oblong; bracts obovate, acute, reddish, about 1.25 in. long; lip obovate, 3-lobed, midlobe rounded, emarginate, lateral small, obtuse; capsules obovoid, .5 in. long, pubescent, red, seeds dark-purple with a large white aril.....6. *macrostachyum*.
 Leafy stem 4–6 ft. high, root yellowish inside, aromatic, tasting of camphor; leaves subsessile, oblong-lanceolate, acute or acuminate, 6–14 in. long, 1–3 in. wide, sometimes almost hairy beneath; sheathing scales numerous, pubescent or subvillous at least above and along the edges; spikes dense, fusiform or oblong-ellipsoid, 3–6 in. long; peduncles 4–12 in. long; bracts broadly ovate, 1–1.5 in. long, subacute, bright red or greenish-red, pubescent, margins narrowly membranous; lip 3-lobed, midlobe suborbicular, deeply 2-lobed, margins crisped, lateral small, oblong, acute or obtuse; capsules subglobose, .66 in. long, seeds very many, small, purple.....7. *Casumunar*.
1. ZINGIBER ROSEUM, Rosc.; F. B. I. vi. 244. *Amomum roseum*, Roxb. Cor. Pl. t. 126.
 N. Circars (Roxburgh); Dummakonda in the Rampa Hills at 3,500 ft. (V. Narayanswami).
 Flowers bright- or pale-red, lip whitish, sometimes with reddish markings. Vern. *Tel.* Bumma-kachikai.
 2. ZINGIBER NIMMONII, Dalz.; F. B. I. vi. 244.
 Bababudan Hills (Law).
 Flowers reddish-yellow, lip yellow.
 3. ZINGIBER WIGHTIANUM, Thw.; F. B. I. vi. 244. *Z. squarrosum*, Wt. Ic. t. 2004.
 W. Gháts, 2,000–3,000 ft., Bison Hill in the Godavari District (Barber).
 Flowers pale-yellow. Vern. *Mal.* Malai-inchi.
 4. ZINGIBER OFFICINALE, Rosc.; F. B. I. vi. 246.
 Wildly cultivated. Run wild in places in the W. Gháts.
 The Ginger plant.
 Flowers greenish-yellow, lip dark purple, often spotted with yellow. The plant rarely flowers. Vern. *Hind.* Adrak; *Ur.* Adroko; *Tel.* Allamu; *Tam.* Shukku, Inchi; *Mal.* Adrakam; *Kan.* Alla.
 5. ZINGIBER ZERUMBET, Sm.; F. B. I. vi. 247.
 W. Gháts, 2,000–3,000 ft. Also widely cultivated.
 Flowers pale sulphur-yellow, lip darker. Vern. *Hind.* Mahabari, Kachur.

6. ZINGIBER MACROSTACHYUM, Dalz. ; F. B. I. vi. 247.

W. Gháts.

Flowers white or greenish-white, lip pale-yellow striped purple.

7. ZINGIBER CASUMUNAR, Roxb. ; F. B. I. vi. 248.

W. and E. Gháts. Also widely cultivated.

Flowers whitish, lip yellowish-white. Vern. *Hind.* Banada ; *Ur.* Ban-oda ; *Tel.* Karu-pasapu ; *Mal.* Kat-inchi ; *Kan.* Agalesunthi.

7. Costus, Linn.

Herbs with a tuberous, horizontal rootstock ; stem long, leafy. *Leaves* oblong ; sheaths broad. *Flowers* in dense globose or ovoid, usually terminal, spikes, rarely direct from the rootstock. *Calyx* short, funnel-shaped, teeth 3, ovate. *Corolla*-tube short or long, lobes large, oblong, subequal. Lateral *staminodes* 0 or minute. *Lip* large, obovate or orbicular, margins incurved. *Stamen* with a broad filament forming an oblong petaloid process with the connective ; anther median on the process, with 2 linear, contiguous cells. *Ovary* 3-celled, ovules many, axile ; style filiform ; stigma with a crescent-shaped depression, margin ciliate. *Fruit* a globose or ovoid, tardily-dehiscing capsule. *Seeds* ovoid or subglobose, aril short.

COSTUS SPECIOSUS, Sm. ; F. B. I. vi. 249 ; Wt. Ic. t. 2014.

In all Districts in moist localities ; near sea-level to 3,000 ft.

A succulent herb attaining 8—9 ft. in height ; stems spirally twisted so that the leaves appear spirally arranged ; leaves oblong, oblong-lanceolate or oblanceolate-oblong, acute or acuminate, often cuspidate, 5—12 in. long, 2—3 in. wide, glabrous above, silky-pubescent beneath ; flowers white in very dense spikes ; bracts ovate, .75—1.25 in. long, bright red ; lip suborbicular, 2 in. or more in diam., often with a yellow centre. Vern. *Tel.* Bomma-kachika ; *Tam.* Kottam ; *Mal.* Anakuva ; *Kan.* Changalakoshta.

8. Elettaria, Maton.

Perennial herbs ; rootstock thick, horizontal ; leafy stem tall. *Leaves* distichous. *Flowers* in elongate, flexuous panicles direct from the rootstock, shortly pedicelled ; bracts 2—7-flowered ; bracteoles membranous, tubular. *Calyx* membranous, tubular, shortly 3-lobed. *Corolla*-tube cylindric, midlobe oblong, convex, lateral narrower. Lateral *staminodes* represented by small, erect teeth. *Lip* oblong-obovate, base cuneate. *Stamen* with a short filament ; anther not crested, its cells contiguous. *Ovary* 3-celled ; ovules many, axile ; style filiform ; stigma small, funnel-shaped, ciliate. *Fruit* a subglobose, coriaceous, indehiscent capsule. *Seeds* obovoid, angular by compression, aromatic, aril 0.

ELETTARIA CARDAMOMUM, Maton ; F. B. I. vi. 251. *Alpinia Cardamomum*, Roxb. Cor. Pl. t. 226.

W. Gháts, wild and cultivated ; 2,500—4,500 ft. The Cardamom. Leafy stem 6—10 ft. high ; leaves linear-lanceolate, acuminate, sessile or very shortly petioled, glabrous above, softly pubescent beneath, 1—2 ft. long, 2—3 in. wide ; panicles several, up to

about 2 ft. long, erect or prostrate; bracts 6—7-flowered, linear-oblong, obtuse, about 1·5 in. long; calyx 5 in. long, corolla-tube white, shortly exserted, lobes 5 in. long; lip longer, white striped with violet; capsule subtrigonal, about 4 in. long, striate. Vern. *Tel.* Elaki; *Tam.* Elam, Anchi; *Mal.* Elattari; *Kan.* Elakki.

Var. *major*, Thw.; F. B. I. vi. 251. More robust; leaves broader; bracts more distant, 2—4-flowered; capsule 1 in. or more long. In the same localities.

The seeds of both used as condiments and medicinally.

9. *Alpinia*, Linn.

Perennial herbs; rootstock horizontal; leafy stem tall. *Leaves* oblong or lanceolate. *Flowers* in usually terminal spikes, racemes or panicles; bracteoles large, sometimes enveloping the bud. *Calyx* laxly tubular, shortly 3-toothed. *Corolla*-tube cylindric, usually not exceeding the calyx, lobes oblong or linear-oblong, the upper one usually broader and more convex. Lateral *staminodes* 0 or minute. *Lip* spreading, often orbicular with incurved margins, sometimes with 2 subulate processes at the base of the claw. *Stamen* with a flattened filament; anther usually without crest, cells diverging at the apex. *Ovary* 3-celled; ovules few or many in each cell, axile; style filiform; stigma subglobose. *Fruit* dry or fleshy, globose, usually indehiscent. *Seeds* globose or angular by compression, often aromatic, aril membranous.

Flowers panicled; buds not enclosed in large bracteoles :—

Ovary glabrous. Leafy stem 6—7 ft. high; leaves oblong-lanceolate, glabrous, acuminate, up to 30 in. long and 6 in. wide, very shortly petioled, ligule short, rounded, ciliate; flowers in open panicles up to 13 in. long, rhachis puberulous; lip orbicular-spathulate, apex shortly 2-lobed, claw slender with 2 subulate glands at the base; capsule about 6 in. diam., orange-red.....1. *Galanga*.

Ovary pilose :—

Leafy stem 3—6 ft. high; leaves linear- or lanceolate-oblong, acuminate, cuspidate, glabrous, 8—18 in. long, 2—4 in. wide; panicle copiously compound, 6—12 in. long, rhachis pubescent or tomentose, floral bracts small, ovate, cupular; flowers small; lip obovate-cuneate or suborbicular, emarginate, slightly over 1 in. long, claw with 2 linear-subulate glands at the base; capsule 6 in. diam., black.....2. *Allughas*.

Leafy stem 2—4 ft. high; leaves linear-lanceolate or linear, finely acuminate, 6—15 in. long, 1—2 in. wide; panicle narrow, dense-flowered, rarely more than 4 in. long, rhachis pubescent; floral bracts small, ovate; lip obovate or oblong, 1—1·5 in. long; capsule red.....3. *calcarata*.

Flowers in simple racemes; bud enclosed in large membranous bracteoles. Leafy stem 6—10 ft. high; leaves shortly petioled, narrowly oblong or oblong-lanceolate, acuminate, up to 3 ft. long and 8 in. wide, glabrous above, pubescent beneath, the margins often densely villous; raceme up to 1 ft. long, rhachis fulvous-hairy; bracts large, white, petaloid; flowers 2—2·5 in. long; lip ovate, 2 in. long; ovary densely pubescent; capsule 1 in. diam., yellow.....4. *malaccensis*.

1. *ALPINIA GALANGA*, Sw.; F. B. I. vi. 253. *Alpinia Rheedii*; Wt. Ic. t. 2026.

W. Gháts. Often cultivated.

Flowers greenish-white, lip veined with red. Vern. *Tel.* Peddampump-rashtrakam; *Tam.* Pera rattai; *Mal.* Peraratta; *Kan.* Dumpa-rasmi.

2. *ALPINIA ALLUGHAS*, Rosc. ; F. B. I. vi. 253.
W. Ghâts, up to 4,000 ft.
Flowers pink.
3. *ALPINIA CALCARATA*, Rosc. ; F. B. I. vi. 254 ; Wt. Ic. t. 2028.
W. Ghâts. Often cultivated.
Flowers white, lip variegated with red and yellow.
4. *ALPINIA MALACCENSIS*, Rosc. ; F. B. I. vi. 255.
Vizagapatam Hills (A. W. Lushington) ; 3,000—7,000 ft.
Flowers white, lip yellow, variegated with red.

Family CL. MARANTACEAE.

Perennial herbs or shrubs. *Leaves* distichous, closely parallel-penniveined, inequilateral, petioled, sheathed ; ligule usually very small, rarely conspicuous or quite absent. *Flowers* very irregular and asymmetric, in spikes or panicles ; bracts distichous ; usually 2-flowered. *Sepals* 3, free, usually equal. *Corolla* tubular below, tube usually long, 3-lobed above. *Androecium* tubular below. *Staminodes* 3—5, the outer sometimes wanting ; one of the inner 3 contracted above and furnished on one side with a hooded appendage (the *cucullum*), another broadened and often hardened (the *labellum*). Perfect stamen in the inner whorl, broad, petaloid with a 1-celled anther. *Ovary* inferior, 3-celled, or 1—2-celled by suppression ; ovules solitary in each cell. *Fruit* dry or fleshy, dehiscent or indehiscent. *Seeds* 1—3, usually arillate.

Ovary 3-celled:—

Stems tall, leafy ; flowers in dichotomously branched panicles terminal on the stem.....1. *Schumannianthus*.

Stemless herbs ; flowers in dense ellipsoid or capitate spikes arising direct from the rootstock or borne laterally on a petiole:—

Spike radical, ellipsoid ; bracts imbricate.....2. *Stachyphrynium*.

Spike capitate, lateral from a petiole ; bracts not imbricate.....3. *Phrynium*.

Ovary 1-celled.....*Maranta*.

1. *Schumannianthus*, Gagnepain.

Erect herbs or shrubs ; stems branching dichotomously. *Leaves* oblong or oblong-lanceolate ; ligule very short. *Panicle* lax-flowered, flowers in pairs ; bracts long, narrow, firm. *Sepals* ovate-lanceolate. *Staminal tube* elongate ; exterior staminodes petaloid, obovate, interior smaller. *Anther* with a petaloid appendage. *Fruit* a 3-coccous (or 2-coccous by abortion) subpyriform capsule. *Seeds* subglobose.

SCHUMANNIANTHUS VIRGATUS, Rolfe. *Clinogyne virgata*, Benth. ; F. B. I. vi. 258. *Maranta virgata*, Wall. ; Wt. Ic. t. 2015.

W. Ghâts in evergreen forests, 300—4,000 ft.

Stems 6—12 ft. high, bamboo-like ; joints knotted ; leaves acuminate, often shortly cuspidate, base rounded, 4—20 in. long, 1·5—6 in. wide, glabrous except sometimes for a band of hairs on the sheath and the 5—1 in. long petiole ; panicle effuse, up to 20 in. long and wide ; bracts narrowly oblong, 1—3·5 in. long ; flowers white, about 3 in long, pedicel about as long ; ovary villous ; capsule 3—4 in. long. Vern. *Tam. Periya-kuhai-valai*.

2. *Stachyphrynium*, K. Schumann.

Stemless herbs; rootstock usually creeping. *Leaves* broad, radical; petioles long, sheathing, simulating stems. *Flowers* in simple, subsessile or peduncled spikes direct from the rootstock. *Sepals* narrow. *Corolla*-tube usually longer than the sepals, lobes oblong or lanceolate. Outer *staminodes* petaloid, obovate, clawed; labellum truncate or shortly toothed; cucullum short, unappendaged. *Stamen* petaloid, anther-cell adnate to its margin. *Ovary* 3-celled, 1 ovule in each cell. *Capsule* 3-seeded or 2-seeded by abortion. *Seeds* smooth, aril 2-lobed, lobes linear.

STACHYPHRYNIUM SPICATUM, K. Schum. *Phrynium spicatum*, Roxb.; F. B. I. vi. 259.

Yeddicarra forests in Malabar (Beddome). Rare.

Leaves 2—4, oblong, caudate-acuminate or cuspidate, base rounded, 5—10 in. long, 1·5—3 in. wide; petiole slender, much longer than the blade, callous below the blade, pilose; flowers white, in narrow spikes 1—1·5 in. long; bracts ovate, .5—·75 in. long; staminal appendage rather large; fruit 3-seeded, seeds triquetrous, brown.

3. *Phrynium*, Willdenow.

Stemless herbs; rootstock usually creeping. *Leaves* broad, long petioled. *Flowers* in dense capitate spikes borne laterally on the petioles. *Sepals* subovate-oblong, equal. *Corolla*-tube usually slightly longer than the sepals, rarely shorter, lobes oblong. Exterior *staminodes* petaloid, obovate unequal; labellum usually very short; cucullum short, with a pendulous appendage. Perfect *stamen* with a small 1-celled anther, the filament adnate to the smaller exterior staminode. *Ovary* 3-celled. *Capsule* 3-celled and 3-seeded, or 1- or 2-seeded by abortion. Seeds subglobose.

Inner bracts of the spike broad upwards, breaking up into fibrillae at the apex. Erect herbs 2—5 ft. high; leaf single or 2, oblong or oblong-lanceolate, cuspidate, base rounded or cuneate, 4—12 in. long, 2—8 in. wide; petioles 2—3 ft. long; spike sessile on the petiole above the middle, 1·5—2 in. in diam., outer bracts 2 or 3 at the base of the spike, large rigid with an incurved scarious tip; lobes of the corolla longer than the tube, ovary silky-hairy; capsule subtruncate-trigonus, .4 in. long, chestnut.....1. *capitatum*. Inner bracts of the spike tapering to an entire, acute, hardened tip. Erect herbs 2—5 ft. high; leaf single or 2, oblong or ovate-oblong, cuspidate, base rounded or abruptly cuneate, 5—20 in. long, 3·5—8 in. wide; petiole with sheath much longer than the blade; spike sessile on the petiole well above the middle, often close to the blade, 1·5—2 in. in diam.; outer bracts at the base of the spike 5, oblong, spinulose-apiculate; lobes of the corolla shorter than the tube, ovary glabrous or apex puberulous; capsule broadly oblong .4—·5 in. long, pale.....2. *parviflorum*.

1. *PHRYNIUM CAPITATUM*, Willd.; F. B. I. vi. 258; Wt. Ic. t. 2016.

W. Ghâts at low elevations.

Flowers purple.

2. *PHRYNIUM PARVIFLORUM*, Roxb.; F. B. I. vi. 259.

Vizagapatam Hills at 3,500 ft. (A. W. Lushington); Bison Hill in the Godavari District (Barber).

Flowers white tipped with yellow.

MARANTA ARUNDINACEA, Linn., the Arrowroot, is occasionally cultivated. Vern. *Hind.* Tikhor; *Tel.* Palaguntha; *Tam.* Arurutuk-kilangu, Kuva mavu; *Kan.* Tavaksha.

Family CLI. CANNACEAE.

Erect perennial, leafy herbs. *Leaves* large, penninerved. *Flowers* in terminal spikes or panicles, asymmetric, usually brightly coloured. *Sepals* 3, free, imbricate, subequal or one smaller, herbaceous or petaloid. *Corolla* of 3 petals more or less tubular below, one always smaller. *Androecium* tubular below, partly adnate to the corolla-tube, of 1—5 members, one bearing a single anther-cell on the margin of a petaloid stamen, the staminodes petaloid, the one opposite the fertile stamen recurved (*labellum*), the others usually erect. *Ovary* inferior, 3-celled; ovules many; style flattened; stigma terminal. *Fruit* a globose or ellipsoid, 3-celled capsule.

Canna, Linn.

The only genus with the characters of the family.

CANNA ORIENTALIS, Rosc. *C. indica*, Linn., var. *orientalis*, Baker; F. B. I. vi. 260.

In most Districts but not common.

An erect herb up to 4 ft. high; flowers bright red, the labellum and style often yellow with red streaks, petals and staminodes linear or linear-lanceolate, acute; capsule globose or ellipsoid, echinate.

Canna indica, Linn., and its varieties are cultivated in gardens.

Family CLII. MUSACEAE.

Perennial herbs, shrubs or trees. *Leaves* distichous or spirally arranged, blade large or gigantic; petiole above the sheath large. *Flowers* in simple or paniced spikes, zygomorphic, usually hermaphrodite but sometimes monoecious, sessile or shortly, rarely long, petioled; bracts sometimes brightly coloured. Outer and inner *perianth* usually both petaloid, free or variously united. Fertile *stamens* 5, rarely 6, free, the 6th usually converted into a staminode; anthers linear, 2-celled. *Ovary* inferior, 3-celled; ovules 1-several in each cell, basal or axile; style simple; stigma simple or 3—6-lobed. *Fruit* baccate or capsular. *Seeds* hard, sometimes arillate.

Musa, Linn.

Erect herbs, shrubs or trees, the stems composed of convolute leaf-sheaths. *Leaves* spirally arranged, very large, oblong. *Flowers* monoecious, on stout, elongate, bracteate spikes, ♂ above, ♀ below; bracts spirally arranged, large, ovate or orbicular. *Sepals* and 2 *petals* usually connate into a 3—5-lobed tube split down one side, remaining petal opposite the split, free, as long as the calyx, embracing the base

of the stamens and style. *Stamens* 5 (rarely 6) perfect, 6th usually rudimentary or absent; filaments erect, stoutly filiform; anthers erect. *Ovary* many-ovuled; style filiform; stigma subglobose, 3–6-lobed. *Fruit* baccate, large, oblong. *Seeds* subglobose or angled by compression, embedded in pulp.

Plant 10–12 ft. high, stem 7–8 ft. in circumference at the base and narrowed to 3 ft. below the leaves, not stoloniferous, dying after flowering; leaves oblong, narrowed to the base, 5–10 ft. long, 2–3 ft. wide, petiole short; spikes ultimately drooping, up to 4 ft. long; bracts very many, orbicular, up to 1 ft. long, dull claret-brown, many-flowered; flowers in 2 dense rows; fruit oblong, 3 in. long, several in a cluster, edible but insipid; seeds subglobose or angled by compression, black or brown. 1. *superba*.
Plant 3–5 ft. high, 3–4 in. diam., stoloniferous, root perennial; leaves linear-oblong, up to 4.5 ft. long and 1 ft. wide, petiole 1–2 ft. long; spikes erect or somewhat bent over, up to 18 in. long; bracts few, lanceolate- to ovate-oblong, 3–6 in. long, bright lilac or pink, 3–4-flowered, the lowest 4 or 5 only fertile; fruit linear-oblong, 4–5 angled, 2–4 in a cluster, 3–4 in. long, inedible; seeds black, tuberculate. 2. *rosacea*.

1. *MUSA SUPERBA*, Roxb. Cor. Pl. t. 223; F. B. I. vi. 261; Wt. Ic. t. 2017.

W. Gháts, on rocky hill-sides, 1,000–5,000 ft.

The Wild Plantain.

2. *MUSA ROSACEA*, Jacq.; F. B. I. vi. 263.

Rampa Hills (Gamble).

MUSA PARADISIACA, Linn. *M. sapientum*, Linn.; F. B. I. vi. 262; Roxb. Cor. Pl. t. 275. The Plantain or Banana Tree; is extensively cultivated. *Musa textilis*, L. Née, Manilla Hemp, is occasionally cultivated for its fibre.

Ravenala madagascarensis, Sonn. The Traveller's Tree, with large plantain-like leaves forming a fan-like head, is grown ornamentally in gardens.

FAMILY CLIII. BROMELIACEAE.

Herbs, rarely shrubby or arboreous, often epiphytic. *Leaves* usually in clustered, radical, spirally arranged rosettes, base amplexicaul and sheathing. *Flowers* 2-sexual, usually from the centre of the rosette, terminal, sessile in heads, spikes, racemes or panicles; often with brilliantly coloured bracts below the flowers which pass into the floral bracts and sometimes with a terminal crown of foliage leaves above. *Sepals* 3, free or connate, herbaceous or coriaceous. *Petals* 3, free or half or wholly connate into a tube, often with 2 scales at the base within. *Stamens* 6, all free or connate or one whorl free and one whorl connate; anthers introrse. *Ovary* inferior, half inferior or superior, 3-celled; ovules usually many in each cell; style with 3 stigmas or stigmatic branches. *Fruit* baccate, sometimes combined into a syncarp, sometimes dehiscent. *Embryo* small, in a small pocket or fork of the mealy albumen.

There are no indigenous genera of this family but *Ananas sativus*, Schult., the Pine Apple, is cultivated in some localities. Vern. Tel. Anasa-pandu; Tam. Anashap-pazham; Mal. Annanas; Kan. Ananasuhannu.

Family CLIV. HAEMODORACEAE.

Perennial herbs; rootstock short, tuberous. *Leaves* usually radical, distichous, narrow. *Flowers* 2-sexual, regular, in terminal spikes, racemes or panicles. *Perianth* petaloid, 2-seriate, lobes 6, free or more or less connate, imbricate or induplicate-valvate. *Stamens* 6 and opposite to the perianth-lobes or more or less adnate to them or fewer; anthers erect or versatile, 2-celled, opening by a slit, rarely by a pore. *Ovary* inferior, subinferior or superior, 3-celled, sometimes imperfectly so; ovules 1—several in the angle of each cell; style filiform, rarely short or wanting; stigma simple or notched. *Fruit* a superior or nearly superior capsule or an inferior berry. *Seeds* various; embryo small, partially enclosed in the fleshy albumen.

Filaments united into a ring closing the mouth of the perianth.....1. **Peliosanthes.**
 Filaments free, short.....2. **Ophiopogon.**

1. **Peliosanthes**, Andr.

Rootstock horizontal. *Leaves* radical, linear or lanceolate, subplicate nerved. *Scape* erect; bracts scarious. *Flowers* small, racemed. *Perianth* broadly campanulate, tube short, lobes spreading. *Stamens* 6; filaments very short; anthers sub-sessile. *Ovary* inferior, the top free, conical, 3-celled; ovules 2 or more in each cell; stigma subsessile, 3-lobed. *Fruit* a berry. *Seeds* few, bursting through the pericarp during ripening and resting on the base of the withered perianth; embryo in the base of the hard fleshy albumen.

Leaves narrowly elliptic-lanceolate or oblanceolate, acuminate, base tapering, glabrous, pale when dry 4—9 in. long, .6—1.6 in. wide; petiole slender, 2.5—12 in. long, pale when dry; raceme slender, rarely as long as the leaves and petioles; bracts ovate, .1—2.5 in. long; flowers numerous, about .2 in. in diam.; berry subglobose, about .3 in. long.....1. *neilgherrensis*.
Leaves lanceolate or oblanceolate, acute or acuminate, base tapering, glabrous, dark when dry, 7—14 in. long, 1—5.3 in. wide; petiole rather stout, 9—20 in. long, dark when dry; raceme moderately slender, usually as long as the petioles; bracts ovate- or linear-lanceolate, .2—5 in. long; flowers numerous, about .25 in. in diam.; berry subglobose, about .5 in. long.....2. *courtallensis*.

1. **PELIOSANTHES NEILGHERRENSIS**, Wt. Ic. t. 2052; F. B. I. vi. 266.

W. Gháts, from the Nilgiri Hills southwards, in dense evergreen forests, 2,000—6,500 ft.

Flowers greenish- to dark-purple; berries blue.

2. **PELIOSANTHES COURTALLENIS**, Wt. Ic. t. 2051; F. B. I. vi. 266.

In the same situations as the last species.

Flowers blue-purple (Jerdon). Very similar to the last species and doubtfully separable though more robust.

2. **Ophiopogon**, Ker-Gawl.

Small, scapigerous herbs; stem short from a short rootstock or elongate and subscandent. *Leaves* radical, linear or lanceolate. *Scape* leafy or naked; bracts scarious. *Flowers* racemed, usually many-flowered. *Perianth* segments spreading. *Stamens* 6, on the bases of the perianth-segments; filaments erect; anthers basifixed. *Ovary* inferior,

3-celled, crown flat or depressed; ovules 2 in each cell, collateral, erect; style columnar; stigma 3-toothed. *Fruit* indehiscent. *Seeds* few, testa fleshy or succulent, like those of *Peliosanthes*.

OPHIPOGON INTERMEDIUS, Don; F. B. I. vi. 269. *O. indicus*, Wt. Ic. t. 2050.

W. Gháts, 3,500—7,300 ft.; Sirumalais and Kollimalais (Jacob); Mahendragiri Hill in the Ganjam District at 4,500 ft. (Fischer and Gage); Vizagapatam District at Endrika, 3,000 ft. (A. W. Lushington).

Leaves narrowly linear, obtuse, acute or acuminate, tapering to the base, 4—24 in. long, 1—5 in. wide; flowers white, about 3 in. diam.; seeds subglobose.

Var. *pauciflorus*, Hook. f.; F. B. I. vi. 269, with 5 or fewer flowers in the raceme.

Var. *gracilipes*, Hook. f.; F. B. I. vi. 269, with very narrow leaves tapering to an almost filamentous base.

Family CLV. AMARYLLIDACEAE.

Perennial herbs, sometimes large, woody shrubs; rootstock a bulb, corm or tuber, rarely an erect stock. *Leaves* radical or clustered at the apex of a more or less well-developed caudex. *Scape* naked (in the Indian genera) or bracteate. *Flowers* few (in the Indian genera) and umbelled, rarely solitary or many and paniced, usually 2-sexual, regular or somewhat zygomorphic, often showy; bracts membranous or coloured, seldom herbaceous (in Indian genera), the outer 1—3 forming an involucre under the umbel. *Perianth* superior, tube 0, short or long, limb 6-lobed or -partite, sometimes with a corona at the mouth. *Stamens* 6, on the base of the perianth segments, rarely epigynous; filaments free or connate by the corona; anthers erect or versatile. *Ovary* inferior, 3-celled; ovules many, 2-seriate in the inner angles of the cells: style stout or slender; stigma simple or 3-cleft. *Fruit* usually loculicidally capsular, sometimes fleshy. *Seeds* few or many; albumen fleshy, enclosing the small embryo.

Leaves all radical from the rootstock, never on a well-developed caudex; flowers not paniced:—

Leaves rigid and usually plicate; scape short, sometimes subterranean; flowers rather small, usually yellow:—

Ovary not or hardly produced upwards into a rostrum:—

Leaves sessile, narrowly linear, not plicate; fruit circumscrib near the apex
1. *Hypoxis*.

Leaves petioled, lanceolate or linear-lanceolate, rarely linear, more or less plicate; fruit indehiscent.....2. *Molineria*.

Ovary produced upwards into a filamentous rostrum.....3. *Curculigo*.

Leaves flat, usually succulent, never plicate; scape usually stout and elongate with 1—3 membranous involucral bracts at the apex; flowers in umbels, rarely solitary, usually showy, not yellow:—

Stamens not united by a membranous corona:—

Flower solitary.....*Zephyranthes*.

Flowers 2 or more.....4. *Crinum*.

Stamens united by a membranous corona.....5. *Pancratium*.

Leaves clustered at the top of a more or less well-developed caudex; flowers panicked on a gigantic, woody scape:—

Perianth shortly tubular below; stamens exserted; style filiform..... **Agave.**
 Perianth divided to the base; stamens included; filaments and style swollen at the base or below the middle..... **Furcraea.**

1. *Hypoxis*, Linn.

Small herbs; rootstock tuberos or a coated corm. *Leaves* sessile, strongly nerved. *Flowers* solitary, racemed or umbelled. *Perianth* rotate, 6-partite, persistent. *Stamens* 6; filaments erect; anthers erect, dorsifixed. *Ovary* 3-celled; style short, columnar; stigmas 3, erect, stout, distinct or connate. *Capsule* circumsciss below the apex or 3-valved. *Seeds* subglobose, testa crustaceous, shining, beaked at the hilum.

HYPOXIS AUREA, Lour.; F. B. I. vi. 277.

Anamalai Hills at 3,000—4,000 ft. (Beddome); Pulney Hills at Kodaikanal (Bourne).

3—15 in. high; rootstock subglobose or elongate and erect, crowned with the fibrous remains of the old leaves; leaves sheathing below, acute, 4—14 in. long, 1—25 in. wide, pilose or glabrescent; scapes 1—4, filiform, 1—4 in. long, 1—2-flowered, glabrous or more or less pilose; flowers 3—5 in. long; the ovary quite evident below the acute, yellow perianth-lobes, ovary and perianth pilose without; capsule cylindric-turbinate, crowned by the enlarged perianth, circumsciss.

2. *Molineria*, Callo.

Perennial herbs; rootstock tuberos. *Leaves* petioled, lanceolate, plicate. *Flowers* sometimes polygamous, racemed or sometimes aggregated in dense capitula. *Perianth* sessile or almost so on the inferior ovary, segments oblong. *Stamens* 6; filaments erect; anthers basifixed. *Ovary* 3-celled; ovules many in each cell; style subulate; stigma capitate, oblong-trigonus. *Fruit* a berry crowned by the enlarged, persistent perianth. *Seeds* globose, black, opaque.

MOLINERIA FINLAYSONIANA, Baker. *Curculigo Finlaysoniana*, Wall.; F. B. I. vi. 279. *Hypoxis latifolia*, Wt. Ic. t. 2044. *H. trichocarpa* and *H. leptostachya*, Wt. Ic. t. 2045. *H. pauciflora* and *H. brachystachya*, Wt. Ic. t. 2046.

W. Ghâts, 400—6,000 ft.; Mahendragiri Hills in the Ganjam District at 4,500 ft. (Fischer and Gage).

Tuber elongate, oblong-cylindric; root-fibres numerous, elongate; leaves lanceolate, acute to finely acuminate, base tapering, 5—20 in. long, .5—2 in. wide, pilose or glabrescent; petiole slender, widened at the base, 2.5—13 in. long, sometimes very short; flowers usually numerous in bracteate racemes, yellow, often the upper ♂ without or with a more or less developed style, perianth-lobes obtuse; filaments filiform; anthers deeply linear-hastate; rachis of scape linear-lanceolate bracts and ovary fulvous-pilose; berry cylindric or fusiform.

3. *Curculigo*, Gaertn.

Stemless herb; rootstock more or less tuberous, sub-oblong, thick, crowned with the remains of old leaves. *Leaves* radical, narrow, more or less pilose, sessile or petioled, prominently nerved and plicate. *Flowers* solitary or racemed on usually a very short scape among the leaves and often subterranean. *Perianth* superior, 6-partite of the base. *Stamens* 6, on the base of the perianth segments; filaments filiform; anthers linear or lanceolate, base sagittate, basifixed. *Ovary* inferior, hidden among the leaves, often subterranean, 3-celled, always produced upwards into a filiform rostrum which pushes the perianth above ground; ovules 12—24 in each cell; style columnar-filiform; stigmas 3, free or connate. *Fruit* indehiscent, more or less succulent. *Seeds* subglobose; testa black, shining, striate, beaked at the hilum.

CURCULIGO ORCHOIDES, Gaertn.; F. B. I. vi. 279; Roxb. Cor. Pl. t. 13; *C. malabarica* and *C. brevifolia*, Wt. Ic. t. 2043.

In all Districts, near sea-level up to 7,500 ft.

Rootstock elongate, up to 1 ft. long; leaves very variable, narrowly linear to lanceolate, acute, sessile or tapering into a short or long petiole, glabrous or more or less whitish pilose, 1·5—21 in. long, 2—1·5 in. wide, often viviparous at the tips; scape usually very short and hidden among the bases of the leaves underground, only the perianths rising not far above ground and appearing solitary; perianth about 5 in. long, more or less pilose; ovary usually below ground; produced into a filamentous pilose rostrum 5—1·6 in. long; fruit subulate to ovate, 5—1 in. long; seeds few to many. Vern. *Tel.* Nalla-tadi.

4. *Crinum*, Linn.

Stout herbs; rootstock bulbous. *Leaves* fleshy, elongate, lorate or ensiform. *Scape* solid. *Flowers* large, in umbels subtended by 2 spathaceous bracts, bracteoles linear. *Perianth* funnel- or salver-shaped, tube long, straight or upcurved, lobes 6, linear to oblong. *Stamens* 6, on the throat of the perianth; filaments free, filiform, erect, spreading or declinate; anthers linear, dorsifixed, versatile. *Ovary* 3-celled; ovules few or many in each cell; style filiform; stigma minute. *Fruit* large, subglobose, breaking up irregularly. *Seeds* few, large, testa thick; albumen copious.

Perianth salver-shaped, erect, lobes linear:—

Bulb 2—4 in. in diam., narrowed into a neck 4—12 in. long; leaves linear-lanceolate, shortly acuminate, 20—30 in. long, 5—7 in. wide, margins smooth; scape 1·5—3 ft. long, up to 1 in. in diam. at the base, 15—50-flowered; bracts 3—4 in. long; pedicels 2—1 in. long; perianth-tube 3—4 in. long, slender, lobes about 2 in. long; filaments shorter than the perianth-lobes; fruit 1—2 in. in diam.1. *asiaticum*.
Bulb ovoid, 2—3 in. in diam., neck 2—6 in. long; leaves linear, deeply channelled, obtuse, 2—3 ft. long, 75—2 in. wide, margins smooth; scapes from the outer leaf-axils, 1—2·5 ft. long, 6—12-flowered; bracts 1·5—3 in. long; pedicels very short; perianth-tube 2·5—4 in. long, slender, lobes 3—4 in. long; filaments rather shorter than the perianth-lobes; fruit 1—1·5 in. in diam.2. *defixum*.
Perianth funnel-shaped, drooping, lobes lanceolate or oblanceolate, 3—4 in. long, 75—1 in. wide, appendaged at the cuspidate apex. Bulb subglobose, 5—6 in. in diam., neck stout; leaves lorate, thin, 2—4 ft. long, 3—5 in. wide, margins slightly

scabrid; scape 2—3 ft. long, stout, 8—20-flowered; bracts 3—4 in. long; pedicels very short; perianth-tube 3—6 in. long; filaments much shorter than the perianth-lobes; fruit 1·5—2·5 in. in diam.....3. *latifolium*.

1. CRINUM ASIATICUM, Linn.; F. B. I. vi. 280. *C. toxicarium*, Roxb.; Wt. Ic. t. 2021—22.

In all Districts, up to 4,000 ft. Often cultivated.

Flowers white, stamens reddish.

2. CRINUM DEFIXUM, Ker; F. B. I. vi. 281.

In all districts; along streams and backwaters, up to 3,000 ft.

Flowers white, stamens bright red.

var. *ensifolium*, Baker; *C. ensifolium*, Roxb.; F. B. I. vi. 281.

Leaves ensiform, gradually acuminate.

3. CRINUM LATIFOLIUM, Linn.; F. B. I. vi. 283; Wt. Ic. t. 2019-20.

In all Districts, up to 6,000 ft.

Flowers white tinged with rose or purple.

5. *Pancratium*, Linn.

Herbs; rootstock a coated bulb. *Leaves* linear or lanceolate, often bifarious. *Flowers* large, solitary or umbelled on a solid scape, sessile or pedicelled, subtended by 1—4 membranous spathes; bracts linear, hyaline. *Perianth* funnel-shaped, tube short or long, lobes 6, narrow. *Stamens* 6, on the throat of the perianth; filaments filiform, united below by a coronal membrane into a toothed or lobed cup; anthers oblong or linear, dorsifixed, versatile. *Ovary* 3-celled; ovules many and 2-seriate in each cell; style filiform; stigma small, capitate. *Capsule* large, subglobose, triangular, loculicidal. *Seeds* many, angled; testa lax, black.

Scapes 2- or more-flowered:—

Filaments much longer than the teeth of the staminal-cup and the anthers. Bulb globose 1·5—2 in. in diam., neck short, long or 0; leaves thin, linear or linear-lanceolate; umbel 2—8-flowered; spathes 2; pedicels short; perianth-tube 1·5—3 in. long, lobes linear, 75—1 in. long; staminal cup with bifid teeth between the filaments.....1. *triflorum*.

Filaments hardly longer than the teeth of the staminal-cup, shorter than the anthers. Bulb globose, neck usually long, cylindric; leaves thin, linear or linear-lanceolate, narrowed towards the base; scape slender, 2—4-flowered; spathe single, sometimes deeply bifid; perianth-tube 2—4 in. long, lobes linear, 1 in. long; staminal-cup as long as the lobes, 12-toothed.....2. *parvum*.

Scape 1- (rarely 2-) flowered. Bulb globose, 1·5—2 in. in diam.; leaves narrowly lanceolate; scape shorter than the leaves; spathe single; perianth-tube 2—6 in. long, slender, lobes linear-lanceolate, 2 in. long; staminal-cup 1 in. long, 2-toothed between the filaments.....3. *longiflorum*.

1. PANCRATIUM TRIFLORUM, Roxb.; F. B. I. vi. 285. *P. verecundum*, Wt. Ic. t. 2023; F. B. I. vi. 286.

In all Districts, up to 2,000 ft.

Flowers pure white, fragrant.

2. PANCRATIUM PARVUM, Dalz.; F. B. I. vi. 286.

Bababudan Hills (Law).

Flowers white.

3. PANCRATIUM LONGIFLORUM, Roxb.; F. B. I. vi. 286.

Vizagapatam District (Barber).

Perianth-tube pale-green, lobes white.

Zephyranthes carinata, Herbert, The Pink Lily, is an escape from gardens in the Hills, and *Z. tubispatha*, Herbert; F. B. I. vi. 277, a similar escape in the plains.

The following have been planted for fibre or as hedge or ornamental plants: *Agave americana*, Linn.; F. B. I. vi. 277, *A. Vera-Cruz*, Mill., *A. Cantala*, Roxb., *A. sisalana*, Perr. (Sisal Hemp), *A. Wightii*, Drum. & Prain; Wt Ic. t. 2024 under *A. vivipara*, and *A. sp. ?*; also *Furcraea gigantea*, Vent., and another species. (For an account of these 2 genera as represented in India see 'Notes on Agave and Furcraea in India,' J. R. Drummond and D. Prain, Bengal Agric. Series, Bull. 8, 1905.)

Family CLVI. TACCACEAE.

Perennial herbs; rootstock tuberous or creeping. *Leaves* radical, entire and costate or pinnately lobed or laciniate and penninerved. *Flowers* 2-sexual, regular, umbelled on a naked scape with an involucre of 2—12 spathaceous bracts and long, filiform bracteoles. *Perianth* superior, urceolate or subcampanulate, 6-lobed in 2 series. *Stamens* 6, included, on the tube or the base of the perianth-lobes; filaments very short, dilated or laterally appendaged at the base, dilated into a hood above the anthers with 2 ribs or horns on the inner face; anthers sessile within the hood. *Ovary* inferior, 1-celled; ovules many on 3 parietal placentas; style short, included; stigmas 3, often petaloid, broad and 2-lobed, reflexed like an umbrella over the style. *Fruit* baccate, or at length 3-valved, 3—6-ribbed. *Seeds* numerous, ovoid, striate; albumen hard; embryo minute.

Tacca, Forst.

Characters of the Family, fruit a berry.

TACCA PINNATIFIDA, Forst.; F. B. I. vi. 287.

Goomsur in Ganjam; Rampa Hill (Ramaswami); Bison Hill in the Godavari District (Barber) Nallamalais; Mysore at Ananthapura (Meebold). Sometimes cultivated.

Rootstock globose, up to 1 ft. in diam.; leaves circular in outline, 1—3 ft. in diam., 3-partite, the segments variously and unequally pinnate; petioles 1—3 ft. long; scape longer than the petioles, terete, hollow, striate; flowers 10—40, pedicelled, drooping; bracts 6—12, oblong-lanceolate, acuminate, about 1 in. long, greenish striped with purple; bracteoles 3—5 in. long; perianth fleshy, subglobose, 6—7 in. in diam., greenish, lobes margined with purple; berry subglobose, about 1 in. long, 6-ribbed, yellow.

Family CLVII. DIOSCOREACEAE.

Climbing, rarely erect, herbs or shrubs; rootstock tuberous or with a hard rhizome and tuberous roots. *Leaves* opposite or alternate (sometimes both on the same plant), simple, lobed or digitately 3—9-foliate, palmiribbed and reticulately veined; petioles often angular and twisted at the base. *Flowers* regular, small or minute, usually monoecious or dioecious, rarely hermaphrodite, in spikes, racemes or panicles. *Perianth*

tubular, urceolate or rotate, 6-cleft, often shortly connate below. *Stamens* of ♂ 3 or 6, or 3 perfect with 3 alternating staminodes, inserted at the base of the perianth or on its lobes; anthers small. *Pistillode* sometimes present. *Staminodes* of ♀ 6, 3 or 0. *Ovary* inferior, 3-quetrous, usually 3-celled; ovules 2 superposed in each cell; styles 3, short; stigmas entire or 2-fid, recurved. *Fruit* a berry or a 3-valved capsule. *Seeds* flat or subglobose, winged or not; embryo small, included in the usually hard albumen.

Climbing plants; flowers 1-sexual; fruit a 3-winged capsule.....1. **Dioscorea.**
 Erect plants; flowers 2-sexual; fruit an unwinged berry.....2. **Trichopus.**

1. *Dioscorea*, Linn.

Climbing herbs. *Flowers* 1-sexual, rarely abnormally 2-sexual. ♂ *perianth* with 6 short lobes. *Stamens* 6 or 3 alternating with staminodes. *Pistillode* thick and fleshy or 0. ♀ *perianth* with 6 free small segments. *Staminodes* 6, 3 or 0. *Ovary* inferior, 3-quetrous, 3-celled; styles 3, short. *Fruit* a loculicidal, flattened, 3-winged capsule. *Seeds* always 2 in each cell, compressed, with a large membranous wing; albumen compressed, fleshy or hard, 2-laminate; embryo between the blades; cotyledons suborbicular.

(The following key and most of the information on the species of *Dioscorea* have been generously supplied by Mr. J. H. Burkill, F.L.S.; they have appeared in part in the 'Journ. As. Soc. Beng.' N.S. x (1914), 6.)

Stems twining to the left; capsules reflexed upwards:—

Leaves simple:—

Tubers numerous, edible, stalked, protected by root-fibres generally bearing spines up to .5 in. long; stem prickly; leaves orbicular or reniform, acuminate or cuspidate, base cordate, 2—5 in. long; petioles about as long; ♂ spikes 6—18 in. long; flowers erect, with a disk within the 6 perfect stamens; capsule oblong, slightly narrowed below, apex retuse; seeds broadly winged all round.....1. *esculenta*.
 Tubers single or at most 2—3, without defined stalk, inedible or very inferior as food, root-fibres not spinous; stem unarmed, bearing warted bulbils in the leaf-axils; leaves broadly ovate to suborbicular, acuminate, cuspidate or caudate, base cordate, 2—8 in. long; petioles usually somewhat shorter; ♂ spikes very slender, 1—4 in. long, close or scattered on long, pendulous, axillary panicles; flowers pendulous without disk within the 6 perfect stamens; capsule quadrately oblong, slightly widened upwards, .6—1 in. long; seeds winged at the base only.....2. *bulbifera*.

Leaves compound, upper sometimes simple; seeds winged at the base only:—

Fertile stamens 6. Root tuberous, lobed; stems more or less prickly; leaves 3-foliate; petiole 2—9 in. long, sometimes prickly, glabrous or finely pubescent; leaflets broadly cuneate-obovate, cuspidately caudate-acuminate, base tapering, the lateral very oblique, sometimes shortly 2-lobed, sometimes gibbous and broader than long, 3—13 in. long, 1.7—6 in. wide, glabrous or finely pubescent below; petiolules .1—75 in. long; ♂ flowers in dense cylindric spikes clustered along a more or less prickly long, pubescent or villous rhachis, ♀ in solitary, distant spikes; capsule quadrately oblong, ends truncately rounded, smooth, 2 in. long, 1 in. wide.....3. *hispida*.

Fertile stamens 3, staminodes 3:—

Many of the upper leaves simple, white tomentose. Tubers elongate; stems slender, often prickly towards the base, tomentose above; leaves mostly 3-foliate, occasionally 5—6-foliate below; petioles 1.5—5.5 in. long; leaflets variable, terminal elliptic or obovate, lateral often very gibbous, all acuminate,

cuspidate or rounded, base acute, the simple leaves ovate- or orbicular-cordate, 1·5–7 in. long 1–4 in. wide; all densely white-tomentose below; ♂ spikes short, 1–3 together on a slender tomentose panicle, ♀ in simple or branched racemes up to 1 ft. long; capsules cuneately oblong, up to 1·1 in. long, downy, eventually glabrescent.....4. *tomentosa*.

Rarely a few of the uppermost leaves simple, rusty-hairy:—

Leaflets 3–5. Tubers oblong or very diverse in different varieties; stem slender, prickly towards the base, glabrous, often bearing axillary bulbils; petioles 2–5 in. long; the simple leaves orbicular or rotund-ovate, cuspidate; leaflets elliptic, lanceolate, ovate or obovate, abruptly cuspidate, base attenuate, lateral often gibbous, glabrous or rusty-pubescent below, 2·5–7 in. long, 1–4 in. wide; ♂ flowers in small racemes on long, slender axillary or terminal panicles, ♀ in slender, elongate, 1–3-nate racemes; capsules oblong, glabrous, up to 1 in. long.....5. *pentaphylla*.

Leaflets 5–7, rarely 3 near the tips, coarse. Tuber single, stem slender, sparsely prickly, hirsute, at length glabrescent; petioles up to 10 in. long; leaflets obovate or elliptic, acuminate, base acute, lateral asymmetric, smaller and wider in proportion, up to 10 in. long and 4 in. wide, pubescent below; ♂ flowers in 1–2-nate spikes on long racemes, spikes long, rusty-tomentose.....6. *Kalkapershadii*.

Stems twining to the right; leaves simple; capsules facing forwards; seeds broadly winged all round:—

Stems glabrous:—

Stems neither winged nor conspicuously angled; axis of the ♂ spikes not zig-zag:—

Leaves coriaceous, elliptic, oblong or ovate, acuminate or cuspidate, base cuneate or rounded, 2–6 in. long, .75–2·75 in. wide; petioles .75–1·75 in. long; spikes simple, solitary or twin, slender; capsules subquadrate or rather broader than long, apex and base retuse, 1·5–2·2 in. wide

7. *spicata*.

Leaves not coriaceous:—

Veins of leaves not prominent, though usually distinct:—

Bases of leaves acute or rounded, very rarely cordate. Tubers deep underground; stem slender, unarmed, not bulbiferous; leaves lanceolate to elliptic-oblong, ovate or suborbicular, acuminate or obtuse, with a well-defined cartilaginous margin, 2–5 in. long, .5–3·5 in. wide; petioles .6–1·6 in. long; ♂ spikes fascicled on a long, slender rhachis, ♀ flowers distant in solitary or fascicled spikes; capsules suborbicular or broader than long, apex retuse or sub-bilobed, .5–1 in. long, 1–1·5 in. wide.....8. *oppositifolia*.

Bases of leaves cordate or truncately cordate:—

♂ spikes simple, 1–4-nate. Stem slender, pale; leaves ovate, acuminate, 2–3·5 in. long, 1–2 in. wide; petioles .8–1·8 in. long; rhachis of ♂ spike capillary up to 3 in. long.....9. *Wightii*.

♂ spikes paniced, very rarely simple:—

Stem woody, often prickly below, arising from a hard woody knot 3–4 in. diam. which below gives forth 1–3 or sometimes more tubers; leaves ovate-hastate, sometimes nearly orbicular, those near the apex often with a rounded base, apex acuminate, up to 5 in. long, secondary nerves irregular; petioles long; capsules subquadrate or orbiculate, .6–8 in. long, 1–1·5 in. wide.....10. *glabra*.

Stem woody, stout, often prickly below, the tubers growing out direct from the base of the stem; leaves suborbicular, broadly ovate or subreniform, abruptly acuminate or cuspidate, up to 6 in. long and 6·5 in. wide, secondary nerves regular and nearly parallel, petioles up to 5 in. long; capsules broadly obovate, apex emarginate, up to 1·5 in. wide.....11. *Wallichii*.

Veins of leaves prominent:—

Stem unarmed, smooth, enlarged into a small rhizome emitting long fleshy tuber-bearing fibres; leaves variable, usually ovate or ovate-lanceolate, apex tapering to an acute point, base deeply to shallowly cordate, 7–9-ribbed, 1·5–4 in. long, .7–2 in. wide, veins rather regular, close and parallel; petioles .5–1·6 in. long; ♂ spikes 1–3-nate in the

axils or on leafless axillary shoots; capsules suborbicular, slightly broader than long, 1—1.5 in. wide.....12. *belophylla*.
 Stem terete, glabrous, unarmed; leaves mostly alternate, elliptic or oblong, acuminate, mucronate, base narrowed or rounded, 3-ribbed, up to 5 in. long and 2.6 in. wide, veins irregular, distant; petioles up to 1.5 in. long; ♂ spikes short, fascicled in long panicles, ♀ spikes short, solitary, usually simple; capsules transversely oblong, apex retuse, 1—1.25 in. diam.....13. *intermedia*.

Stems winged or regularly angled; axis of ♂ spikes zig-zag:—

Whole plant reddish when dry; stems angled, sometimes subulate, unarmed; tubers long-stalked, deep underground; leaves ovate or lanceolate, acuminate, truncately to deeply cordate, 1.75—4.5 in. long, .75—2 in. wide, secondary nerves close, rather regular and subparallel, petioles 1—2.5 in. long; ♂ spikes short, 1—4-nate or subverticillate on slender axillary branchlets; capsules reniform, retuse, .8—1 in. long, 1—1.6 in. wide.....14. *Hamiltonii*.

Plant not conspicuously reddish when dry; stems 4—5- (sometimes 6—8- at the base) winged, wings sometimes reduced to ribs, usually with scattered broad-based prickles; tubers shallow or deep underground, but without long stalks; leaves usually broadly ovate or subrotund, suddenly cuspidate, sometimes rounded, base cordate with a broad sinus, upper smaller and narrower, 2.5—8.5 in. long, 1.5—5 in. wide; petioles 1.5—4.5 in. long; rhachis of ♂ spike winged, ♂ spikes 1—3-nate or subverticillate on axillary branchlets; capsules broadly obcordate, 1—1.5 in. wide.....15. *alata*.

Stems densely pubescent, unarmed, woody, directly producing a long cylindric tuber; leaves broadly ovate or suborbicular, acuminate or cuspidate, base cordate, 3—7-in. long, 2.25—4 in. wide, pubescent at least on the nerves below; petioles 1—2.25 in. long, pubescent; ♂ spikes pubescent, 1—3-nate on axillary panicles up to 14 in. long; capsules subcordate; .5—7 in. long, 1 in. wide, rarely quite glabrous.....16. *anguina*.

1. DIOSCOREA ESCULENTA, Burk. *D. spinosa*, Roxb.; F. B. I. vi. 291.
D. fasciculata, Roxb.; F. B. I. vi. 296.

Cultivated on the E. and W. Coasts; probably nowhere truly wild but occurring as an escape. Very variable under cultivation when it often loses the spines on the roots. Vern. *Tel.* Tivvi tige, Tippa tige; *Tam.* Musilam valli kilangu, siruvalli kilangu; *Mal.* Mullu kilangu, Cheru kilangu.

2. DIOSCOREA BULBIFERA, Linn.; Wt. Ic. t. 878. *D. sativa*, Thunb. non Linn.; F. B. I. vi. 295.

Wild on the W. Coast, in Coimbatore and along the whole of the E. Coast Districts. Cultivated in many localities. Vern. *Hind.* Karukanda; *Tam.* Pannu kilangu; *Kan.* Heggenasu.

Var. *vera*, Pr. & Burk. Tubers and bulbils small, acrid (wild).

Var. *sativa*, Pr. & Burk. Tubers almost entirely absent, bulbils large and edible (cultivated).

3. DIOSCOREA HISPIDA, Dennst. *D. daemona*, Roxb.; F. B. I. vi. 289; Wt. Ic. t. 811.

W. and E. Coast Districts, up to 1,000 ft.; Anamalai Hills (Wight, Beddome); Hyderabad State (Heyne).

One of the most important natural famine foods. Vern. *Tel.* Tella gini-geddala, Puli-dumpā; *Tam.* Pei-perendai; *Mal.* Podava-kilangu.

4. DIOSCOREA TOMETOSA, Heyne; F. B. I. vi. 289.

In all Districts, up to 4,000 ft. Very common.

Flowers purplish. Vern. *Tel.* Burdi gaddi, Tegadumpa, Nalla

- tiga, Nadang, Adavi-denda-tiga; *Tam.* Nalveli-kilangu, Shaval-kilangu; *Mal.* Inthi-kachchil, Núli, Chávú, Píndi.
5. *DIOSCOREA PENTAPHYLLA*, Linn.; F. B. I. vi. 289; Wt. Ic. t. 814.
In all districts, up to 4,000 ft.
Flowers greenish, fragrant. Vern. *Tel.* Duka-pendalam, Moyakku-pendalam, Pendi-muka-tiga, Adavi-ginusu-tiga; *Tam.* Chedukundi, Vallai-kodi; *Mal.* Núran, Chaval, Korna-pídan.
Var. *Linnaei*, Pr. & Burk. Tuber elongate, white, edible; leaves shining.
Var. *Rheedei*, Pr. & Burk. Tuber elongate, white, edible; leaves dark when dry, bulbils much elongated.
Var. *communis*, Pr. & Burk. Tuber short, inedible; leaves rusty-pubescent.
6. *DIOSCOREA KALKAPERSHADII*, Pr. & Burk.
Shevaroy Hills (Perrottet).
Capsules unknown. Perhaps only a coarse variety of *D. pentaphylla*, L.
7. *DIOSCOREA SPICATA*, Roth; F. B. I. vi. 291.
Travancore and Tinnevely Hills, 3,000—5,000 ft.
Vern. *Mal.* Atthi-kilangu, Kavalai.
8. *DIOSCOREA OPPOSITIFOLIA*, Linn.; F. B. I. vi. 292; Wt. Ic. t. 813.
In all districts, 500—5,000 ft.
Vern. *Tel.* Yella-gadda; *Tam.* Kavala-kodi, Thavaikachchu; *Mal.* Kanji; *Kan.* Bellarai.
Var. *Linnaei*, Pr. & Burk. Leaves lanceolate or ovate; axis of ♂ inflorescence usually brown-pubescent.
Var. *dukhunensis*, Pr. & Burk. Leaves ovate; axis of ♂ inflorescence glabrous or nearly so.
9. *DIOSCOREA WIGHTII*, Hook. f.; F. B. I. vi. 291.
Courtallam (Wight).
♀ flowers and capsules unknown.
10. *DIOSCOREA GLABRA*, Roxb.; F. B. I. vi. 294.
Godavari District (Barber).
11. *DIOSCOREA WALLICHII*, Hook. f.; F. B. I. vi. 295. *D. aculeata*, Linn.; F. B. I. vi. 296; Wt. Ic. t. 2060 (excluding the mature fruit).
W. Coast and Gháts; N. Circars; Mysore at Chickenhalli at 3,000 ft. (Meebold).
Vern. *Tel.* Cheranga; *Mal.* Vara-kilanga, Katta-kilanga, Váli.
12. *DIOSCOREA BELOPHYLLA*, Voight.
W. Gháts, on the crests.
13. *DIOSCOREA INTERMEDIA*, Thw.; F. B. I. vi. 297.
Malabar (Barber); Travancore (Bourdillon).
14. *DIOSCOREA HAMILTONII*, Hook. f.; F. B. I. vi. 295.
W. Coast and Gháts, up to 4,000 ft.
Tubers eaten. Vern. *Mal.* Veinti.
15. *DIOSCOREA ALATÁ*, LINN.; F. B. I. vi. 296; Wt. Ic. t. 810. *D. globosa*, Roxb.; F. B. I. vi. 296; Wt. Ic. t. 812.
Widely cultivated; nowhere truly wild. Vern. *Tel.* Pendalam, Dukka-pendalam, Kavili-gadda; *Tam.* Mullu-valli, Siru-valli,

Vettilai-valli, Atthi-kavali, Eyamichavali, Kappa-kavali, Kappan-kachchil; *Mal.* Kachchil-kilangu, Thamban; *Kan.* Tuna-genasu.

16. *DIOSCOREA ANGUINA*, Roxb.; F. B. I. vi. 293.

Rampa Hills at 2,500 ft. (Ramaswami, Narayanswami); Travancore (Calder and Ramaswami).

Tubers edible, but not much sought after.

2. *Trichopus*, Gaertn.

Small, erect, perennial herbs; stem short. *Leaves* terminal, 3—7-costate, petioled. *Flowers* small, bisexual, fascicled at the base of the leaves. *Perianth* campanulate, subequally 6-lobed. *Stamens* 6, on the base of the perianth-lobes; anthers subsessile, short and broad, connective produced. *Ovary* inferior, 3-celled; ovules 2-superposed in each cell; style very short; stigmas 3, short, reflexed, bifid. *Fruit* 3-winged, indehiscent. *Seeds* oblong, dorsally grooved; embryo minute in a cartilaginous albumen.

TRICHOPUS ZEYLANICUS, Gaertn.; F. B. I. vi. 297. *Trichopodium zeylanicum*, Bedd. Ic. Pl. Or. t. 290.

Tinnevely and Travancore Hills.

Stems several from a nodose rhizome, slender, 1—5 in. long; leaves ovate-lanceolate to broadly triangular-ovate, apex acute and minutely apiculate, obtuse or rounded, base more or less deeply cordate with a wide sinus, 2·5—5·5 in. long, 1·3—3 in. wide; petioles 1—2·75 in. wide; flowers 4 or 5 together; perianth dark-brown, lobes lanceolate, acute; pedicels slender, 1 in. long, lengthening and thickening below the ellipsoid, 5—75 in. long fruit.

Family CLVIII. ROXBURGHACEAE.

Erect or climbing herbs; rootstock tuberous or creeping. *Leaves* alternate, opposite or whorled, simple, petioled, 3- or more-ribbed, cross-nervules parallel. *Flowers* regular, 2-sexual on axillary peduncles. *Perianth* superior or half-superior, in 2 whorls of 2 subequal, free or more or less connate segments each. *Stamens* 4, on the base of the perianth-segments or subhypogynous; anthers dorsifixed. *Ovary* 1-celled; ovules 2 or more, erect from the base or pendulous from the apex, anatropous; stigmas 1—3, subsessile. *Fruit* a 2-valved capsule. *Seeds* oblong, testa coriaceous; embryo long, albumen hard.

Stemona, Lour.

Stem erect or twining; root tuberous. *Leaves* ovate or lanceolate, 3—13-ribbed. *Flowers* rather large, solitary or few subracemose. *Perianth* segments lanceolate, many-nerved. *Stamens* subhypogynous; filaments more or less connate into a ring; anthers erect, linear, connective produced into a very long linear appendage. *Ovary* free, compressed; ovules 2 or more, erect; stigma small, pointed. *Capsule* ovoid or oblong, compressed. *Seeds* ovoid or oblong, terete, grooved, beaked.

STEMONA TUBEROSA, Lour. ; F. B. I. vi. 298. *Roxburghia gloriosoides*, Jones ; Roxb. Cor. Pl. t. 32. *R. Viridiflora*, Sm. ; Wall. Pl. As. Rar. t. 282.

N. Circars as far south as Kambakkam Hill in the Chingleput District, 300—4,000 ft.

Stems twining ; leaves membranous, opposite, rarely alternate, ovate, cuspidate to caudate, base truncately to deeply-caudate with rounded lobes, rarely abruptly cuneate, 7—13-ribbed, up to 10·5 in. long and 6 in. wide, cross-nervules straight, very close, petioles up to 3·5 in. long ; flowers 1—3, 1—2 in. long, segments acuminate, greenish with purple nerves ; stamens large, filaments red, stout, deeply grooved in front with crenulate margins, connective green ; capsule ovoid-oblong, 1·5 in. long, 5—8-seeded. Vern. Tel. Kanipu tiga, Ijedigadda.

Var. *minor*, Fischer. *S. minor*, Hook. f. ; F. B. I. vi. 298 *Roxburghia gloriosoides*, Wt. Ic. t. 2061. All parts smaller ; leaves not caudate, base narrowed or rounded, rarely more than 7-ribbed ; flowers rarely exceeding 1 in. long, segments usually acute.

Family CLIX. LILIACEAE.

Herbs, sometimes climbing, rarely shrubby or arboreous with secondary growth in thickness ; roots fibrous or tuberous or a creeping rhizome, or bulbs or corms. *Leaves* various, cauline or radical, sometimes functionally replaced by cladodes, sometimes fleshy, usually parallel-veined. *Flowers* usually regular and 2-sexual, axillary or terminal, solitary, twin, spicate, umbelled, racemose, fascicled or paniced. *Perianth* inferior, free from the ovary, herbaceous or petaloid, 6- (rarely 4- or 8-) merous in 2 series, imbricate, rarely valvate, in bud. *Stamens* 6, rarely 3 or less, hypogynous or on the perianth lobes ; filaments free or connate ; anthers oblong or linear, often versatile. *Ovary* superior, 3-celled ; ovules 2 or more in the inner angles of each cell, anatropous, rarely orthotropous ; style usually simple, rarely 3, usually long, rarely short or 0. *Fruit* a berry or capsule, usually 3-celled, rarely 1-celled. *Seeds* globose or flattened ; embryo small, terete, surrounded by the horny or fleshy albumen.

Leaves minute, often spinescent scales, bearing axillary tufts of needle-like or slightly flattened cladodes.....1. *Asparagus*.
Leaves well developed:—

Climbing plants:—

Leaves not ending in a tendril ; flowers small, whitish or greenish...2. *Smilax*.

Leaves ending in a tendril ; flowers large, yellow and red.....3. *Gloriosa*.

Erect undershrubs or herbs:—

Leaves very thick, cartilaginous or fleshy:—

Margins of leaves not spinous ; perianth narrowly tubular, divided into linear segments for at least half its length, white or cream-coloured

4. *Sansevieria*.

Margins of leaves spinous ; perianth tubular, shortly toothed, reddish-yellow and green.....5. *Aloe*.

Leaves not very thick, neither cartilaginous nor fleshy:—

Undershrubs or stout herbs with a definite above-ground leafy stem:—

Flowers less than 2 in. long:—

Leaves sheathing at the base:—

Perianth segments connate below in a tube.....6. *Dracaena*.

- Perianth segments free to the base.....7. **Dianella**.
 Leaves sessile or shortly petioled, not sheathing.....8. **Disporum**.
 Flowers trumpet-shaped, at least 5 in. long.....9. **Lilium**.
 Herbs without distinct above-ground stems:—
 Flowers in heads or umbels sheathed by 1 or more spathes.....**Allium**.
 Flowers racemose or fascicled in racemes:—
 Rootstock small with fleshy or tuberous roots:—
 Leaves semi-terete, fistular.....10. **Asphodelus**.
 Leaves flat, not fistular.....11. **Chlorophytum**.
 Rootstock a bulb or corm:—
 Flowers several to many, racemose on a simple, naked scape:—
 Flowers distant, usually appearing before the leaves, dingy-brown,
 .5 in. or more long, pedicels 1 in. long; seeds compressed....12. **Urginea**.
 Flowers close, appearing with the leaves, greenish-purple, .25 in. or
 less long, pedicels under 1 in. long; seeds subglobose.....13. **Scilla**.
 Flowers solitary or few corymbose; scape with a few leaves....14. **Iphigenia**.

1. *Asparagus*, Linn.

Scandent or erect undershrubs, rarely herbs; rootstock stout, creeping, sometimes bearing tubers. *Leaves* reduced to minute, often spinescent, scales which bear in their axils tufts of more or less leaf-like acicular, triquetrous or flattened cladodes. *Flowers* small or minute, 2- (rarely 1-) sexual, regular, axillary, solitary, fascicled, umbelled or racemed; pedicels jointed. *Perianth* petaloid, campanulate, 6-partite. *Stamens* 6, on the bases of the perianth-segments; filaments free; anthers oblong. *Ovary* 3-celled, 3-gonous; ovules 2 or more in each cell; style 1, columnar; stigmas 3. *Fruit* a globose, pulpy berry. *Seeds* 1—6, testa black, brittle; embryo dorsal.

Flowers solitary, clustered or umbelled, not racemed:—

Leaves not spinescent. Stem slender, unarmed, terete, striate; branchlets sulcate; cladodes 3—6-nate, firm, up to 2 in. long; flowers in dense clusters, pedicels up to .5 in. long, jointed below the middle.....1. *Rottleri*.

Leaves distinctly spinous:—

Stem erect, tall, smooth; branchlets grooved; spines straight, long; cladodes 6—12-nate, triquetrous, acuminate, .16—35 in. long; flowers 1—2 together, pedicels jointed above the middle.....2. *Fysoni*.

Stem scandent, slender, terete, smooth; branchlets grooved; spines short, recurved; cladodes 6—15-nate, terete, mucronate, .16—25 in. long; flowers solitary or few and umbelled, pedicels jointed in the middle.....3. *asiaticus*.

Flowers racemed:—

Cladodes triquetrous or very slightly compressed:—

Cladodes 2—6-nate, falcate-divaricate, sometimes slightly compressed, .5—1.5 in. long. Stem scandent, woody; branchlets angular; spines strong, long, straight or decurved; racemes solitary or fascicled, simple or branched, many- or few-flowered, 1—3 in. long; bracts minute; pedicels slender, jointed at the middle.....4. *racemosus*.

Cladodes 3—6-nate, stout, acuminate, spreading, .25—35 in. long; bracts comparatively large. Otherwise as *racemosus*.....5. *laevissimus*.

Cladodes flat, falcate-ensiform, 2—6-nate, acute or acuminate, .35—1 in. long. Stem subscaudent, terete, smooth; branchlets angled; spines short; racemes often fascicled, 1—3 in. long; pedicels jointed at the middle.....6. *gonoclados*.

1. *ASPARAGUS* ROTTLEI, Baker; F. B. I. vi. 315.

Precise locality not known; probably South India (Rottler).

2. *ASPARAGUS* FYSONI, Macbride; *A. subulatus*, Steud.; F. B. I. vi. 315.

A. asiaticus, Wt. Ic. t. 2055.

Nilgiri, Anamalai and Pulney Hills, 4,000—8,000 ft.

3. *ASPARAGUS ASIATICUS*, Linn.; F. B. I. vi. 316.
Bellary District (Beddome); also Rottler without precise locality.
4. *ASPARAGUS RACEMOSUS*, Willd.; F. B. I. vi. 316; Wt. Ic. t. 2056.
In all Districts, sea-level to 4,500 ft. Very common. Vern. *Ur.* Mohajolo; *Tel.* Pilli-gaddalu, Toalla-gaddalu; *Tam.* Ammai-kodi, Kadumulla, Nili-chedi.
5. *ASPARAGUS LAEVISSIMUS*, Steud.; F. B. I. vi. 317.
Nilgiri Hills at about 6,000 ft.
Hardly more than a variety of *A. racemosus*, Willd.
6. *ASPARAGUS GONOCADOS*, Baker; F. B. I. vi. 318.
W. Ghats, 4,000—6,000 ft.

2. *Smilax*, Linn.

Climbing shrubs (rarely erect herbs); stem often prickly. *Leaves* alternate, rarely opposite, 3—9-ribbed, reticularly veined; petioles usually short, generally bearing a tendril on either side above the base, often dilated into a narrow or broad sheath. *Flowers* dioecious, umbellate. *Perianth* of 6, free, subequal segments. *Stamens* in ♂ 6 or more on the base of the perianth-segments; filaments free, erect; anther oblong, didymous or the cells separated by the forking of the connective. *Pistillode* 0. *Staminodes* in ♀ 3 or 6, filiform. *Ovary* 3-celled, 3-gonous; ovules 1—2 in each cell, orthotropous, pendulous; style short or 0; stigmas 3, stout, recurved. *Fruit* a globose berry. *Seeds* solitary or more often 2, rarely 3, hemispheric; embryo small; albumen horny.

Umbels sessile on an axillary peduncle 2—6 in. long, sometimes forming a terminal panicle by the suppression of the upper leaves. Branches rather slender, armed or not; leaves ovate-deltoid, hastate-lanceolate or broadly cordate, sometimes a little broader than long, acute or acuminate, base more or less deeply cordate, 5—9-ribbed, margins and veins below sometimes prickly, 1.6—4.5 in. long, 1—3.2 in. wide; petioles .5—1 in. long, sometimes armed, hardly sheathed at the very base; tendrils from near the base.....1. *aspera*.

Umbels not sessile:—

Umbels 1—3 on an axillary peduncle; sheath of petiole narrow not auricled:—

Branches rather stout, more or less angled, armed or not; leaves very variable; lanceolate, elliptic, broadly oblong or orbicular, acute or abruptly cuspidate, base narrowed, rounded or cordate, 3—7 or 9-ribbed, up to 14 in. diam.; petioles up to 2 in. long.....2. *zeylanica*.

Branches rather stout, terete, very sparsely or not armed; leaves broadly ovate or suborbicular, apex rounded or bluntly cuspidate, sometimes acuminate, base rounded or shallowly cordate, 5—7-ribbed, up to 5 in. long; petioles up to 1.75 in. long.....3. *Wightii*.

Umbels many, alternate or verticillate on an axillary peduncle. Branches stout, armed or not; leaves elliptic, ovate or very broadly oblong, apex rounded, sometimes retuse, or with a short hard cusp, base rounded or subcordate, 3—7-ribbed, 4—7 in. long, 2—6 in. wide; petioles up to 2 in. long, broadly sheathed for about half their length, the sheath auricled, often amplexicaul, at the base...4. *prolifera*.

1. *SMILAX ASPERA*, Linn.; F. B. I. vi. 306. *S. maculata*, Roxb., Wt. Ic. t. 2059.

W. Ghâts, 4,000—7,000 ft.; Vizagapatam District at Ventala, 4,000 ft. (A. W. Lushington).

Leaves often blotched with white.

2. *SMILAX ZEYLANICA*, Linn.; F. B. I. vi. 309. *S. macrophylla*, Roxb.; F. B. I. vi. 310. *S. ovalifolia*, Roxb.; Wt. Ic. t. 809.

In all Districts, near sea-level to 6,000 ft. Vern. *Tel.* Kondagurvatiga; *Tam.* Kattu-kodi.

3. *SMILAX WIGHTII*, A. DC.; F. B. I. vi. 310. *S. zeylanica*, Wt. Ic. tt. 2057-8.

Nilgiri and Anamalai Hills, 4,000—8,000 ft.

Doubtfully distinct from the last species.

4. *SMILAX PROLIFERA*; Roxb.; F. B. I. vi. 312.

In all Districts, from 2,500 ft. upwards. Vern. *Ur.* Mitri; *Kan.* Nirubetta.

3. *Gloriosa*, Linn.

Climbing herbs, stems leafy; rootstock tuberous, naked. *Leaves* alternate, opposite or ternately whorled, midrib prominent, tip elongate, spiral, functioning as a tendril. *Flowers* large, axillary, usually solitary; pedicels reflexed near the tip. *Perianth* petaloid, persistent; segments 6, free, spreading or reflexed, narrow, margins usually undulate. *Stamens* 6, hypogynous; filaments filiform; anthers linear, dorsifixed, versatile, extrorse. *Ovary* 3-celled; ovules many in each cell; style filiform, sharply deflexed; apex 3-fid, segments subulate, stigmatose within. *Fruit* a large, coriaceous, septicidal capsule. *Seeds* subglobose; testa spongy; embryo cylindric.

GLORIOSA SUPERBA, Linn.; F. B. I. vi. 358; Wt. Ic. t. 2047.

In all Districts; sea-level to 7,000 ft. Common, often climbing on hedge-row plants.

Stem herbaceous, up to 20 ft. long; tubers cylindric, large, simple or forked, white; leaves linear- to ovate-lanceolate, apex tapering, base rounded or cordate, 3—7.5 in. long (excluding the coiled, tendril-like tip), .5—2 in. wide, sessile or nearly so; pedicels rather stout, up to 7 in. long; perianth-segments linear, acute, margins crisply waved, up to 3.5 in. long, at first greenish, then yellow, passing through orange and scarlet to crimson; capsules linear-oblong, up to 2.7 in. long. The Glory Lily. The tubers are poisonous. Vern. *Hind.* Karihari; *Ur.* Mcheria-phulo, Agni-sikha; *Tel.* Adivi-nabhi, Kalappa-gadda, Potti-dumpa, Ganjeri; *Tam.* Kalap-paik-kilangu, Kannuvelli; *Mal.* Mettonni.

4. *Sansevieria*, Thunb.

Stout, usually fleshy herbs; rootstock short, often stoloniferous, or a creeping rhizome. *Leaves* narrow, cartilaginous or fleshy, flat or terete, nerves immersed. *Flowers* racemed on a stout scape. *Perianth*-tube slender, lobes 6, long, narrow. *Stamens* 6, on the perianth-tube; filaments filiform; anthers dorsifixed. *Ovary* attached by a broad base, 3-celled; ovules solitary in each cell, erect; style filiform; stigma simple. *Fruit* membranous, indehiscent, pericarp evanescent. *Seeds* 1—3, large, globose, fleshy, ripening outside the pericarp.

SANSEVIERIA ROXBURGHIANA, Schult. f.; F. B. I. vi. 271. *S. zeylanica*, Roxb. Cor. Pl. t. 184.

In all Districts except the W. Coast; sea-level to 3,500 ft.

Stemless; rootstock creeping; leaves linear; deeply concave-channelled, rounded or obtusely keeled on the back, tapering to a stout, subulate point, 65—2 ft. long, green transversely marked with a number of darker bars, edges often whitish when old; scape 1—2.5 ft. high, raceme 1—1.5 ft. long; bracts membranous; flowers about 4 in a cluster, 6—8 in. long, white, pedicels jointed near the middle; seeds .25 in. diam. The Bow-string Hemp. Vern. *Hind.* Marúl; *Tel.* Chamakada-nar, Sagal; *Tam.* Marul, Mottamanji.

5. *Aloe*, Linn.

Dwarf plants, less often arboreous. *Leaves* fleshy, forming rosettes or 2-ranked, usually spinose-dentate. *Flowers* in terminal, simple or branched racemes. *Perianth*-segments united into a cylindric or campanulate, sometimes curved tube, the 6 tips usually free. *Stamens* 6, as long as or longer than the perianth; filaments inserted in a pit in the connective. *Fruit* a loculicidal capsule.

ALOE VERA, Linn.

Introduced and run wild, especially in hedge-rows, in the drier localities, up to 2,500 ft. The Barbados Aloe.

Leaves dense, aggregated, ensiform, 1—2 ft. long, 2—4 in. wide, with horny prickles on the margins; scape 2—3 ft. long; perianth reddish-yellow and green, cylindric, .75—1 in. long. Vern. *Tam.* Kathalai.

6. *Dracaena*, Linn.

Shrubs, sometimes climbing, or small trees. *Leaves* alternate or crowded and subterminal, sessile or petioled, either with strong ribs or with many fine parallel nerves. *Flowers* in terminal, rarely also axillary, racemes, panicles, heads or umbels; bracts small. *Perianth* tubular, campanulate or funnel-shaped, cleft into 6 narrow lobes. *Stamens* 6, at the base of the perianth; filaments filiform; anthers versatile. *Ovary* 3-celled; ovules solitary in each cell, erect; style filiform; stigma capitate. *Fruit* a globose, didymous or 3-lobed berry. *Seeds* globose or angular; testa thickened; embryo small; albumen horny.

DRACAENA TERNIFLORA, Roxb.; *F. B. I.* vi. 328. *D. terminalis*, Wt. *l.c.* t. 2054.

W. Gháts, 250—4,000 ft.; Rampa Hills, 2,000—3,000 ft. (Gamble, Narayanaswami).

A straggling shrub, stems slender, sometimes rooting near the base; leaves elliptic-lanceolate, acute or acuminate, narrowed to the base, 4—9 in. long, 1.4—2.5 in. wide; petioles 1—3 in. long, with widened, amplexicaul base; raceme sometimes branched, usually shorter than the leaves; flowers 1—3 together, 6—9 in. long, cleft about half way, white; pedicels short, jointed below the flower; berry red, 1—3-seeded; seeds 2—3 in. diam.

7. *Dianella*, Lam.

Herbs, often stout, usually branched and stoloniferous. *Leaves* rigid, distichous, sometimes rosulate, often equitant. *Flowers* in cymose

panicles, nodding; pedicels jointed at the top. *Perianth* marcescent, 6-partite; segments spreading. *Stamens* 6, hypogynous or the 3 inner on the bases of the perianth-segments; filaments much thickened; anthers basifixed, reflexed, opening by terminal pores or short slits. *Ovary* 3-celled; ovules 4—8 in each cell; style filiform; stigma minute. *Fruit* a globose berry. *Seeds* few, ovoid or compressed; testa black, shining; albumen fleshy.

DIANELLA ENSIFOLIA, Red.; F. B. I. vi. 337; Wt. Ic. t. 2053.

Anamalai, Pulney and Tinnevely Hills, 3,000—4,000 ft., in evergreen forest.

A stout herb up to 3 ft. high; leaves equitant, linear-ensiform, 1—3 ft. long, .7—1 in. wide; sheath acutely keeled, keel and margins smooth or scabrid; panicle 1—2 ft. long, scape slender, angled and sulcate; flowers white, greenish or bluish, .25—.35 in. long; berry .3—.4 in. diam., cobalt-blue or dark-purple.

8. *Disporum*, Salisb.

Erect herbs, sometimes stout; stems angular, leafy; rootstock creeping. *Leaves* alternate or sometimes opposite, sessile or shortly petioled, strongly nerved, almost ribbed. *Flowers* in terminal or rarely also axillary, few-flowered umbels. *Perianth* petaloid, campanulate, deciduous, 6-partite, segments erect, their bases saccate or spurred. *Stamens* 6, hypogynous; filaments erect, usually flattened; anthers dorsifixed, extrorse. *Ovary* 3-celled; ovules 2—6 in each cell; style long or short; stigmas 3, short. *Fruit* a pisiform berry. *Seeds* few, subglobose; testa brown; albumen horny; embryo small.

Perianth-segments spurred at the base; segments lanceolate, acute, minutely ciliate. *Leaves* oblong-lanceolate, acuminate, base rounded, 2—4 in. long, .75—1.5 in. wide; flowers in sessile or shortly peduncled umbels, .5—.7 in. long, white, greenish or purplish.....1. *calcaratum*.

Perianth segments not spurred at the base, saccate or subsaccate:—

Umbels usually peduncled, peduncles up to .6 in. long; fruiting pedicels 1—1.4 in. long. *Leaves* narrow- to ovate-lanceolate, acuminate, base rounded, sessile or shortly petioled, 2.5—4 in. long, .6—1.75 in. wide; perianth-segments spatulate or lanceolate, acute or acuminate, white or dull purple, .8—.9 in. long...2. *pullum*. Umbels sessile, very rarely very shortly peduncled; fruiting pedicels .7—.9 in. long. *Leaves* ovate to suborbicular, acuminate, base rounded, 1.5—4.8 in. long, .75—2.7 in. wide; petioles .12—.3 in. long, rarely 0; flowers white, segments broadly oblong, acute or acuminate, .3—.6 in. long.....3. *leschenaultianum*.

1. *DISPORUM CALCARATUM*, D. Don; F. B. I. vi. 359.

Vizagapatam District at Lochili, 4,000 ft. (A. W. Lushington).

2. *DISPORUM PULLUM*, Salisb.; F. B. I. vi. 360. *Uvularia umbellata*, Wall. Pl. As. Rar. t. 269.

Vizagapatam District at Antala, 1,500 ft. (Gamble); Godavari District at Ethakonda, 3,000 ft. (Narayanswami).

3. *DISPORUM LESCHENAUXTIANUM*, D. Don; F. B. I. vi. 360; Wt. Ic. t. 2048; *D. mysorensis*, Wt. Ic. t. 2049.

W. Ghâts, 3,000—7,500 ft.

Var. *angustifolium*. *Leaves* linear-lanceolate, caudate-acuminate, base acute, 3—5.5 in. long, .5—1.2 in. wide, calbrid on the nerves beneath.

Nilgiri Hills at Coonoor (Prain).

(All these are very closely allied and may be geographical races rather than separable species.)

9. *Lilium*, Linn.

Tall, unbranched, leafy herbs; root bulbous. *Leaves* few or many, often verticillate. *Flowers* usually very large, axillary or terminal, solitary or 2 or several umbelled or racemed. *Perianth* petaloid, funnel-shaped, 6-partite, usually narrowly nectariferous at the base. *Stamens* 6, hypogynous; filaments long, filamentous or slightly flattened; anthers dorsifixed, versatile. *Ovary* sessile, cylindric, 3-celled; ovules many in each cell, horizontal; style long; stigma globose, sub-3-lobed, rarely 3-fid. *Fruit* a coriaceous, erect, loculicidal, 3-valved, usually 6-angled capsule. *Seeds* vertically compressed; testa pale, membranous.

LILIUM NEILGHERRENSE, Wt. Ic. t. 2031—2; F. B. I. vi. 350. *L. tubiflorum*, Wt. Ic. t. 2033—4. *L. Wallichianum*, Wt. Ic. t. 2035.

Mysore (Lobb); Nilgiri and Pulney Hills; Billigiri Rangan Hills (Fischer); Anamalai Hills (Fischer); Tinnevely Hills; 5,000—8,000 ft.

Stem up to 3 ft. high; leaves sessile, linear- to elliptic-lanceolate, acute, tip callous, strongly nerved, 2·5—6 in. long, 3—1·2 in. wide; flowers 1—3 together, terminal or in the upper axils, 6—10 in. long, white; apex of segments shortly callous, puberulous. The Nilgiri Lily.

10. *Asphodelus*, Linn.

Annual or perennial herbs; root-fibres slender or fleshy. *Leaves* radical, linear, triquetrous or terete and fistular. *Flowers* in simple or paniced racemes, solitary in the axils of small scarious bracts. *Perianth* petaloid, segments 6, free or shortly connate below. *Stamens* 6, hypogynous; filaments dilated below and embracing the ovary; anthers versatile, dorsifixed, filament inserted in a pit. *Ovary* sessile, globose, 3-celled; ovules 2 in each cell, collateral; style filiform; stigma sub-3-lobed. *Fruit* a loculicidal, 3-valved capsule. *Seeds* 1—2 in each cell, triquetrous; testa crustaceous, black; embryo nearly as long as the cartilaginous albumen.

ASPHODELUS TENUIFOLIUS, Cav.; F. B. I. vi. 332. *A. parviflorus*, Wt. Ic. t. 2062.

A weed of fields and gardens. Rare in S. India. Bangalore (Bourne).

Annual; leaves terete, fistular, very slender, acute, 6—12 in. long, base sheathing, glabrous or minutely puberulous; scapes several, 1—2 ft. long, glabrous or sparsely minutely puberulous; flowers white, distant, 1·5—2 in. long; pedicels jointed at or below the middle; capsule 1·5—2 in. in diam., valves transversely wrinkled; seeds sharply 3-angled.

11. *Chlorophytum*, Ker.

Perennial herbs; roots fascicled, often thick, fleshy and tuber-like. *Leaves* radical, clustered, linear or lorate, sometimes broad. *Flowers*

racemose on simple or branched scapes, usually fascicled in the axils of small scarious or large membranous bracts. *Perianth* petaloid, white, marcescent, rarely deciduous; segments 6, free, 3—9-nerved. *Stamens* 6, all hypogynous or the 3 inner shortly adnate to their perianth-segments, included; filaments filiform, often widened above the middle; anthers versatile, linear or oblong, filaments inserted in a small dorsal pit. *Ovary* sessile or subsessile, globose, 3-celled; ovules 4 or more in each cell; style filiform; stigma small. *Fruit* a coriaceous or fleshy, truncate or emarginate, 3-winged or sharply 3-angled, loculicidal, 3-valved capsule. *Seeds* discoid; testa black; embryo rather large, often curved; albumen copious, hard.

Flowers in simple or shortly branched, dense-flowered racemes:—

Leaves narrow-lanceolate or oblanceolate, narrowed into a petiole:—

Scape 2—6 in. long. Collar rather stout; leaves oblanceolate, acuminate, 6—18 in. long (including the broad petiole), 1—2·2 in. wide; bracts longer than the small flowers; pedicels short, jointed near the tip; capsules elliptic-oblong, apex retuse, sharply triquetrous, ·5 in. long.....1. *Heynei*.
Scape 1—2 ft. long:—

Anthers longer than the glabrous filaments. Leaves narrow, lanceolate or oblanceolate, acuminate, 6—24 in. long (including the petiole), 1—2·5 in. wide; scape naked, usually as long as the leaves; pedicels jointed usually below the middle; perianth-segments ·3—·5 in. long; capsules depressed-globose, ·25—·3 in. diam.....2. *arundinaceum*.

Anthers shorter than the papillose filaments. Leaves narrowly oblanceolate, usually recurved, acuminate, 12—18 in. long, 1—2 in. wide; scape usually longer than the leaves with 2—3 sheaths; pedicels jointed usually above the middle; perianth-segments ·25—·33 in. long; capsules globose, emarginate, ·25—·3 in. diam.....3. *glaucum*.

Leaves linear or lorate, not or rarely narrowed into a petiole:—

Leaves falcate; filaments glabrous:—

Scape usually longer than the leaves; perianth-segments 7—9-nerved, ·5—·66 in. long. Root-fibres long, cylindric, tuber-like; leaves sessile, usually ensiform, 8—24 in. long, ·6—1·5 in. wide, margins usually crisped; scape 6—36 in. long; pedicels jointed at or below the middle; anthers as long as the filaments; capsules orbicular, retuse, ·3—·5 in. long, 4—6-seeded.....4. *tuberosum*.
Scape shorter than the leaves; perianth-segments 3-nerved, ·3 in. long. Root-fibres short or long, fleshy or not; leaves ensiform, 6—12 in. long, ·7—1 in. wide; pedicels jointed at or above the middle; anthers shorter than the filaments; capsules broadly obcordate, ·25—·3 in. across, 2—5-seeded.

5. *malabaricum*.

Leaves not falcate; filaments papillose. Root-fibres cylindric, often tuber-like; leaves linear, 7—18 in. long, ·5—1 in. wide, slightly narrowed at the base; scape as long or longer, naked; pedicels jointed about the middle; perianth-segments 3—5-nerved, ·33—·5 in. long; anthers longer than the filaments; capsules obcordate, ·33 in. wide, 3—4-seeded.....6. *attenuatum*.

Flowers in simple or branched racemes, remotely scattered, solitary or in pairs:—

Leaves elliptic-lanceolate, acute, 1—2 ft. long, 1—3·5 in. wide; scape tall, paniculately branched. Root-fibres tuber-like; flowers in distant pairs; pedicels jointed at about the middle; perianth-segments ·33 in. long; capsules reniform, apex 2-lobed, ·33 in. across, cells 1-seeded; seeds evenly orbicular in outline

7. *orchidastrium*.

Leaves subdistichous, grass-like, 6—24 in. long; ·12—·5 in. wide; scape filiform, flexuous, 1—12 in. long; flowers distant; pedicels jointed at about the middle, slender; perianth-segments ·15—·2 in. long; capsules subrotund to oblong ·25—·35 in. long, cells 1—4-seeded; seeds irregularly angled.....8. *laxum*.

1. CHLOROPHYTUM HEYNEI, Baker. *C. Heyneanum*, Wall.; F. B. L. vi. 333.

W. Gháts.

2. *CHLOROPHYTUM ARUNDINACEUM*, Baker; F. B. I. vi. 333.
Godavari District (Bourne); Rampa Hills at 1,000 ft. (Narayan-swami); Nilgiri Hills, Karkur Ghát.
3. *CHLOROPHYTUM GLAUCUM*, Dalz.; F. B. I. vi. 334.
Bababudan Hills (Law). Rare.
4. *CHLOROPHYTUM TUBEROSUM*, Baker; F. B. I. vi. 334. *Phalangium tuberosum*, Wt. Ic. t. 2036.
In all Districts, up to 4,500 ft. Vern. *Tel.* Kushelli.
5. *CHLOROPHYTUM MALABARICUM*, Baker; F. B. I. vi. 335.
W. Gháts, 3,000—6,500 ft.
6. *CHLOROPHYTUM ATTENUATUM*, Baker; F. B. I. vi. 335. *Phalangium attenuatum*, Wt. Ic. t. 2037.
W. Gháts, 1,400—7,000 ft.
7. *CHLOROPHYTUM ORCHIDASTRUM*, Lindl.; F. B. I. vi. 336. *Phalangium oligospermum*, Wt. Ic. t. 2038.
W. Gháts, up to 3,000 ft.; Rampa Hills (Ramaswami).
8. *CHLOROPHYTUM LAXUM*, R. Br.; F. B. I. vi. 336. *Phalangium parviflorum*, Wt. Ic. t. 2039.
W. Gháts, 800—6,000 ft.; Vizagapatam District at Endrika, 5,000 ft. (A. W. Lushington).

12. *Urginea*, Steinh.

Bulbous, scapigerous herbs. *Leaves* narrow. *Flowers* racemed, bracteate, often appearing before the leaves. *Perianth* petaloid, 6-partite, campanulate or tubular. *Stamens* 6, at the base of the perianth-segments, included; filaments filiform, sometimes flattened below; anthers linear or oblong, versatile. *Ovary* sessile, 3-celled; ovules numerous in each cell; style filiform, sometimes geniculate; stigma capitate, 3-grooved. *Fruit* an oblong, ellipsoid or globose, 3-quetrous, loculicidal, 3-valved capsule. *Seeds* numerous, flat; testa black, membranous; embryo rather large; albumen fleshy.

Flowers appearing usually before the leaves:—

- Bulb ovoid, 2—4 in. long; leaves linear-lorate, acute, 6—18 in. long; ·5—1·1 in. wide; scape erect, stout, brittle, 12—30 in. long; perianth-segments linear-oblong, ·5—·75 in. long; pedicels ·5—1 in. long; capsules ellipsoid, ·5—·75 in. long
1. *indica*.
- Bulb globose, 1·5 in. diam.; leaves linear, 4—12 in. long, ·2—·5 in. wide; scape slender, 6—18 in. long, flowers drooping; perianth-segments narrowly linear-oblong, ·25—·4 in. long, tips of all or the inner 3 often puberulous; pedicels filiform, ·4—1·5 in. long; capsules ellipsoid, ·4—·5 in. long...2. *coromandeliana*.
- Flowers appearing with the leaves. Bulb ellipsoid, 1 in. diam.; leaves linear, 3—6 in. long, up to 2 in. wide, sometimes filiform; scape as long or longer; perianth segments linear-oblong, ·2 in. long; pedicels ·15—·25 in. long; capsules subglobose; ·3 in. diam.....3. *congesta*.

1. *URGINEA INDICA*, Kunth; F. B. I. vi. 347.
Coimbatore District, 1,000—1,500 ft. (Fischer).
Flowers dingy-brown.
2. *URGINEA COROMANDELIANA*, Hook. f.; F. B. I. vi. 347. *U. Wightiana*, Hook. f.; F. B. I. vi. 347. *U. indica*, Wt. Ic. t. 2063.
Central and Eastern Districts in fairly dry localities, sea-level to 3,500 ft.
Flowers dull-green and purplish.

3. *URGINEA CONGESTA*, Wt. Ic. t. 2064 (left-hand fig.); F. B. I. vi. 348. Sea-coast (Wight).
Flowers white and purplish.

13. *Scilla*, Linn.

Scapigerous herbs; bulb tunicate. *Leaves* radical, linear, lorate or lanceolate. *Flowers* racemed, bracts small; pedicels inarticulate. *Perianth* petaloid, persistent, 6-partite, stellate or campanulate; segments often recurved; *Stamens* 6, perigynous; filaments usually filiform; anthers ovate or oblong, versatile. *Ovary* sessile or shortly stipitate, 3-celled; ovules 1—2—several in each cell; style filiform; stigma small, capitate. *Fruit* a globose or ovoid, membranous, loculicidal, 3-valved capsule. *Seeds* obovoid or globose, never flat, testa thin, black; embryo shorter than the firm albumen.

SCILLA INDICA, Baker; F. B. I. vi. 348. *Ledebouria hyacinthina*, Roth; Wt. Ic. t. 2040. *Barnardia indica*, Wt. Ic. t. 2041.

In all but the West Coast Districts, sea-level to 4,000 ft.

Bulb ovoid or globose, .5—1.5 in. diam., leaves linear, oblong or lanceolate, obtuse or acute, narrowed into a sheathing petiole, rather fleshy, obtusely keeled on the back, 1.5—7 in. long, .3—1 in. wide, dark-green above, often blotched with black, paler and glaucous below; scape 2—6 in. long; flowers greenish-purple, usually dense; perianth-segments linear-oblong, .15—2.5 in. long; capsules subglobose, .2—3 in. diam. Indian Squill. Vern. Tel. Adavi-tellagadda; Tam. Narivengayam.

14. *Iphigenia*, Kunth.

Erect herbs; stem slender; root a tunicate corm. *Leaves* few, cauline, scattered, narrow. *Flowers* small, erect, solitary or few, corymbose. *Perianth* petaloid, 6-partite; segments stellately spreading or recurved, clawed, deciduous. *Stamens* 6, hypogynous; filaments short, flat; anthers oblong, versatile, introrsely attached. *Ovary* sessile, 3-celled; ovules numerous in each cell; styles 3, minute, connate at the base, stigmatose within. *Fruit* a loculicidal, 3-valved capsule. *Seeds* subglobose; testa thin, brown; embryo small; albumen fleshy.

IPHIGENIA INDICA, Kunth; F. B. I. vi. 357. *Anguillaria indica*, R. Br. Wall. Pl. As. Rar. t. 259.

In all Districts except in the wettest localities, sea-level to 7,000 ft. Corm subglobose, .4—7.5 in. diam.; stem 3—10 in. high; leaves sessile, linear, 3—9 in. long, filiform to .28 in. wide, acuminate; flowers dark-purple, sometimes almost black; perianth-segments linear-subulate to linear-spathulate; filaments sometimes papillose; capsule oblong-ellipsoid, .5—7 in. long. Vern. Tam. Nirpanai.

Allium Cepa, Linn.; F. B. I. vi. 337, the Onion, *A. sativum*, Linn.; F. B. I. vi. 337, the Garlic and other species of the genus are cultivated for their edible bulbs.

Yucca gloriosa, Linn., Adam's Needle or the Egg Plant, is cultivated for its fibre for carpet and mat making.

Family CLX. PONTEDERIACEAE.

Fresh-water and marsh herbs, rooting in mud and erect or floating. *Leaves* erect or floating, parallel-nerved. *Flowers* 2-sexual, irregular, in spikes or racemes or subumbellate, arising from the sheath of the uppermost leaf; bracts sheathing, irregular. *Perianth* inferior, petaloid, unequally or subequally 6-fid or -partite. *Stamens* 1—6, inserted at the base of the perianth, equal or one longer; anthers erect or versatile. *Ovary* superior, free, 3-celled or 1-celled with 3 parietal placentas; ovules 1-many on each placenta; style slender; stigma subentire or lobed. *Fruit* a membranous, loculicidal, 3-valved capsule. *Seeds* small, ovoid or ellipsoid; embryo cylindric; albumen horny or floury.

Petioles not enlarged to form floats; perianth-segments free; one anther longer than the rest, its filament horned on one side.....1. **Monochoria**.
Some, at least, of the petioles enlarged to form floats; perianth distinctly tubular below; anthers equal, filaments not horned.....2. **Eichhornia**.

1. **Monochoria**, Presl.

Fresh-water and marsh herbs; rootstock short or creeping. *Leaves* radical and solitary at the top of the emerging stem or branches. *Perianth* campanulate, tube 0. *Stamens* 6, one usually longer than the rest with its filament horned on one side; anthers basifixed, dehiscing by a terminal, ultimately elongate slit. *Ovary* 3-celled; ovules many in each cell; style filiform; stigma minutely 3-lobed. *Capsules* oblong. *Seeds* many, ovoid, many-ribbed.

Rootstock elongate, creeping; leaves hastate, sagittate or cordate, nerves very close and numerous, acute or acuminate, 3—8 in. long, .75—6 in. wide; petioles up to 2 ft. long, of the floral leaves tumid above and embracing spathe-like the short, stout peduncle; flowers crowded, racemose or subumbellate; perianth-segments obovate, .66 in. long, large anther .2 in. long; pedicels .5—1.2 in. long

1. *hastaeifolia*.

Rootstock short, suberect; leaves ovate or subreniform, nerves not very close or very numerous, acute or acuminate, base rounded or cordate, 2—6 in. long, 1—6 in. wide; petioles up to 21 in. long, the flowering channelled above and embracing spathe-like the elongate peduncles; flowers spicately racemose; perianth-segments narrowly obovate, .5 in. long, large anther .12—15 in. long; pedicels .4 in. or less long.....2. *vaginalis*.

1. MONOCHORIA HASTAEFOLIA, Presl.; F. B. I. vi. 362. *Pontederia hastata*, Roxb. Cor. Pl. t. 111.

In the E. Districts, sometimes in brackish water, at low elevations.

Flowers brilliant purplish blue. Vern. *Tel.* Nir-tamara.

2. MONOCHORIA VAGINALIS, Presl.; F. B. I. vi. 363. *Pontederia vaginalis*, Roxb. Cor. Pl. t. 110.

In all Districts, sea-level to 3,000 ft.

Flowers blue, usually spotted with red. Vern. *Tel.* Nir-Kancha.

Var. *plantaginea*, Solms-Laub.; F. B. I. vi. 363. Smaller, often only 3—4 in. high; leaves linear or narrowly ovate, racemes few-flowered.

2. **Eichhornia**, Kunth.

Water plants, rooting in mud or free floating and rooting at the nodes. *Leaves* erect or floating, obovate, rotund or cordate, rarely

lanceolate. *Flowers* in simple, rarely paniculate, sub-spicate racemes from the sheath of the leaf. *Perianth* funnel-shaped, tube short or long, limb irregular, often 2-lipped. *Stamens* 6, declinate, irregularly inserted, upper included; anthers subequal. *Ovary* sessile, 3-celled; ovules many in each cell; style filiform; stigma slightly swollen or shortly 3-6-lobed. *Capsule* ovoid-oblong or linear. *Seeds* ovoid, many-ribbed.

EICHHORNIA CRASSIPES, Solms.

A beautiful introduced American plant which is gradually spreading in waterways and lakes. It has become a very serious pest in Bengal and Burma. The Water Hyacinth. Leaves in a rosette, spoon- or paddle-shaped, apex rounded, 2-8 in. diam.; petioles usually turbinate swollen to form floats, up to 10 in. long; scape erect from the centre of the rosette, 6-10 in. long; flowers violet-blue, 1-1.3 in. long.

Family CLXI. XYRIDACEAE.

Erect tufted, reed-like, scapigerous herbs. *Leaves* radical, elongate, linear or subulate; sheaths short. *Scape* simple, usually naked. *Flowers* 2-sexual, sessile in the axis of rigid, brown imbricating bracts forming a terminal head or spike; bracts orbicular or obovate, coriaceous, persistent. *Perianth* inferior, 2-seriate. *Sepals* 3, deciduous, 2 lateral small, scarious, like bracteoles, narrow, arched, keeled or winged, dorsal sepaloid, broader, arching over the corolla, sometimes absent. *Petals* 3, marcescent, yellow, clawed, claws more or less connate into a tube below. *Stamens* 3 perfect, shorter than the petals and attached near their bases; anthers sagittate. *Staminodes* 3 alternating with the petals, filiform, sometimes 0. *Ovary* superior, free, 1- or incompletely 3-celled, placenta 3, basal, confluent or parietal; ovules many on each placenta; style 3-fid; stigmas capitate or dilated. *Fruit* a loculicidal, 3-valved capsule, or splitting lid-like round the top. *Seeds* numerous, minute, linear or ellipsoid, strongly ribbed; embryo minute, albumen floury.

Xyris, Linn.

Leaves linear, caespitose or distichous. *Scape* naked or with a single leaf. *Flowers* in globose or ovoid, rarely hemispheric or shortly cylindric heads, opening one at a time; bracts usually obtuse and rigid. *Dorsal sepal* broad, more or less distinctly 3-nerved. *Corolla*-tube short or long, lobes ovate. *Staminodes* usually 3, rarely 0, between the corolla-lobes, shortly filiform, bearded or with an aborted anther.

Comparatively robust herbs, 10-38 in. high; leaves distinctly flat, 1 in. or more wide; scapes strongly ridged or flat and 2-edged:—

Leaves obtuse or acute, 5-12 in. long, 1-2.7 in. wide, not margined or scabrid; scape usually longer, 6-20 in. long, terete, strongly ridged, not scabrid; heads subglobose or ellipsoid, 4-1 in. long; bracts orbicular or cuneately obovate, usually broader than long, dark red-brown, margins entire, glabrous and scarious; lateral sepals linear-spathulate, smooth.....1. *indica*.
Leaves often twisted, rigid, pungently acute, 5-20 in. long, 1-2.5 in. wide, margined, margins usually minutely scabrid; scape longer, up to 38 in. long, flat and sharply 2-edged, edges minutely scabrid; heads ovoid or ellipsoid-

cylindric, 4—9 in. long; bracts orbicular, brown, margins minutely denticulate or ciliate; lateral sepals ovate-lanceolate, keel spinulose.....2. *complanata*. Comparatively slender herbs, 2·5—14 in. high, rarely up to 22 in. high; leaves very narrow, rarely as much as ·1 in. wide; scapes terete, not distinctly ribbed:— Leaves 2—9 in. long, ·03—·1 in., rarely up to ·17 in. wide, acute, often pungent, not papillose; scape usually much longer, striate, sometimes flattish and slightly 2-ribbed, up to 22 in. long; heads globose or ovoid, ·25—·3 in. long; bracts broadly oblong, obtuse, usually dorsally keeled towards the apex, dark-brown; lateral sepals oblanceolate, acuminate.....3. *schoenoides*. Leaves 2—9 in. long, ·03—·07 in. wide, acuminate, minutely papillose; scape as long or a little longer, rarely more than 12 in. long, finely striate, often minutely papillose; heads globose or ovoid, ·2—·5 in. long; bracts orbicular, shining, chestnut-brown, the margins yellowish-brown, apex usually with an acute green tip; lateral sepals oblanceolate, acuminate, keeled, hyaline...4. *pauciflora*.

1. XYRIS INDICA, Linn.; F. B. I. vi. 364.

In marshy localities on the W. Coast.

2. XYRIS COMPLANATA, R. Br. X. *anceps*, Hook. f. non Lam.; F. B. I. vi. 364.

In swampy localities, Quilon (Wight, Rama Row); Malabar-Wynaad at Muthanga, 2,600 ft. (Fischer).

3. XYRIS SCHOENOIDES, Mart.; F. B. I. vi. 365.

In marshy localities, W. Gháts, 4,000—7,000 ft.; Vizagapatam District at Ventala, 4,500 ft. (A. W. Lushington).

4. XYRIS PAUCIFLORA, Willd.; F. B. I. vi. 365.

In marshy localities in all Districts, sea-level to 2,000 ft.

FLORA
OF THE
PRESIDENCY OF MADRAS

J. S. GAMBLE

PART IX
COMMELINACEAE TO CYPERACEAE

BY
C. E. C. FISCHER
LATE OF THE INDIAN FOREST DEPARTMENT

REPRINTED UNDER THE AUTHORITY
OF THE GOVERNMENT OF INDIA

CALCUTTA

1956

INTRODUCTION TO PART IX.

THE present part has been reduced in length so as to close it with the *Cyperaceae*. A full part would have included the first quarter or so of the *Gramineae*, and this would have entailed considerable delay, as the key to the genera, which must find place at the beginning, can be compiled only when the whole family has been reviewed. For this reason it has been deemed advisable to divide the last two parts into three more or less equal ones, of which this is the first. The remaining ones will comprise the family *Gramineae*, the index and other appendices.

The Supplementary Note, dealing with points in Part VIII which required explanation, appeared as No. VI in the 'Kew Bulletin' for 1928, p. 281.

CECIL E. C. FISCHER.

ROYAL BOTANIC GARDENS, KEW :
January, 1931.

FLORA OF MADRAS.

Family CLXII. COMMELINACEAE.

Prostrate or erect herbs, rarely climbing, very rarely shrubby. *Leaves* alternate, with a strong midrib and many slender, parallel nerves, bases usually sheathing. *Inflorescence* various, often cymose and scorpioid, sometimes paniced. *Flowers* usually 2-sexual, more or less irregular, often enclosed in spathe-like bracts. *Perianth* inferior, 6-partite, 2-seriate; 3 outer segments herbaceous (*sepals*), often persistent, 3 inner petaloid (*petals*), free or united into a tube below, spreading above, marcescent. *Stamens* 6, adnate to the base of the perianth, all perfect or 2 or more reduced to staminodes; filaments often bearded with jointed hairs; anthers oblong or globose, often dissimilar. *Ovary* superior, 2—3-celled; ovules 1—several in the inner angle of each cell, orthotropous; style terminal, stigma small. *Fruit* a loculicidal capsule or indehiscent. *Seeds* angled; testa smooth or rugose; embryo minute; albumen floury.

- Fruit indehiscent, fragile, blue.....1. **Pollia**.
 Fruit loculicidally 2—3-valved:—
 Fertile stamens 3, staminodes 1—3:—
 Cymes 1—2, arising from a spathaceous bract.....2. **Commelina**.
 Cymes paniced, not arising from a spathaceous bract.....3. **Aneilema**,
 Fertile stamens 6, staminodes 0:—
 Cymes not paniced; capsules 3-celled:—
 Cymes scorpioid, formed by biseriata, foliaceous bracteoles.....4. **Cyanotis**.
 Cymes not scorpioid, not enclosed in biseriata bracteoles.....5. **Belosynapsis**.
 Cymes paniced; capsules 2-celled.....6. **Floscopa**.

1. **Pollia**, Thunb.

Large erect, sparsely branched herbs. *Leaves* lanceolate. *Cymes* in a terminal, sometimes also axillary, panicle. *Sepals* 3, free. *Petals* 3, free, smaller, subequal. *Stamens* 6 or 3 with 3 staminodes; filaments naked; anthers oblong, sterile anthers triangular-lanceolate-hastate. *Ovary* sessile, 3-celled; ovules 2—10 in each cell. *Fruit* globose or ovoid. *Seeds* 2-seriate, dorsally or laterally compressed, smooth; testa firm.

POLLIA SORZOGONENSIS, Endl. var. INDICA, C. B. Clarke; F. B. I. vi. 368.

Coorg (Hohenacker); S. Kanara (Meebold); Wynaad at 3,000 ft. (Gamble); Anamalai and Tinnevely Hills (Beddome) Godavari District at Ethakonda, 2,800 ft. (V. Narayanswami).

Stem, stout, viscid; leaves linear- or elliptic-lanceolate, caudate-acuminate, base narrowed or rounded, 3.75—10 in. long, 1.2—3 in. wide, puberulous when young, glabrescent; petioles of lower leaves up to .5 in. long, with loose puberulous sheaths up to 1.5 in. long, upper leaves practically sessile and sheathless; panicle

viscidly pubescent; bracts oblong persistent; petals white or pale pink; stamens 3 perfect; fruit globose, blue, .25 in. diam., cells many-seeded.

2. *Commelina*, Linn.

Herbs, usually slender and creeping below; sometimes tuberous. *Leaves* with usually lax sheaths, sessile or petioled. *Flowers* in usually 2-fid cymes emerging one at a time from a terminal complicate, cucullate or funnel-shaped spathiform bract, the flowers of the upper cyme usually small and deciduous, of the lower fertile; fruiting pedicels and capsules retracted within the bract. *Sepals* 3, membranous, the 2 inner often connate at the base. *Petals* 3, longer, 2 of them usually larger and long-clawed, the 3rd sometimes absent. *Stamens* 3 perfect and 2—3 imperfect; filaments filiform, often spirally coiled; anthers oblong, one usually larger than the rest, the imperfect often cruciform. *Ovary* 3- (rarely 2-) celled, 2 anticus cells 1—2 ovuled, the posticus, when present, 1-ovuled or empty. *Fruit* a loculicidal capsule, the posticus cell sometimes indehiscent, sometimes absent, or the 2 anticus cells empty, indehiscent and connate as a ligulate body from which the posticus falls away. *Seeds* cylindric, ellipsoid, subglobose or angled; testa smooth, rugose, reticulate, pitted or grooved.

The 2 anticus cells of the ovary 2-ovuled, the posticus 1-ovuled or obsolete:—

Spathes complicate, margins free or connate only at the very base:—

Capsules 3-celled:—

Posticus cell of the capsule keeled:—

Spathes sessile or nearly so, falcate, acute, base cordate, .25—4 in. long, pubescent, ciliate; seeds transversely grooved, puberulous, black. Stem erect, slender, 8—16 in. high; leaves linear, acute, 1—3 in. long, .1—1.5 in. wide; sheaths .5 in. long or less, margins glabrous or ciliate

1. *subulata*.

Spathes distinctly peduncled; seeds not grooved:—

Seed tuberculate and reticulate, oblong-cylindric, dark brown. Stem diffuse, subsucculent, 2—3 ft. high, sometimes more; leaves lanceolate or ovate-lanceolate, acute or acuminate, glabrous or puberulous, 1.25—3 in. long, .4—75 in. wide; sheaths loose, .75 in. or more long, glabrous, margins usually ciliate; peduncles .5—75 in. long; spathes ovate or ovate-lanceolate, acute or acuminate, base rounded or cordate, .75—1.3 in. long.....2. *nudiflora*.

Seeds smooth, truncate at one end:—

Branches of cymes equal, usually 1—2-flowered, flowers small, polygamous; seeds ovoid or subglobose, black powdered with white, with a whitish membranous appendage at one end. Stems slender, decumbent, internodes long; leaves linear to linear-lanceolate; spathes ovate or narrow-lanceolate, short and acute or acuminate or long and finely or subobtusely caudate-acuminate, base rounded, more or less cordate, sometimes strongly auriculate; .8—2.5 in. long; peduncles .3—2.2 in. long.....3. *salicifolia*.
Branches of cymes usually unequal, upper 2—4 lower usually 1—2-flowered; seeds cylindric, subacute or rounded at one end, not appendaged. Stem much-branched; leaves narrow-lanceolate, subacute, 1—3 in. long, .4—7 in. wide; sheaths .5 in. long, base broad, ciliate; peduncles .5—1.5 in. long; spathes ovate-lanceolate, base rounded and cordate, .5—1.3 in. long, glabrous, scabrid or hispid

4. *Hasskarltii*.

Posticus cell of capsule not keeled:—

Whole plant hirsute (rarely glabrescent); stems erect, usually branched from the base, 3—18 in. high, slender; leaves linear to linear-lanceolate, obtuse, acute or acuminate, peduncles .5—2 in. long; spathes lanceolate

or linear-lanceolate, acuminate, base shallowly cordate, nerves slightly curved, .6—1.6 in. long.....5. *hirsuta*.
 Glabrous or nearly so; stems erect or caespitose, branched, 5—20 in. high, slender; leaves linear to oblong, obtuse or acute, .6—3 in. long, .2—.5 in. wide; sheaths short, margins ciliate; peduncles slender, .5—3 in. long, usually scabrous-pubescent; spathes ovate-lanceolate, acuminate, base deeply cordate, nerves strongly arched, .5—.9 in. long, margins usually ciliate

6. *glabra*.

Capsules 2-celled, rarely the posticous cell present and empty or with an imperfect seed :—

Spathes broad, base not auricled :—

Leaves linear- to elliptic-lanceolate, acute or acuminate, base narrowed, 1.5—3 in. long, .5—.75 in. wide; sheaths .4—1 in. long, narrowed to the blade, usually hirsute at the mouth; peduncles .75—1.75 in. long; spathes ovate-lanceolate, acuminate, base rounded or cordate, .8—1.7 in. long; capsule slightly constricted at the middle, tip bicuspidate; seeds 4 (sometimes 2 wanting), reticulately pitted.....7. *clavata*.

Leaves ovate-lanceolate, acuminate, base rounded and then narrowed into a short petiole, 2—.5 in. long, .9—2 in. wide; sheaths .6—1 in. long, mouth usually minutely pubescent; peduncles .5—.75 in. long; spathes ovate, acute, base truncately rounded; .7—1 in. long, capsules oblong, obtuse; seeds obscurely undulate-rugose.....8. *persicariaefolia*.

Spathes narrowly ovate-lanceolate, acute or caudate-acuminate, base distinctly sagittate-auriculate, .5—1.6 in. long. Stem slender, .5—3 ft. long; leaves linear or linear-lanceolate, sometimes falcate, acute or subobtuse, 1—3 in. long, .12—.5 in. wide; peduncles slender, .3—1.5 in. long; flowers small; seeds pale with a white appendage at each end.....9. *attenuata*.

Spathes funnel-shaped or cucullate :—

Leaves ovate or ovate-lanceolate :—

Leaves ovate, oblong or suborbicular, obtuse or acute, base contracted into a petiole, often inequilateral, .75—3.6 in. long, .6—1.7 in. wide, pubescent or villous; petioles up to .5 in. long, rarely 0; sheaths short or long, like the petioles pubescent or villous and the margins strongly ciliate with rufous hairs. Stem 2—3 ft. long, branched, diffuse; peduncles very short or 0; spathes 1—3 together, auricled on one side, pubescent or hirsute, .4—.7 in. long; capsules pyriform; seeds closely pitted.....10. *benghalensis*.

Leaves ovate or ovate-lanceolate, acute or acuminate, base rounded or subcordate, sessile, 1—2.4 in. long, glabrous, margins often crisped; sheaths .4—.8 in. long, mouth minutely ciliate; peduncles .4—.6 in. long, sulcate and angled, thickened and puberulous at the apex; spathes ovate-falcate, acute, base rounded, .6—1 in. long, puberulous; capsules quadrate, margined, either 3-celled and 5-seeded or 2-celled and 4-seeded; seeds oblong, curved, with 4—7 transverse ridges.....11. *Jacobii*.

Leaves linear or linear-oblong, obtuse or subacute, narrowed at the base, 1—2 in. long, .25—.5 in. wide, margins usually undulate or crenulate. Stems diffuse, short or long; sheaths .3—.5 in. long, ciliate; peduncles .25—.4 in. long; spathes broadly ovate, acute, base usually truncate, sparsely hairy with long slender hairs, .4—.5 in. long; seeds orange-brown.....12. *Forskalaiei*.

All the cells of the ovary 1-ovuled :—

Capsules 3-celled :—

Capsules subequally 3-valved, seeds free in the cells :—

Spathes sessile or nearly so :—

Leaves lanceolate or elliptic-lanceolate, acute or caudate-acuminate, base narrowed, glabrous, scabrous or villous, 2.2—8 in. long, .6—2 in. wide, sessile or shortly petioled; sheaths up to 1 in. long, mouth bearded with long, sometimes rufous, hairs. Stem stout, 2—3 ft. high; spathes sessile, solitary or crowded in terminal heads, funnel-shaped, acute, .75—1 in. long, glabrous, subsabrid or glandular-hirsute with red hairs, usually filled with a clear glutinous fluid; capsules trigonous-obovoid; seeds oblong or ellipsoid, smooth, lead-coloured.....13. *obliqua*.

Leaves linear or linear-lanceolate, obtuse, acute or acuminate, base narrowed, sessile, glabrous or minutely puberulous, 2—6 in. long, .2—.5 in. wide. Stem slender, 9—24 in. high; sheaths .5—1 in. long, glabrous or

minutely puberulous, mouth glabrous or ciliate; spathes usually very shortly peduncled, cucullate, acute, base truncate, .6—8 in. long, pubescent and often setose.....14. *undulata* var. *setosa*.

Spathes distinctly peduncled, shortly cucullate, ovate, acute or acuminate, base broadly rhomboid, .75—1.3 in. long, scabridly pubescent; peduncles .3—8 in. long. Stem stout, branched; leaves elliptic to broadly lanceolate, acuminate, base usually cuneate, 2—6 in. long, 1—1.75 in. wide, glabrous or nearly so; capsules quadrate-oblong; seeds ellipsoid, dull black

15. *paleata*.

Capsules 2-valved; seeds adnate to the cells, broadly ellipsoid, ashy. Stem stout, 1—2 ft. high, hairy or glabrate; leaves narrowly lanceolate, acuminate, scaberulous, puberulous or hirsute, 2—6 in. long, .25—1 in. wide; sheaths .5—1 in. long, ciliate; spathes sessile or nearly so, solitary or clustered, cucullate, broadly cordate, acute, recurved, about .75 in. long and broad, glabrous or pubescent.....16. *Kurzii*.

Capsule 2-celled. Stem slender, up to 18 in. long; leaves linear to linear-lanceolate, acute or subobtuse, base narrowed, 1—3 in. long, .2—4 in. wide, glabrous or with deciduous hairs; sheaths .4—8 in. long, often rather inflated, glabrous or minutely puberulous; peduncles short; spathes cucullate, ovate, acute, truncate on one margin, hooked on the other, glabrous or hairy, .5—7 in. long; seeds ellipsoid, smooth.....17. *ensifolia*.

1. *COMMELINA SUBULATA*, Roth; F. B. I. vi. 369.

Hills of the Deccan; 3,000—4,000 ft.

Flowers orange-purple, drying violet.

2. *COMMELINA NUDIFLORA*, Linn.; F. B. I. vi. 369.

In all Districts, up to 4,500 ft.

Flowers blue, sometimes very pale.

3. *COMMELINA SALICIFOLIA*, Roxb.; F. B. I. vi. 370; Clarke Comm. Beng. t. 2.

N. Circars; W. Gháts; 100—7,000 ft.

Flowers dark-blue.

4. *COMMELINA HASSKARLII*, Clarke Comm. Beng. t. 3; F. B. I. vi. 370.

Deccan and W. Gháts at low elevations.

5. *COMMELINA HIRSUTA*, Clarke; F. B. I. vi. 371. *Heterocarpus hirsutus*, Wt. Ic. t. 2067.

Nilgiri and Pulney Hills; 6,000—8,000 ft.

Flowers yellow, drying deep-blue.

6. *COMMELINA GLABRA*, Clarke; F. B. I. vi. 371. *Heterocarpus glaber*, Wt. Ic. t. 2067.

In the Central Districts; 600—3,000 ft.

Flowers yellow.

7. *COMMELINA CLAVATA*, Clarke Comm. Beng. t. 5; F. B. I. vi. 371.

In all Districts; sea-level to 7,000 ft.

Flowers lilac.

Var. *Hohenackeri*, Clarke; F. B. I. vi. 371. Leaves oblong, sub-acute, spathes smaller, tip acuminate.

8. *COMMELINA PERSICARIAEFOLIA*, Wight; F. B. I. vi. 372.

Anamalais at 2,000 ft. (Fischer); Dindigul (Wight); Pulney Hills (Bourne, Saulière); Mangalore (Meebold).

9. *COMMELINA ATTENUATA*, Koen.; F. B. I. vi. 372.

E. Districts from the Nallamallais to Salem District, Mysore and Quilon. On sea-shore sands and up to 3,000 ft.

Flowers small, blue.

10. *COMMELINA BENGHALENSIS*, Linn.; F. B. I. vi. 370; Wt. Ic. t. 2065; Clarke Comm. Beng. t. 4.
In all Districts except in the wettest localities; sea-level to 4,000 ft.
Flowers blue. The lower nodes sometimes develop naked underground shoots bearing smaller white flowers which ripen large seeds underground, whereas perfect seeds are often not developed in the normal flowers. Vern. Tam. Adutinnathalai.
11. *COMMELINA JACOBII*, Fischer in Kew Bull. 1928, 277.
Salem District at Buddireddipatti (K. C. Jacob) and Coimbatore District at the Agricultural College farm (K. C. Jacob); about 1,300 ft.
Flowers blue.
12. *COMMELINA FORSKALAEI*, Vahl; F. B. I. vi. 371.
In dry tracts from Mysore to Cape Comorin.
Flowers blue.
13. *COMMELINA OBLIQUA*, Ham.; F. B. I. vi. 372; Clarke Comm. Beng. t. 9. *C. polyspatha*, Wt. Ic. t. 2066.
In all Districts, up to 3,000 ft.
Flowers blue.
14. *COMMELINA UNDULATA*, R. Br. *var. SETOSA*, Clarke; F. B. I. vi. 373.
E. Districts from Anantapur to Tinnevely and Travancore (M. Rama Rao); sea-level to 4,000 ft.
Flowers blue.
15. *COMMELINA PALEATA*, Hassk.; F. B. I. vi. 372.
Bababudans (Law); Coimbatore District at 600 ft. (Fischer); Pulneys at 1,600 ft. (Rodriguez); Courtallam.
Flowers blue.
16. *COMMELINA KURZII*, Clarke Comm. Beng. t. 8; F. B. I. vi. 373.
Deccan from Kurnool and Mysore to Coimbatore; 1,000—4,000 ft.
Flowers blue.
Var. glochidea, Clarke; F. B. I. vi. 374. Leaves elliptic-lanceolate, shorter, laxly pilose, scabrid or nearly glabrous.
17. *COMMELINA ENSIFOLIA*, R. Br.; F. B. I. vi. 374.
E. Districts from Bellary to Tinnevely; sea-level to 4,000 ft.

Commelina coelestis, Willd.; F. B. I. vi. 369, is an escape from cultivation round about Ootacamund, where it is becoming established. It is a stout plant 2—3 ft. high with large lanceolate, sessile leaves; peduncled, shortly cucullate spathes which are ovate- to rotund-lanceolate, 1—1.5 in. long and beautiful large deep-blue flowers.

3. *Aneilema*, R. Brown.

Herbs; roots often tuberous. Leaves usually alternate, sometimes all radical. Flowers in axillary and terminal panicles, seldom solitary or a few fascicled, bracteate and bracteolate, bracts not spathaceous. Sepals 3, free, membranous. Petals 3, free, subequal. Stamens 2 or 3 with perfect anthers; filaments naked or bearded; anthers oblong, one usually larger or smaller. Staminodes 2—4, rarely 0, with imperfect, rarely polliniferous, and minute, anthers. Ovary sessile, 2- or 3-celled;

ovules 1—2-many in each cell; style slender, naked or bearded; stigma minute. *Fruit* a loculicidal capsule. *Seeds* 1 or more in each cell; testa hard, rugose, pitted or smooth.

Cells of ovary 2-many-ovuled:—

Seeds 1-seriate in each cell:—

Cells of the ovary 3—many-ovuled; of the capsule 1—many-seeded:—

Flowers panicled on a radical or subradical, rarely leafy scape:—

Roots fibrous; leaves rosulate, broadly ensiform, acute or acuminate, 2—9 in. long, .6—1.6 in. wide, margins crisped; scape erect, branched from near its base, up to 9 in. long; panicle spreading, lax-flowered; bracts small, not sheathing.....1. *glaucum*.

Roots of fascicled, elongate tubers; leaves radical, linear-ensiform, acuminate, 2.5—10 in. long, .3—5 in. wide; scape erect, up to 20 in. long; panicle elongate, narrow; bracts large, sheathing.....2. *scapiflorum*.

Flowering stem leafy:—

Flowers corymbose or panicled:—

Leaves ovate-lanceolate or elliptic-oblong, acute or acuminate, base rounded or cordate, 4—6 in. (lower sometimes 12 in.) long, 1.2—2.3 in. wide, margins white, undulate. Root of slender tubers; stem 3—4 ft. high; panicles stout, dichotomously branched; capsule subglobose; seeds reticulate, glandular-pubescent.....3. *lineolatum*.
Leaves usually narrow, margins not white nor undulate; capsules narrowly ellipsoid:—

Leaves narrowly lanceolate, rarely ovate-lanceolate, acuminate, rarely acute, base cuneate, rounded or cordate, 2—9 in. long, .5—1.6 in. wide; sheaths .5—1.25 in. long; panicles terminal and from the 1 or 2 uppermost axils, sessile or nearly so; seeds not glandular

4. *zeylanicum* var. *longicapsa*.

Leaves .25—5 in. wide; sheaths .6 in. or less long; panicles on terminal peduncles:—

Stems erect; leaves narrowed or rounded at the base; mouth of sheath oblique:—

Roots tuberous; stems subsolitary; leaves linear, usually complicate, often recurved, obtuse or acute, 2—4 in. long, .25—4 in. wide; panicle spreading; bracts oblong or the lower 1 or 2 foliaceous; seeds subcubical, dark-brown, obscurely scabrid or pitted.....5. *esculentum*.

Roots fibrous; stems few-many, branching from the base; leaves linear-oblong to ovate-lanceolate, usually flat, acute or obtuse, 1—3 in. long, .3—5 in. wide; panicles sparingly dichotomously branched usually few-flowered; bracts ovate or orbicular, cucullate; seeds subcubical, dark-brown, minutely striate.....6. *dimorphum*.

Stems decumbent, usually dwarf; roots fibrous; leaves oblong, sometimes the lower narrowly lanceolate, acute, base cordate and amplexicaul, .5—1.5 in. long, .3—5 in. wide, ribbed when dry; mouth of sheath straight; panicles branched, few-flowered, terminal and from the upper axils; bracts minute, ovate, amplexicaul; seeds minute, angular or cubical, straw-coloured.....7. *spiratum*.

Cymes 1—3 (rarely 4- or 5-) flowered, axillary. Roots fibrous; stems decumbent and rooting at the nodes, villous on one side; leaves sessile, ovate, acute or subacute, base usually cordate, .5—2 in. long, .25—65 in. wide, more or less hairy; sheaths short, usually hairy; fruiting pedicels usually decurved; seeds cubical, black, nearly smooth.....8. *pauciflorum*.

Cells of the ovary 2- (rarely 3-) ovuled; of the capsule 2- (rarely 3-) seeded:—

Flowers in subglobose or subcorymbose cymes at the ends of the branches of the panicle; scars on the rhachis not or obscurely raised. Root fibrous; stem subsimple or branched from the base, branches usually weak and procumbent, often rooting at the nodes; leaves linear or linear lanceolate, acute or acuminate, base narrowed, rounded or cordate, 1.5—5 in. long, .25—5 in. wide; sheaths open, margins strongly ciliate; panicles terminal, rarely axillary.....9. *nudiflorum*.

Flowers in lax panicles; scars on the rhachis usually prominently raised:—
 Roots tuberous; stems 1–2 ft. high; leaves tufted at the base and a few
 cauline, linear, acute or acuminate, 3–12 in. long, .25–.6 in. wide;
 sheaths long, ciliate; bracts ovate, acute, membranous; fertile stamens 2;
 filaments bearded, twice as long as the 3 naked staminodes, rudimentary
 stamen bearded; seeds obscurely rugose.....10. *sinicum*.
 Roots fibrous; stems 1–3.5 ft. high; leaves linear, finely acuminate,
 striate, lowest 10–18 in., upper 2–5 in. long, .3–.6 in. wide; sheaths
 glabrous or villous with long hairs; bracts broadly ovate, acute, base
 cordate; fertile stamens 3; filaments bearded, as long as the 3 bearded
 staminodes, no rudimentary stamen; seeds rough or echinulate

11. *giganteum*.

Seeds 2-seriate in each cell:—

Flowers axillary, solitary or few clustered; pedicels jointed:—

Leaves oblong or ovate-oblong, acute or subobtusate, base cordate, subam-
 plexicaul, .5–1 in. long, .2–.5 in. wide, glabrous or nearly so. Stems 4–8
 in. long, rooting at the lower nodes, usually villous on one side, leafy;
 pedicels 1–7 together, .25–.75 in. long, jointed usually well below the
 middle, erect in fruit; capsules broadly oblong, obtuse, mucronate, .12–.16
 in. long; seeds angular, rugose, straw-coloured.....12. *ochraceum*.
 Leaves linear to linear-lanceolate, finely acuminate, base broad, 1–2.5 in.
 long, .2–.5 in. wide, pubescent, conspicuously striate, margins undulate.
 Stems erect, 6–16 in. long, pubescent, villous or nearly glabrous, leafy;
 pedicels 1–5 from the upper leaf-sheaths, .75–2 in. long, jointed at the
 middle, with 2 minute, scarious bracteoles at the joints, puberulous below
 the joint, glabrous above; capsules oblong-trigonal, long-cuspidate with
 the style, .25–.3 in. long; seeds angular, smooth or slightly pitted

13. *lanuginosum*.

Flowers terminal, paniced; pedicels not jointed:—

Stems much branched, 6–12 in. high; leaves linear to linear-lanceolate,
 obtuse or acute, base rounded or shallowly cordate, 1–3 in. long, .1–.25 in.
 wide; panicles much dichotomously branched, branches slender flexuous;
 bracts persistent, ochreate; filaments all bearded; capsules linear oblong,
 .17–.2 in. long; seeds 15–16 in each cell, minutely tessellate.....14. *Koenigii*.
 Stems tufted, 1.5–8 (rarely —12) in. high, sheathed at the base with broad,
 scarious sheaths; leaves filiform, narrowly linear or subulate-semiterete,
 acute and often apiculate, 1–6.5 in. long, up to .08, rarely .1, in. wide;
 panicles branched, spreading branches capillary, few-flowered; bracts minute,
 ochreate, apiculate; filaments all naked; capsules subglobose, .08–.12 in.
 long; seeds 6–8 in each cell, smooth.....15. *paniculatum*.

Cells of the ovary 1-ovuled; of the capsule 1-seeded or empty:—

Capsules glabrous; bracts not funnel-shaped:—

Leaves linear, sessile, acuminate, 1.5–8 in. long, .2–.4 in. wide; flowers
 solitary or 2–6 fascicled in the axils of persistent, usually distant, bracts.
 Root of stout, almost fleshy, fibres; stems 6–18 in. long, flaccid, often root-
 ing at the lower nodes; bracts narrowly oblong, obtuse, sheathing, strongly
 ribbed, .3–.6 in. long; pedicels slender, usually 2-jointed, with a scarious,
 sheathing bracteole at the lower or only joint; capsule globose, cuspidate,
 .15 in. long; seeds hemispheric, rugose.....16. *vaginatum*.

Leaves broad, petioled, aggregated and enlarging upwards; flowers in terminal
 panicles; bracts caducous:—

Panicles lax, peduncled, much exceeding the uppermost leaves; fruiting
 pedicels erect. Roots fibrous; stem stout, creeping and rooting, then erect,
 6–36 in. high; leaves elliptic-lanceolate, acuminate, base narrowed into a
 short petiole, glabrous or scaberulous, 2.5–7 in. long, .8–1.75 in. wide;
 sheaths .5–1.6 in. long, glabrous or puberulous, mouth usually ciliate;
 fertile stamens 3; capsule globose, .16 in. diam.; seeds hemispheric, rugose

17. *montanum*.

Panicles short, subsessile, pyramidal, much shorter than the uppermost
 leaves; fruiting pedicels decurved. Roots long fibrous; stem stout, erect,
 8–36 in. long; leaves broadly elliptic or elliptic-lanceolate, acuminate or
 caudate-acuminate, base narrowed into the petiole, puberulous or

glabrescent, 3—6·5 in. long, 1—2 in. wide; sheaths glabrous or pubescent, mouth usually ciliate, 6—1·3 in. long; fertile stamens 2; capsules globose, 2—2·5 in. diam.; seeds reticulate.....18. *ovalifolium*.

Capsules globose, pubescent, 12—15 in. long; bracts persistent, funnel-shaped. Roots fibrous; stem stout, 2—3 ft. high, puberulous, sometimes decumbent and rooting at the lower nodes; leaves scattered, usually distant, not enlarging upwards, lanceolate or oblong-lanceolate, acuminate, base rounded and then narrowed into a petiole, 3—7 in. long, 75—1·75 in. wide, hispid above, glabrous below; sheaths loose, 6—1·2 in. long, viscid or hispid, mouth long-ciliate; panicles with long, slender peduncles and branches; seeds plano-convex, glaucous, black, rugose.....19. *scaberrimum*.

1. *ANEILEMA GLAUCUM*, Thw.; F. B. I. vi. 375.
Travancore and Tinnevely Hills; 3,000—5,000 ft.
Flowers pale pinkish-violet.
2. *ANEILEMA SCAPIFLORUM*, Wt. Ic. t. 2073; F. B. I. vi. 375; Clarke Comm. Beng. t. 14.
Coorg (Heyne); Nilambur (Bourne); Cochin and Courtallam (Wight).
Flowers blue-mauve.
3. *ANEILEMA LINEOLATUM*, Kunth; F. B. I. vi. 376; Clarke Comm. Beng. t. 15. *A. latifolium*, Wt. Ic. t. 2072.
W. Gháts; 1,500—4,000 ft.
Flowers blue.
4. *ANEILEMA ZEYLANICUM*, Clarke *var.* *LONGICAPSA*, Clarke; F. B. I. vi. 376.
W. Gháts; 4,000—6,000 ft.
Flowers white.
5. *ANEILEMA ESCULENTUM*, Wall., F. B. I. vi. 377.
In rice-fields near Madras (Heyne, Wight).
6. *ANEILEMA DIMORPHUM*, Dalz.; F. B. I. vi. 377. *A. paniculata*, Wt. Ic. t. 2075.
In all Districts, on sea-shore sands and up to 7,500 ft.
Flowers blue or white.
7. *ANEILEMA SPIRATUM*, R. Br.; F. B. I. vi. 377. *A. nanum*, Kunth; Wt. Ic. t. 2077; Clarke Comm. Beng. t. 18.
In all Districts; sea-level to 5,000 ft.
Flowers blue to rose-brown.
8. *ANEILEMA PAUCHFLORUM*, Wt. Ic. t. 2077; F. B. I. vi. 378.
W. Coast and Gháts; near sea-level to 3,000 ft.
Flowers brownish-yellow, drying blue.
9. *ANEILEMA NUDIFLORUM*, R. Br.; F. B. I. vi. 378; Clarke Comm. Beng. t. 21.
In all Districts, sea-level to 4,000 ft.
Flowers blue or purplish.
Var. terminalis, Clarke; F. B. I. vi. 379. *A. terminalis*, Wt. Ic. t. 2076. More robust, leaves up to 8 in. long and 75 in. wide.
10. *ANEILEMA SINICUM*, Lindl.; F. B. I. vi. 379. *A. secundum*, Wt. Ic. t. 2075.
W. Gháts; 3,000—5,000 ft.
Flowers blue.

11. ANEILEMA GIGANTEUM, R. Br.; F. B. I. vi. 379. *A. ensifolium*, Wt. Ic. t. 2074; Clarke Comm. Beng. t. 22.
W. Gháts; 1,000—2,000 ft.
Flowers blue.
12. ANEILEMA OCHRACEUM, Dalz.; F. B. I. vi. 380. *Dichaespermum repens*, Wt. Ic. t. 2078, fig. 3.
Coorg (Bourne); S. Kanara (Hohenacker); Quilon in damp sandy soil (Wight).
Flowers brownish-yellow.
13. ANEILEMA LANUGINOSUM, Wall.; F. B. I. vi. 380.
Bababudan and Brahmagiri Hills (Beddome); Nilgiri Hills; 4,000—6,000 ft.
Flowers salmon-yellow, drying blue.
14. ANEILEMA KOENIGII, Wall. F. B. I. vi. 381. *Dichaespermum lanceolatum*, Wt. Ic. t. 2078, fig. 1.
Nilgiris? (Adam); Mangalore (Hohenacker); Quilon, Courtallam at 500 ft. and Palamkotta (Wight); Red Hills (G. Thomson).
Flowers blue.
15. ANEILEMA PANICULATUM, Wall.; F. B. I. vi. 381. *Dichaespermum juncoides*, Wt. Ic. t. 2078, fig. 2.
W. Coast and Gháts; near sea-level to 4,000 ft.
Flowers blue.
16. ANEILEMA VAGINATUM, R. Br.; F. B. I. vi. 381; Wt. Ic. t. 2076; Clarke Comm. Beng. t. 23.
Low-lying tracts on both coasts, often on sea-shore sands.
Flowers blue.
17. ANEILEMA MONTANUM, Wight; F. B. I. vi. 381. *Dictyospermum montanum*, Wt. Ic. t. 2069.
W. Gháts; 1,000—5,000 ft.
Flowers blue.
18. ANEILEMA OVALIFOLIUM, Hook. f.; F. B. I. vi. 382. *Dictyospermum ovalifolium*, Wt. Ic. t. 2070.
W. Gháts from Mysore to Travancore; 3,000—4,000 ft.
19. ANEILEMA SCABERRIMUM, Kunth; F. B. I. vi. 382. *A. protensum*, Wall.; Clarke Comm. Beng. t. 24. *Dictyospermum protensum*, Wt. Ic. t. 2071.
W. Gháts from Coorg to Travancore; 500—6,000 ft.; Rampa Hills at Sesharayi, 2,000 ft. (V. Narayanswami).
Flowers white.

4. Cyanotis, Don.

Prostrate, creeping or erect terrestrial herbs; roots sometimes tuberous. *Leaves* sheathing. *Flowers* in axillary or terminal, usually scorpioid, cymes formed by imbricate, biserial, secund, foliaceous bracteoles, usually the petals, stamens and style alone, rarely the whole flower, exposed. *Sepals* 3, subequal, free or connate below. *Petals* 3, subequal, often united into a tube below. *Stamens* 6, all perfect, subequal; filaments filiform, usually bearded, sometimes inflated towards the apex; anthers oblong. *Ovary* 3-celled; ovules 2 in each cell, collateral, one erect, the other pendulous; style linear, bearded or

naked, sometimes inflated below the apex; stigma minute, concave. *Fruit* a 3-celled, loculicidally 3-valved capsule. *Seeds* usually 2, casually 1 or 0, in each cell, superposed, cubical, cylindric or pyramidal, usually rugose or pitted.

Cymes not enclosed in the leaf-sheaths:—

Valves of the capsule separating from a free, central, columnar, 3-toothed axis. Stem 3—12 in. long, decumbent and often rooting at the nodes, usually patently hirsute, sometimes nearly glabrous, often reddish; leaves linear-lanceolate or -ensiform or -oblong, acute, acuminate or obtuse and apiculate, more or less hairy, .7—2.5 in. long, .1—4 in. wide; peduncles .5—3 in. long, usually patently hairy; bract falcate, usually slightly longer than the cyme; bracteoles .2—35 in. long, ovate, falcate, acute, ciliate; filaments bearded; capsules hairy at the apex.....1. *papilionacea*.

Capsule without a free, central column after dehiscence:—

Not cottony- or silky-cobwebby:—

Bract much exceeding (usually at least twice) the cyme. Stem 6—18 in. long, glabrous or with spreading hairs, internodes usually long; leaves ovate-oblong, obtuse or subacute, base rounded or cordate, glabrous or with spreading hairs, ciliate, 1—3.7 in. long, .25—8 in. wide; peduncles 0—5 in. long; bract leaf-like, acute or acuminate, up to 2.8 in. long; cyme usually much recurved; bracteoles ovate, usually broad, falcate, .5 in. long, often very numerous, glabrous or ciliate with long hairs; filaments bearded, apex inflated; capsules nearly glabrous; seeds black, striate, with 2 large pits on 2 of their faces.....2. *cristata*.

Bracts shorter than or equalling the cyme, rarely slightly longer:—

Root fibres usually tuberous; stem strongly hirsute at the collar, 6—36 in. long, densely villous or almost glabrous; leaves linear to broadly ensiform, acute or acuminate, often slightly narrowed to the base, silky-villous, often purple beneath, 3—18 in. long, .2—1 in. wide, radical usually much longer than cauline; cymes usually long-peduncled, villous or densely hirsute, rarely nearly glabrous; bract ovate, acute, shorter than the cyme; bracteoles .4—6 in. long, falcate, ciliate; filaments densely bearded, inflated at the apex; capsules hairy upwards; seeds pyramidal, brown, obscurely rugose.....3. *tuberosa*.

Root-fibres not tuberous; collar not prominently hirsute:—

Leaves glabrous or sparsely pilose below, linear to narrowly lanceolate, acute or acuminate, radical leaves 4—18 in. long, .4—1.5 in. wide, cauline smaller, margins ciliate; sheaths broad, loose, pilose. Stem 2—3 ft. high, softly villous or pilose; cymes subcorymbose, usually several together from a large, lanceolate, falcately deflexed leaf; bracts ovate-lanceolate, as long as the cyme; bracteoles ovate, falcate, acute or acuminate, .5—75 in. long, glabrous, ciliate, sepals fulvous pilose; filaments bearded; capsules hirsute at the apex; seeds pyramidal, pitted.....4. *pilosa*.

Leaves silky-villous below; sheaths moderately loose, pilose, sometimes lanate. Stems 3—4 ft. high, silky or villous with spreading hairs; leaves all cauline, narrowly lanceolate, acuminate, the smallest sometimes ovate and obtuse, 1—6 in. long, .4—1.2 in. wide, ciliate; cymes terminal and in the upper axils, often sessile, bracteoles semi-elliptic, falcate or nearly straight, acute or acuminate, .4—5 in. long, more or less silky-villous, usually densely ciliate; sepals fulvous pilose; filaments bearded; capsules pilose; seeds usually rugose.....5. *villosa*.

Cottony- or silky-cobwebby:—

Suberect; stems 6—24 in. high, slender or robust, often decumbent and rooting below, more or less cottony-cobwebby; leaves very variable, narrowly linear to oblong obtuse, acute or acuminate, 1—12 in. long, .2—1 in. wide, more or less cottony-cobwebby; cymes subsessile or peduncled, terminal and axillary, often large and dense; bract short, rarely as long as the cyme; bracteoles falcately lanceolate, acuminate, .3 in. long, silkily cobwebby; filaments bearded; capsules pilose; seeds narrowly cylindric, obscurely pitted.....6. *arachnoidea*.

Stem slender, decumbent, 2—12 in. high, floccosely silky- or woolly-cobwebby; leaves broadly ovate to narrowly linear, usually obtuse, sometimes apiculate, 4—3 in. long, 2—5 in. wide, more or less silky-cobwebby or floccose, sometimes silvery-silky; cymes axillary and terminal; peduncles slender, 25—125 in. long, solitary or several together; bract narrowly lanceolate, sharply acuminate, falcate, longer than the slender cyme; bracteoles narrowly ovate, falcate, acute or acuminate, 2—35 in. long, more or less cobwebby or floccose; filaments bearded; capsules pilose at the apex; seeds oblong, faintly rugose.....7. *fasciculata*.

Cymes enclosed in the leaf-sheaths:—

Stem stout or slender, leafy, glabrous, prostrate or suberect, 6—30 in. long; leaves linear, glabrous or sparsely hairy, 1.5—8 in. long, 1—4 in. wide; sheaths short, inflated, quite glabrous or mouth ciliate; cymes reduced to axillary fascicles; bracteoles linear lanceolate, almost hidden, glabrous or minutely ciliate; filaments densely bearded, inflated at the apex; capsules beaked, glabrous; seeds shortly cylindric, pitted.....8. *axillaris*. Filaments naked; capsules 3-horned at the apex which is depressed between the horns; seeds subquadrate, smooth or obscurely pitted. Otherwise not differing from the last species.....9. *cucullata*.

1. CYANOTIS PAPILIONACEA, Schult. f.; F. B. I. vi. 384; Wt. Ic. t. 2089.
On both coasts from Mangalore and Madras southwards;
Cuddapah, Anamalai and Pulney Hills; up to 3,000 ft.
Flowers blue, anthers violet.

Var. *vaginata*, Fischer n. comb. *C. vaginata*, Wt. Ic. t. 2088; F. B. I. vi. 385. Sheaths inflated; bracteoles transversely striate; seeds sub-tuberculately rugose.

2. CYANOTIS CRISTATA, Schult. f.; F. B. I. vi. 385; Wt. Ic. t. 2082;
Clarke Comm. Beng. t. 36.
In all Districts; near sea-level to 5,000 ft.
Flowers blue. Vern. Tel. Netha Kina.

3. CYANOTIS TUBEROSA, Schult. f.; F. B. I. vi. 386. *Tradescantia tuberosa*, Roxb. Cor. Pl. t. 108.
In all Districts from Kurnool southwards; near sea-level to 7,000 ft.
Flowers blue or bluish-purple.

Var. *adscendens*, Clarke; F. B. I. vi. 386. *C. sarmentosa*, Wt. Ic. t. 2087. Smaller, more glabrous; branches rooting and proliferous at the nodes.

Bolampatti (Wight).
Flowers pale-rose.

4. CYANOTIS PILOSA, Schult. f.; F. B. I. vi. 387. *C. Wightii*, Clarke;
F. B. I. vi. 386. *C. longifolia*, Wt. Ic. t. 2084.
W. Gháts; 4,000—7,000 ft.
Flowers blue.

5. CYANOTIS VILLOSA, Schult. f.; F. B. I. vi. 387. *C. lanceolata*, Wt. Ic. t. 2085.
W. Gháts; Shevaroy and Kollimalai Hills; 2,000—8,000 ft.
Flowers blue; stems and leaves often dark-purple.

6. CYANOTIS ARACHNOIDEA, Clarke; F. B. I. vi. 386. *C. pilosa*, Wt. Ic. t. 2083.
W. Gháts; Rampa, Shevaroy, Kollimalai, Sirumalai and Travancore Hills; 2,000—7,000 ft.
Flowers blue.

7. *CYANOTIS FASCICULATA*, Schult. f.; F. B. I. vi. 387; Wt. Ic. t. 2086.
C. rosea, Wt. Ic. t. 2086. *C. decumbens*, Wt. Ic. t. 2088.
 W. Gháts and all E. Districts; near sea-level to 6,000 ft.
 Flowers blue, purple or pink; beard of filaments often of two colours: blue and white.
 There are several not very well defined varieties, the most distinct being var. *glabrescens*, Clarke; F. B. I. vi. 388.
 Nearly glabrous; bracteoles woolly.
 Mysore State at Shimoga, 2,000—3,000 ft. (Meebold).
8. *CYANOTIS AXILLARIS*, Roem. & Sch.; F. B. I. vi. 388; Clarke Comm. Beng. t. 35. *Tradescantia axillaris*, Roxb. Cor. Pl. t. 107.
 In all Districts; near sea-level to 5,000 ft.
 Flowers blue or pink. Vern. *Tel.* Golla-gundi.
9. *CYANOTIS CUCULLATA*, Kunth; F. B. I. vi. 389.
 Bellary District.
 Flowers blue.

5. *Belosynapsis*, Hasskarl.

Prostrate or epiphytic herbs; roots fibrous; stem sometimes viviparous at the nodes. *Leaves* radical and cauline, sheathed, sometimes fleshy. *Flowers* small, terminal or subterminal, solitary or in few-flowered cymes; bracteoles 0. *Sepals* 3, subequal, free or very shortly united. *Petals* 3, subequal, free or united below. *Stamens* 6, all perfect; filaments bearded or naked; anthers oblong. *Ovary* 3-celled; ovules 2 in each cell, collateral, one erect, one pendulous; style filiform. *Fruit* a 3-celled, loculicidally 3-valved capsule. *Seeds* 2 in each cell, superposed, cylindric.

Prostrate on rocks; stems and branches thick, somewhat fleshy, 3—12 in. long, rooting at the nodes, densely hairy, hairs turning brown on drying; leaves radical and cauline, rather fleshy, densely villous and ciliate, radical rosulate, elliptic, acuminate, base narrowed, 1·5—2·2 in. long, ·5—·75 in. wide, cauline distichous, ovate or ovate-lanceolate, acute or acuminate, base usually cordately auriculate on one side, on erect shoots base usually equally rounded ·5—2 in. long, ·25—·75 in. wide, often bright red beneath, especially on the apical part; sheaths short, densely villous; flowers 4—8, racemed in pairs on a densely hairy peduncle, shortly pedicelled; bract short, hairy, elliptic-oblong; sepals with long, rufous hairs from bulbous bases; petals free; filaments bearded; capsules hairy; seeds subcubical or shortly cylindric, obscurely pitted.....1. *keuwensis*.
 Epiphytic, subscapigerous; flowering stems numerous, slender, 3—10 in. long, laxly pilose with rufous hairs, rooting below and viviparous at the apex; leaves radical and cauline, more or less pilose and ciliate with rufous hairs, radical linear or linear-lanceolate, acute or acuminate, base narrowed, 1—5 in. long, ·2—·4 in. wide, cauline ovate or elliptic, acute, ·2—·75 in. long; flowers in 2—4-flowered umbels on capillary, pilose peduncles, 2-bracteate; sepals villous; petals connate to the middle; filaments naked; capsules rufous-hairy; seeds cylindric, smooth.....2. *vivipara*.

1. *BELOSYNAPSIS KEUWENSIS*, Hassk. *Cyanotis keuwensis*, Clarke; F. B. I. vi. 388.
 Travancore on Myhendra Hill at 3,000 ft. (Beddome), "growing on rocks."
 Flowers blue or rose-purple with blue-hairy filaments.
2. *BELOSYNAPSIS VIVIPARA*, Fischer in Kew Bull. 1928, 254. *Cyanotis vivipara*, Dalz.; F. B. I. vi. 388.

Mysore at Manjerabad, 3,000 ft. (Meebold); Wynaad at 3,000 ft. (Lawson, Gamble); Anamalai Hills at 4,000 ft. (Beddome). Flowers white.

6. *Floscopa*, Loureiro.

Erect or subsucculent herbs. *Leaves* lanceolate. *Flowers* in terminal or axillary thyrsoid panicles, cymes secund, not scorpioid; bracts minute. *Sepals* 3, free, oblong. *Petals* 3, free, obovate. *Stamens* 6, all perfect, rarely 1 imperfect; filaments glabrous. *Ovary* 2-celled; ovules 1 in each cell; style simple. *Fruit* a loculicidal 2-celled, crustaceous capsule. *Seeds* hemispheric.

FLOSCOPA SCANDENS, LOUR.; F. B. I. vi. 390. *Tradescantia paniculata*, Roxb. Cor. Pl. t. 109. *Dithyrocarpus petiolatus*, Wt. Ic. t. 2079. *D. undulatus*, Wt. Ic. t. 2080. *D. Rothii*, Wt. Ic. t. 208. *D. paniculatus*, Kunth.; Clarke Comm. Beng. t. 34.

W. Ghâts, 500–3,000 ft.; Rampa Hills at Sesharayi, 2,000 ft. (Narayanaswami).

Stem rather slender, rooting below, glabrous or pubescent; leaves elliptic-lanceolate, acuminate, much narrowed to the base, 1.5–4 in. long, .5–1 in. wide, scaberulous above; sheaths short, glabrous or villous, mouth fringed with long hairs; flowers pedicelled, lilac or pink; filaments purplish; capsules suborbicular; seeds dorsally transversely wrinkled. Vern. *Tel.* Konda-amadikada.

Family CLXIII. JUNCACEAE.

Erect, usually perennial herbs; stems tufted; rootstock usually creeping. *Leaves* very narrow, flat or terete, or reduced to sheaths. *Flowers* usually small, regular, 2-sexual, in axillary or terminal bracteate cymes. *Perianth* in 2 whorls, whitish and membranous or brown and scarious or coriaceous. *Stamens* 6, seldom 3, hypogynous or on the bases of the perianth-segments; anthers basifixed. *Ovary* superior, 1-celled or more or less completely 3-celled by the intrusion of the placenta; style filiform or short or 0; stigmas 3, filiform; ovules 3, basal, or many superimposed on 3 placenta. *Fruit* a 1- or more or less 3-celled, loculicidally 3-valved capsule. *Seeds* 3 or many; testa membranous, sometimes produced at each end; albumen dense; embryo small, cylindric.

Sheaths of leaves split down one side; ovules and seeds many.....1. **Juncus**.
Sheaths of leaves entire; ovules and seeds 3.....2. **Luzula**.

1. *Juncus*, Linn.

Glabrous herbs. *Perianth* with the midrib of the 3 outer segments keeled or thickened. *Ovary* and capsule 3-, rarely 1-celled; ovules and seeds numerous.

Leaves reduced to sheaths; cyme one to a stem and lateral on it. Stems terete, striate, usually glaucous, up to 4 ft. high; cataphyls up to 4 in. long, usually mucronate, often reddish-brown; cymes up to 2 in. long and broad; flowers distinctly pedicelled.....1. *glaucus*.

Leaves developed; cymes several to a stem, not lateral:—

Leaves flat, very slender, concave above, not hollow nor septate within, 1–4 in.

long; stems densely clustered, 1—12 in. long; flowers solitary or in few-flowered clusters; stamens usually 6, but some terminal cleistogamous with 3 stamens; ovary and oblong or obovate capsule, 3-celled.....2. *bufonius*. Leaves terete or compressed, hollow and distantly septate within, 1—many-tubular, 2—10 in. long, .06—12 in. wide; stems terete or compressed, smooth, 3—26 in. high; cymes irregularly compound, in 6—10-flowered heads, stamens 3, ovary and prismatic or conical, trigonous capsule 1-celled.....3. *prismatocarpus*.

1. *JUNCUS GLAUCUS*, Ehrh.; F. B. I. vi. 393.
Nilgiri and Pulney Hills; 6,000—7,500 ft.
2. *JUNCUS BUFONIUS*, Linn.; F. B. I. vi. 392; Fyson, Fl. Nilg. & Puln. iii. t. 540.
Nilgiri Hills at about 6,500 ft. (Fyson).
3. *JUNCUS PRISMATOCARPUS*, R. Br.; F. B. I. vi. 395.
W. Gháts, 3,500—7,500 ft.; Kollimalai Hills (K. C. Jacob); High Wavy Mountains (Blatter and Hallberg).

2. *Luzula*, D.C.

More or less hairy herbs with grass-like leaves. *Perianth* glumaceous. *Capsule* 1-celled, loculicidally 3-valved. *Seeds* 3.

LUZULA CAMPESTRIS, D.C.; F. B. I. vi. 401.

Nilgiri and Pulney Hills; 7,000—8,000 ft.

An erect herb 5—18 in. high; leaves 1—15 in. long, .05—35 in. wide, usually densely ciliate; flowers in peduncled umbellate clusters of 6—10, sessile, bracts very short, scarious; capsule broadly oblong or subglobose, obtuse or mucronate.

Family CLXIV. PALMACEAE.

Shrubs or trees, sometimes climbing, rarely branched, often spiny. *Leaves* alternate, usually in a terminal crown, when mature usually palmate or pinnately divided, rarely simple or bipinnate; petiole sheathing. *Flowers* usually small, 1- or 2-sexual, monoecious or dioecious, sessile or sunk in the rachis of simple or branched spikes or panicles which are enclosed in 1-many sheathing spathes, ♂ and ♀ usually differing in form. *Perianth* of 6 segments in 2 whorls of 3, usually all free, dry or coriaceous, imbricate or valvate. *Stamens* 3, 6 or many. *Staminodes* often present in the ♀. *Ovary* superior, 1—3-celled or of 3 1-celled carpels; ovules 1—2 in each cell or carpel; stigmas 3, usually sessile. *Fruit* a 1—3-celled drupe or hard berry or of 1—3 carpels; pericarp smooth, rough or clothed in shining, downward-imbricating scales. *Seeds* erect or laterally attached; raphe usually branching all over the testa; albumen horny or bony, often ruminant; embryo small in a cavity near the surface of the albumen.

Stems not climbing by hooked spines; leaves in a terminal crown; fruit not scaly:—

Leaves compound:—

Leaves pinnate; leaflets linear or linear-lanceolate:—

None of the leaflets transformed into spines:—

Leaflets not auricled at the base:—

Apex of leaflets premorse; spadix inserted below the leaves:—

Stems 30—80 ft. high, over 6 in. diam.:—

Flowers not sunk in pits in the branches of the spadix, only ♀ flowers at the base.....1. *Areca*.

- Flowers sunk in pits in the branches of the spadix, both ♂ and ♀ flowers together at the base.....2. *Bentinckia*.
 Stems 15—25 ft. high, 2—3 in. diam.....3. *Pinanga*.
 Apex of leaflets acuminate, not premorse.....4. *Cocos*.
 Leaflets with two unequal auricles at the base.....5. *Arenga*.
 One or more of the lowest pairs of leaflets transformed into spines.....6. *Phoenix*.
 Leaves bipinnate; leaflets cuneate or fan-shaped.7. *Caryota*.
 Leaves simple, circular or lunate in outline:—
 Leaf-blades 8—16 ft. diam.; spadix terminal, erect, 10—20 ft. long; fruit 1.5 in. diam.....8. *Corypha*.
 Leaf-blades 2—5 ft. diam.; spadices from among the leaves, 1—5 ft. long; fruit 6 in. diam.....9. *Borassus*.
 Stems climbing by hooked spines; leaves scattered; fruit scaly.....10. *Calamus*.

1. *Areca*, Linn.

Stem tall, slender, annulate. *Spadices* from the axils of fallen leaves below the crown, branched. ♂ *flowers* minute, numerous on the upper parts. *Petals* obliquely lanceolate, valvate. ♀ *flowers* much larger, few, at the bases of the branches. *Perianth* accrescent, segments orbicular, imbricate, the inner with acute, valvate tips. *Ovary* 1-celled; ovule single, basal, erect. *Fruit* ovoid or oblong. *Seed* truncate at the base; albumen ruminant; embryo basilar.

ARECA CATECHU, Linn.; F. B. I. vi. 405; Roxb. Cor. Pl. t. 75.

Cultivated in many localities; not known truly wild. The *Areca*-or *Betul-nut Palm*.

A graceful tree reaching 100 ft. high, rarely over 1 ft. diam.; stem annulate with raised rings; leaves 4—6 ft. long, leaflets numerous, 1—2 ft. long, the upper confluent; spadix much branched; fruit 1.5—2 in. long, smooth, orange or scarlet. The seed is the well-known masticatory and is used in medicine. Vern. *Hind.* and *Ur.* *Supāri*; *Tel.* *Poka-vakka*; *Tam.* *Kamugu*, *Pakku*; *Mal.* *Adakka*, *Kavugu*; *Kan.* *Adike*.

2. *Bentinckia*, Berry

Stem slender, annulate. *Leaves* with the upper leaflets sometimes confluent. *Spadices* from the axils of fallen leaves below the crown, branched. *Spathes* many, the 2 lower short, incomplete, the upper 2-fid. *Flowers* minute, sunk in spirally arranged pits in the branches, 1, 2 or 3 together, the ♂ above and ♂ and ♀ together below, bracts forming a 2-lipped vertical mouth to each pit, bracteoles 2. ♂ *flowers* glumaceous. *Sepals* imbricate, connate below. *Petals* longer, valvate, connate into a stipes. *Stamens* 6. *Pistillode* conical. ♀ *flowers* large, ovoid. *Sepals* imbricate. *Petals* longer, valvate. *Staminodes* 6, minute. *Ovary* 3-celled; 1 ovule only developed. *Fruit* subspherical. *Seed* solitary, pendulous from the top of the cavity, sinuately grooved or ridged; albumen not ruminant.

BENTINCKIA CODDAPANNA, Berry; F. B. I. vi. 418.

Tinnevely and Travancore Hills; 2,500—6,000 ft.; abundant in its restricted locality. The *Hill Areca-nut*.

Stem smooth, grey, attaining 60 ft. high and 1 ft. diam.; leaves 3—5 ft. long; leaflets opposite, 2—2.5 ft. long, 1—1.5 in. wide, ribbed,

the ribs sometimes with a few paleæ; spadix 2 ft. long, 3 ft. wide, much branched, purple; ♂ flowers 12 in. diam., ♀ rather larger, opening after the fall of the ♂; fruit ovate-globose; 5–65 in. diam., bright-chocolate. Wood grey, not used. The terminal bud is edible. Vern. *Tam.* Varei-kamugu; *Mal.* Kanthal, Kanthakamugu.

(This description and the information is mainly from Mr. T. F. Bourdillon's careful M.S. notes in the Kew Herbarium.)

3. *Pinanga*, Blume.

Stem rather short, slender, annulate. *Leaves* with the upper leaflets confluent. *Spadices* from the axils of fallen leaves below the crown. *Spathes* solitary. *Flowers* monoecious, 3 together, a ♀ between two ♂, the clusters in 2, 4 or 6 series. ♂ *flowers* obliquely triquetrous. *Sepals* keeled, not imbricate. *Petals* ovate or lanceolate, valvate. *Stamens* 6—many; anthers subsessile, basifixed. ♀ *flowers* much smaller, ovoid or globose. *Sepals* and *petals* orbicular, imbricate. *Staminodes* often present. *Ovary* 1-celled; ovule solitary, basilar. *Fruit* ovoid or ellipsoid; pericarp fibrous. *Seed* ovoid or ellipsoid; albumen ruminant; embryo basilar.

PINANGA DICKSONII, BL.; F. B. I. vi. 409.

Western Ghâts; 1,000—3,000 ft.

Stem smooth, green, up to 25 ft. high and 3 in. diam.; leaves 3–5 ft. long, leaflets 1–2 ft. long, 1 in. wide, premorse; spadix with 4–8 branches clothed with imbricating flowers; ♂ flowers with tapering petals; stamens 20–30; pistillode 0; ♀ flowers with reniform perianth-segments, staminodes 6, clavate, tips penicillate; fruit ellipsoid, 5–8 in. long, 35 in. diam. The fruit are sometimes used by the poor as a substitute for Betel-nut. Vern. *Mal.* Kanakamugu.

4. *Cocos*, Linn.

Stem tall, slender. *Leaves* pinnatisect; leaflets narrow. *Spadices* erect at first, later drooping, simply paniced; branches bearing scattered ♀ flowers, often between 2 ♂, towards their bases and ♂ only above. *Spathes* 2 or more, lower short, upper fusiform or clavate. ♂ *flowers* small. *Sepals* and *petals* valvate. *Stamens* 6, filaments subulate; anthers linear, erect. *Pistillode* minute or 0. ♀ *flowers* usually much larger, ovoid. *Perianth* greatly accrescent. *Sepals* 3, imbricate. *Petals* 3, shorter, convolute with imbricate tips. *Disc* annular or 0. *Ovary* 3-celled; ovule 1 in each cell; style short; stigmas 3, recurved. *Fruit* large, ovoid, terete or trigonous, 1-seeded; pericarp thick, fibrous; endocarp bony or stony with 3 basal pores. *Seed* cohering with the endocarp; albumen solid or hollow or lining the endocarp, not ruminant; embryo opposite one of the pores.

COCUS NUCIFERA, Linn.; F. B. I. vi. 482; Roxb. Cor. Pl. t. 73.

Much cultivated, especially along the coasts. Country of origin disputed. The Coconut Palm.

Stem slender, curved or straight, 40–80 ft. high, marked with ring-like leaf-scars; leaves 6–15 ft. long, leaflets numerous,

linear-lanceolate, 2—3 ft. long; petioles 3—5 ft. long, stout; spadix 4—6 ft. long; lower spathes 2—3 ft. long; fruit green or yellowish, 8—12 in. long, the cavity containing a potable milky fluid. Wood hard, red outside, reddish-brown and softer within, used for rafters. The leaves are plaited into mats and used for thatching, fencing, partitions, etc. Toddy is obtained by tapping the peduncles and is convertible into arrack and "jageri." The kernel of the fruit is edible and yields an edible and burning oil. The fibres of the pericarp are used for cordage and matting. Vern. *Hind.* Nariyal; *Ur.* Nodia; *Tel.* Kobari, Tenkai; *Tam.* Tenga, Thennei; *Mal.* Tenga; *Kan.* Tengina.

5. *Arenga*, Labill.

Stem stout, densely clothed above with the black fibrous remains of the leaf-sheaths. *Spadices* first from an upper leaf-axil and successively from lower ones, large, much branched; peduncle decurved, clothed by numerous imbricating spathes. *Flowers* monoecious, the sexes usually on separate spadices, rarely a ♀ between 2 ♂. ♂ *sepals* orbicular imbricate. *Petals* oblong, valvate. *Stamens* numerous. ♀ *flower* subglobose. *Sepals* accrescent. *Petals* triangular, valvate. *Staminodes* many or 0. *Ovary* globose, 3-celled; ovule 1 in each cell; stigmas conic. *Fruit* ovoid-globose, 2—3-seeded. *Seeds* compressed or plano-convex; albumen not ruminant; embryo dorsal.

ARENGA WIGHTII, Griff.; *F. B. I.* vi. 422.

W. Ghâts; 500—3,000 ft. The Wild Cocoanut.

Stem smooth, grey, up to 30 ft. high and 1 ft. diam.; leaves 12—28 ft. long, leaflets dark green above, white beneath, linear-ensiform, the apical often confluent and obconic, 1—3.5 ft. long, .75—2 in. wide, apex narrowed, sometimes shortly, unequally 2-lobed, entire or toothed in the upper half, base 2-auricled, the lower lobe up to 2 in. long, obliquely overlying the midrib, the upper shorter; petiole 4—8 ft. long, ♂ and ♀ spadices separate, up to 4 ft. long; fruit depressed-globose, 1 in. long, 1.5 in. wide. Toddy is obtained by the hill-men by tapping the peduncle. Vern. *Tam.* Alam panei; *Mal.* Alathil tenga, Malam tengu.

6. *Phoenix*, Linn.

Low shrubs or trees up to 60 ft. high, dioecious; stems clothed completely or at least above with the persistent bases of the petioles, rarely branched. *Leaves* pinnate; leaflets linear, longitudinally folded and attached obliquely by their folded bases to the rachis, the lower ones usually transformed into spines. *Spadices* from the axils of the leaves, usually several, branched. *Spathes* simple, basilar, coriaceous. ♂ *calyx* cupular, 3-toothed. *Petals* 3, obliquely ovate, valvate. *Stamens* usually 6. *Pistillode* minute or 0. ♀ *flowers* globose. *Calyx* as in the ♂, accrescent. *Petals* rounded, imbricate, *Staminodes* 6, sometimes united into a 6-toothed cup. *Ovary* of 3 free carpels; ovule 1 in each, erect; stigmas sessile, uncinat. *Fruit* oblong, terete; pericarp fleshy. *Seed* oblong, ventrally grooved; albumen not or only slightly ruminant; embryo dorsal or subbasilar.

Stem 10—50 ft. high:—

Stem slender, 25—50 ft. high, clothed with the large persistent bases of the petioles; leaves 7—15 ft. long; leaflets fascicled, 2—4-farious, rigid, 6—18 in. long, .75—1 in. wide, a few at the base forming channelled triangular spines up to 4 in. long; spathes 12—16 in. long, almost woody, scurfy, separating into 2 boat-shaped valves; ♂ flowers .25—.35 in. long, dense; ♀ smaller, distant; fruiting spadix 3 ft. long, much compressed, golden-orange; fruit oblong-ellipsoid, 1—1.25 in. long, orange-yellow.....1. *sylvestris*.

Stem stout, 10—20 ft. high, about 15 in. diam., clothed and appearing tessellated by the small, spirally-arranged leaf-sheaths; leaves 3—5 ft. long; leaflets fascicled, 4-farious, strict, shining, up to 12 in. long and .6 in. wide, a few basal forming channelled spines up to 3.5 in. long; spathes narrow, coriaceous, up to 8 in. long, fringed with brown wool on the keel; ♂ flowers .15—.2 in. long, dense; ♀ distant; fruiting spadix about 2 ft. long; fruit oblong-ellipsoid, .4—.5 in. long, brown.....2. *robusta*.

Stem .5—10 ft. high:—

Stem very short, thickly clothed and hidden by the old leaf-sheaths; leaves 3—5 ft. long, leaflets fascicled, more or less 4-farious, rigid shining, usually with an orange-red pulvinus at the junction with the rhachis, 3—8 in. long, .4—.6 in. wide, several basal forming stout flat spines 2—3 in. long; fruit .5—.75 in. long, at first green, black when ripe.....3. *farinifera*.

Stem usually well-developed, up to 10 ft. high, and 9 in. diam., densely covered with the bases of the petioles; leaves 4—8 ft. long, leaflets 8—20 in. long, .3—.75 in. wide, pliable, fascicled, more or less 4-farious, not or hardly pulvinate at the insertion, a number of the lowest forming channelled spines 1—3 in. long; spathes 8 in. long, fringed on the margins; spadix much branched, in fruit 3—4 ft. long; ♂ flowers .2—.25 in. long; fruit .5—.6 in. long, at first orange, black when ripe.....4. *humilis* var. *pedunculata*.

1. PHOENIX SYLVESTRIS, Roxb.; F. B. I. vi. 425.

In all the drier Districts, cultivated and run wild; from sea-level to 3,500 ft.; often in dense thickets. The Wild Date-Palm.

The fruit is edible. The stem is much tapped for toddy. The leaves are plaited into mats. Vern. *Hind.* Khajur; *Ur.* Khejuri, Kojari; *Tel.* Pedda-ita; *Tam.* Icham; *Kan.* Ichal.

2. PHOENIX ROBUSTA, Hook. f.; F. B. I. vi. 427.

Ganjam District (Gamble), Ventala in the Vizagapatam District (A. W. Lushington), 300—5,000 ft.

3. PHOENIX FARINIFERA, Roxb. Cor. Pl. t. 74; F. B. I. vi. 426.

Coromandel, at low elevations not far from the sea.

The pulp of the fruit is sweet and mealy. The leaflets are woven into mats and the split petioles into baskets. The farinaceous pith is used by the poor for "kanji." Vern. *Tel.* Chittisita, Chiruta-ita; *Tam.* Ithi.

4. PHOENIX HUMILIS, Royle var. PEDUNCULATA, Becc.; F. B. I. vi. 427.

In all the hilly Districts; 500—7,000 ft.

The fruit is sweet and edible. The leaves are plaited into mats. Vern. *Ur.* Bukhorjuro, Kojiri; *Tel.* Konda-ita; *Tam.* Inji, Malai-icham.

7. Caryota, Linn.

Stem tall, annulate, naked or sheathed. Leaves few, very large, bipinnate; leaflets obliquely cuneate or fan-shaped, premorse or rounded at the apical margin. Spadices first from the upper leaf-sheaths and successively from lower ones, shortly peduncled, much

branched; branches slender, pendulous. *Spathes* 3—5. *Flowers* monoecious, solitary and ♂ or in groups of one ♀ between 2 ♂. ♂ *sepals* rounded imbricate. *Petals* linear-oblong, valvate. *Stamens* very many. ♀ *flowers* subglobose. *Sepals* as in the ♂. *Petals* rounded, valvate. *Staminodes* 6, 3 or 0. *Ovary* 3-celled; ovule 1 in each cell, erect. *Fruit* globose, 1—2-seeded. *Seeds* erect; albumen ruminant; embryo small.

CARYOTA URENS, Linn.; F. B. I. vi. 422.

In all Districts; from sea-level to 4,000 ft., scattered; sometimes cultivated. The Bastard Sago or Kitul Palm.

Stem up to 60 ft. high and 1.5 ft. diam., smooth, shining; leaves 18—20 ft. long, 10—12 ft. wide; pinnae 5—6 ft. long, curved, drooping; leaflets 4—8 in. long, broadly cuneate, obliquely truncate or rounded and serrate on the apical margin, the outer angle often caudate; spadix 10—12 ft. long; spathes 1.5 ft. long; flowers ternate, ♂ .5 in. long, ♀ longer; fruit globose, .6—75 in. long, reddish.

Wood brown with close black streaks, very hard, strong and durable; used for hut-building, agricultural implements and fencing. The fibre of the petioles is used for fishing-lines. The pith makes a good sago. Toddy, convertible into arrack, is obtained by tapping the peduncles. *Vern. Hind. Mari; Ur. Solopo; Tel. Mari, Kondajivalaggu; Tam. Konda-panei, Thippili-panei; Mal. Iram-panei, Chunda-pana, kala-pana; Kan. Baini.*

8. *Corypha*, Linn.

Stem tall, stout, dying after once flowering and fruiting. *Leaves* very large, circular or lunate in outline, flabellately multifid round the margin, the segments folded lengthwise; petioles stout, concave, spinous at the edges. *Spadix* large, terminal, erect, paniculate, pyramidal. *Spathes* many, tubular. *Flowers* small, bisexual. *Calyx* cupular, 3-fid. *Petals* 3, connate at the base, ovate, acute, imbricate or subvalvate. *Stamens* 6; filaments subulate; anthers dorsifixed. *Ovary* 3-lobed, 3-celled; ovule 1 in each cell, basilar erect; style short, stigma minute. *Fruit* of 1—3 fleshy, globose drupes with basilar style. *Seeds* globose or oblong, erect; albumen not ruminant; embryo spiral.

CORYPIA UMBRACULIFERA, Linn.; F. B. I. vi. 428.

Malabar; Travancore; doubtfully wild. The Talipot Palm.

Stem 30—80 ft. high, 2—3 ft. diam., annulate; leaves circular or sublunate, 8—16 ft. diam., cleft to the middle into 80—100 linear-lanceolate, acute or 2-fid lobes; petioles 5—10 ft. long, very stout, margins armed with short, compressed dark spines; spadix 10—20 ft. long; spathes pierced by the primary branches of the spadix; fruit globose, 1.5 in. diam., usually only 1 carpel developed with 2 abortive ones at its base; seeds smooth, polished, very hard.

Wood soft with a hard rind; not used. The leaves used for thatching. The pith is used for flour. A very ornamental tree, flowering, fruiting and then dying at about 40 years of age. *Vern. Mal. Kodapana.*

9. *Borassus*, Linn.

Stem tall, stout. *Leaves* simple, palmately fan-shaped, plicate, the margin multifid; petioles spinous. *Spadices* dioecious, large, simply branched; peduncles sheathed with open spathes. ♂ *flowers* small, mixed with scaly bracts, secund in 2 series in a small spikelet. *Sepals* 3, narrowly cuneate, imbricate. *Petals* 3, shorter, obovate-spathulate, imbricate. *Stamens* 6; anthers subsessile. *Pistillode* of 3 bristles. ♀ *flowers* larger, globose. *Perianth* fleshy, accrescent. *Sepals* reniform, imbricate. *Petals* smaller, convolute. *Staminodes* 6—9. *Ovary* globose, subtrigonus, entire or 3—4-partite, 3—4-celled; ovules basilar, erect; stigmas 3, sessile, recurved. *Fruit* a large subglobose drupe with 1—3 fibrous pyrenes; pericarp thinly fleshy. *Seed* oblong, top 3-lobed; testa adhering to the pyrene; albumen hollow, not ruminant; embryo subapical.

BORASSUS FLABELLIFER, Linn.; F. B. I. vi. 482. *B. flabelliformis*, Linn.; Roxb. Cor. Pl. tt. 71 and 72.

In most Districts, wild or cultivated; sea-level to 2,500 ft.

The Palmyra Palm.

Stem up to 100 ft. high and 3 ft. diam., greyish-black, swollen above the middle and again contracted above, when young clothed with the dry leaves or the bases of the petioles; leaves 2—5 ft. diam., approximately circular, the margins split into 60—80 linear-lanceolate, acuminate segments with spinulose margins; petioles 2—4 ft. long, stout, semiterete, the edges armed with hard, horny, spinescent serratures; ♂ *spadix* simply branched, ♀ simple; fruit 6—8 in. diam., seated on the greatly enlarged perianth.

Outer wood hard black, inner soft, light brown, handsomely streaked; much used for rafters, posts and fences, water pipes, troughs, etc. The leaves are used for thatch, fans, hats, basket work, etc. The pulp of the fruit is edible. The sap of the peduncle yields a toddy which is fermented into arrack or boiled down into "jageri." Vern. *Hind.* Tal, Tar; *Ur.* Talo; *Tel.* Tadu, Tadi; *Tam.* and *Mal.* Panei, Karrumpanei; *Kan.* Tali.

10. *Calamus*, Linn.

Scandent, occasionally erect, tufted shrubs armed with spines or prickles. *Leaves* pinnatisect, the rhachis often produced into a whip-like cirrus armed with claws; petiole and rhachis armed with spines or prickles; sheathes armed, produced into long or short ligules or ochrea and often bearing a lateral flagellum armed with claws; leaflets evenly or unevenly spaced along the rhachis, often varying in arrangement in different parts of the plant and of the rhachis in the same leaf. *Spadices* axillary, usually elongate and much branched, often produced into a flagellum armed with claws. *Spathes* tubular or open, sheathing the peduncle and the branches of the spadix and passing into bracts and bracteoles (*spathels* and *spathellules*). *Flowers* small, polygamodioecious, usually in distichous, often scorpioid spikelets, solitary or binate (♂, ♀ or both) in the bracteoles. *Calyx* cupular, 3-toothed.

Petals 3, usually free in ♂ and tubular below in ♀, valvate. *Stamens* 6, shortly connate at the base. *Staminodes* in ♀ forming a cup with 6 short teeth with abortive anthers. *Ovary* incompletely 3-celled, clothed with retrorse scales; ovules 3, basal, erect; style short or long; stigmas 3. *Fruit* globose or ellipsoid, style terminal; pericarp thin, clothed with appressed, closely imbricating, polished scales. *Seed* solitary, rarely 2—3 developed, subglobose or oblong; albumen sometimes ruminant; embryo ventral or basal.

(The parts differ in young and adult plants; the key applies only to adult forms. In some species some of the parts are unknown, the key, therefore, is tentative.)

Leaf not ending in a cirrus; sheaths usually flagelliferous; leaflets usually narrowly-linear or lanceolate:—

Leaflets fascicled at least near the base:—

Leaflets not fascicled in threes, very narrow; secondary spathes closely sheathing, not strongly clawed nor 2-keeled:—

Petioles with flat, black, seriate spines; basal part of rhachis channelled above, trigonous upwards, the flat lower surface armed throughout with solitary or ternate reflexed, straight spines; leaflets in opposite or nearly opposite distant groups of 2 or 3 on each side in the basal part, often more or less regular and equidistant upwards, narrowly lanceolate or ensiform, up to 28 in. long and 2 in. wide, with a few short, black bristles on the ribs on both surfaces, the margins ciliate throughout with similar bristles; primary spathes very long, tubular, armed with short black-tipped prickles; fruit obovoid, suddenly beaked, .75—1 in. long, scales broad, channelled in the middle, yellowish-brown with a dark brown margin.....1. *Thwaitesii* var. *canarana*.

Spines on the petioles not flat and black:—

Leaflets numerous in several planes pointing in different directions, distinctly grouped in fascicles of 2—4 (seldom of 5—6) on each side, those near the apex more regular, nearly equidistant and in one plane, narrowly lanceolate, up to 11 in. long and .8 in. wide, densely bristly on the margins and on the midrib above; rhachis nearly terete, armed below with solitary or ternate, needle-like, pale, spreading or deflexed spines up to 1.25 in. long; primary spathes tubular, clawed mainly on the back; fruit globose or slightly turbinate, distinctly beaked, .4 in. long, scales broad, not channelled, uniformly pale-straw coloured.....2. *viminalis* var. *fasciculata*.

Leaflets all in one plane, not numerous (not more than 35):—

Primary spathes coriaceous, not produced above the insertion of the partial inflorescence, closely sheathing, not expanded, smooth or sparingly spinous, with a lanceolate point at the apex, mouth bearded. Leaf-sheath densely armed with scattered, slender, needle-like spines from subtuberculiform bases, mouth very short, ochrea with numerous spiculae up to 2 in. long; rhachis acutely trigonous, at least near the base, armed below with a few very strong, solitary, pale spines; leaflets few, sometimes only 15, very distinctly fascicled, narrowly elongate-lanceolate, apex acuminate and bristle-spinous, sparingly bristly above, densely so on the margins, up to 11 in. long and 1 in. wide; fruit nearly globose, slightly turbinate, .3 in. long including the sudden beak, scales semi-circular, not channelled, pale-brown with a broad submarginal dark brown band.....3. *Brandisii*.

Primary spathes membranous, much longer than the partial inflorescence, loose and expanded flatly at least in the middle, the margins spinulose near the base; rhachis trigonous, the flat lower face bearing irregular weak claws; leaflets 20—30, distinctly grouped into 3—4 opposite fascicles 3—4 in. apart, each of 3—5 close-set leaflets, very narrowly oblanceolate, tip filamentous and shortly bristly on the margin, up to 8 in. long and .7 in. wide, more or less bristly on the ribs above and densely along the margins; fruit unknown.....4. *travancoricus*.

Leaflets in distant fascicles of 3, 2 opposed to 1, near the base of the leaf, upwards becoming regular in opposite distant pairs, elongate-lanceolate, apex acuminate, bristly penicillate, up to 20 in. long and 4 in. wide, ribs 5—7, the middle one hardly more prominent, without bristles or cilia; secondary spathes coriaceous, loose and widened at the mouth, flattened on one side near the base and strongly 2-keeled, armed with strong claws all round a little below the mouth; spathels usually armed with 1—3 claws; fruit ovoid or ellipsoid, .8 in. long including a rather long, stout beak and .4 in. wide, perianth pedicelliform, .15 in. long, scales narrowly triangular, faintly keeled along the middle, pale brown, slightly paler near the base.....5. *Rheedei*.
 Leaflets not fascicled, more or less regularly equidistant:—

♀ spikelets inserted within their spathes:—

Rhachis of leaf trigonous, armed below in its lower half with straight, needle-like spines pointing in different directions; ochrea of leaf very large, usually over 4 in. long; leaflets linear-lanceolate, up to 20 in. long and .8 in. wide, apex usually bristly-penicillate, more or less bristly on the 3 ribs above, the margins very bristly-ciliate or almost smooth; primary spathes long, closely sheathing, the lowest flattened and acutely 2-edged, armed with scattered, straight, horizontal, usually short spines; fruit subovoid, .5 in. long including the sudden beak, scales broadly triangular, not channelled, orange-yellow with a broad chestnut submarginal band, their margins and apex pale and erose

6. *pseudo-tenuis*.

Rhachis of leaf trigonous in the upper part, terete or semi-terete in the basal half, armed with small, solitary, though often approximated, claws; leaflets numerous, rather distant, elongate-ensiform near the apex, lower ones lanceolate, up to 28 in. long and 3 in. wide, tapering into a long acuminate bristle-ciliate tip, with 3 or 5 distinct ribs which are remotely brown-bristly on both surfaces, margins remotely spinous-ciliate; secondary spathes unarmed; fruiting perianth pedicelliform; fruit globose, obpyriform or turbinate-globose, slightly tapering to a caudiculate base, apex flatish and mucronulate, about 1 in. long; scales broadly and rather acutely triangular, rather deeply channelled, shining, pale yellow with a narrow marginal dark line.....7. *Gamblei*.

♀ spikelets inserted at or well above the mouths of their spathes:—

Leaf-sheath and its spines glabrous:—

Spines of leaf-sheath tumescent above, hollowed below; ochrea short, truncate; petiole very short or obsolete; rhachis near the base flat and smooth above, channelled at the sides to receive the leaflets, trigonous upwards, armed below along the middle and occasionally along the sides with rather approximate, solitary, black-tipped claws; leaflets very numerous, narrowly lanceolate, apex very gradually acuminate, 1-ribbed, but with distinct primary nerves, the rib usually bearing scattered bristles on both surfaces, margins ciliate with spreading bristles, up to 12 in. long and .8 in. wide; primary spathes tubular, the lowest acutely 2-edged, smooth or armed at the sides with straight spines, the upper slightly widened upwards, flat at the base on the inner face, armed on the back with strongish claws; fruit globose or slightly longer than wide, .6 in. long, minutely apiculate, scales rhomboid, nearly as long as wide, very faintly channelled, light straw-coloured, the apex sometimes reddish-brown, the margins closely toothed.....8. *Rotang*.

Spines of leaf-sheath needle-like; rhachis acutely trigonous, subregularly armed on the flat lower face with short, solitary claws; leaflets numerous, not very close-set, narrowly ensiform, apex gradually acuminate and bristly penicillate, 3-ribbed above, the ribs above bearing a few bristles with bulbous bases, up to 12 in. long and .5 in. wide, margins minutely appressed, bristly ciliate; upper primary spathes narrow-cylindric, loosely sheathing, sprinkled with short prickles; very young fruit almost at right angles to the spikelet, subglobose-ovate, broadly conical at the apex, .4 in. long, scales semicircular, slightly apiculate, not channelled, yellowish-brown at the base, chestnut apically, margins finely erose-toothed....9. *Hookerianus*.

Leaf-sheath and its flat, straight or slightly hooked spines greyish-brown scurfy; petiole green, up to 12 in. long; rhachis acutely trigonous, armed on the flat lower face with a single medial series of solitary claws; leaflets

numerous, narrowly ensiform, apex long acuminate, bristle-penicillate, distinctly 3-keeled above, naked or with a few long bristles on the ribs above, margins distinctly bristle-ciliate, up to 28 in. long (usually 15—20), 1—1.25 in. wide; lower primary spathes somewhat compressed and 2-keeled, armed with solitary, straight, short, broad-based spines, upper elongate, sometimes up to 18 in. long, almost polished, tubular, base long attenuate, more or less densely prickly on the outer side in the lower half and, like the lower, prickly all round in the apical part; fruiting perianth shortly pedicelliform; fruit nearly globose, .7 in. diam., very suddenly contracted into a short conic beak, terminated by the persistent stigmas; scales rhomboid, not channelled, black or chestnut-brown with a dark marginal band, distinctly erosely toothed.....10. *Huegelianus*.

Leaf-rhachis produced into a cirrus up to 3 ft. long armed with many strong, irregularly aggregated $\frac{1}{2}$ — $\frac{3}{4}$ -whorled claws; sheaths not flagel-liferous, more or less armed with very large laminar, elastic, elongate-triangular or sublanceolate spines up to 1.25 in. long, sometimes scattered but more often confluent and irregularly whorled at intervals of 1—2.25 in.; rhachis in lower portion biconvex, armed beneath with solitary strong claws, upwards 2-faced and smooth above, obsoletely angular beneath and armed with half-whorled strong claws; leaflets 28—30, very inequidistant, more or less geminate on each side, with irregular interspaces 6—10 in. long, broadly lanceolate, or elliptic-lanceolate, conspicuously concavo-convex, shortly acuminate, apex bristle-hispid, up to 16 in. long and 3 in. wide, 3—7-ribbed, margins appressedly bristly; primary spathes tubular, closely sheathing, the lower compressed with 2 acute spinous edges, the upper more cylindric, more or less armed on the outer side with robust sub-deflexed spines; fruit unknown.....11. *latifolius*.

1. CALAMUS THWAITESII, Becc. var. CANARANA, Becc.; Ann. Calc. xi. 138, t. 12. *C. Thwaitesii*, Becc.; F. B. I. vi. 441.
Along the W. coast at low elevations.
Erect or high climbing. Vern. *Mal.* Valia chural; *Kan.* Jed-dubetta.
2. CALAMUS VIMINALIS, Willd. var. FASCICULATA, Becc.; F. B. I. vi. 444; Ann. Calc. xi. t. 57.
Vizagapatam and Ganjam Districts; Rampa Hills (Gamble); 1,000—2,000 ft.
A moderate-sized climber. Canes straw-coloured, shining, vitrous.
3. CALAMUS BRANDISH, Becc.; F. B. I. vi. 448; Ann. Calc. xi. t. 102.
W. Gháts from Kanara to Tinnevely.
A slender scandent shrub.
4. CALAMUS TRAVANCORICUS, Bedd.; F. B. I. vi. 452; Ann. Calc. xi. t. 121.
W. Gháts from Coorg (Bidie) to Tinnevely, up to 3,500 ft.
A graceful, slender climber. Vern. *Mal.* Cheru churel.
5. CALAMUS RHEEDII, Griff.; F. B. I. vi. 452; Ann. Calc. xi. t. 226 III.
Hilly tracts from Malabar (Rheede) to Tinnevely (Beddome).
Scandent. Vern. *Mal.* Katu churel.
6. CALAMUS PSEUDO-TENUIS, Becc.; F. B. I. vi. 445; Ann. Calc. xi. t. 69.
Throughout the W. Gháts; 1,000—5,000 ft.
A slender climber. Vern. *Kan.* Betta.
7. CALAMUS GAMBLEI, Becc.; F. B. I. vi. 453; Ann. Calc. t. 123.
Mukurti forests in the Nilgiris at 5,000 ft. (Gamble); Anaimalais

in S. Coimbatore; Udumbansholay in Travancore at 5,000 ft. (Meebold).

A moderate-sized shrub, probably scandent. Vern. *Tam.* Othaiyadi Perambu.

Var. *sphaerocarpa*, Becc. with spherical fruit.

Nilgiris in same locality as the type (Gamble).

8. *CALAMUS ROTANG*, Linn.; F. B. I. vi. 447; Ann. Calc. xi. t. 97.

In all the drier tracts; from sea-level to 1,500 ft.

A tall, slender climber. The cane is used for basket-making, but is too coarse for the best work. Vern. *Ur.* Betto; *Tel.* Bettam; *Tam.* Churel, Sothu Perambu.

9. *CALAMUS HOOKERIANUS*, Becc.; Ann. Calc. xi. 226, t. 70 and App. t. 14.

W. Gháts.

Probably a tall, slender climber.

10. *CALAMUS HUEGELIANUS*, Mart.; F. B. I. vi. 452; Ann. Calc. xi. t. 122.

Nilgiri, Anamalai and Tinnevely Hills, 4,000—6,000 ft.

A moderate-sized climber.

11. *CALAMUS LATIFOLIUS*, Roxb.; F. B. I. vi. 455; Ann. Calc. xi. t. 176. Madgole Hills in the Vizagapatam District (A. W. Lushington); 3,000—4,000 ft.

A tall climber.

Family CLXV. PANDANACEAE.

Dioecious shrubs or small trees, sometimes scandent, often throwing out aerial roots which form struts. *Leaves* simple, narrow, acuminate, sessile, base sheathing, margins and keel beneath usually spinulose, usually arranged in tristichous spirals. *Spadices* axillary or terminal, simple or branched, clothed with leafy, sometimes coloured spathes. *Flowers* small, usually crowded or catkin-like; perianth usually absent. *Stamens* of ♂ flowers usually numerous; filaments free or connate; anthers erect, basifixed. *Pistillode* 0 or minute. *Staminodes* of ♀ flowers 0 or small. *Ovary* 1—many-celled, free or connate with those of adjoining flowers; ovules solitary and suberect or many and parietal; style short or 0, stigmas papillose. *Fruit* a globose or oblong syncarp of free or connate 1—many-celled woody or fleshy angular drupes or berries. Seeds minute, testa striate; albumen hard, fleshy; embryo minute.

Pandanus, Linn. f.

Characters of the family. *Inflorescence* capitate or spicate, simple or racemose; flowers sessile, crowded; perianth absent. *Stamens* numerous. *Staminodes* 0. *Ovules* solitary. *Fruit* usually solitary, forming a syncarp of free or connate drupes seated on a fleshy receptacle; the upper half of each carpel hollow or filled with a spongy pith-like tissue.

Ovary 5—12-celled. Leaves coriaceous, ensiform, caudate-acuminate, 3—5 ft. long, 1—2 in. wide, glossy green, margins with forward-pointing spinules, the keels with forward or backward-pointing spinules; spathes of the ♂ spadix lanceolate or linear-lanceolate, 5—24 in. long, the lower with a long flagellum, white, fragrant; ♂ spadix with numerous cylindric spikes 2—4 in. long; anthers .15—.2 in. long; ♀ spadix solitary, 2 in. diam.; carpels confluent in groups of 4—10; syncarp 6—10 in. long, yellow or red; drupes of 5—12 carpels, carpels 2—3 in. long, turbinate, angular, apex rounded with a depressed centre.....1. *tectorius*.

Ovary 1-celled:—

Drupe club-shaped, nearly 2 in. long and .4 in. wide, connate to just below the broadly convex pyramidal apex; style .8—1 in. wide, somewhat bilobed; anthers .08—.1 in. long; lower ♂ spathes flagelliferous.....2. *canaranus*.

Drupe cylindric:—

Anthers .2 in. long. Leaves dark-green, 6—15 ft. long, 3—6 in. wide, margins and keel below armed with short, sharp, forward-pointing spinules, not conspicuously tessellated; ♂ spathes golden-yellow, unscented, the lower attaining 3 ft. long and 4 in. wide, produced into a spinulose 3-quetrous acumen, the margins not spinulose or only slightly so near the apex; syncarp subtrigono-oblong, 6—9 in. long, orange-red; drupes connate, obconic-cylindric, 1.2—1.6 in. long, .3—.4 in. wide, apex convex, style 2—3-forked, spine-tipped

3. *furcatus*.

Anthers filamentous, .5—.6 in. long. Leaves chartaceous, up to 8 ft. long, 1—1.75 in. wide, margins and keel (sometimes 2-keeled) beneath ascendingly spinulose, glaucous below, conspicuously tessellated by the raised longitudinal veins and transverse venules; ♂ spathes boat-shaped, lower flagelliferous, margins spinulose throughout or only in the upper half; syncarp oblong-rotund, up to 5 in. long; drupes connate, slightly narrowed to the base, 1.6 in. long, .25 in. wide, free apex pentagonal-pyramidal, terminated by the entire subspinescent subulate style.....4. *Thwaitesii*.

1. *PANDANUS TECTORIUS*, Soland. *P. fascicularis*, Lam.; F. B. I. vi. 485. *P. odoratissimus*, Roxb. Cor. Pl. t. 94—96.

In all Districts, especially near the coast. Often planted as a hedge. The Screw Pine.

A branched shrub or small tree up to 25 ft. high. The leaves are used for mat- and umbrella-making and their fibres for cordage and fishing-lines; the roots are used in basket- and brush-making; an aromatic medicinal oil is distilled from the spathes; the floral leaves are eaten. Vern. *Hind.* Keora; *Ur.* Khia; *Tel.* Mogali; *Tam.* and *Mal.* Kaitha; *Kan.* Kaida.

2. *PANDANUS CANARANUS*, Warb.

Near Mangalore (Hohenacker).

Little is known of this plant; it appears to be that figured by Rheede in Hort. Malab. ii, t. 7 and called Perin-Kaida Taddi.

3. *PANDANUS FURCATUS*, Roxb.; F. B. I. vi. 484.

Cochin (Gamble); Travancore (Lawson, Barber).

A gregarious tree up to 40 ft. high. Appears to be the plant figured in Rheede's Hort. Malab. ii. t. 8 and called Kaida Tsjerria.

4. *PANDANUS THWAITESII*, Mart.

At Bantwal in S. Kanara (Hohenacker); near Aiyankavu in Travancore at 1,000 ft. (Bourdillon).

A common undershrub in evergreen forest with very fragrant white flowers (Bourdillon).

Family CLXVI. TYPHACEAE.

Aquatic or marsh herbs with perennial, creeping rhizome clothed with distichous scales. Leaves distichous, linear, erect or floating, sheathing below. *Flowers* monoecious, minute, in terminal superposed dense cylindric spikes, the upper spike ♂, the lower of ♀ flowers often intermixed with slender clavate bracts, sterile ♀ flowers or simple or branched hairs; perianth 0. *Stamens* 2—7, usually 3, rarely 1; filaments usually connate, tip of connective thickened, sometimes produced; anthers 4-celled, erect, basifixed. *Ovary* borne on a slender, usually densely hairy gynophore or in the axis of a membranous spatulate bract, 1-celled, fusiform, narrowed into a slender persistent style; stigma filiform or clavate; ovule solitary, pendulous from near the apex. Sterile ♀ flowers on a long axis with a clavate pistillode. *Fruit* minute, membranous or drupaceous, fusiform, detached with the hairy gynophore, dehiscing by an apical lid. *Seed* often adnate to the wall; albumen fleshy or floury; embryo axile, cylindric.

Typha, Linn.

The only genus; characters of the family.

TYPHA ANGUSTATA, Bory & CHAUB.; F. B. I. vi. 489.

In all districts from sea-level to 2,500 ft. The Reed Mace or Bulrush.

A robust plant up to 10 ft. high occurring in marshes. Leaves up to 8 ft. long, 2—1 in. wide, semi-terete above the sheath; ♂ and ♀ spikes separated by a considerable interval, up to 12 in. long, .25—.9 in. diam., brown, ♂ paler and more slender, ♀ flowers mixed with clavate sterile pistillodes. Vern. *Tel.* Jambu; *Tam.* Sambu.

Family CLXVII. ARACEAE.

Herbs or shrubs or small trees, sometimes climbing by aerial roots; rhizomatous or tuberous; juice often acrid, sometimes milky. *Leaves* in herbaceous species solitary, clustered or radical, in shrubby and arboreal species alternate, often fleshy or coriaceous, simple, entire or lobed, or variously compound, often appearing at different times from the inflorescence; petioles sheathing. *Flowers* hermaphrodite, monoecious or dioecious, sessile or shortly pedicelled on a spadix which is more or less enclosed in a spathe, neuters often present; perianth 0 or of scales. *Anthers* 4—8 in ♂ flowers, 1—many in the male, usually opening by a terminal pore. *Ovary* entire, rarely lobed, 1—3, rarely more, -celled; style 0, short or long; ovules 1—many in each cell. *Fruit* usually baccate, free or confluent. *Seeds* 1—many, usually embedded in mucilaginous pulp; albumen 0 or copious; embryo axile or in exalbuminous seeds thick with the plumule in a lateral slit.

Floating herb; leaves in a close spiral, cuneate.....1. **Pistia**.

Terrestrial or marsh plants, rooting in soil or epiphytic; leaves not in a close spiral:—

Erect, not scandent plants; no adventitious aerial roots:—

Quite unarmed:—

Marsh plants; rootstock creeping, not tuberous:—

Leaves not distichous; spadix enclosed in a chamber in the spathe; flowers monoecious:—

Leaves usually grass-like; ovaries few in a single whorl...2. **Cryptocoryne**.

Leaves broad; ovaries numerous in several cycles.....3. **Lagenandra**.

Leaves distichous; spadix free; flowers hermaphrodite.....4. **Acorus**.

Terrestrial or epiphytic plants; roots tuberous, rarely creeping:—

Leaves simple though often deeply lobed:—

Terrestrial, not bearing leafless bulbiferous shoots:—

Small plants; leaves rarely over 7 in. long:—

Leaves ovate-hastate or sagittate, not peltate:—

Spadix usually exerted from the spathe; ovules 1—2

5. **Typhonium**.

Spadix included in the spathe; ovules many.....6. **Theriophonum**.

Leaves suborbicular, peltate.....7. **Ariopsis**.

Robust herbs or shrubs; leaves ovate-cordate, rarely under 7 in. long:—

Ovules many, parietal; leaves peltate.....8. **Colocasia**.

Ovules few, basal; leaves peltate or not.....9. **Alocasia**.

Epiphytic or in pockets on bare rock; bearing leafless bulbiferous shoots; rarely flowering.....10. **Remusatia**.

Leaves compound:—

Leaflets pedately or radially arranged.....11. **Arisaema**.

Leaves 3-partite, each division again variously cut:—

Spadix with a barren appendage.....12. **Amorphophallus**.

Spadix without a barren appendage:—

Flowers monoecious, ♂ and ♀ inflorescences separated by a belt of large clavate neuters.....13. **Plesmonium**.

Flowers hermaphrodite.....14. **Anaphyllum**.

Thorny marsh plants.....15. **Lasia**.

Scandent shrubs with adventitious aerial roots:—

Leaves ovate to suborbicular; flowers monoecious:—

Leaves entire; petioles winged throughout; ovule solitary.....16. **Scindapsus**.

Leaves usually perfoliate or more or less pinnatifid, rarely entire; petioles not winged; ovules many.....17. **Rhaphidophora**.

Leaves linear- to oblong-lanceolate, entire; flowers hermaphrodite...18. **Pothos**.

1. *Pistia*, Linn.

A small, floating, gregarious, stoloniferous herb; roots of tufted fibres. *Leaves* sessile in a close spiral, together forming a cup. *Spathe* small, shortly peduncled, shortly tubular below, opening out into an ovate, concave limb. *Spadix* adnate to the back of the tube of the spathe, free above. ♂ *flowers* in a whorl of a few connate stamens beneath the apex of the spadix. *Neuters* few, minute, confluent in a ring below the ♂. ♀ *flowers* solitary. *Perianth* 0. *Ovary* 1-celled, obliquely adnate to the spadix, the apex free and forming a conical style; stigma discoid; ovules many, crowded on a parietal or subbasal placenta, orthotropous. *Berry* ovoid; pericarp thin. *Seeds* few to many, oblong or obovoid; albumen copious, floury; embryo minute, cuneiform.

PISTIA STRATIOTES, Linn.; F. B. I. vi. 497; Roxb. Cor. Pl. t. 268.

Common in tanks and wells in all districts; up to 3,000 ft.

The Water Soldier.

Leaves obovate-cuneate, apical margin rounded or retuse or shallowly lobulate and undulate, densely, closely pubescent on both faces, 1—4 in. long, very variable in breadth; spathe 5 in.

long. Vern. *Hind.* Jalkhumbi; *Tel.* Antharai-dhaman, Nirubuduki; *Tam.* Kodi-tamarai, Agasa-tamarai; *Mal.* Koddapail.

2. *Cryptocoryne*, Fisch.

Aquatic, marsh, or riverain herbs; rootstock creeping; stem short or 0. *Leaves* often grass-like, radical. *Spathe* often partly subterranean or submerged, margins connate into a tube below with a transverse septum forming an almost closed chamber for the spadix, the tube more or less produced above the chamber and then expanding into a usually narrow, often contorted, limb. *Spadix* very slender, adnate at the tip to the septum of the spathe; ♂ and ♀ flowers separated by a bare region of the spadix. *Perianth* 0. ♂ flowers numerous, forming a cylinder. *Stamens* 1—2; anthers sessile, cells 2, conical, pollen vermiform. *Ovaries* in a single whorl of 4—7 at the base of the spadix, connate, 1-celled, mixed with a few neuters; style short; recurved; ovules many, erect, orthotropous. *Berries* of fleshy, connate, 2-valved carpels. *Seeds* many, oblong; testa rugose; albumen copious; embryo axile.

Limb of spathe longer than the limb:—

Limb of spathe ovate-oblong, densely fimbriate-ciliate, 2—3 in. long, .6—1.2 in. wide. Leaves linear-oblong or lanceolate, inequilateral, 7—16 in. long, .8—4 in. wide; petioles 4—12 in. long; peduncles short, tube of spathe up to 12 in. long; ovaries 5—7; fruit long-peduncled, globose, 1 in. diam.1. *ciliata*.

Limb of spathe not fimbriate-ciliate:—

Spathe closely twisted, 4—10 in. long, limb linear-lanceolate, caudate, 1—3 in. long. Leaves linear or narrowly linear-lanceolate, grass-like, up to 18 in. long and .75 in. wide; peduncle very short; ovaries 4—6.2. *retrospiralis*.

Spathe not twisted; limb ovate or lanceolate:—

Leaves oblong-lanceolate, finely acuminate, 4—6 in. long, .5—8 in. wide, margins flat; peduncle short; tube of spathe 4—5 in. long, limb narrowly ovate, 1—1.5 in. long with a subulate-caudate prolongation up to 3 in. long; ovaries 5—6.3. *consobrina*.

Leaves linear, 6—10 in. long, .25—3 in. wide, margins crisply waved; peduncles slender, 2—3 in. long (fruiting up to 5 in. long); tube of spathe 5—6 in. long, limb lanceolate, acuminate, 1.5—3 in. long; ovaries 6—7

4. *Wightii*.

Tube of spathe shorter than the limb:—

Limb of spathe linear-lanceolate, 3—5 in. long, at first twisted, margins denticulate, transversely lamellate within, tube obconic, less than 1 in. long; peduncle very short included with the tube of the spathe in the leaf-sheath. Leaves linear-lanceolate, 3—8 in. long, .3—6 in. wide; ovaries 5—6, stigmas broadly elliptic.5. *spiralis*.

Limb of spathes very slender, 6—8 in. long, closely twisted, margins entire, not lamellate within, tube nearly cylindric, 1 in. or less long; peduncle very short. Leaves narrowly linear, 8—12 in. long, .5—7 in. wide; ovaries 4—5, stigmas orbicular or broadly oblong.6. *unilocularis*.

1. *CRYPTOCORYNE CILIATA*, Fisch.; F. B. I. vi. 492; Wt. Ic. t. 775.

Coromandel (Roxburgh); Mysore and Carnatic (G. Thomson).
Spathe dull-green, spotted with purple near the limb which has an ovate yellow patch nearly 1 in. long in the mouth.

2. *CRYPTOCORYNE RETROSPINALIS*, Kunth; F. B. I. vi. 493; Wt. Ic. t. 772.

In most Districts up to 1,500 ft.
Spathe deep-green, streaked with purple.

3. *CRYPTOCORYNE CONSOBRINA*, Schott; F. B. I. vi. 493.
W. Gháts (G. Thomson, Perrottet).
4. *CRYPTOCORYNE WIGHTII*, Schott; F. B. I. vi. 493.
Mysore (Wight); Calicut.
5. *CRYPTOCORYNE SPIRALIS*, Fisch.; F. B. I. vi. 494; Wt. Ic. t. 773.
E. and W. Coasts at low levels.
Spathe greenish without, dark-purple within.
6. *CRYPTOCORYNE UNILOCULARIS*, Wight Ic. t. 774. *C. Roxburghii*,
Schott; F. B. I. vi. 494.
N. Circars (Roxburgh); Coromandel (Wight).
Spathe within purple marbled with white.

3. *Lagenandra*, Dalz.

Marsh herbs; rootstock creeping, usually annulate. *Leaves* usually long-petioled and broad. *Spathe* tubular below, margins connate with a transverse septum forming an almost closed chamber for the spadix, limb expanded above. *Spadix* slender, adnate by its apex to the septum of the spathe; ♂ and ♀ portions well separated by a bare region of the spadix. *Perianth* 0. ♂ *flowers* numerous, forming a cylindric or oblong mass near the apex of the spadix. *Stamens* 1–2; anthers sessile, pollen sausage-shaped. *Ovaries* numerous, at the base of the spadix, spirally arranged and free or in several connate cycles, 1-celled; stigma subsessile, peltate or discoid; ovules 1 or 2—many on a basal placenta, orthotropous. Berries free or connate. *Seeds* 1–6 oblong, furrowed; albumen copious; embryo elongate, axile.

Rhizome stout, up to 2 in. diam.; leaves oblong or elliptic-oblong, obtuse or acute at both ends, 6–17 in. long, 2–5 in. wide, margins undulate, veins very numerous, ascending, nearly straight from the very broad midrib; petioles as long as the blade; stipular sheaths acuminate, 2-keeled, up to 7 in. long; peduncles shorter and more slender than the petioles, up to 12 in. long; spathes 3–9 in. long, tube broad, limb much longer, ovate-lanceolate, caudate-acuminate.....1. *ovata*. Rhizome up to .5 in. thick; leaves ovate- or elliptic-oblong, acute or obtuse, base rounded, sometimes emarginate, 3–6 in. long, 1.4–2.6 in. wide; petioles usually longer than the blade, up to 7.5 in. long; veins numerous, ascending from the broad midrib, widely arched, margins not undulate; stipular sheaths triangular-lanceolate, acute, not keeled, up to 2.5 in. long; peduncles 1 in. or less long, slender; tubular portion of the spathe 2 in. long, oblong, closed chamber about half that length, slightly constricted above the spadix, limb triangular, terminating in a subulate-filiform appendage 1.5–2 in. long, verrucose within.....2. *Meeboldii*.

1. *LAGENANDRA OVATA*, Thw. *L. toxicaria*, Dalz.; F. B. I. vi. 495.
Throughout the W. Coast and Gháts, in marshes and along water-courses, often gregarious; from sea-level to 4,000 ft.
Spathe greenish-purple without, dark-purple within. Vern. *Mal. Karin-pola*.
2. *LAGENANDRA MEEBOLDII*, Fischer n. comb. *Cryptocoryne Meeboldii*,
Engl. in Pflanzenr. iv. 23. F. 234.
Agalhatti, Mysore at 3,000 ft. (Meebold); Tuppanad, S. Malabar at 650 ft. (Fischer).
Spathe dark-purple.

4. *Acorus*, Linn.

Aromatic marsh herbs; rootstock creeping. *Leaves* distichous, ensiform, bases equitant. *Peduncle* like the leaves and as long. *Spathe*

continuing the ensiform peduncle. *Spadix* sessile, cylindric, dense-flowered. *Flowers* hermaphrodite. *Perianth* of 6 orbicular, concave segments. *Stamens* 6; filaments linear, flat; anthers reniform, cells confluent above. *Ovary* conical, 2—3-celled; style and stigma minute; ovules many, pendulous, orthotropous. *Berries* oblong. *Seeds* few, oblong, pendent from the apex of the cells; albumen fleshy; embryo axile.

ACORUS CALAMUS, Linn.; F. B. I. vi. 555.

Lower Pulney Hills (Bourne). The Sweet Flag.

Rootstock very aromatic; leaves 1·5—6 ft. long, 3—1·25 in. wide; spathe 6—30 in. long; spadix 2—4 in. long, free from the spathe. The roots are used medicinally and also to protect clothing from insect-attack. Often cultivated. Vern. *Hind.* Gorbach; *Tel.* Vasa Vadaja; *Tam.* Vashambu; *Mal.* Vashanpa; *Kan.* Bajai.

5. *Typhonium*, Schott.

Tuberous herbs. *Leaves* entire, 3—5-lobed or pedatisect; appearing with the inflorescence. *Spathe* with a short, convolute, persistent tube below, mouth constricted, expanded above into a broad or narrow deciduous limb. *Spadix* usually exserted, with a long smooth or muricate, often stipitate, barren appendage. ♂ and ♀ flowers well separated, with neuters above the ♀ and sometimes below the ♂. *Perianth* 0. *Stamens* 1—3; anthers subsessile. *Ovary* 1-celled; stigma sessile; ovules 1—2, basal, erect, orthotropous. *Berry* ovoid, 1—2-seeded. *Seeds* globose; albumen copious; embryo axile.

Limb of spathe open, broadly ovate:—

Apex of spathe acute or acuminate, not twisted; neuters above ♀ flowers numerous, long, filiform, curved. Leaves hastately 3-lobed or sub-3-partite, 2—12 in. diam., lobes ovate, acute or acuminate; petioles up to 1 ft. long; peduncle 1—4 in. long; spathe 3—12 in. long, 1·5—4 in. wide, nearly flat; appendage of spathe stipitate, muricate, base expanded and intruded.....1. *trilobatum*. Apex of spathe elongate-caudate, twisted; neuters above ♀ flowers dense, erect, short, obtuse or subacute. Leaves cordately or hastately sagittate, sub-3-lobed, 2—5 in. long, 2—4 in. wide; petioles 4—8 in. long; peduncles 2·5—2 in. long; spathe 1·5—4 in. long, 1—3 in. wide; appendage of spadix truncate or rounded at the base.....2. *divaricatum*.

Limb of spathe narrowly lanceolate, acuminate, not expanded. Leaves ovate-cordate, sagittate or hastate-oblong, 1—7 in. long, sometimes almost 3-partite and 6 in. across; petioles 4—12 in. long; peduncles slender, 2—8 in. long; spathe 3—8 in. long, 3—5 in. wide, tube ovoid or oblong; appendage of spathe shortly stipitate, as long as or longer than the spathe, base conical, tip filiform; neuters short, lower clavate, upper subulate.....3. *flagelliforme*.

1. *TYPHONIUM TRILOBATUM*, Schott; F. B. I. vi. 509. *Arum orixense*, Roxb.; Wt. Ic. t. 801.

E. Coast. Not common.

Spathe red-purple within; appendage of spathe bright-red.

2. *TYPHONIUM DIVARICATUM*, Dcne.; F. B. I. vi. 510. *Arum divaricatum*, Linn.; Wt. Ic. t. 790.

E. Coast. Not common.

Spathe red-brown.

3. *TYPHONIUM FLAGELLIFORME*, Bl. *T. cuspidatum*, Dcne.; F. B. I. vi. 511. *Arum flagelliforme*, Roxb.; Wt. Ic. t. 791.

E. and W. Coasts as far N. as Cochín; at low elevations.
Spathe greenish, white or lurid without, red within.

6. *Therophonum*, Bl.

Tuberous herbs. *Leaves* few, cordate, sagittate or hastately 3-lobed; petioles long. *Spathe* tubular below, slightly constricted at the mouth, limb erect, oblong or lanceolate, acuminate or subcaudate. *Spadix* included, slender. ♂ and ♀ flowers well separated. *Perianth* 0. *Stamens* 1—2, aggregated in a narrow, cylindric mass 3—5 times longer than the ♀ inflorescence; anthers subsessile, globose, connective thin, sometimes produced. *Ovaries* usually few, oblong, 1-celled; stigmas sessile; ovules few to many, basal or apical, orthotropous. *Neuters* below rather long, filiform, upper shortly subulate, uppermost sometimes verrucose. *Berries* ovoid. *Seeds* ovoid, erect or pendulous; albumen copious; embryo axile.

Anthers beaked, opening by slits; neuters many, close to the anthers:—

Spathe subcylindric, margins waved and crenate, subacute or shortly cuspidate, 3—5 in. long, 1.25—1.75 in. wide, base of tube broadly truncate, intruded. Leaves orbicular-hastate or hastate-triangular-trilobed, margins undulate, 1.5—4 in. long; petioles 2—12 in. long; peduncle a little shorter; spadix half as long as the spathe, appendage cylindric; neuters 13—16 in. long.....1. *minutum*.

Spathe oblong, acute, margins not crenate, 4—6 in. long, 1.25—2 in. wide, base truncate. Leaves hastately triangular, sometimes 3-lobed, up to 4 in. diam.; petioles 3—12 in. long; peduncles 2—4 in. long; spadix about half as long as the spathe, appendage cylindric; neuters 25—33 in. long.....2. *Wightii*.

Anthers not beaked, opening by pores; lower neuters near the ovaries, upper few or 0:—

Leaves distinctly 3-lobed, lobes linear to broadly triangular, the lateral usually at right angles to the apical or even sometimes pointing slightly forwards, the sinus very wide, midlobe largest, all acute or acuminate, up to 5 in. long and 4.5 in. across the lateral lobes; petioles usually much longer than the blade; somewhat shorter than the peduncle; spathes 2—5 in. long, tube short, cylindric or oblong, base rounded, limb expanded, oblong, 1—2 in. wide, acute, spadix about half as long as the spathe, appendage shortly stipitate, slender, subulate.....3. *indicum*.

Leaves cordately linear- to ovate-hastate, not or indistinctly 3-lobed, acute, basal lobes rounded, sinus narrow, up to 5 in. long and 2 in. wide; petioles slender, as long as or up to 3 times longer than the blade; peduncles very slender, short; spathe with a long cylindric tube, limb narrowly lanceolate, acute; spadix about $\frac{1}{4}$ the length of the spathe, appendage stipitate, slender, subulate.....4. *infaustum*.

1. *THERIOPHONUM MINUTUM*, Engl. *T. crenatum*, Bl.; F. B. I. vi. 512.
Mootalur, Madras (Wight); Tranquebar (Heyne).
Spathe pale-yellowish-green, striated, the waved margin red; appendage purple.
2. *THERIOPHONUM WIGHTII*, Schott; F. B. I. vi. 512.
Carnatic (Wight).
Spathe white (?).
3. *THERIOPHONUM INDICUM*, Engl. *T. Dalzellii*, Schott; F. B. I. vi. 513.
Wynaad (Beddome), Attapadi Valley and Anamalai Hills at 2,000 ft. (Fischer); Krishnagiri, Salem (Jacob); Punalur, Travancore (M. Rama Rao).
Tube of spathe green fading to white, limb deep-purple; appendage greenish-yellow.

4. THERIOPHONUM INFAUSTUM, N. E. Br.; F. B. I. vi. 513.

Palghat (Wight); Travancore (V. Narayanswami).
Spathe white or purplish.

7. Ariopsis, Nimmo.

Small tuberous herbs. *Leaves* entire, peltate, appearing with or before the inflorescence. *Spathe* small, cymbiform, open, tube 0, persistent. *Spadix* shorter than the spathe, appendage 0. ♂ and ♀ flowers approximated, ♂ imbedded in the spadix, neuters 0. *Perianth* 0. *Anthers* connate in groups of 3, each 2-celled, surrounding a pore into which all open. *Ovaries* few, on one side of the spadix only, 1-celled, oblong; stigmas sessile, stellately 4—6-fid; ovules many, orthotropous, 2-seriate on 4—6 parietal placentæ. *Berries* 3—6-angled. *Seeds* linear-oblong, slightly attenuate to an obtuse apex, pendulous; albumen copious; embryo axile.

ARIOPSIS PELTATA, Nimmo; F. B. I. vi. 519. *Remusatia vivipara*, Wight Ic. t. 900.

W. Coast and Ghâts; from near sea-level to 4,000 ft.

Tubers small, clustered, with many slender root-fibres; leaf solitary, suborbicular, sometimes broader than long, apiculate, 1—8·5 in. diam., base rounded, emarginate or cordate; petioles about as long as the blade, slender, inserted about $\frac{1}{3}$ up the blade; peduncles 1—4 in. long, slender; spathes 1—1 in. long, 3—6 in. wide, apiculate, violet with a green dorsal ridge, paler within, ♂ flowers dark-purple, ♀ green, stigmas yellow; seeds longitudinally furrowed.

8. Colocasia, Schott

Tall, coarse herbs; tuberous or with a short stout caudex. *Leaves* appearing with the flowers, simple, peltate. *Peduncles* stout. *Spathe* with a thick, convolute, accrescent tube, mouth constricted, persistent, limb erect, deciduous. *Spadix* free, shorter than the spathe, appendage cylindric-subulate or 0. ♂ and ♀ flowers with interposed flat neuters. *Perianth* 0. *Stamens* 3—6, connate in an obpyramidal synandrium, cells linear, opening by short slits. *Ovaries* ovoid or oblong, 1-celled; stigmas sessile, flat, 3—5-rayed; ovules several to many, suborthotropous, on 2—4 parietal placentas. *Berries* obconic or oblong. *Seeds* oblong; albumen copious; embryo axile.

COLOCASIA ANTIQUORUM, Schott; F. B. I. vi. 523; Wt. Ic. t. 786, fig. 1.

Arum nymphaeifolium, Roxb.; Wt. Ic. t. 786, fig. 2.

In all Districts, wild or cultivated; sea-level to 3,000 ft.

Tubers up to 6 in. diam.; leaves ovate- to suborbicular-cordate, 6—20 in. long, 3—12 in. wide, apex rounded and usually apiculate, basal sinus triangular, margins undulate, dark-green sometimes clouded with black; petioles stout, 3—4 ft. long, green or violet, inserted $\frac{1}{4}$ — $\frac{1}{3}$ of the blade from the sinus; peduncles much shorter, solitary or clustered and connate; spathe 8—18 in. long, tube oblong, limb narrowly lanceolate, caudate-acuminate, pale-yellow, 2—4 times longer than the tube.

All parts of the plant are eaten. Vern. *Hind.* Kachu; *Ur.* Saru; *Tel.* Kaladi; *Tam.* Shana-dumpa; *Mal.* Shamai-gaddai; *Kan.* Kachchi.

9. *Alocasia*, Neck.

Stout herbs or shrubs, roots usually rhizomatous but often forming a distinct above-ground caudex. *Leaves* entire, usually very large, sometimes peltate, more or less ovate-cordate or -sagittate; petioles long. *Peduncles* usually several, sometimes connate, appearing with the leaves. *Spathes* with a thick, convolute, persistent tube constricted at the mouth; limb erect, cymbiform, cucullate or oblong, much longer than the tube. *Spadix* free, shorter than the spathe; appendage cylindric-subulate or 0. ♂ and ♀ flowers separated by a few flat neutrals. *Perianth* 0. *Stamens* 3—8, connate into an obpyramidal, hexagonal synandrium. *Ovaries* ovoid or oblong, 1-celled; styles very short; stigmas 2—4-lobed; ovules few, basilar, erect, orthotropous. *Berries* enclosed in the accrescent tube of the spathe which becomes lacerate, ellipsoid or obconic-ellipsoid or subglobose. *Seeds* subglobose, erect, testa smooth; albumen copious; embryo axile.

Not caulescent; lowest secondary nerves of the leaves flabellately spreading, not united for any distance with the primary nerves of the basal lobes. Caudex a short cylindrical tuber up to 2 in. diam.; leaves broadly ovate-cordate, obtuse and shortly apiculate, 6—8 in. long, nearly 6 in. wide, margins undulate; petioles stout, 8—10 in. long, sinus semi-circular; spathe 4—6 in. long, limb cucullate; spadix nearly as long, appendage thickened at the base, subulate, subacute.

1. *montana*.

Caulescent; lowest secondary nerves of the leaves united to the primaries of the basal lobes to near their apex:—

Leaves not or very slightly peltate, ovate-cordate, up to 3 ft. long, width less than the length from sinus to apex, acute or rounded with a deflexed cusp, sinus rather narrow and deep, margins undulate. Caudex up to 8 ft. long and 8 in. diam.; petioles 2—3 ft. long; peduncles 4—8 in. long, several, usually paired; spathes 8—12 in. long, limb narrowly oblong, apex rounded with a small subulate cusp; spadix about as long, appendage conoid, rugulose.

2. *indica*.

Leaves distinctly though not deeply peltate, broadly ovate-sagittate, 2—4 ft. long, 1·5—3 ft. wide, width greater than the length from sinus to apex, shortly apiculate, sinus deep and narrow, margins undulate. Caudex up to 16 ft. long and 1 ft. diam., but usually much smaller; petioles 2—4 ft. long; peduncles 6—8 in. long, usually 2 or more in each axil, stout; spathes 6—10 in. long, limb hooded-cymbiform, cuspidate; spadix nearly as long, appendage nearly as long as the floral part, cylindric, obtuse, sinuously sulcate.....3. *macrorrhiza*.

1. *ALOCASIA MONTANA*, Schott; F. B. I. vi. 525. *Arum montanum*, Roxb.; Wt. Ic. t. 796.

N. Circars (Roxb.).

Spathe coloured. The roots are said to be used for poisoning tigers.

2. *ALOCASIA INDICA*, Schott; F. B. I. vi. 525. *Arum indicum*, Roxb.; Wt. Ic. t. 794.

Probably not wild in S. India, but widely cultivated.

Spathe yellowish-green, sometimes with reddish streaks; smelling offensively. The stem and roots are eaten. Vern. *Hind.* Mankanda.

3. *ALOCASIA MACRORRHIZA*, Schott; F. B. I. vi. 526. *Arum odorum*, Roxb.; Wt. Ic. t. 797.

Rampa Hills (Ramaswami, Narayanswami).

Spathe pale-green; fragrant.

10. *Remusatia*, Schott

Tuberous herbs emitting leafless bulbiferous shoots from the sides of the tuber. *Leaf* solitary or 2 from a tuber, entire, peltate, ovate-cordate. *Spathes* coriaceous; tube ovoid, convolute, accrescent over the fruit, mouth constricted; limb broad or narrow, erect or refracted, deciduous. *Spadix* very short, sessile; appendage 0. ♂ and ♀ flowers separated by neuters. *Perianth* 0. *Stamens* 2—3; anthers sessile, connate into a 4—6-angled and sulcate, flat-topped synandrium, synandria densely packed, mixed with neuters. *Ovaries* crowded, ovoid, 1-celled or 2—4-celled upwards; stigmas sessile, disciform; ovules many, orthotropous or nearly so, in 2 series on 4—6 parietal placentae. *Berries* small, obovoid. *Seeds* small, ovoid; albumen copious; embryo axile.

REMUSATIA VIVIPARA, Schott; F. B. I. vi. 521. *Arum viviparum*, Roxb.; Wt. Ic. t. 798.

In all Districts up to 5,000 ft. In clefts on tree trunks or in pockets of soil on bare rock; rarely flowering but propagating by bulbils.

Tubers .5—1.5 in. diam.; bulbiferous shoots up to 18 in. long, slender, brown, bulbils at the nodes oblong, squarrosely scaly, .1—2.5 in. long; leaves acute, up to 18 in. long and 12 in. wide, margins undulate, basal lobes rounded; petioles 6—12 in. long, inserted $\frac{1}{4}$ — $\frac{1}{2}$ of the blade above the sinus; peduncles short, enclosed in cataphylls; spathe 4—5 in. long, tube ovoid or oblong, green, much shorter than the orbicular-ovate or caudate, golden-yellow limb; spadix hardly longer than the tube, ♂ portion clavate.

11. *Arisaema*, Mart.

Tuberous herbs. *Leaves* 1—2, rarely 3, 3- or pedati-sect or the leaflets radiate. *Spathes* deciduous, convolute, limb often broad, usually incurved, often acuminate or caudate. *Spadix* included or exerted; appendage often very long. *Flowers* dioecious or monoecious and the sexes contiguous, neuters 0, few or many above the fertile. *Perianth* 0. ♂ flowers many, usually stipitate. *Stamens* 2—5; anthers sessile, oblong or subglobose. *Ovaries* densely crowded, 1-celled; styles short or 0; stigmas disciform; ovules 1—9, basal, orthotropous. *Berries* 1—few-seeded. *Seeds* ovoid or globose; albumen copious; embryo axile.

Spadix with appendage much longer than the spathe. Leaves usually pedatisect, sometimes nearly radiate; leaflets 5 (rarely 4) —18, sessile or petiolulate, linear-to ovate- or ob-lanceolate, subcaudately acuminate; petioles 1—3 ft. long; sheaths often purple-mottled; peduncles .5—4 ft. long; spathe 3—6 in. long; tube sub-cylindric, gaping, gradually dilated into the ovate or ovate-oblong, acuminate,

incurved limb; spadix with a smooth appendage tapering like a rat-tail, sigmoidally curved, often erect, then curved down and finally again erect; flowers monoecious or dioecious, a few neuters above the ♂.....1. *tortuosum*.

Spadix with appendage shorter than the spathe, rarely exerted from the tube; leaves always radiate:—

Spathe caudate-acuminate:—

Appendage of spadix not stipitate, apex clavate; neuters present in the ♀ inflorescence:—

Leaflets 5—11, linear- to ob-lanceolate, acuminate, margins papillose, 2—11 in. long, .8—3 in. wide; petioles stout, up to 2 ft. long, usually mottled and banded with red and brown; peduncles shorter than the petioles; spathes 4—12 in. long; tube narrowly cylindric, ribbed, dilated into the ovate-lanceolate limb which terminates in a caudate prolongation .3—1.5 in. long, mouth often slightly revolute; spadix tapering into a narrowly clavate appendage.....2. *Leschenaultii*.

Leaflets 10 (in the only known specimen), obovate-lanceolate, abruptly cuspidate, margins smooth, revolute, base cuneately narrowed from about $\frac{1}{2}$ below the apex with nearly straight sides, posterior leaflets 6 in. long, 2.5 in. wide, the others decreasing to the anterior pair 4.5 in. long, 1.5 in. wide; petiole stout, suffused with pale reddish-brown and spotted with pink; peduncle stout; spathe 8 in. long; tube 3 in. long, gaping above; limb broadly ovate-acuminate, inarching, mouth revolute, apex long-caudate; spadix a little longer than the tube, appendage stout, cylindric, base slightly enlarged, obtuse; flowers monoecious.....3. *pulchrum*.

Appendage of spadix stipitate, slender, tapering to the erect or recurved tip. Leaflets 5—9, cuneately obovate, cuspidate-acuminate, 3—5 in. long, 1.25—2 in. wide; petioles 10—22 in. long; peduncles shorter or longer; spathe 3.5—7 in. long; tube funnel-shaped; limb ovate-lanceolate, caudate-acuminate, mouth slightly revolute; neuters 0.....4. *Wightii*.

Spathe 3—5 in. long; tube broadly cylindric, base almost truncate, limb broadly ovate, acute, not caudate, margin dilated around the mouth. Leaflets 5—9, ovate- to oblong-lanceolate, acuminate, 2.5—7 in. long, .75—2.25 in. wide, veins close, parallel, submarginal close to the usually undulate, papillose margin; petioles rather slender, up to 16 in. long; peduncles as long, stouter, green mottled with red-brown; spadix with a slender, subulate appendage shortly exerted from the tube; flowers monoecious, neuters a few above the ♂.....5. *Murrayi*.

1. *ARISAEMA TORTUOSUM*, Schott; F. B. I. vi. 502. *Arum curvatum*, Roxb.; Wt. Ic. t. 788: *Arum tortuosum*, Wall. Pl. As. Rar. t. 111. Rampa Hills at 4,500 ft. (Narayanswami); Horsleykonda at 4,000 ft. (Fischer); W. Gháts, 3,000—7,000 ft. The Cobra-flower. Spathe pale-green or purplish. Vern. Tam. Katu-senai; Kan. Awu-mari-gidda.

Var. *neglectum*, Fischer. *A. neglectum*, Schott; F. B. I. vi. 504. Leaflets always radiate. W. Gháts.

2. *ARISAEMA LESCHENAUTII*, Bl.; F. B. I. vi. 504.

W. Gháts; 4,000—8,000 ft. The Cobra-flower.

Spathe dark-green, vertically striped with purple.

3. *ARISAEMA PULCHRUM*, N. E. Br.; F. B. I. vi. 505.

Sispara Ghát, Nilgiri Hills at 3,000 ft. (Beddome).

Spathe light-green tinged with purple at the base, vertically striped with white.

4. *ARISAEMA WIGHTII*, Schott; F. B. I. vi. 507.

W. Gháts; Billigirirangans at 5,000 ft. (Fischer); Nilgiri Hills (King); S. Coimbatore, Sholear banks at 3,300 ft. (Fischer);

Tinnevely Hills (Barber). Travancore 2,700—3,300 ft. (K. Venkoba Rao).

5. *ARISAEMA MURRAYI*, Hook; F. B. I. vi. 507.

Nilgiri Hills (G. Thomson, King).

Tube of spathe green, limb white with a red rim round the mouth of the tube.

12. *Amorphophallus*, Bl.

Tuberous herbs, rarely subarborescent. *Leaves* appearing after the flowers, 1—2 or 3, trisect, segments pinnati- or bipinnati-sect. *Peduncles* usually long. *Spathes* broadly ovate or oblong; limb campanulate or funnel-shaped, convolute or open. *Spadix* included or exerted. *Flowers* monoecious, crowded in cylindric masses, the 2 sexes contiguous or shortly separated by a few neutrals. *Perianth* 0. *Stamens* 1—6; anthers subsessile or the filaments as long, 2-celled, opening by pores, the 2 pores joined by a slit. *Ovaries* globose or ovoid, 1—4-celled; styles short or long; stigmas capitate, entire, emarginate or 2—4-lobed; ovules solitary, sub-basal, anatropous. *Neuters* 0 or few. *Berries* subglobose or ovoid. *Seeds* exalbuminous; embryo filling the seed.

♂ and ♀ inflorescences contiguous, neutrals 0:—

Leaves not bulbiferous; styles 3—4 times longer than the ovary; stigmas deeply 2—4 lobed:—

Appendage of spadix subglobose or amorphous, deeply sinuously lobed, equalling or longer than the fertile region, up to 5 in. diam. Tuber 8—10 in. diam.; leaves 1—3 ft. wide, segments spreading, entire or forked, the ultimate obliquely oblong, acuminate, 2·5 in. long; petioles 2—3 ft. long, stout, smooth or warted, dark-green with paler blotches; peduncles short, stout, elongating in fruit; spathes campanulate, fleshy below, 6—10 in. wide and long, margins recurved, undulate and crisped; spadix as long; ♂ and ♀ regions about equal in length; styles up to 5 in. long, purple.....1. *campanulatus*.

Appendage of spadix globose ovoid, smooth, shorter than the fertile region, up to 1·5 in. diam. Tuber 2—3·25 in. diam.; leaves as of the last species; peduncle very short, rough; spathe campanulate-infundibuliform, 3—5 in. diam., margins crisply waved; spadix shorter than the spathe, ♂ inflorescence about twice as long as the ♀; styles up to 3 in. long.....2. *dubius*.

Leaves bulbiferous at the forks, 12—18 in. diam.; leaflets lanceolate or obovate, 3—8 in. long, acute or acuminate, margins usually purple; petioles 3—4 ft. long, spotted. Tuber 2—4 in. diam.; peduncle 8—12 in. long, green and pink streaked with green or black; spathe erect, ovate-cymbiform, acute or obtuse, 4—8 in. long, 3—5 in. wide; spadix sessile, stout, about as long as the spathe; appendage about as long as the fertile region, elongate-conoid or oblong, rounded; ♂ inflorescence half as long again as the ♀.....3. *bulbifer*.

♂ and ♀ inflorescences separated by a row of neutrals:—

Spadix with appendage 3—6 times longer than the spathe. Tuber 2—2·2 in. diam., bulbiferous; leaves 1—2·5 ft. diam., segments lanceolate, long acuminate, 2—6 in. long; petioles 1—2 ft. long; spathes erect, ovate, convolute to the middle, 2—4 in. long, 1·4—2 in. wide, acute or acuminate; spadix stipitate, fertile region as long as the spathe or a little less; appendage linear-subulate, flexuous; neutrals oblong or elongate diamond-shaped, rather large, depressed, rugose.....4. *sylvaticus*.

Spadix with appendage as long as or a little shorter than the spathe. Tuber about 1 in. diam.; leaflets oblong, acute or acuminate, decurrent, 1—10 in. long; petioles 8—12 in. long; spathe 3 in. long, 1·2 in. wide, convolute below, expanded above into an erect, lanceolate, acute limb; spadix shortly stipitate, appendage slender, subulate, about 1½ times the length of the fertile region; neutrals elongate diamond-shaped, gibbous in the middle.....5. *Hohenackeri*.

1. AMORPHOPHALLUS CAMPANULATUS, Bl.; F. B. I. vi. 513. *Arum campanulatum*, Roxb. Cor. Pl. t. 272; Wt. Ic. tt. 782, 785.
N. Circars (Roxb.); Rampa Hills (Ramaswami, Narayanswami). Cultivated in most districts for the edible tubers. Spathe greenish-pink with pale blotches, purple at base within, appendage red-purple. Vern. *Hind.* Zamin-kand; *Tel.* Manshi-kanda. *Tam.* Karu-naik-kishangu; *Mal.* Karuna-kishannai, Muleshena.
2. AMORPHOPHALLUS DUBIUS, Bl.; F. B. I. vi. 514.
Malabar (Rheede).
Spathe green, limb purple, edges greenish, appendage chestnut-brown. Vern. *Mal.* Shena.
3. AMORPHOPHALLUS BULBIFER, Bl.; F. B. I. vi. 515.
Rampa Hills at 2,000 ft. (Narayanswami); Nadgani Ghát, S. Malabar (Bourne).
Spathe greenish or yellowish mottled pink without, pink or salmon deepening to scarlet within, appendage pale flesh-coloured or white, ♀ flowers red.
4. AMORPHOPHALLUS SYLVATICUS, Kunth. *Synantherias sylvatica*, Schott; F. B. I. vi. 518. *Arum sylvaticum*, Roxb.; Wt. Ic. t. 802.
Circars (Roxb.); Nilgiri-Wynaad (Beddome).
Spathe clouded, barred and streaked with green and pale-pink, appendage brown.
5. AMORPHOPHALLUS HOHENACKERI, Engl. *Raphiophallus*, Schott; F. B. I. vi. 518.
S. Kanara near Mangalore among bushes (Hohenacker).

13. *Plesmonium*, Schott.

Tuberous herbs. *Leaves* 1—3, appearing after the flowers; 3-foliate or -sect and pinnatisect. *Spathes* ovate, erect, convolute-campanulate below, expanded above. *Spadix* free, stipitate, included or exserted; appendage 0. ♂ and ♀ *inflorescences* separated by a dense belt of clavate, disciform or truncate neuters. *Perianth* 0. *Stamens* 1—6; anthers nearly sessile, cells subquadrate, immersed in the connective, opening by short, curved, apical pores. *Ovaries* slightly sunk in the spadix, 2—3-celled; styles conical; stigmas large, capitate or discoid; ovule solitary, axile. *Berries* ovoid, 2—3-celled and seeded. *Seeds* ellipsoid; albumen 0; embryo filling the seed.

PLESMONIUM MARGARITIFERUM, Schott; F. B. I. vi. 518. *Arum margaritifera*, Roxb.; Wt. Ic. t. 795.

Vizagapatam District (Barber); Rampa Hills at 1,500 ft. (Ramaswami, Narayanswami).

Tuber up to 4 in. diam.; leaf solitary, rarely 2, 12—18 in. diam.; leaflets narrowly lanceolate, acuminate, sometimes forked, 4—8 in. long; petioles 12—30 in. long; peduncles 1—2 ft. long; spathe broadly ovate, 3—5 in. long, leathery, green without, deep purple at the base within, sometimes flushed with purple upwards; ♀ inflorescence .75—1.5 in. long, neuters large, clavate, pure white, occupying a space of about .75 in., ♂ inflorescence 1.5—2 in. long.

14. *Anaphyllum*, Schott.

Tall herbs; rootstock creeping. *Leaves* hastate-sagittate when young, later pinnati- or pedati-sect; petioles very long. *Peduncles* long. *Spathes* oblong-ovate or lanceolate, base convolute or open, limb sometimes twisted. *Spadix* much shorter than the spathe, stipitate, cylindric; appendage 0. *Flowers* hermaphrodite, covering the whole spadix. *Perianth* of 4 truncate sepals incurved at the top. *Stamens* 4—6; filaments flat; anthers much shorter. *Ovary* ovoid, 1-celled; style thick, conical or almost absent; stigma disciform; ovule solitary, parietal, anatropous or semi-anatropous. *Berries* obovoid.

Mature leaves tristect usually not quite to the rib; up to 18 in. diam., the middle segment deeply pinnately lobed, the lateral pedately lobed; lobes linear-, oblong- or triangular-lanceolate, obtuse, acute or acuminate; petioles slender, very long; peduncles slender, up to 3 ft. long; spathes oblong-ovate or -elliptic, acute or obtuse and apiculate, 2—4.5 in. long, .9—2.25 in. wide, expanded from the base, not twisted; spadix 1—1.3 in. long.....1. *Beddomei*.

Mature leaves up to 2 ft. long, pinnatisect to or nearly to the midrib; leaflets often narrowed into a definite petiolule, sometimes sessile and shortly decurrent, apical leaflet sometimes 3-lobed, basal pair undivided, linear-oblong- or ovate-lanceolate, acute or acuminate, up to 20 in. long and 6 in. wide, lowest pair usually the largest; petioles 2—4 ft. long; peduncles about as long; spathes linear- to oblong-lanceolate, acuminate or caudate-acuminate, shortly convolute at the base, then expanded and lightly contorted, 8—16 in. long, 1.5—5.25 in. wide; spadix 1.5—3.5 in. long.....2. *Wightii*.

1. *ANAPHYLLUM BEDDOMEI*, Engl.

Anamalai Hills (Beddome, Fischer); Tinnevely and Travancore Hills, at about 4,000 ft.

Spathe 5—7-veined.

2. *ANAPHYLLUM WIGHTII*, Schott; F. B. I. vi. 551.

W. Gháts from the Attapadi Valley (Fischer) to Tinnevely and Travancore, 300—4,000 ft.

Spathe about 13-veined, dark-violet; smelling strongly of putrid flesh. Vern. *Mal.* Sulli.

15. *Lasia*, Lour.

Stout herbs; rhizome branched, spinous. *Leaves* hastate and entire or pedately pinnatifid, petioled. *Peduncles* long, spinous. *Spathes* very long, base convolute, blade much longer, twisted. *Spadix* short, sessile, cylindric, obtuse; appendage 0. *Flowers* hermaphrodite. *Perianth* of 4, rarely 6, obovate, truncate segments incurved at the tip. *Stamens* 4—6; filaments short, flat; anthers a little shorter. *Ovaries* ovoid, 1-celled; styles stout; stigmas depressed; ovules solitary, pendulous from the top of the cell, anatropous or semi-anatropous. *Berries* obpyramidal, hexagonal. *Seeds* compressed, rugose; albumen 0 or evanescent; embryo filling the seed.

LASIA SPINOSA, Thw. *L. heterophylla*, Schott; F. B. I. vi. 550; Wt. Ic. t. 777.

Rampa Hills at 2,500 ft. (Gamble, Narayanswami).

Rhizome thick; leaves 6—18 in. long, when young hastate or sagittate, acuminate, older often broader than long and deeply pedately pinnatifid, lobes linear-, elliptic- or oblong-lanceolate, acuminate, 1-ribbed, spinous on the nerves beneath; petioles

terete, 1—4 ft. long, spinous; peduncles as long; spathe 8—14 in. long, purple or claret, open only at the base; spadix 1—2 in. long; perianth-segments pink; berries densely, minutely muricate at the apex.

16. *Scindapsus*, Schott.

Stout shrubs climbing on trees and rocks by means of adventitious aerial roots. *Leaves* entire, alternate, distichous; petiole long, geniculate near the apex, often winged. *Peduncles* axillary, short. *Spathe* coriaceous, deciduous. *Spadix* sessile, cylindric, a little shorter than the spathe, dense-flowered; appendage 0. *Flowers* hermaphrodite. *Perianth* 0. *Stamens* 4—6; filaments short, flattened; anthers erect, longer than the filaments. *Ovary* obconic, truncate, 1-celled; stigma sessile, linear or elliptic; ovule solitary, basilar, anatropous. *Berries* confluent, pericarp with many inter-cellular needles. *Seeds* rounded, compressed; albumen 0; embryo filling the seed, horse-shoe-shaped.

SCINDAPSUS OFFICINALIS, Schott; F. B. I. vi. 541; Wt. Ic. t. 778.

Ganjam District (Gamble, Barber); Vizagapatam District (Jacob). *Leaves* ovate to suborbicular, inequilateral, 5—12 in. long, 2·5—6 in. wide, acuminate; petioles 3—6 in. long, more or less broadly winged to the knee, wing rounded or subcordate at the apex; spathe oblong with a cuspidate beak, 4—6 in. long, green outside, yellow within; spadix stout, nearly as long as the spathe, lengthening up to 9 in. in fruit, densely packed with prismatic, truncate ovaries. Vern. *Tel.* Enugu-tippali.

17. *Rhaphidophora*, Hassk.

Differing from *Scindapsus* only by the following characters: *Leaves* often pinnatipartite or pinnatisect, or if entire usually variously perforate; petioles not winged, but more or less sheathing at the base. *Anthers* much shorter than the filaments. *Ovary* sub 2-locular; style very short or elongate conical; ovules many. *Seeds* oblong; albumen copious; embryo axile.

RHAPHIDOPHORA PERTUSA, Schott; F. B. I. vi. 546. *Scindapsus pertusus*, Schott; Wt. Ic. t. 781.

In all Districts in hilly tracts in evergreen or moist deciduous forests; up to 4,000 ft.

Leaves ovate to suborbicular in outline, inequilateral, sometimes entire and if so perforate with elliptic holes, sometimes pinnatifid on one side to near the base and perforate on the other or more rarely completely pinnatifid to near the midrib, 8—12 in. long, 6—12 in. wide, apex shortly cuspidate, lobes few, unequal, dilated towards the oblique, falcate-acuminate margin; petioles deeply channelled above, 6—12 in. long; ovaries truncate; stigmas subsessile, pulvinate. Vern. *Tel.* Enugan-alleru; *Tam.* Anai-tippili; *Mal.* Anatippali; *Kan.* Dodda-tippali.

18. *Pothos*, Linn.

Evergreen branching shrubs climbing by adventitious aerial roots. *Leaves* distichous, simple, blade sometimes obsolete; petioles often

broadly winged and articulated to the blade. *Peduncles* axillary or terminal or on short lateral shoots. *Spathes* small, persistent, reflexed. *Spadix* sessile or stipitate, globose, obovoid, cylindric or filiform, often decurved. *Flowers* hermaphrodite, aggregated or distant. *Perianth* of 6 segments incurved at the tip. *Stamens* 6; filaments flat; anthers small. *Ovaries* ovoid, oblong or depressed, 3-celled; stigmas sessile, umbonate; ovules 1 in the inner angle of each cell, anatropous, ascending. *Berries* ellipsoid or obovoid, 1—3-seeded. *Seeds* compressed-ellipsoid, testa thick; albumen 0; embryo filling the seed.

Stems unarmed; spadix globose, ovoid or cylindric, dense-flowered, glabrous:—

Petioles broadly winged, wings truncate or rounded at the apex, narrowed to the semi-amplexicaul base, 1—2.5 in. long, .2—5 in. wide at the apex, in young shoots sometimes reduced to .2 in. long and .1 in. wide; blade of leaf usually lanceolate, sometimes linear-lanceolate, acuminate, rarely very broadly obovate and rounded, up to 4 in. long and 1.5 in. wide, often reduced to a mere point or altogether wanting, base rounded, veins close, forming a very acute angle with the mid-rib; peduncles axillary, solitary, .2—3 in. long, base embraced by a few minute, apiculate, suborbicular cataphylls; spathe suborbicular, apiculate, .1—2 in. long; spadix globose or obovoid, .25—3 in. long, deflexed; berries oblong, .5—7 in. long.....1. *scandens*.

Petioles not winged, channelled above, .2—7 in. long, very shortly sheathing; leaves elliptic- or oblong-lanceolate, cuspidate-acuminate, base narrowed, 4.5—7.5 in. long, 1.2—2 in. wide, veins nearly horizontal; peduncles from extra-axillary very short branchlets, solitary or 2—3 together, slender, .9—2 in. long, embraced by ovate to linear-oblong apiculate or obtuse cataphylls, the terminal up to .4 in. long; spathe linear- to broad-oblong, .6—1 in. long, acute or obtuse; spadix narrowly cylindric, .7—1.4 in. long; berries oblong, .4 in. long

2. *Thomsonianus*.

Stems armed at the nodes with 1-several straight or curved spinules up to .1 in. long; leaves linear- or elliptic-lanceolate, acute or acuminate, base narrowed, 3—5.6 in. long, .8—1.4 in. wide, veins prominent below, forming an obtuse angle with the midrib (about 45°); petioles .25—5 in. long, channelled above, shortly sheathing; peduncles 1.3—2.5 in. long, slender, usually curved, on short axillary branchlets embraced by several linear-oblong, blunt cataphylls, the terminal .3 in. long; spathe ovate-lanceolate, cymbiform, acute or obtuse, .5—7 in. long; spadix very slender, 1.5—2.3 in. long, furfuraceously brown-pubescent as are the flowers, straight or zig-zag; flowers in distant groups of 3—4.....3. *armatus*.

1. *POTHOS SCANDENS*, Linn.; F. B. I. vi. 551; Wt. Ic. t. 776.

W. Coast and Gháts, up to 2,500 ft.; growing on trees and rocks like ivy. Spadix yellow.

2. *POTHOS THOMSONIANUS*, Schott; F. B. I. vi. 555.

Wynaad (Beddome); Carnatic (G. Thomson); Travancore (Beddome, Lawson, M. Rama-Rao); Kannikatti, Tinnevely District (Herb. Madras).

3. *POTHOS ARMATUS*, Fischer in Kew Bull. 1929, 126.

Tambracheri Ghát, Malabar (Barber); Ponnudi to Kullar (Barber).

The spines are modified adventitious rootlets.

Family CLXVIII. LEMNACEAE.

Small or minute scale-like, green, gregarious, floating herbs, stemless, rootless or with capillary rootlets; propagating by budding or by hibernating bulbils, rarely by seed. *Fronds* smooth above, spongy below. *Flowers* very minute, monoecious, naked or enclosed in a

membranous spathe. *Perianth* 0. *Stamens* 1 or 2; anthers 1- or 2-celled. *Ovary* sessile, 1-celled; style short; stigma truncate or funnel-shaped; ovules 1—7. *Fruit* a flask-shaped utricle. *Seeds* 1—7; testa coriaceous; albumen fleshy or 0; embryo cylindric, axile.

Fronds flat above, with 1 or more roots; flowers in marginal clefts; anthers 2-celled.....1. *Lemna*.

Fronds minute, subglobose, rootless; flowers on the upper surface; anthers 1-celled, sessile.....2. *Wolffia*.

1. *Lemna*, Linn.

Fronds flat with 1 or more capillary rootlets from the margins or lower surface. *Flowers* in marginal clefts enclosed together in a transitory spathe; ♂ in pairs. *Stamens* solitary; filament filiform; anther 2-celled, globose. *Ovary* solitary; ovules 1—7. *Utricle* 1—7-seeded.

Rootlet solitary:—

Frond asymmetric, nearly flat on both surfaces, .12—25 in. long, root sheathed, appendaged; root-cap acute.....1. *paucicostata*.

Frond suborbicular or obovate in outline, flat above, convex below, .3—5 in. long; root-sheath elongate; root-cap acute.....2. *gibba*.

Rootlets several, tufted from the lower surface; fronds thick, orbicular or nearly so in outline, flat above, slightly convex below, .25—35 in. long, often purple below.....3. *polyrrhiza*.

1. *LEMNA PAUCICOSTATA*, Hegelm.; F. B. I. vi. 556.

In still waters in most localities.

2. *LEMNA GIBBA*, Linn.; F. B. I. vi. 556.

In still waters in all Districts.

3. *LEMNA POLYRRHIZA*, Linn.; F. B. I. vi. 557.

In still waters in all Districts.

2. *Wolffia*, Horkel.

Fronds very minute, subglobose, rootless. *Flowers* in a groove on the upper surface of the frond, naked; ♂ solitary. *Stamen* solitary; anther 1-celled, sessile. *Ovary* solitary; style short; stigma depressed; ovule solitary. *Utricle* spherical.

WOLFFIA ARRHIZA, Wimm.; F. B. I. vi. 557.

In still waters in all Districts.

Fronds .05 in. long or less.

Family CLXIX. TRIURIDACEAE.

Slender, leafless, saprophytic herbs devoid of chlorophyll. *Stems* simple or very little branched, filiform, bearing a few distant scales. *Flowers* monoecious or dioecious, small, in terminal corymbs or racemes; pedicels decurved, bracteate. *Perianth* 3—8-partite or -lobed, segments valvate in bud. *Stamens* 2—6, hypogynous or perigynous; anthers free or immersed in a thick disk, cells 2, confluent. *Pistillodes* 0 or 3, subulate. *Staminodes* in ♀ 0 or few. *Ovary* of many 1-celled carpels sessile on a receptacle; style terminal, lateral or basal, persistent; stigma acute, clavate or penicillate; ovule solitary, erect, anatropous. *Fruit* of several obovoid, coriaceous or fleshy achenes in a globose head; nucleus hard.

Sciaphila, Blume.

Perianth 3—8-partite or -lobed. *Anthers* sessile at the base of the perianth. *Styles* ventral or basal.

SCIAPHILA JANTHINA, Thw.; F. B. I. vi. 558.

Tinnevely and Travancore; 2,000—3,000 ft. (Beddome).

Stems 4—8 in. long; scales and bracts ovate-lanceolate, acuminate, up to 1 in. long; flowers monoecious or dioecious, long pedicelled, ♂ 12 in. diam., ♀ 25 in. diam.; perianth segments 8; anthers 4, sessile on a thick disk; style subbasilar, filiform, much longer than the ovary.

Family CLXX. ALISMACEAE.

Marsh or water plants, usually erect, sometimes floating, often with milky juice. *Leaves* radical or clustered at the nodes of floating stems, entire. *Flowers* regular, 1-sexual or hermaphrodite, in umbellate or paniculate whorls. *Perianth* of 6 segments in 2 series, the outer 3 herbaceous, the inner petaloid, rarely 0. *Stamens* 6— (rarely 3—) many, hypogynous or epigynous; anthers basifixed, erect. *Carpels* superior, 3—6 or more, 1-celled; sessile or stipitate on a flat or raised receptacle; style long, short or 0, subterminal or ventral; stigma simple; ovules 1—many in each carpel. *Fruit* of achenes or follicles. *Seeds* small; albumen 0; embryo straight or conduplicate.

Fruit indehiscent, of 3 or more achenes; ovule solitary, basal:—

Flowers all hermaphrodite.....1. **Alisma**.

Some or all of the flowers 1-sexual:—

Some of the flowers hermaphrodite; stamens 6; receptacle flat

2. **Limnophyton**.

All the flowers 1-sexual; stamens usually more than 6; receptacle oblong or globose.....3. **Sagittaria**.

Fruit dehiscent, of 6—9 follicles; ovules many on the inner wall

4. **Tenagocharis**.

1. Alisma, Linn.

Scapigerous herbs. *Leaves* lanceolate, cordate or sagittate. *Flowers* in umbelled or paniced whorls. *Sepals* persistent. *Petals* deciduous. *Stamens* 6 or 9. *Carpels* few-many; receptacle small. *Fruit* of small coriaceous or hard achenes. *Seeds* with a horse-shoe-shaped embryo.

Leaves coriaceous, reniform- or orbicular-cordate, apex rounded or retuse, basal sinus wide, 2.5—4.5 in. long, 2—6.5 in. wide, ribs 13—17, prominent, cross-nervules very numerous and close, straight; bracts at the lower forks less than .5 in. long; achenes 5—8, obovoid, long-awned with the persistent style, dorsally ridged, ridges smooth.....1. **reniforme**.

Leaves membranous, narrowly to broadly ovate-cordate, narrowed to a blunt apex, basal sinus narrow, 2.5—6 in. long, 1.2—3 in. wide, ribs 5—17, often slender, cross-nervules comparatively few and distant, not markedly straight; bracts at the lower forks 1—2.5 in. long, smaller upwards; achenes 2—6, ovate-reniform, style deciduous, dorsally ridged, ridges tubercled.....2. **oligococcum**.

1. ALISMA RENIFORME, Don; F. B. I. vi. 560; Wt. Ic. t. 322.

Mangalore (Wight).

Flowers white or pink-purple.

2. *ALISMA OLIGOCOCUM*, F. Muell.; F. B. I. vi. 560.
Paravur in Travancore (K. Venkoba Rao).
Flowers white.

2. *Limnophyton*, Miq.

Erect, succulent marsh herbs. Characters the same as those of *Alisma* except that there are ♂ flowers with 6 stamens in 2 series as well as the hermaphrodite ones with smaller stamens.

LIMNOPHYTON OBTUSIFOLIUM, Miq.; F. B. I. vi. 560.

In all Districts, more common on the Eastern side; sea-level to 6,000 ft.

Leaves reniform- or deltoid-sagittate, apex usually rounded, sometimes acute, basal sinus usually deep and wide, basal lobes spreading, long, tapering to a fine point, usually longer than the blade above the petiole, which is 1.5–6.5 in. long, 1.5–12 in. wide; petioles 4 in.—5.5 ft. long; panicle 1.4 ft. long; bracts at the forks whorled, broadly ovate-lanceolate, acuminate, up to 1 in. long; flowers numerous, .3–.5 in. diam., white, of the upper whorls ♂, of the lower ♀; achenes 12–20 in a globose head, obovoid, .15 in. long, irregularly 4-ridged, ridges indistinctly crenulate.

3. *Sagittaria*, Linn.

Erect aquatic herbs. *Leaves* erect or in deep water sometimes floating, cordate or sagittate. *Flowers* 1-sexual or polygamous, in paniced or spicate whorls. *Sepals* herbaceous, persistent. *Petals* membranous, deciduous. *Stamens* 6—many; filaments compressed. *Staminodes* often present in ♀ flowers. *Carpels* laterally flattened, crowded on a large globose or oblong receptacle; style ventral or apical; stigma papillose; ovule solitary, basal. *Fruit* a globose or oblong head of crowded, flattened, crested or winged achenes. *Seeds* erect, testa thin; embryo horseshoe-shaped.

Mature leaves hastate or sagittate, blade above the petiole 2–8 in. long, apex acute or acuminate, basal lobes usually diverging, narrower and often longer than the rest of the blade, tapering to a fine point; petioles up to 2 ft. long, trigonous; flowers .5–.75 in. diam., lower ♀ nearly sessile, with staminodes, upper ♂ with longer pedicels and about 24 stamens, ♂ rare; achenes obliquely obovate, apiculate, wing broad, entire or subcrenate. Young and floating leaves often strap-shaped or cordate-oblong.....1. *sagittifolia*.
Leaves broadly ovate, deeply cordate, apex rounded, 1–4 in. long, 1–3.5 in. wide, basal lobes rounded; petioles, scapes and pedicels often hairy; flowers .7 in. diam., lower ♀ with 9–12 stamens, upper more numerous ♂ with 6–12 stamens; achenes surrounded by a broad, prominently toothed wing.....2. *guayanensis*.

1. *SAGITTARIA SAGITTIFOLIA*, Linn.; F. B. I. vi. 561.
Nilgiris at 7,800 ft. (Lawson). Rare.
Petals white, the claw usually purple.
2. *SAGITTARIA GUAYANENSIS*, H. B. K.; F. B. I. vi. 561.
Nilgiris (G. Thomson); Quilon. Not common.
Petals white.

4. *Tenagocharis*, Hochst.

Marsh plants with milky juice. *Leaves* petioled, elliptic. *Flowers* hermaphrodite, in terminal single or superposed, bracteate whorls. *Sepals* herbaceous, persistent. *Petals* membranous, deciduous. *Stamens* 8—12; filaments filiform. *Carpels* 6—9, whorled, sessile on a flat receptacle; style short; ovules many, anatropous. *Fruit* of 6—7 erect, membranous follicles. *Seeds* numerous, minute, smooth; embryo conduplicate, horseshoe-shaped.

TENAGOCHARIS LATIFOLIA, Buchen. *Butomopsis lanceolata*, Kunth; F. B. I. vi. 562.

Ganjam District (Beddome, Barber).

Leaves elliptic-lanceolate, acute at both ends, 2—6 in. long, .65—2.25 in. wide; petioles up to 8 in. long, dilated at the base; scapes stout, usually longer than the leaves; bracts scarious, ovate, acute, up to .65 in. long; flowers .75 in. diam., 3—20 at the apex, sometimes with an additional whorl below; pedicels 1—6 in. long; petals white; follicles .35 in. long, shortly beaked, connate below.

Family CLXXI. APONOGETONACEAE.

Submerged or floating glabrous, aquatic herbs; rhizome tuberous or stoloniferous; tubers usually globose with numerous root-fibres. *Leaves* radical, rarely sessile, petioles with a sheathing base; blade oblong to linear-lanceolate, membranous, floating or submerged, with 3—7 or more longitudinal nerves and numerous transverse nervules. *Peduncles* long, emerging, bearing a simple or 2—4-branched spike. *Flowers* very small, actinomorphic, hermaphrodite, very rarely dioecious. *Perianth* of 1—3, generally 2, membranous, white or coloured sepals. *Stamens* 6 in 2 whorls, rarely more in 3 or 4 whorls; filaments free, filiform or subulate; anthers small, basifixed, 2-celled, subglobose or ellipsoid. *Carpels* free, usually 3, rarely 4—5 or in ♀ flowers 6—8, sessile, 1-celled, usually narrowed into a slender style; stigma discoid or linear, slightly decurrent; ovules 2—8, basal or 2-seriate on the ventral suture, ascending, anatropous. *Fruit* of 3 or more inflated, coriaceous, beaked follicles. *Seeds* 1—8, erect, oblong or cylindric; exalbuminous; testa herbaceous or fleshy, sometimes ribbed; embryo elongate, compressed or cylindric, erect.

Aponogeton, Linn. f.

The only genus. Characters of the Order.

Spike simple in all Indian species.

Leaves mostly floating, oblong to linear-lanceolate, acute or obtuse, base rounded or shallowly cordate, 1—8 in. long, up to 2 in. wide; spike 1—6 in. long, usually dense-flowered; sepals 2, obovate or suborbicular, .1 in. long; stamens as long or longer; follicles 3, subglobose; seeds 1—8, 6—8-ribbed, striate.....1. *natans*. *Leaves* all submerged, oblong to linear-oblong, rounded or subacute, base narrowed into the petiole, 7—20 in. long, sometimes much longer, up to 1.5 in. wide, margins undulate or crisped; spike 3—5 in. long, usually lax-flowered; sepals 2, obovate-spathulate, .17 in. long, much longer than the stamens; follicles 3, oblong, beaked; seeds 1—2, smooth.....2. *crispus*.

1. *APONOGETON NATANS*, Engl. & Kr. *A. monostachyon*, Linn. f.; F. B. I. vi. 564; Roxb. Cor. Pl. t. 81.
In all Districts; sea-level to 4,000 ft.
Sepals white, pink or pale-blue, anthers bluish-purple. Vern. Tel. Namma; Mal. Parua-kelanga.
2. *APONOGETON CRISPUS*, Thunb.; F. B. I. vi. 564.
Travancore (Rangachari); Madras (Bourne); Wynaad (Beddome).
Sepals white.

Family CLXXII. POTAMOGETONACEAE.

Freshwater or marine herbs, submerged or floating. *Leaves* distichous, alternate or less often opposite, sessile or petioled, often vaginate at the base, often stipulate. *Flowers* usually very small, emerging or submerged, solitary, spicate or cymose, hermaphrodite or monocious, actinomorphic. *Perianth* 0 or of 3-4 sepals, rarely cupular. *Anthers* sessile. *Carpels* 1-several, free or nearly so, 1-celled; stigmas 1 or 2; ovule solitary, usually pendulous from the apex and orthotropous, rarely parietal and anatropous. *Fruit* of coriaceous, subwoody or membranous drupelets. *Seeds* exalbuminous; embryo axile.

Flowers in erect, emerging, naked spikes; perianth of 4 sepals...1. *Potamogeton*.
Flowers submerged, solitary or in small cymes enclosed in the leaf-sheath or a spatheiform bract; perianth cupular or 0:—

Delicate herbs; leaves filiform; stigma single, peltate:—

Carpels 4, stipitate, ovoid, not keeled.....2. *Ruppia*.
Carpels 2-9, sessile, curved, sausage-shaped, dorsally keeled...3. *Zanichellia*.

More robust herbs; leaves strap-shaped or terete; stigmas 1-2, subulate:—

Anthers 2, inserted at the same level; stigmas 2.....4. *Cymodocea*.

Anthers 2, one inserted above the other; stigma 1.....5. *Diphanthera*.

1. *Potamogeton*, Linn.

Submerged or floating herbs; rhizome creeping. *Leaves* submerged or floating, linear, lanceolate, oblong or sometimes rotund, petioled or sessile, rarely amplexicaul. *Flowers* very small on spikes rising from a membranous spathe, hermaphrodite; bracts 0. *Perianth* of 4 concave, green sepals. *Anthers* 4, sessile at the base of the sepals; pollen globose. *Carpels* 4, sessile; stigma subsessile or decurrent, persistent. *Drupelets* small, coriaceous or membranous, often dorsally ridged. *Seeds* subreniform.

Upper or all the leaves floating, the latter petioled, none amplexicaul or semi-amplexicaul:—

Leaves all broad and petioled. Stem terete, branched; upper floating leaves sometimes opposite, thinly coriaceous, elliptic-lanceolate and acute or oblong or suborbicular and obtuse, base rounded or cuneate, 1.5-4 in. long, 1-2.5 in. wide, submerged leaves membranous linear- to elliptic-lanceolate, acute, up to 8 in. long and 1 in. wide, often undulate; petioles often very long; stipules free, up to 1.5 in. long; peduncles axillary or leaf-opposed, 1-6 in. long; spikes 1-1.5 in. long, dense-flowered; sepals .1 in. long, suborbicular, clawed; drupelets .1-.125 in. long, oblique, shortly beaked.....1. *indicus*.
Submerged leaves very narrowly linear or filiform without distinct petiole. Stems very slender; floating leaves membranous, elliptic- to ovate-oblong, acute, .5-1.5 in. long; petioles usually shorter than the blade; stipules free, .5-1 in. long;

peduncles slender, axillary or leaf-opposed; spikes 3—5 in. long, lax-flowered; sepals orbicular-obovate; drupelets semiglobose with a hooked beak, .08 in. long, ribs often toothed and tubercled.....2. *javanicus*.
 Leaves all submerged, without distinct petiole:—
 Stem rather stout, terete, slightly branched; leaves ovate-lanceolate, cordate, amplexicaul, obtuse, .75—1.5 in. long, .5—1 in. wide; stipules small, caducous; peduncles axillary, rather stout, 1—2 in. long; spikes dense-flowered, .5—1 in. long; sepals elliptic-obovate, clawed; drupelets compressed-globose with a short curved beak, hardly keeled, smooth, .1 in. long.....3. *perfoliatus*.
 Stem filiform, copiously distichously branched; leaves narrowly linear or filiform, acute, 1—6 in. long, .04—1 in. wide; stipules adnate to the leaf-sheath with free tips; peduncles slender, axillary, elongate; flowers interruptedly whorled on a spike .2—1.25 in. long; sepals suborbicular; drupelets dimidiate-obovate, shortly beaked, .1—1.5 in. long.....4. *pectinatus*.

1. POTAMOGETON INDICUS, Roxb.; F. B. I. vi. 565.

In all Districts; sea-level to 7,000 ft.

2. POTAMOGETON JAVANICUS, Hassk.; F. B. I. vi. 566.

Travancore; in backwaters.

3. POTAMOGETON PERFOLIATUS, Linn.; F. B. I. vi. 566.

Chingleput lake; Ootacamund lake (Gamble).

4. POTAMOGETON PECTINATUS, Linn.; F. B. I. vi. 567.

Chilka lake (Hooper, Annandale); Samalkota canal (Barber); Kistna District (Gamble); Coimbatore (Wight).

2. *Ruppia*, Linn.

Slender, much-branched herbs submerged in brackish water; rootstock creeping. *Leaves* alternate or subopposite, filiform; sheaths stipuliform. *Flowers* minute, hermaphrodite, peduncled within the leaf-sheath; peduncle elongating after flowering, ultimately straight or spirally coiled. *Perianth* 0. *Stamens* 2; anthers sessile, 2-celled. *Carpels* 4; stigma sessile, peltate; ovule pendulous. *Drupelets* 4, stipitate, ovoid, obtuse or beaked. *Seeds* pendulous, uncinat, embryo macropodal.

RUPPIA MARITIMA Linn.; *R. rostellata*, Koch; F. B. I. vi. 568.

Along the coasts.

Leaves 2—4 in. long; peduncles .25 to several inches long; stipes of drupelets up to 1 in. long; drupelets .08—1 in. long.

Subspecies *spiralis*, Linn. peduncles long and spirally coiled.

Subspecies *rostellata* Koch. peduncles .25—1 in. long, not coiled.

3. *Zanichellia*, Linn.

Submerged fresh- or brackish-water herbs; rootstock slender; stem filiform, cymosely branched. *Leaves* narrowly linear or filiform; stipular sheaths membranous. *Flowers* minute, monoecious, both sexes enclosed together in a membranous sheath. ♂ *perianth* 0. *Stamen* solitary; filament filiform; anther linear, 2—3-celled. ♀ *perianth* cupular, hyaline. *Carpels* 1—9, sessile or stipitate; style short or long; stigma peltate; ovule pendulous, orthotropous. *Drupelets* usually 4, coriaceous, compressed. *Seeds* pendulous, oblong, testa thin; embryo cylindric.

ZANICHELLIA PALUSTRIS, Linn. *subsp. PEDICELLATA* Syme; F. B. I. vi. 568.

Salt marshes and fresh-water lagoons.

Leaves 1—3 in. long, alternate or opposite; drupelets distinctly stipitate, compressed sausage-shaped, incurved, beaked, crested on the back.

4. *Cymodocea*, Koenig

Submerged marine herbs; rootstock rigid, jointed, creeping, branching, bearing the annular scars of fallen leaves. *Leaves* distichous, oblong, linear or terete; stipular sheaths membranous, mouth more or less 2-auriculate. *Flowers* axillary, monoecious, enclosed in membranous sheaths. *Perianth* 0. *Stamens* 2; anthers elongate, connate, stipitate, pollen in threads. *Carpels* 2, subsessile, ovoid, compressed; style short; stigmas 2, subulate; ovule pendulous, orthotropous. *Drupelets* 2, ovoid, coriaceous or woody. *Seeds* pendulous; embryo macropodal.

Leaves flat, flowers solitary:—

Leaf scars forming closed rings; leaves up to 8 in. long, .2 in. wide, apex rounded, usually entire, 7—13-nerved; sheaths compressed-cylindric, up to 2.5 in. long and .2 in. wide; drupelets with a coarsely, acutely dentate keel

1. *rotundata*.
Leaf scars forming open rings; leaves up to 8 in. long and .4 in. wide, apex rounded, minutely toothed, 11—19-nerved; sheaths obconic, 1—1.5 in. long, up to .4 in. wide at the mouth, much narrowed to the base.....2. *serrulata*.
Leaves fleshy, terete, grooved, tip 3-toothed, 3—6 in. long, .05 in. wide or less; sheaths narrowly obconic, up to 1.25 in. long and .2 in. wide at the mouth; flowers in terminal, dichotomously branched cymes 1—2 in. long, each pair sessile on a short peduncle enclosed in a spatheiform bract with a linear tail; bracts .2 in. long.....3. *isoetifolia*.

1. *CYMODOCEA ROTUNDATA*, Aschers. & Schweinf.

Pambam (Parthasarathy Iyengar); Tuticorin.

2. *CYMODOCEA SERRULATA*, Aschers. & Magn.; F. B. I. vi. 570.

Pambam (Parthasarathy Iyengar); Tuticorin (Wight).

3. *CYMODOCEA ISOETIFOLIA*, Aschers.; F. B. I. vi. 570.

Pambam (Parthasarathy Iyengar); Tuticorin (Wight, Thurston).

5. *Diplanthera*, Thouars

Submerged marine herbs; rootstock slender, branching, rigid, jointed, bearing the annular scars of fallen leaves. *Leaves* very narrowly linear, apex with 2 minute lateral teeth, 3-nerved; sheaths cylindric, distinctly 2-auriculate and ligulate. *Flowers* axillary, monoecious. ♂ *peduncles* long. *Anthers* equal, sessile, one inserted above the other by about half its length. *Carpels* included in the sheath with the single subulate style exerted. *Drupelet* subrotund-ovate, slightly compressed.

DIPLANTHERA UNINERVIS, Aschers. *Cymodocea australis*, Trim.; F. B. I. vi. 570.

Ennore backwater (Thurston); Tuticorin.

Leaves 3—7 in. long, .1—1.6 in. wide, apex between the teeth truncate or rounded, the midnerve often shortly excurrent to form a third tooth; anthers .12 in. long; drupelets .12 in. long.

Family CLXXIII. NAJADACEAE.

Slender, submerged, salt- or fresh-water herbs; stems rooting from the nodes, branched, filiform, smooth or muricate. *Leaves* alternate, opposite or ternate, linear, entire or minutely spinulose-serrulate; base sheathing, sheaths truncate, rounded or 2-auriculate at the apex margins more or less toothed. *Flowers* minute, axillary, solitary or a few together, monoecious, rarely dioecious, naked or enclosed in a tubular or inflated spathe. *Perianth* 0 or tubular and hyaline. *Stamen* 1, adnate to the perianth, 1—4-celled. *Carpel* 1, sessile; style cylindric; stigmas 2—4, slender; ovule solitary, basal, erect, anatropous. *Achenes* oblong or ellipsoid. *Seeds* erect, testa very thin, areolate; embryo straight, macropodal.

Najas, Linn.

The only genus. Characters of the Order.

(The key and characters below have been adapted from Rendle's monograph in 'Pflanzenreich,' iv. 12.)

Flowers of both sexes devoid of spathe. Shoots a few inches to over 2 ft. long; leaves .6—1 in. long, .16—25 in. wide, marginal spinules minute, numerous; auricles of the sheath elongate, about $\frac{1}{2}$ the length of the sheath, toothed; flowers solitary or 2—4 together; ♂ perianth ending directly above the anther in 2 ear-like lobes; fruit ellipsoid-oblong, attenuate at the apex, .07—09 in. long; areoles minute, subquadrate or polygonal.....1. *graminea*.
At least the ♂ flowers enclosed in a spathe:—

Flowers of both sexes in a spathe. Shoots very slender; leaves .8—1.6 in. long, .2 in. or less wide, marginal spinules few, often as long as the width of the leaf; auricles of sheath variable, truncate or lobed, never elongate; spathe of ♂ narrowed into an irregularly toothed mouth ending in 2 opposite linear prolongations 1—2-spined at the apex; perianth closely investing the anther; spathe of ♀ with a neck $\frac{1}{4}$ — $\frac{1}{2}$ its length, mouth spinulose; fruit ellipsoid, enclosed in the persistent spathe, .08 in. long; areoles quadrate.....2. *indica*.
Spathe absent from ♀ flowers:—

Anthers 1-celled. Shoots 1.5—10 in. long; leaves tapering, .4—1 in. long, .12—2 in. wide, margins with a few broad-based, up-curved spinules; sheaths broad, usually truncately rounded with a few prominent teeth on the shoulders; spathe of ♂ ellipsoid, elongate below, ending above the perianth in a short cylindrical neck; perianth closely investing the anther; fruit ellipsoid, .08—1.2 in. long; areoles in the shape of ladder-like pits

3. *minor*.

Anthers 4-celled:—

Apex of the spathe cut into deep irregular segments bearing 1 or more brown spinules. Shoots dichotomously branched, up to 6 in. long; leaves up to 1 in. long and .02 in. wide, spinules few, the dorsal keel sometimes spinulose; auricles of sheath rather broad, the apex cut into 2—4 deep spiny teeth.....4. *lacerata*.

Spathe ellipsoid, apex not lacerate. Leaves .6—8 in. long, .025 in. wide, marginal spinules numerous; auricles of sheath often falcately curved, with a few teeth along the outer edge, inner edge entire; fruit .8 in. long; areoles minute, quadrate.....5. *falciculata*.

1. *NAJAS GRAMINEA*, Del.; F. B. I. vi. 569.

Cuddapah and Anantapur Districts, up to 3,000 ft. (Gamble); Madras (Wight).

Var. *minor*, Rendle. Smaller and more delicate; leaves .28—.64 in. long; auricles of sheath shorter; fruit .04—.06 in. long. Tuticorin (Wight).

2. *NAJAS INDICA*, Cham.
Tranquebar (Klein.)

3. *NAJAS MINOR*, All. ; F. B. I. vi. 569.
Horsleykonda at 4,000 ft. (Gamble); ponds in Ootacamund
Gardens at 7,500 ft. (Gamble).

Var. *spinosa*, Rendle. Leaves very narrow, marginal spinules as
long as the width of the leaves or nearly so; fruit .06—.07 in. long.
Godavary District (Gamble); Madras (Wight).

4. *NAJAS LACERATA*, Rendle.
Madras (Wight); Tinnevely (Beddome).

5. *NAJAS FALCICULATA*, A. Braun ; F. B. I. vi. 569.
Madras (Wight).

Family CLXXIV. ERIOCAULACEAE.

Annual or perennial scapigerous, marsh (less frequently aquatic) herbs. *Stem* usually simple, often very short or 0. *Leaves* radical or, in aquatic species, cauline, usually narrow and grass-like, base sheathing, veins parallel. *Flowers* minute, unisexual, densely packed in a solitary, globose, hemispheric subglobose or discoid head surrounded by an involucre of bracts terminating a usually ribbed peduncle with a basal sheath. *Heads* androgynous, rarely unisexual, but often with a preponderance of one sex; receptacle naked or pilose, flat, convex, hemispherical, conical or columnar; flowers solitary in the axil of a bract. ♂ *flower* stipitate; sepals 2 or 3, free or more or less connate or spathaceous and split down one side, equal or often one smaller and differently shaped, sometimes winged on the back; petals usually united into a cylindric or funnel-shaped lobed or truncate tube, one lobe sometimes much larger than the rest, rarely free, each lobe usually bearing a black subapical gland; stamens 4 or 6, usually in 2 series, filaments filiform, anthers 2- or 4-celled, usually black, sometimes white or yellow. ♀ *Flower* sessile or stipitate; sepals usually free, rarely more or less connate, usually 2 or 3, rarely 1 or 0; petals 3, free (rarely 0), usually pilose and bearing a black gland at the apex; ovary superior, sessile or shortly stipitate, 2—3-celled, cells 1-ovuled, style single, usually short, stigmas as many as the cells of the ovary, usually long and single, sometimes 2-fid. *Seeds* pendulous, minute, oblong or ellipsoid, brown, testa thin, often with rows of white papillae, smooth or reticulate and often more or less ribbed; albumen farinaceous; embryo minute.

Eriocaulon, Linn.

Characters of the Order. *Stem* when present always simple, usually short or 0. *Peduncles* often twisted, glabrous or hairy. ♂ *flowers*: lobes of the corolla always present though often minute, 1 often enlarged and sometimes protruding beyond the floral bract, usually bearing an apical black, rarely red, gland. ♀ *flowers*: petals very rarely absent, rarely less than 3, always free. In many species the floral bracts and the sepals are furnished with peculiar white or

yellowish cylindrical, blunt, opaque hairs which resemble elongate papillae; in the key these are termed papillose-hairs.

N.B.—*The flowers are very apt to vary; sometimes 2 and 3 sepals are found in the different flowers of the same head; black and white anthers have been seen in the same head; there is often considerable variation in the indumentum, from glabrous to almost densely hairy. In older flowers the originally spathaceous calyx is apt to split into its component sepals, consequently great care is needed in dissection, especially when examining herbarium specimens.*

Water-plants, only peduncles emerging; stems submerged, up to 3 ft. long, with many capillary, flexuous, 1-nerved leaves 1·5–2 in. long; peduncles numerous, umbellate on the apex of the stem, 1·5–4 in. long; sheath up to 1 in. long, mouth oblique; heads subglobose, 12–16 in. diam., dark-brown and glabrous or pale-green and white-puberulous at the apex; receptacle villous; ♂ calyx spathaceous, split down the front, anthers black; ♀ sepals 3, obovate, cymbiform, petals linear or linear-spathulate, pilose, usually with an apical black gland

1 *setaceum*.

Terrestrial or marsh plants; stems very short or 0; leaves radical:—

Leaves linear-oblong, apex rounded and cuspidate, 1–3·5 in. long, 16–25 in. wide, glabrous; peduncles few to many, 6–12 in. high, 7-ribbed; sheaths up to 4 in. long, glabrous, mouth oblique; heads subglobose, 16–25 in. diam.; bracts broadly obovate-cuneate, obtuse, glabrous, the floral slightly narrower; receptacle glabrous; ♂ sepals 2, free, obovate-lanceolate, hyaline, slightly winged and puberulous near the apex, corolla lobes unequal, anthers black; ♀ sepals 2, elliptic-lanceolate, acute, with a pubescent, rounded crest-like wing on the back, petals 3, unequal, narrowly linear-lanceolate, apex villous and with a conspicuous black gland.....2. *cuspidatum*.

Leaves not linear-oblong, apex not rounded:—

All the bracts much longer than the flowers and stellately spreading. Leaves linear-ensiform, subacute, 1–3 in. long, 25–5 in. wide, glabrous or slightly hairy; peduncles 2–8 in. high, 4-ribbed, more or less hairy with spreading hairs; sheaths 1–1·5 in. long, glabrous or slightly hairy near the base, mouth oblique, long acuminate; heads globose, 25–35 in. diam., stellately echinulate from the long, spreading, glabrous bracts, the involucre lanceolate, scarious, the floral narrower, hyaline; receptacle pilose; ♂ sepals 2, free or connate, obliquely ovate, glabrous, hyaline, anthers black; ♂ sepals 3, falcately ovate with a long subulate acumen, dorsally crenately winged, glabrous, white, petals 3, linear-spathulate, pilose, with an apical black gland; seeds oblong-subglobose, dark brown.....3. *stellulatum*.

Floral bracts not much longer than the flowers, not stellately spreading:—

Floral bracts conspicuously regularly imbricating, closely appressed and concealing the flowers:—

Peduncles many; heads conical or hemispheric, base usually truncate, 13–38 in. diam., up to 3 in. high. Stem short, thick; leaves linear or linear-ensiform, glabrous, 3–12 in. long, up to 1 in. wide at the base; peduncles stiff, up to 22 in. high, 4–5-ribbed, glabrous; sheaths 3–6 in. long, mouth oblique, long acuminate; involucre bracts orbicular or obovate, glabrous, yellow, shining; floral bracts cuneate-obovate, triangular-cuspidate, white-pubescent in the upper half; receptacle globose, columnar or hemispheric, sparsely hairy; ♂ sepals 2, usually more or less connate, boat-shaped, winged, glabrous; ♀ sepals 3, free, glabrous, 2 boat-shaped and broadly winged on the back, 1 smaller, linear, flat, petals 3, much shorter, linear, with an apical tuft of long hairs, eglandular; seeds subglobose, longitudinally ribbed, ribs white-papillose

4. *sexangulare*.

Peduncle solitary; head depressed-globose, 5 in. diam. Stem very short, thick, woolly; leaves equitant, ensiform, acute, minutely papillose, sparsely pilose below, about 20-nerved, up to 10 in. long and 1 in. wide at the base; peduncle 16 in. long, about 10-ribbed, glabrous; sheath 10 in. long,

externally sparsely pilose, mouth oblique, acute; involucre bracts obovate, glabrous, pale-brown, the inner ones darker; floral bracts rhomboid- or obovate-cuneate, acute, dark-grey, upper part inflexed, white papillose-hairy on the black; ♂ sepals 2, free or nearly so, obovate, apex densely white papillose-hairy, corolla-lobes with a black ensiform gland and a tuft of white papillose hairs; stamens black; ♀ sepals 2, free, boat-shaped, densely white-silky in the upper half, petals 3, linear, silky-pilose, apex with a black gland and a tuft of white papillose-hairs, stigmas overtopping the petals.....5. *ensiforme*.

Floral bracts not conspicuously regularly imbricating:—

One ♂ petal larger and extruded beyond its floral bract:—

Heads .5 in. diam. or larger, subglobose. Stem short, thick, silkily woolly; leaves ensiform, acute or subacute, glabrous, striate, glaucescent, many-nerved, 2—12 in. long, up to 1.25 in. wide at the base; peduncles solitary, rarely 2, glabrous, many-ribbed, up to 3 ft. long; sheath lax, usually rather longer than the leaves, mouth very oblique, subacute, often lacerate; involucre bracts ovate-lanceolate, acute or subacute, glabrous, olivaceous; floral bracts cuneate-oblong, long acuminate, olive-grey, dorsally long-pilose in the upper half; receptacles pilose; ♂ sepals 3, nearly free, dark-green, spatulate-oblong, keeled, pilose, corolla-lobes rather large, apex with a black gland and densely papillose-hairy; anthers black; ♀ sepals 3, free, narrowly obovate-oblong, dark-olive, pilose, petals 3, free, unequal, spatulate-oblong, pilose, with an apical black gland.....6. *robustum*.

Heads less than .4 in. diam:—

Mouth of sheath distinctly oblique:—

Floral bracts oblanceolate, conspicuously caudately cuspidate, very black, dorsally more or less white papillose-hairy near the apex. Leaves narrowly linear-ensiform, acute or acuminate, glabrous, 1—5 in. long, .05—1.5 in. wide; peduncles 1-many, 3—20 in. long, 6-ribbed, glabrous; sheaths close, as long as the leaves, glabrous, acute, sometimes lacerate; heads globose, dark or ashy; involucre bracts obovate, rounded, scarious, blackish, shining; receptacle convex, shortly villous; ♂ sepals 3, free, nearly black, apex hairy, anthers black; ♀ sepals 3, free, narrow, nearly black, more or less whitish hairy, petals 3, narrowly oblanceolate, pilose, with a small black apical gland.....7. *longicuspis* var. *polycephala*.

Floral bracts obovate-cuneate, rounded or acuminate, not caudate, yellowish-brown, sparsely hairy. Leaves linear-ensiform, acute, 1—3 in. long, up to .2 in. wide, glabrous; peduncles few-many, glabrous, 5—6-ribbed, slender, 4—12 in. high; sheaths as long as the leaves, close; heads subglobose, .15—.2 in. diam.; involucre bracts broadly obovate, rounded, glabrous, straw-coloured or pale-brown; receptacle more or less pilose; ♂ sepals 3, free or connate into a spathe split down the front, obovate-lanceolate, glabrous or more or less hairy near the apex, one sometimes flatter, narrower and acute; ♀ sepals 2, rarely 3, boat-shaped, acute, glabrous or with a few papillose hairs at the apex, petals 3, linear, hairy, with an apical black gland, 1 slightly longer than the rest...8. *odoratum*.

Mouth of sheath truncate or nearly so, rarely somewhat oblique, often lacerate, narrowly scarious. Leaves linear, acuminate, glabrous, 3—7-nerved, .5—3 in. long; peduncles 1—4, glabrous, 5—8-ribbed, 1—8 in. high; sheaths close, usually a little shorter than the leaves, glabrous; heads globose, black and densely snowy-white papillose-hairy, .18—3.5 in. diam.; involucre bracts broadly obovate, rounded or subacute, black, glabrous; floral bracts cuneate-obovate, cuspidate, black, outermost nearly glabrous, inner with an inflexed and densely snowy papillose-hairy apex; receptacle conical or subglobose, glabrous, ♂ sepals 3, more or less united into a spathe split down one side, obovate, concave, nearly black, apex densely white papillose-hairy, corolla-lobes white papillose-hairy and with a black apical gland, anthers yellow turning black; ♀ sepals 3, free, elliptic to obovate,

boat-shaped, acute, black, apex white papillose-hairy, petals 3, linear-spathulate, pilose and with an apical black gland.....9. *metaleucum*.

♂ petals equal or nearly so, none extruded beyond the floral bract; mouth of sheaths oblique:—

Plant more or less hairy, the involucre bracts at least pubescent:—

Heads .35—1 in. diam.:—

Involucre bracts black or dark-brown, obovate, rounded or subacute, base often brown-woolly. Leaves linear or linear-ensiform, acuminate, long-hairy on both faces, up to 20 in. long and .75 in. wide; peduncles usually several, hairy, 5—8-ribbed, up to 36 in. long; sheaths as long as the leaves, hairy, close, acute; heads globose, .5—1 in. diam. or more; floral bracts obovate or spatulate cuneate, acute or subacute, dark-olive, apex densely white papillose-hairy; receptacle flat or convex, pilose; ♂ calyx spathaceous, split down one side, lobes 3, acute, dark olive, apex white papillose-hairy, corolla-lobes triangular-ligulate, apex white papillose-hairy and with a black gland; ♀ sepals 3, free, deeply boat-shaped, base usually subacute, keeled, apex densely white papillose-hairy, petals linear-spathulate, pilose, with an apical black gland; seeds subglobose, dark-brown, finely reticulate.....10. *Brownianum* var. *nilagirensis*. Involucre bracts straw-coloured or pale-brown, obovate or obovate-oblong, rounded, inner acute, pale-brown silky at least at the base. Leaves linear or ligulate, apex attenuate, obtuse or subacute, glabrous, up to 20 in. long and 1 in. wide; peduncles several to many, twisted, stout, 6—9-ribbed, glabrous or sparsely hairy, up to 31 in. high; sheath lax, glabrous or more or less hairy, mouth very oblique, acuminate; heads globose, snowy, appearing echinate through the prominent floral bracts, which are cuneate-obovate, caudate-acuminate, pale or dark grey-green, apex densely white papillose-hairy; receptacle narrowly columnar, pilose, ♂ calyx spathaceous, split down one side, dark, lobes 3, short, rounded, apex white papillose-hairy, corolla-lobes triangular-ligulate, apex white papillose-hairy and with a black gland, anthers black; ♀ sepals 3, free, oblanceolate-oblong, concave or nearly flat, often keeled, apex densely white papillose-hairy, petals 3, oblanceolate-oblong, shortly clawed, hairy, with or without an apical black gland; seeds subglobose, red-brown, with a few longitudinal white-fenestrate ribs.....11. *robustum*-*Brownianum*.

Heads not exceeding .25 in. diam.:—

Bracts whitish. Leaves linear-lanceolate or ligulate, apex attenuate; subacute, glabrous, 1—2.5 in. long, .2—5 in. wide; peduncles few, slender, shallowly 6-ribbed, glabrous, 3—8 in. high; sheaths lax, glabrous, 1—2.25 in. long, acute; heads subglobose; involucre bracts broadly obovate or quadrate, obtuse, scarious, hairy upwards and ciliate at the apex; floral bracts cuneate-oblong, obtuse, dorsally hairy; receptacle villous; ♂ calyx spathaceous, split down one side, truncate, glabrous or nearly so, corolla-lobes minute, with an apical black gland, glabrous, anthers black; ♀ sepals 3, free, deeply boat-shaped, 1 sometimes winged on the back, 1 sometimes flat, petals 3, spatulate, pilose, with an apical black gland; seeds broadly oblong, reddish-brown, slightly ribbed.....12. *lancoelatum*. Involucre bracts blackish or dark-brown, floral bracts greenish-brown. Leaves linear-lanceolate, obtusely acuminate, glabrous, 3—5 in. long; peduncles several, glabrous, acutely 4—5-ribbed, 5—10 in. high; sheaths half as long as the peduncles, widened and lax in the upper half, glabrous, long acuminate; heads cylindric-globose, .15—.2 in. diam.; involucre bracts semi-circular, dorsally white powdery-pubescent; floral bracts rhomboid- or cuneate-obovate, apex inarched, acute, white powdery-pubescent, receptacle large, ellipsoid, more or less pilose; ♂ sepals 2, free, narrowly boat-shaped, olive, curved, powdery-puberulous upwards, corolla-lobes minute, papillose, with or without a black apical gland, anthers black; ♀ sepals 2, free, olive, falcate-ovate or semirhomboid, boat-shaped, apiculate,

keel winged, white powdery-pubescent upwards, petals 3, linear-spathulate, pilose, with or without a black apical gland

13. *Vanheurckii*.

Plant and involucre bracts quite glabrous:—

Anthers white or yellow:—

Bracts pale; ♀ petals 0. Leaves capillary or very narrowly linear, finely acuminate, 4—2 in. long; peduncles numerous, slender, faintly ribbed, 6—6 in. high; sheaths shorter than the leaves, acute; heads 1—2 in. diam., whitish or purplish; involucre bracts scarious, outer broadly obovate-oblong, inner narrower, apex of all rounded; floral bracts linear-oblong to oblanceolate, obtuse or subacute, glabrous, hyaline, shining, often with a central purplish zone; receptacle columnar, glabrous or nearly so; ♂ calyx spathaceous, split down one side, apex 3-toothed, glabrous, corolla-lobes minute, glabrous, with an apical black gland; ♀ sepals usually 2, sometimes 0, 1 or 3, free, narrowly linear or filiform, acute, glabrous, hyaline; seeds oblong-globose, reddish-brown, apex shortly mucronate and darker, finely transverse-striate.....14. *Sieboldianum*.

Bracts black; ♀ petals 3. Leaves linear, acuminate, 4—7-nerved, transverse venules usually conspicuous, 1—3 in. long, .05—1 in. wide; peduncles several, not ribbed, transverse venules usually visible, 4—10 in. high; sheaths close, usually a little longer than the leaves, transverse venules conspicuous, acute, often divided into 2—5 segments; heads subglobose, .15—2 in. diam., black, the apex with white indumentum; involucre bracts suborbicular or obovate-oblong, rounded; floral bracts obovate-lanceolate, boat-shaped, acute or cuspidate, white papillose-hairy at the apex on the back; receptacle conical or subhemispheric, glabrous; ♂ calyx spathaceous, split down one side, truncate or obscurely 3-lobed, blackish upwards, apex more or less densely white papillose-hairy, corolla lobes white papillose-hairy and with an apical black gland; ♀ sepals 3, free, oblong or obovate, boat-shaped, greenish-black, truncate or rounded, denticulate, apex white papillose-hairy, petals 3, linear-spathulate, usually longer than the sepals, pilose, with a large apical black gland; seeds subglobose, brown, angular.....15. *Ritchieanum*.

Anthers black or dark green:—

Involucre bracts hyaline:—

Leaves narrowly linear or setaceous, 1—2 in. long; peduncles several, slender, striate, 2—4 in. long; sheaths shorter than the leaves, acute; heads conic-subglobose, .06 in. diam., whitish; involucre bracts obovate-oblong, rounded or subacute; floral bracts narrowly obovate, acute, hyaline, glabrous or subpubescent; receptacle shortly columnar, villous; ♂ calyx spathaceous, split down one side, 3-lobulate, glabrous, silvery-grey, corolla-lobes small, with an apical black gland; ♀ sepals 3, narrowly boat-shaped, acute, hyaline, glabrous, with a spongy wing on the middle of the back, petals 3, linear, glabrous, ciliate, eglandular; seeds oblong-subglobose, one side nearly straight, brown.....16. *Margaretæ*. Leaves linear, up to 2 in. long and .1 in. wide; peduncles many, slender, striate, up to 6 in. high; sheaths shorter than the leaves, striate, acute, often split; heads conic-subglobose, .1 in. diam., whitish; involucre bracts lanceolate, acute or subacute; floral bracts obovate, cuspidate or caudate, pale straw-coloured or darkish-grey, glabrous or sparsely white-hairy; receptacle columnar, villous; ♂ calyx spathaceous, split down one side, lobes ovate or obovate, acute, sparsely white-ciliate, darkish, corolla-lobes glabrous, with or without an apical black gland; ♀ sepals 3, free, boat-shaped, hyaline, 2 broadly winged, the third narrower and not winged, all more or less ciliate, petals 3, linear, apex pilose, eglandular.....17. *Elenoræ*.

Involucre bracts not hyaline:—

Floral bracts glabrous or nearly so:—

Leaves ensiform, subacute, or obtusely acuminate, .5—2.25 in.

long, .05—.13 in. wide; peduncles many, shallowly 5—8-ribbed, 2—10 in. high; sheaths shorter than the leaves, lax upwards, acute; heads hemispheric, .1—1.5 in. diam.; involucre bracts broadly obovate, rounded or truncate, pale straw-coloured, scarious; floral bracts spatulate-obovate, concave, rounded or shortly acute, glabrous or sparsely puberulous, subhyaline; receptacle narrowly conic, glabrous; ♂ sepals 2, connate on one side by half their length, obovate, concave, rounded or truncate, glabrous or slightly puberulous, corolla-lobes glabrous or puberulous, with or without a black apical gland; ♀ sepals 2, free, linear or spatulate, obtuse, hyaline, glabrous or sparsely puberulous, petals 3, narrowly oblanceolate, glabrous or nearly so, with or without an apical black gland; seeds ellipsoid, brown, longitudinally few-ribbed.....18. *truncatum*.
Leaves very narrowly linear or filiform, acuminate, base dilated, .5—.75 in. long; peduncles numerous, capillary, striate, 1—2 in. high; sheaths shorter than the leaves, lax, acute; heads campanulate, white, shining, .1 in. diam.; involucre bracts ovate-lanceolate, acute or acuminate; floral bracts shorter, oblanceolate, acute or cuspidate; receptacle small, columnar, glabrous or sparsely villous; ♂ calyx spathaceous, split down one side, irregularly 3-toothed, pale, glabrous; ♀ sepals 2, free, boat-shaped, falcately curved, spinulose-winged or -keeled on the back, glabrous, rarely a third filiform present, petals 0

19. *minutum*.

Floral bracts pilose or distinctly pubescent:—

Leaves densely rosulate, pectinate, linear-lanceolate, acute, slightly concave above, .4—7 in. long, .1 in. wide at base; peduncle solitary, 2—2.5 in. long; sheath lax, as long as the leaves; heads subglobose, .15—.2 in. diam.; involucre bracts broadly obovate, conspicuous, yellowish; floral bracts obovate, cuspidate, keeled, hairy at the apex; ♂ calyx spathaceous, nearly truncate or shortly 3-cuspidate, ciliolate, corolla-lobes with a black apical gland; ♀ sepals 3, free, oblong-ovate, sub-obtuse, brown upwards, ciliate, petals 3, oblong-cuneate, with an apical black gland.....20. *pectinatum*.

Leaves not rosulate nor pectinate:—

Involucre bracts lanceolate, much longer than the floral bracts and the flowers:—

Floral bracts oblong-obovate, truncate or rounded, hyaline, apex shortly white-hairy. Leaves linear-lanceolate, acute or acuminate, 7—11-nerved, .2—1.5 in. long, .06—.16 in. wide at base; peduncles several striate, .3—2.5 in. high; sheaths lax, up to 1 in. long, acute; heads hemispheric, small, few-flowered; involucre bracts acuminate, scarious, pale-yellow or nearly white, glistening; receptacle glabrous or nearly so; ♂ sepals 3, free or more or less connate into a split spathe, obovate-cuneate, truncate or obtuse, dark, apex white papillose-hairy, corolla-lobes minute, glabrous, apical black gland minute; ♀ sepals 2, rarely 3, linear, when 3 one narrower, apex dark with pubescent tip, petals 3, oblanceolate, tip hairy with a black gland; seeds narrowly oblong, yellow, with longitudinal rows of white papillae

21. *xeranthemum*.

Floral bracts obovate-cuneate, cuspidate, dark-green, apex white papillose-hairy. Leaves linear, apex narrowed, sub-acute, .15—.4 in. long, .25 wide; peduncles many, striate, 2.5—7 in. long; sheaths lax, half as long as the leaves, obtuse; heads hemispheric, .2—2.5 in. diam.; involucre bracts acute or obtuse, straw-coloured; receptacle small, conical, pilose; ♂ calyx spathaceous, split down one side, lobes 3, small, rounded, apex white papillose-hairy, corolla-lobes white papillose-hairy at the tip with a black gland;

♀ sepals 3, free, dark, 2 narrowly boat-shaped, white-puberulous in the upper half, 1 flat, linear-spathulate, tip white-hairy, petals 3, linear-oblanccolate, pilose, eglandular

22. *Dianae*.

Involucral bracts not longer than the floral bracts and the flowers:

♂ calyx spathaceous, split down one side, 3-lobed or partite:—

Sepals white or nearly so. Leaves linear-ensiform, acute or acuminate, 5—11-nerved, purplish beneath, often drying red, .5—4 in. long, up to .5 in. wide; peduncles numerous, 5-ribbed, 1—11 in. high; sheaths lax, shorter than the leaves, often purplish, obtuse; heads globose ovoid or hemispherical, grey or snow-white, .16—.25 in. diam.; involucral bracts obovate, very obtuse, scarious, glistening, eventually reflexed and often concealed under the head; floral bracts obovate or oblanceolate, acuminate or cuspidate, dark or pale, hairy near the apex; receptacle globose or columnar, sparsely pilose; ♂ calyx-lobes oblong, apex white papillose-hairy, corolla-lobes linear, apex white papillose-hairy, with or without a black gland; ♀ sepals 3, free, linear-spathulate, hyaline or nearly so, apex hairy, petals narrowly oblanceolate, pilose, apex with a black gland; seeds oblong-ellipsoid, pale-brown, smooth or with a few transverse striae.....23. *quinquangulare*.

Sepals dark:—

Heads subglobose:—

Leaves linear or ensiform, obtuse or acuminate, .2—3.5 in. long; peduncles few—many 5—8-ribbed, .7—16 in. high; sheaths lax, as long as the leaves, obtuse, often split; heads subglobose, black, .15—.25 in. diam., involucral bracts obovate or suborbicular, rounded, black or dark brown; floral bracts cuneate-obovate, acute or cuspidate, nearly black, more or less pubescent near the apex; receptacle small, hemispherical, pilose; ♂ calyx spathaceous, split down one side, lobes, obovate, more or less white papillose-hairy at the apex and with a black gland; ♀ sepals 3, free, all boat-shaped or 1 flat, dark green, white papillose-hairy near the apex, petals spathulate, pilose, with an apical black gland; seeds oblong-subglobose, brown, finely transverse-striate, often white-papillose

24. *collinum*.

Leaves ligulate, narrowed to an obtuse apex, many-nerved, 2—12 in. long, .15—.6 in. wide at base; peduncles many, about 8-ribbed, 4—15 in. high; sheaths lax, up to 3 in. long, obtuse; heads .1—.25 in. diam. involucral bracts lanceolate or ovate, acute or subacute, pale; floral bracts cuneate- or oblong-obovate, cuspidate, dark green, apex white, hairy.

Other characters as in last the species.

22. *Dianae* var. *Richardiana*.

Heads distinctly conical with a flat base, .1—.15 in. diam. and up to .2 in. high. Leaves linear, up to 1.5 in. long, acuminate; peduncles many, 2.5—6 in. long, usually 5-ribbed; sheaths close, shorter than the leaves, acute or obtuse; involucral bracts obovate, rounded, pale brown; floral bracts obovate, caudately cuspidate, outer glabrous, innermost white- or yellowish-puberulous near the apex; receptacle conical, pilose; ♂ calyx-lobes subacute, glabrous, corolla-lobes glabrous or with a few white papillose hairs at the tip, with or without a small apical

black gland; ♀ sepals 3, free, linear-spathulate, glabrous, subequal or 1 shorter and narrower, petals 3, ligulate or ligulate-spathulate, longer than the sepals, usually with a small apical black gland, glabrous or sparsely pilose; seeds oblong-subglobose, yellowish-brown, reticulated with transverse ridges.....25. *conicum*.

♂ sepals free, 2, rarely 3:—

H heads 1—15 in. diam., many-flowered. Leaves linear, or ensiform, .5—3 in. long; peduncles many, 1—5 in. long, shallowly 5-ribbed; sheaths lax, widened upwards, as long as or a little shorter than the leaves, acute; involucre bracts obovate-oblong or nearly rotund, apex rounded or subtruncate, yellowish-brown, shining; floral bracts obovate-spathulate, concave, rounded or shortly cuspidate, dark, apex white-hairy; receptacle flat, shortly conical or hemispheric, pilose; ♂ sepals rarely 3, obovate-oblong, concave, obtuse, glabrous or more or less white hairy at the apex, corolla-lobes glabrous or nearly so, with or without an apical black or red gland; ♀ sepals 2, rarely 3, boat-shaped, sometimes with a thickened keel or a narrow dorsal wing, white pubescent near the apex, petals 3, very short, filiform, with an apical tuft of long hairs, eglandular; seeds oblong, reddish-brown, with longitudinal rows of white papillae.....26. *Thwaitesii*.

H heads .05 in. diam., few-flowered. Leaves linear, acute, up to .5 in. long; peduncles solitary or few, .5—1.6 in. high, 2—4-ribbed; sheaths lax upwards, about as long as the leaves, acute; involucre bracts obovate-oblong, obtuse or apiculate, dark green; floral bracts narrowly obovate, concave, obtuse or subacute, dark green, apex shortly puberulous; ♂ sepals narrowly obovate-oblong, apex shortly white-pubescent, apex of corolla-lobes shortly white-pubescent and with a black gland; ♀ sepals 2, boat-shaped, sometimes keeled, obtuse, apex shortly white-pubescent, petals 3, half as long as the sepals, capillary, with a tuft of long hairs at the apex, eglandular; seeds subglobose-ovate, reddish-brown, faintly transverse-reticulate, with or without longitudinal rows of white papillae.....27. *Gamblei*.

Neduvattam, Nilgiris at 6,000 ft. (Gamble).

Family CLXXV. CYPERACEAE.

Grass-like annual or perennial herbs; roots fibrous; rhizomes 0, short or long, often scaly. *Stems* usually solid, terete or more often 3-angled. *Leaves* grass-like, sometimes 0, often 3-ranked, usually crowded near the base of the stem; sheaths closed, rarely split; ligule 0 or insignificant. *Bracts* usually like the leaves and commonly a little broader. *Flowers* 1 or 2-sexual, in the axils of glumes arranged distichously or spirally in spikelets which are solitary or variously disposed in heads or panicles; the bases of the branches of the inflorescence sometimes embraced by a sheath (*cladophyllum*). *Perianth* 0 or of 6 scales or bristles or an indefinite number of hairs. *Stamens* 1—3, rarely more; anthers linear or oblong, basifixed, apex sometimes crested. *Ovary* superior, sometimes enclosed in a utricle, 1-celled; ovule 1, basal, erect, anatropous; style short or long, 2—3-cleft, rarely entire or nearly so, branches slender, stigmatic. *Fruit* a compressed, rounded or 3-angled, sometimes bony, nut. *Seed* free, erect; embryo minute, enclosed in the usually floury albumen.

Nut not enclosed in a utricle:—

Nut-bearing glumes containing perfect stamens as well:—

Empty glumes at base of spikelets 0—2:—

Glumes distichous (see also 8. *Fimbristylis*); hypogynous bristles 0:—

Stigmas 2:—

Rhachilla deciduous as a whole.....1. *Kyllinga*.

- Rhachilla persistent:—
 Nut compressed radially to the rhachilla.....2. **Pycnus**.
 Nut compressed tangentially to the rhachilla.....3. **Juncellus**.
 Stigmas 3 or style subentire:—
 Rhachilla persistent.....4. **Cyperus**.
 Rhachilla deciduous above the 2 lowest glumes leaving a knob:—
 Keels of nut-bearing glumes not winged.....5. **Mariscus**.
 Keels of nut-bearing glumes winged.....6. **Courtoisia**.
 Glumes spirally arranged (basal ones sometimes distichous in 8. **Fimbristylis**);
 hypogynous bristles or scales sometimes present:—
 Style-base dilated and constricted or articulated above the nut:—
 Hypogynous bristles present; style usually persistent; leaves 0
 7. **Eleocharis**.
 Hypogynous bristles 0; leaves usually developed:—
 Style-base often persistent, if falling not leaving a tumour on the nut;
 leaves sometimes reduced to sheaths.....8. **Fimbristylis**.
 Style deciduous, leaving a tumour on the nut.....9. **Bulbostylis**.
 Style-base not dilated, continuous with the nut:—
 Hypogynous bristles not hyaline, sometimes 0; not enveloping the nut:—
 Hypogynous bristles all setaceous, rarely 0; glumes rarely awned and
 then from the apex.....10. **Scirpus**.
 Hypogynous bristles rarely 0, 3 of them broadly ovate, rarely all
 setaceous; glumes awned on the back from below the apex
 11. **Fuirena**.
 Hypogynous bristles 2, hyaline, elliptic, enveloping the nut
 12. **Lipocarpha**.
 Empty glumes at base of spikelets 3 or more:—
 Stigmas 2; style-base dilated, not continuous with the nut; nut beaked by
 the persistent style-base.....13. **Rynchospora**.
 Stigmas 3; style-base not dilated; nut not beaked.....14. **Remirea**.
 Nut-bearing glumes devoid of perfect stamens:—
 Spikelets 2-sexual; ♀ flower solitary, terminal; nuts not bony:—
 Stems trigonous; leaves broad; inflorescence paniculate.....15. **Hypolytrum**.
 Stems terete; leafless; inflorescence of a single lateral spikelet.....16. **Lepironia**.
 Spikelets 1-sexual or the ♀ flower basal; nuts bony:—
 Spikelets usually 2-sexual, ♀ flower basal.....17. **Scleria**.
 Spikelets unisexual, ♀ flower terminal.....18. **Diplacrum**.
 Nut enclosed in a utricle:—
 Spikelets 1-flowered; flower 2-sexual; rhachilla deciduous above the 2nd glume;
 2nd glume spatheform.....19. **Ascopholis**.
 Spikelets many-flowered; flowers unisexual; rhachilla persistent; glumes not
 spatheform.....20. **Carex**.

1. *Kyllinga*, Rottb.

Stem 3-angled, leafy only at the base, terminated by 1—3, rarely more, sessile, capitate, ovoid or cylindric spikes. *Spikelets* numerous, small, compressed; glumes 4—5, rarely more, distichous; rhachilla disarticulating and falling off whole above the 2 lowest, very small, empty glumes; 3rd glume 2-sexual, 4th ♂ or empty, rarely ♀, 5th (and rarely 1 or 2 more) rudimentary or altogether absent. *Stamens* 1—3. *Ovary* suborbicular; style not swollen at the base. *Nut* smooth, sometimes apiculate by the persistent base of the style.

Rhizome very short or 0; stems close:—

Keel of nut-bearing glume not crested:—

Rhizome practically 0; stems not robust:—

Stems more or less thickened at the base, solitary or tufted, 3—10 in. high; leaves from half to as long as the stem, rarely longer, .05—17 in. wide; bracts 3—4, up to 6 in. long; heads usually 3, rarely fewer or 4—5, cylindric-ovoid, pale, central one up to .4 in. long, others smaller; 2 upper glumes narrow, nutlet yellow-brown.....1. *triceps*.

- Stems not or hardly thickened at the base, solitary or tufted, 3—16 in. high; leaves from half to $\frac{3}{4}$ as long as the stem, .05—1 in. wide; bracts 3—4, up to 4.5 in. long; heads usually solitary, cylindric, up to .6 in. long, sometimes 2 smaller lateral present; upper glumes broad; nut yellow-brown, ultimately black.....2. *cylindrica*.
 Rhizome horizontal, thick; stems 2—many, rather robust, up to 36 in. high, acutely 3-angled at the summit; leaves much shorter, .1—2 in. wide; bracts 3—4, 1—7.5 in. long; head solitary, subglobose or ovoid, up to .4 in. long; upper glumes subequal, ovate, acute, keel smooth, tip excurrent; nut oblong-obovoid, ultimately black.....3. *melanosperma*.
 Keel of nut-bearing glume with a broad, hyaline, toothed crest. Root fibrous; stems slender, 2—12 in. long, tufted; leaves usually longer, up to .12 in. wide; bracts 3—4, divaricate, up to 6 in. long; head usually solitary, subglobose, .17 in. diam.; upper glumes ovate, subacute, keel excurrent and recurved...4. *squamulata*.
 Rhizome elongate, clothed with oblong brown scales; stems spaced, rarely close:—Rhizome up to 16 in. long; stems .75—36 in. high; leaves few, usually much shorter, up to .2 in. wide; bracts 3—4, up to 6 in. long; head usually solitary, subglobose or ovoid, up to .3 in. long; upper glumes ovate, keel scutellous; nut elongate, yellowish-brown.....5. *brevifolia*.
 Rhizome up to 6 in. long; stems slender, up to 25 in. long; leaves as long, longer or shorter, up to .2 in. wide; bracts 3—4, up to 7 in. long; head usually solitary, ovoid, up to .4 in. long, upper glumes ovate, keel of the nut-bearing one with a lunate, entire crest; nut suborbicular, yellowish-brown.....6. *monocephala*.

1. KYLLINGA TRICEPS, Rottb.; F. B. I. vi. 587.
In all the E. and Central Districts, up to 3,000 ft.; dry parts of Travancore. Vern. *Kan. Ananta Gonde Hullu*.
2. KYLLINGA CYLINDRICA, Nees; F. B. I. vi. 588.
Mysore; Nilgiri and Pulney Hills; up to 6,000 ft.
Very like the previous species but more slender.
3. KYLLINGA MELANOSPERMA, Nees; F. B. I. vi. 588.
W. Gháts; 4,000—7,000 ft.; Travancore at 300 ft. (Calder); Kollimalai Hills.
4. KYLLINGA SQUAMULATA, Vahl.; F. B. I. vi. 589.
S. Kanara (Metz).
5. KYLLINGA BREVIFOLIA, Rottb.; F. B. I. vi. 588.
Mahendragiri, Ganjam District (Fischer); Rampa (Narayan-swami); Vizagapatam District, Mysore and W. Gháts.
6. KYLLINGA MONOCEPHALA, Rottb.; F. B. I. vi. 588.
In all Districts; from sea-level to 7,000 ft.
Much resembling the last species.

2. *Pycneus*, Beauv.

Stems leafy at the base or sometimes above. Inflorescence of 1—many corymbose-subumbellate spikes, sometimes fascicled; umbel usually simple. Glumes distichous, 4—very many, 2 lowest empty, the next bi-sexual, the uppermost 1—3 sterile or empty. Rhachilla persistent. Stamens 1—3. Style 2-fid. Nut laterally compressed in the plane of the rhachilla.

Epidermal cells of the nut longitudinally oblong. Stems tufted, 4—12 in. high; leaves filiform, usually shorter; bracts 1—2, often 1 or 2 more above, subtending the next spikelets, up to 3 in. long; spikelets straw-coloured, compressed, linear-oblong, .25—.5 in. long, .1 in. wide, in fruit up to 1.5 in. long; glumes 7—40 pairs, narrowly ovate, acute, margins sometimes partly hyaline, minutely mucronate; nut compressed-orbicular, obtuse, black, often with whitish transverse lines

1. *stramineus*.

Epidermal cells of the nut subquadrate-hexagonal, sometimes appearing dotted:—

Stems clothed to considerably above the base (up to half its length) with the leaf-sheaths, 3—18 in. high. Rhizome creeping, 4—10 in. long; leaves from half to as long as the stem, up to 15 in. wide, rarely 0; bracts 3—5, 1—6 in. long; umbel simple, sometimes contracted into a head, rays stout or slender, up to 1.5 in. long; spikelets linear or oblong-lanceolate, compressed, 3—7 in. long, 1—15 in. wide, reddish; glumes 3—14 pairs, shallowly boat-shaped, obtuse, 3-nerved on the back, mid-nerve green, not excurrent, sides reddish-brown; nut suborbicular, compressed, brown.....2. *sanguinolentus*.

Stems with leaves only at the base:—

Rhachilla of spikelets distinctly winged. Stems 2—12 in. high, tufted; leaves as long or longer, flaccid; bracts 3—4, up to 6.5 in. long and .2 in. wide, often longer than the stem; umbel simple, rays 3—7, up to 3.5 in. long, sometimes reduced to a cluster of sessile spikelets; spikelets compressed, oblong, 6—10-flowered; glumes narrowly ovate-oblong, keel herbaceous, produced into a slightly recurved cusp, sides hyaline with 2—3 strong nerves; nut oblique, ovate-oblong, much compressed, apex truncate or slightly retuse, dark-brown.....3. *hyalinus*.

Rhachilla of spikelet not or very faintly winged:—

Glumes distinctly cuspidate, apex retuse. Stems tufted, few or crowded, slender, 1—6 in. high; leaves shorter or longer, filiform; bracts 3—4, up to 5 in. long; heads of spikelets sessile and congested or umbelled with 2—6 rays or broken up into pedunculate spikes sometimes up to 3 in. long; spikelets compressed, ovate-lanceolate to linear, .15—7 in. long, .05—1 in. wide; glumes 8—25 pairs, pale or marked with red, oblong or orbicular when opened out, keel strong, sides hyaline; nut obovoid or oblong, minutely apiculate, dark-brown.....4. *pumilus*.

Glumes not cuspidate nor retuse:—

Stems tufted:—

Nut symmetric or nearly so:—

Rhachilla straight, not at all winged; glumes obtuse; styles long-exserted. Annual; stems 2—25 in. high; leaves shorter, almost filiform; umbel simple, rays 3—5, subsessile to 2 in. long; bracts 2—4, up to 9 in. long; spikes of 5—50 more or less congested spikelets; spikelets compressed, linear, parallel-sided, apex hardly tapering, blunt or subacute, .15—7.5 in. long, .1—12 in. wide, pale-brown to dark-chestnut or almost black, 2—50-flowered; nut broadly ellipsoid or obovoid, apex rounded and distinctly apiculate, dark-brown.....5. *globosus*.

Rhachilla more or less zigzag with a very narrow hyaline wing, wider near the insertion of the acute glumes; styles not or slightly exserted. Perennial; stems 3—30 in. high, sometimes almost 0; leaves shorter, up to 16 in. wide; umbel simple, rays 2—7, up to 2 in. long, or sometimes congested into a single head; bracts 3—8, up to 8.5 in. long; spikelets congested or distant, narrowly linear, tapering to an acute apex, .3—7.5 in. long, .1 in. or less wide, pale- or reddish-brown, 10—50-flowered; nut narrowly oblong, apex subtruncate, minutely apiculate, brown.....6. *odoratus*.

Nut asymmetric, oblong, sometimes slightly curved, the side away from the rhachilla flattened, the other curved, both faces with a median longitudinal depression. Stems rarely solitary, 1—10 in. high; leaves shorter, very narrow; umbel usually simple, rays 3—6, up to 4 in. long; bracts 3—6, up to 6 in. long and .1 in. wide; spikelets aggregately spicate at the ends of the rays, linear, straw-coloured, .4—1 in. long, .05 in. wide, 16—50-flowered; rhachilla in fruit zigzag; glumes narrow, obtuse, sides nerveless; nut shortly apiculate, dark-brown.....7. *sulcinus*.

Stems solitary:—

Glumes acute, not white- or hyaline-margined. Stems 6—36 in. high; leaves $\frac{1}{2}$ — $\frac{3}{4}$ as long, .1 in. wide, rigid, sometimes twisted; umbel simple, rays 3—8, up to 4 in. long; bracts 2—5, up to 8 in. long;

spikelets ovate or ovate-lanceolate, yellowish- or reddish-brown, .4—7 in. long, .15—2 in. wide; glumes ovate, .15—1.75 in. long, usually mucronate; nut broadly obovate, slightly unsymmetric, black

8. *unioloides* var. *angulata*.

Glumes obtuse, margins white- or brownish-hyaline:—

Stems robust, 10—31 in. long; leaves as long, .2 in. wide, flaccid; umbel simple or compound, primary rays 4—10, up to 6 in. long; bracts 3—5, up to 25 in. long; bracteoles few, confined to the base of the umbel, subulate, filiform, rays closely embraced below by a truncate or shortly acutely 2-lobed sheath; spikelets racemed, linear to ovate-oblong, reddish-brown, .5—1.25 in. long, .1—12 in. wide; glumes on the same side slightly overlapping at maturity, .1 in. long, margin paler, usually undulate; nut broadly ellipsoid or obovate, truncate or retuse, black or dark-brown.....9. *puncticulatus*. Stems robust, up to 3 ft. high; leaves shorter, up to .5 in. wide, flaccid; umbel compound; primary rays 4—12, up to 9 in. long, loosely embraced below by a 2-lobed sheath, the lobes short or long and acuminate; bracts 4—6, up to 20 in. long and .6 in. wide; bracteoles numerous, throughout the umbel, filiform; spikelets racemed, linear or linear-lanceolate, pale-brown, .6—1.1 in. long, .1—12 in. wide; glumes distant, not overlapping at maturity, .1 in. long, margins white, conspicuous, flat; nut obovate, apex rounded, black.....10. *albomarginatus*.

1. *PYCREUS STRAMINEUS*, C. B. Clarke; F. B. I. vi. 589.
Kamban, Madura District (Blatter and Hallberg); S. Kanara; Cochin (Gamble); Travancore.
Roots aromatic (J. D. Hooker).
2. *PYCREUS SANGUIOLENTUS*, Nees; F. B. I. vi. 590.
Mahendragiri, Ganjam District (Fischer); Mysore (Meebold); Kurnool (Bourne); Coimbatore (Wight); Nilgiri and Pulney Hills, up to 6,000 ft.; Malabar (Barber); Peermade, Travancore (K. Venkoba Rao).
3. *PYCREUS HYALINUS*, Dom. *P. pumilus*, Nees; F. B. I. vi. 591.
About Madras City; Satiyamangalan, Coimbatore District (A. W. Lushington, Fischer); Pulney Hills at 6,000 ft. (Anglade).
4. *PYCREUS PUMILIS*, Dom. *P. nitens*, Nees; F. B. I. vi. 591. *Cyperus pygmaeus*, Retz., and *C. pusillus*, Vahl; F. B. I. vi. 619.
E. and W. Coasts at low levels; Nilgiri, Shevaroy and Bababudan Hills.
5. *PYCREUS GLOBOSUS*, Reichb. *P. capillaris*, Nees, var. *nilagiricus*, C. B. Clarke; F. B. I. vi. 592.
In all Districts; from near sea-level to 7,000 ft. Vern. *Kan.* Chendu Cheni Hullu.
6. *PYCREUS ODORATUS*, Urb. *P. polystachyus*, Beauv.; F. B. I. vi. 592. *P. ferrugineus*, C. B. Clarke; F. B. I. vi. 593.
In all Southern Districts; up to 2,000 ft. Vern. *Kan.* Mummule Jambu Hullu.
7. *PYCREUS SULCINUX*, C. B. Clarke; F. B. I. vi. 593.
Anamalais (Beddome); Travancore (M. Rama Rao).
8. *PYCREUS UNIOLOIDES*, Dom., var. *ANGULATUS*, Dom. *P. angulatus*, Nees; F. B. I. vi. 593.
Nilgiri and Pulney Hills; 6,000—7,000 ft.

9. PYCREUS PUNCTICULATUS, Nees; F. B. I. vi. 593.

Ganjam (Beddome); Carnatic and Mysore; in rice-fields and tank margins.

10. PYCREUS ALBOMARGINATUS, Nees; F. B. I. vi. 594.

Quilon (K. Venkoba Rao), in rice-fields.

3. Juncellus, C. B. Clarke.

Stems erect, leafy only near the base. *Leaves* rarely reduced to sheaths; sheaths not inflated. *Inflorescence* umbellate or capitate. *Spikelets* compressed; rachilla persistent. *Glumes* distichous, concave, the 2 lowest empty, the uppermost 1—3 sterile or empty, the intermediate bisexual. *Stamens* 3 or 2. *Style* 2-fid. *Nut* plano-convex, more or less compressed at right angles to the rachilla.

Inflorescence umbelled. *Rhizome* very short or 0; *stems* robust, 3 ft. or sometimes more high, often over 1 in. diam. at the foot; *leaves* several, as long as the stem or shorter, .3—5 in. wide, coriaceous; *umbel* large, compound, *primary rays* 4—10, up to 8 in. long, *secondary rays* 4—8, up to 6 in. long; *bracts* about 6, up to 35 in. long and .6 in. wide; *bracteoles* 3—6, linear, usually shorter than the spikes; *spikelets* straw-coloured, in sessile and peduncled crowded spikes up to 2 in. long, elliptic-lanceolate or ovate-oblong, .15—25 in. long; *glumes* ovate, mucronulate; *nut* obovoid, pale-brown.....1. *alopecuroides*.
Inflorescence capitate:—

Rhizome 0; *stems* densely tufted, .5—10 in. long; *leaves* numerous, as long or shorter, very narrow; *bracts* 2—6, dilated at the base, up to 6 in. long; *spikelets* sessile, densely packed in a terminal ovate or globose head .2—5 in. long, .1 in. wide; *glumes* greyish-brown; closely imbricate, oblong-lanceolate, cuspidate; *nut* ellipsoid, pale brown.....2. *pygmaeus*.

Rhizome creeping, slender, short or long, sometimes floating and up to 2 yards long, clothed with brown scales; *stems* congested or distant, bases enclosed in chestnut-red sheaths, 3—24 in. high; *leaves* usually short, sometimes as long as the stem, sometimes almost absent; *bracts* 2, 1 very short and broad, the other up to 2 in. long, appearing as if a continuation of the stem; *spikelets* sessile, few—30 in a densely congested head which appears to be lateral, linear-oblong, straw-coloured, .2—5 in. long; *glumes* broadly ovate, acute, mucronulate; *nut* obovoid, plano- or concavo-convex.....3. *laevigatus*.

1. JUNCCELLUS ALOPECUROIDES, C. B. Clarke; F. B. I. vi. 595.

Vizagapatam District at 2,000 ft. (Gamble); Carnatic and Mysore; in rice-fields.

Vern. Kan. Billi Jambu Hullu.

2. JUNCCELLUS PYGMAEUS, C. B. Clarke; F. B. I. vi. 596.

In all Districts; up to 1,500 ft.

3. JUNCCELLUS LAEVIGATUS, C. B. Clarke; F. B. I. vi. 596.

In all the Eastern Districts; in marshy places.

4. Cyperus, Linn.

Annual or perennial erect or floating herbs. *Leaves* usually radical, flat or terete and channelled, rarely entirely reduced to sheaths. *Inflorescence* capitate or of simple or compound umbels; *bracts* like the leaves, rarely reduced almost to scales, usually divaricate, sometimes one erect. *Spikelets* linear or oblong, usually compressed, seldom terete. *Rachilla* persistent, often winged, the wings often interrupted and in pairs opposite the nuts, sometimes united to the glumes. *Glumes* usually distichous, the 2 lowest empty, 4—many

succeeding ones bisexual, the uppermost 1—3 sterile or empty. *Stamens* 3 or 2, rarely 1; anthers sometimes crested. *Style* 3-fid, rarely undivided, not tumid at the base nor articulated to the nut. *Nut* usually 3-gonous, less often plano-convex.

Plants floating in water; base or angles of the nut corky:—

Style long, undivided or obscurely 3—2-toothed. *Stems* slender, up to 18 in. long; *leaves* from $\frac{2}{3}$ to as long; *bracts* 1—8 in. long; *spikelets* numerous, congested in a single head $\cdot 2$ — $\cdot 7$ in. diam., angular, $\cdot 2$ — $\cdot 5$ in. long, rigid, often curved; *rhachilla* stout, very narrowly winged; *glumes* broadly ovate, boat-shaped, rigid, acute or acuminate; *nut* half as long as the glume, ovoid, unequally 3-sided, base corky.....1. *cephalotes*.

Style short, *branches* 3, as long, linear. *Stem* robust, sharply 3-angular, up to 4 ft. high; *leaves* as long or longer, up to $\cdot 5$ in. wide; *bracts* several, up to 20 in. long, margins usually scabrous; *umbel* compound, usually large with corymbose radii up to 2 in. long; *spikelets* narrowly ovate to oblong, $\cdot 3$ — $\cdot 6$ in. long, light- or reddish-brown, umbellately or digitately clustered; *glumes* regularly imbricate, ovate, boat-shaped, mucronate; *nut* $\frac{2}{3}$ the length of the glume, ellipsoid, unequally 3-sided, angles corky.....2. *platystyliis*.

Plants rooted in marshes, dry soil or sand; nut not corky:—

Spikelets digitate or clustered, not spicate nor racemose:—

Glumes aristate or distinctly mucronate:—

Leaves and *bracts* filiform, less than $\cdot 05$ in. wide:—

Spikelets less than $\cdot 1$ in. wide:—

Glumes chestnut-brown, ovate, plicate, with awnlets $\frac{1}{2}$ as long, margins not hyaline. *Stems* tufted, 1—5 in. high; *leaves* as long or shorter; *bracts* shorter or longer than the inflorescence, up to $\cdot 4$ — $\cdot 5$ in. long; *spikelets* $\cdot 2$ — $\cdot 1$ in. long, clustered in single heads or compound-umbellate with rays up to 2 in. long; *nut* trigonous, linear-oblong, sides parallel, dark-red.....3. *castaneus*.

Glumes pale- or ferruginous-brown, ovate, plicate, with awnlets as long, margins often hyaline. *Stems* tufted, 2—6 in. high; *spikelets* $\cdot 15$ — $\cdot 5$ in. long; *nut* trigonous, oblong-obovoid, chestnut. *Other characters as in the last species*.....4. *uncinatus*.

Spikelets much compressed, $\cdot 3$ — $\cdot 7$ in. long, $\cdot 12$ — $\cdot 18$ in. wide, reddish-brown. *Stems* tufted, 2—8 in. high; *leaves* usually shorter; *bracts* 2, rarely 3, usually short, sometimes up to 2 in. long; *inflorescence* of a single head of 3—20 digitate spikelets; *glumes* broadly ovate, boat-shaped, keeled, conspicuously mucronate, margins usually hyaline, bases imbricating; *nut* trigonous, obovoid, dark-brown.....5. *Teneriffae*.

Leaves and *bracts* $\cdot 25$ in. or more wide:—

Glumes lax and rather distant, at least in fruit. *Rhizome* short; *stems* up to 24 in. high; *leaves* as long, $\cdot 3$ — $\cdot 6$ in. wide; *bracts* 4—10, nearly as long as the leaves; *umbel* decomposed, 3—12 in. diam.; *rays* many, up to 4 in. long; *spikelets* 3—9 together, digitate, linear-oblong, $\cdot 15$ — $\cdot 4$ in. long, compressed; *rhachilla* narrowly winged; *glumes* complicate, sub-orbicular when opened out, shortly cuspidate, margins broadly hyaline, pale-yellow to nearly chestnut; *nut* trigonous, broadly ellipsoid, dark-brown.....6. *diffusus*.

Glumes closely imbricate even in fruit. *Spikelets* $\cdot 2$ — $\cdot 7$ in. long, hardly compressed; *glumes* ovate, cuspidate. *Other characters as in the last species*, but plant generally larger; *stem* up to 30 in. high; *leaves* and *bracts* longer; *umbel* larger and more compound; *rays* up to 8 in. long

7. *pubisquama*.

Glumes at most minutely mucronate:—

Glumes $\cdot 025$ in. or less long, obovate, apex rounded. *Stems* tufted, weak, 3—20 in. long; *leaves* flaccid, usually shorter, $\cdot 1$ — $\cdot 17$ in. wide; *bracts* 2—4, 1—10 in. long; *umbel* simple or compound or less often reduced to a head, *rays* 3—10, slender, up to $\cdot 15$ in. long; *spikelets* many, densely aggregated into congested globose heads, $\cdot 1$ — $\cdot 2$ in. long; *rhachilla* not winged; *nut* subequally trigonous, broadly ellipsoid, nearly as long as the glume, yellow or pale-brown.....8. *difformis*.

Glumes .04 in. or more long, oblong or ovate, obtuse or acute:—

Inflorescence umbellate, not a single head:—

Rhizome slender, creeping; stems arising along it singly or in tufts, weak, up to 30 in. high; leaves usually shorter but sometimes longer, 1—3, narrow; bracts 2—3, usually shorter than the umbel, but occasionally much longer; umbel simple or compound; rays usually 4—10, sometimes up to 20, slender, up to 4 in. long; spikelets in clusters of 3—8, spreading stellately, linear, acute, compressed, .1—·5 in. long, .04 in. wide; glumes plicate, ovate-oblong when unfolded, obtuse, sometimes very shortly mucronate, pale- or chestnut-brown, .05—·075 in. long; nut trigonous, globosely obovoid, pale-brown, smooth.....9. *Haspan.*
Rhizome 0; stems solitary or tufted, weak, 2—12 in. high; spikelets .1—·3 in. long; glumes .04 in. long, apex broadly obtuse, not mucronulate, margins hyaline; nut nearly globose or very obscurely 3-sided, white, minutely verrucose when ripe. *Other characters as in the last species*.....10. *tenuispica*.

Inflorescence a single head:—

Rhizome short; rootlets wiry; spikelets distinctly compressed:—

Stem considerably thickened below, rigid, 5—18 in. high; leaves from $\frac{1}{2}$ to nearly as long, narrow; bracts 2, rarely 3, one longer than the other, .5—9 in. long; spikelets 3—20, spreading, lanceolate to elliptic-oblong, acute, pale, sometimes almost white, .4—1 in. long, .15—·2 in. wide; glumes ovate-lanceolate, acute, closely imbricate, up to .2 in. long; nut trigonous, obovoid, dark-brown or black.....11. *niveus*.
Stem only slightly thickened below, very slender, 3—10 in. high; leaves shorter or longer, very narrow; bracts 3—5, usually 3, .5—4 in. long; head dense, globose, whitish or pale cinnamon-coloured, .2—6 in. diam.; spikelets elliptic, .15—·2 in. long, .1 in. wide, obtuse; glumes oblong-lanceolate, obtuse, hardly imbricate, .05—·1 in. long; nut trigonous, oblong-ellipsoid, black.....12. *leucocephalus*.

Rhizome creeping; rootlets thick; spikelets not or hardly compressed:—
Rootlets glabrous or nearly so; rhizomes dichotomously branched, sheathed at the nodes with chestnut-coloured scales, rarely tuberosus; stems rigid, terete, 2—20 in. high; leaves usually shorter, terete, grooved on the upper side, rigidly coriaceous, often recurved, bracts 2—3, the lower up to 4 in. long, erect and appearing to be a prolongation of the stem; head globose, of many radiating sessile spikelets; spikelets ovoid or elliptic-oblong, acute, .25—·3 in. long, straw-coloured or pale-brown; glumes ovate, convex, hardly keeled, rounded and sometimes minutely apiculate, conspicuously 13-nerved, margins hyaline; nut trigonous, obovoid, concavo-convex, black...13. *arenarius*.
Rootlets densely woolly; stems robust, trigonous at the apex, up to 24 in. high, base thickened and clothed with broad dark-chestnut scales; leaves about as long, narrow, concave, coriaceous; bracts 3—4, elongate; head of 30—80 congested spikelets; spikelets lanceolate, acute, slightly compressed, .5 in. long, pale-brown; glumes imbricate, ovate, acute or very shortly cuspidate; nut obovoid, obscurely trigonous, dark-brown.....14. *pachyrhizus*.

Spikelets distinctly spicate or racemose:—

Rhachilla of spikelets not or hardly winged:—

Glumes cuspidate or aristate:—

Spikelets linear-oblong, acute, strongly compressed, .3—·7 in. long (up to 1.25 in. in fruit), .1—·2 in. wide, yellowish when ripe, 20—60-flowered. Stems tufted, up to 30 in. long, sometimes much reduced and almost absent; leaves usually shorter, very narrow; bracts 3—5, up to 8 in. long; umbel simple, often with a sessile head at the fork, sometimes reduced to a single head; rays up to 6, up to 5 in. long; spikelets 4—9, subdigitate or spicate at the ends of the rays, more numerous when in a single head; glumes plicate, ovate when unfolded, imbricate, keel produced into a strong mucro, .15—·2 in. long; nut trigonous, broadly obovoid, black or dark-brown.....15. *compressus*.
Spikelets oblong or linear-oblong, flat, .1—·3 in. long, 6—30-flowered, yellowish- or reddish-brown. Stems tufted, 1—9 in. high; leaves usually

shorter, narrow; bracts 2—5, .5—4 in. long; heads single or in umbels of 2—5 rays up to 1 in. long; spikelets crowded into globose or oblong heads which appear echinate by the spreading awns; glumes oblong, .04—05 in. long, tapering into a fine recurved awn as long, sides strongly nerved to the margin; nut trigonous, elliptic-obovoid, dark-brown

16. *aristatus*.

Glumes obtuse or minutely mucronate, not cuspidate nor aristate:—

Glumes plicate, orbicular-obovate when opened out, gibbous towards the rhachilla when folded, scarcely imbricate, keeled, sides nerveless, .05 in. long. Stems solitary or tufted, 3—31 in. high, trigonous; leaves usually shorter; bracts 3—5, 1—14 in. long; umbel decomposed, rays many, 1—8 in. long, bearing irregularly fascicled umbellules formed of narrow interrupted spikes of 5—20 spikelets; spikelets linear-oblong, .2—6 in. long, yellow or pale-brown; nut trigonous, obovoid, black.....17. *Iria*.

Glumes oblong or elliptic-oblong, not gibbous:—

Spikelets crowded in cylindric spikes. Stems stout, trigonous, 10—48 in. high; leaves usually a little shorter, sometimes longer, up to .35 in. wide; bracts 3—7, up to 28 in. long and .5 in. wide; umbel compound, large, erect, primary rays 4—13, up to 16 in. long, secondary umbels with 2—6 rays up to 6 in. long; spikelets densely imbricate in spikes 1—2 in. long, linear-oblong, flat, erect, .3—7 in. long, pale, reddish- or chestnut-brown; glumes oblong, apiculate or cuspidate, .05 in. long, margins hyaline, keel 5-nerved, hardly imbricate; nut trigonous, obovoid-oblong, dark-brown.....18. *eleusinoides*.

Spikelets not crowded in cylindric spikes:—

Margins of glumes not or very inconspicuously hyaline:—

Glumes .05 in. long, conduplicate:—

Spikelets spreading even in fruit. Rhizome stoloniferous; stems solitary or 2—3, slightly apart, 4—36 in. high; leaves longer or shorter, narrow; bracts 3—6, up to 16 in. long; umbel compound, usually large; primary rays 6—10, up to 10 in. long; secondary rays fewer, shorter, spreading, bearing horizontally spreading sessile spikelets on a slender rhachis; spikelets narrowly linear, .3—1 in. long; rhachilla very slender, wavy; glumes red-brown, elliptic-oblong, obtuse, distant, very slightly imbricate, diverging in fruit; nut trigonous, narrowly oblong, as long as or slightly exceeding the glume, dusky-brown.....19. *distans*.

Spikelets nearly erect, not spreading, in fruit contracted into tassels. Bracts usually, at least 1—2 of them, longer than the inflorescence, up to 43 in. long and .6 in. wide; spikelets .3—5 in. long; glumes pale-, red- or chestnut-brown, more or less imbricate and closely appressed to the straight or slightly wavy rhachilla even in fruit, not diverging; nut trigonous, narrowly oblong, shorter than the glume, brown. *Other characters as in the last species*.....20. *nutans*.

Glumes coriaceous, .07—09 in. long, shallowly concave, oblong, apex rounded, not keeled, brown or pale-brown, imbricate. Rhizome creeping, thick, stoloniferous; stems robust, up to 3 ft. high, sharply trigonous; leaves 0 or few, 2—6 in. long; bracts 3—5, up to 6 in. long and .35 in. wide; umbel simple, compound or congested; rays 3—12, 1—3 in. long, the longer ones corymbosely branched; spikelets 4—10 in a spike, linear, nearly terete, .3—6 in. long; nut narrowly oblong, obovately trigonous, ultimately black.....21. *malaccensis*.

Margins of glumes distinctly hyaline:—

Rhachis of spike hispidulous on the angles. Rootstock small, stoloniferous; stems up to 3 ft. high; leaves nearly as long or much shorter, up to .4 in. wide; bracts 3—5, up to 21 in. long and .5 in. wide; umbel compound; primary rays 2—10, up to 9 in. long, bearing pedicelled spikes of horizontal spikelets; spikelets linear or linear-lanceolate, .15—5 in. long; glumes .05—08 in. long, broadly ovate, sometimes minutely apiculate, pale- or reddish-brown; nut trigonous, subglobose obovate, black.....22. *pilosus*.

Rhachis of spike glabrous. Rootstock short, stout, stoloniferous and bulbiferous; stems up to 42 in. high; leaves often longer, thick, coriaceous or spongy, .1—5 in. wide; bracts 2—5, up to 8 in. long; umbel compound; primary rays 3—7, rather stout, 1—8 in. long; secondary rays bearing loosely corymbose spikes of 5—10 spikelets; spikelets remote, linear-oblong, .3—1.2 in. long, straw-coloured or reddish, shining; glumes boat-shaped, suborbicular when expanded, .08—1 in. long; nut trigonous, broadly obovoid, black

23. *procerus*.

Rhachilla of spikelets distinctly 2-winged opposite the seeds:—

Leaves short, rarely half as long as the stem, or 0:—

Stems terete, stout, thickened below, transverse septa distinct when dry, up to 6 ft. high. Rootstock stout, woody, stoloniferous; leaves reduced to sheaths or sometimes with a short foliaceous limb; bracts 1—3, scale-like, triangular, acute, under 1 in. long; umbel compound; primary rays up to 10, 1—6 in. long, slender, often curved; secondary rays terminating in corymbs of 8—15 spikelets; spikelets narrowly linear; .4—1.5 in. long; glumes oblong, obtuse or subacute, concave, .1 in. long; nut trigonous, narrowly oblong, black.....24. *articulatus*.

Stems trigonous above, spongy below, septae not or hardly visible when dry, up to 6 ft. high. Rhizome creeping, stout, woody; leaves reduced to sheaths or sometimes with a blade up to 6 in. long; bracts developed:—

Stems bluntly trigonous above; bracts 3—5, linear-ensiform, shorter than the inflorescence, up to 3 in. long and .2 in. wide; umbel compound; primary rays 6—15, slender, up to 6 in. long; secondary rays terminated by spikes or corymbs of 4—16 spikelets; spikelets linear, .4—1.5 in. long; glumes ovate-oblong when unfolded, obtuse or subacute, .1 in. long, straw-coloured or pale reddish-brown; wing of rhachilla narrow, usually pale; nut narrowly elliptic-oblong, trigonous, .06 in. long, black.....25. *corymbosus*.

Stems sharply trigonous above; lower bracts longer than the inflorescence, up to 25 in. long and .5 in. wide; glumes usually red-brown; wing of rhachilla rather wide, usually blood-red in fruit. Other characters as in the last species.....26. *Pangorei*.

Leaves long, very rarely less than half as long as, often longer than, the stem:—

Rhizomes stoloniferous:—

Stolons slender, ending in black-coated bulbils; stems subsolitary, slender, 2—12 in. long; leaves many, coming off a little distance above the base, slender, usually as long as or a little longer than the stem; bracts 2 or 3, arising one above the other, filiform, up to 4 in. long; inflorescence of a head of umbels 1—2 in. in diam., formed of slender alternate spikes bearing 3—12 spikelets; spikelets linear, .3—7 in. long; glumes ovate-oblong when unfolded, boat-shaped, obtuse, sometimes minutely mucronate, .05 in. long, 7—13-nerved, reddish-brown, laxly imbricate; nut trigonous with concave sides, obovoid, obtuse, black...27. *bulbosus*. Stolons not bulbiferous:—

Leaves flaccid, flat; umbels expanded, usually compound:—

Tubers not zoned; stems subsolitary, trigonous, 4—48 in. high; leaves shorter or longer, narrow, often numerous; bracts usually 3, shorter or more often longer than the inflorescence, up to 2 ft. long; umbel simple or compound; rays few to many, up to 6 in. long; secondary, if present, few, ending in 4—8 approximate, spreading spikelets; spikelets linear to lanceolate, .3—1.4 in. long; glumes imbricate, .1 in. long, plicate, ovate when expanded, obtuse or acute, keel 5—7-nerved, pale-straw or brown, or chestnut, sometimes with a reddish tinge; nut trigonous, broadly obovoid, greyish-black

28. *rotundus*.

Tubers zoned; stems usually solitary, trigonous, 6—12 in. high; leaves as long or nearly so; bracts 3—5, often shorter than the inflorescence; umbel usually compound; primary rays 6—8, slender, up to 4 in. long; secondary 3, up to 1.5 in. long; spikelets distantly alternate at the ends of the rays, yellow or yellow-brown, .4—8 in.

long; glumes rather laxly imbricate, .1 in. long, plicate, ovate when expanded, obtuse, distinctly striately nerved and keeled, keel greenish. *Other characters as in the last species.....29. esculentus.* Leaves rigid, filiform or very narrow; umbel simple, compact. Stolons elongate, branching, clothed with broad, acute scales; stems enlarged and tuberous below, 4—12 in. long, wiry, often flexuous; leaves shorter or as long, usually subulate and squarrosely recurved; bracts 3, up to 3 in. long; umbel of 4—6 rays, sessile or with peduncles up to 1.2 in. long, bearing 3—8 spreading spikelets; spikelets ovate- or linear-oblong, hardly compressed, .25—.6 in. long; glumes densely imbricate, broadly ovate when expanded, plicate, acute, .1 in. long, red, keel greenish, margins broadly hyaline, the lowest sometimes scarious; nut obovoid, plano-convex, dorsal surface hardly keeled, dark-brown.....30. *stoloniferus.*

Rhizome not stoloniferous:—

Spikelets linear, .4—1.2 in. long. Stems solitary, trigonous, 9—36 in. high; leaves from $\frac{2}{3}$ as long up to a little longer, narrow; bracts 3—5, usually short but sometimes up to 20 in. long; umbel usually with several rays up to 10 in. long, each with 3—16 alternating spikelets aggregated at the end; glumes broadly ovate when expanded, very concave, obtuse, .15 in. long, yellowish-brown, keel broad, margins scarious; nut subglobose in outline, sharply trigonous, dark red-brown

31. *Zollingeri.*

Spikelets .3 in. or less long, numerous in large compound umbels:—

Anthers not or very shortly crested:—

Spikelets distinctly compressed:—

Spikes digitate, all sessile, dense, cylindric, up to 1.5 in. long. Rhizome 0; stems solitary, stout, up to 3 ft. long, sharply trigonous; leaves rather shorter, up to .3 in. wide; bracts 5—7, some shorter, rest much longer than the inflorescence, up to 23 in. long; umbel rarely simple, dense; spikelets ovate- or oblong-lanceolate, .12—.2 in. long, .05 in. wide, suberect; glumes densely imbricate, plicate, broadly ovate when expanded, .05 in. long, obtuse, keel produced into a cusp, brown; nut small, ovoid or broadly ellipsoid, trigonous or with the dorsal angle very obtuse, black.....32. *imbricatus.*

Spikes umbelled or corymbose, some at least peduncled, cylindric, dense or lax, 1—2.5 in. long. Rhizome short; stems usually solitary, robust, spongy below, trigonous, up to 6 ft. high; leaves shorter or longer, up to .4 in. wide; bracts 3—6, up to 3 ft. long and .5 in. wide; primary rays 5—12, up to 9 in. long; spikelets numerous, close or somewhat distant, erect or spreading horizontally, elliptic- or oblong-lanceolate, subacute, markedly compressed, .15—.3 in. long, .05—.075 in. wide; glumes closely or laxly imbricate, broadly ovate when expanded, .05 in. long, keel produced into a distinct cusp, bright brown, red-brown or chestnut, keel often green or pale; nut very small, trigonous, broadly ellipsoid, narrowed at both ends, yellowish, dark-brown or black.....33. *exaltatus.*

Spikelets terete or nearly so, spirally inserted round an angular rachis, spreading horizontally, .15—.3 in. long, .05 in. or less wide. Rhizome stout, woody, creeping, sometimes 0; stems robust, woody, sharply trigonous upwards, up to 5 ft. high; leaves longer or shorter, up to .6 in. wide; bracts 3—12, up to 30 in. long and .6 in. wide; primary rays 4—10, up to 1 ft. long; spikes sessile or some peduncled, dense, cylindric, 1—2.2 in. long; glumes minute, broadly oblong when expanded, obtuse with a short cusp, chestnut or yellowish-brown; nut trigonous, ellipsoid or obovoid, straight or curved, dark-yellowish-brown or dark-grey.....34. *digitatus.*

Anthers with a crest $\frac{1}{2}$ — $\frac{1}{4}$ as long as the cells:—

Stem above bluntly trigonous, the angles smooth, stout, up to 4 ft. high; leaves nearly as long, up to .6 in. wide; bracts 8—12, up to 30 in. long; primary rays 7—12, up to 8 in. long; secondary

fewer, up to 2 in. long; spikes narrowly cylindric, clustered at the ends of the rays and a few sessile at the base of the partial umbels, 1—2.5 in. long; spikelets more or less densely spirally inserted on the angular rhachis, erect, linear, hardly compressed, .15—.25 in. long, acute, glumes closely imbricate, ovate when expanded, keeled, acute or very shortly mucronate, .05 in. long or less, pale- or yellowish-brown; nut very small, trigonous, ellipsoid, subacute at both ends, pale-brown or grey.....35. *elatus*. Stem upwards sharply trigonous, angles scabrous, cutting, stout, sometimes reaching 20 ft. high, usually much shorter; leaves as long or somewhat shorter, up to 1 in. wide, margins and keel serrulate; bracts 4—6, up to 31 in. long and 1 in. wide; primary rays 8—12, erect, up to 9 in. long; spikes linear, 5—10 corymbose at the ends of the secondary rays; spikelets densely spiral on the angular rhachis, subulate or nearly so, acute, .2—3 in. long; glumes closely imbricate and appressed, broadly ovate or suborbicular when expanded, concave, slightly keeled and minutely mucronulate, .1 in. long, pale-brown; nut very small, trigonous, narrowly oblong, apex acute, pale-lead-coloured.....36. *platyphyllus*.

1. CYPERUS CEPHALOTES, Vahl; F. B. I. vi. 597.
Madras (Wight); Cochin (Meebold); Travancore (Calder and Ramaswami).
2. CYPERUS PLATYSTYLIS, R. Br.; F. B. I. vi. 598.
Locality uncertain (Wight, Heyne).
3. CYPERUS CASTANEUS, Willd.; F. B. I. vi. 598.
In all Districts; at low elevations in swamps and rice-fields.
4. CYPERUS UNCINATUS, Poir. *C. cuspidatus*, H. B. K.; F. B. I. vi. 598.
S. Kanara (Hohenacker); Pulney Hills at 3,000 ft. (Saulière); Travancore (Ramaswami). In moist sandy places.
5. CYPERUS TENERIFFAE, Poir.; F. B. I. vi. 601.
Nallamalai Hills (Beddome); Dekkan; Coromandel; Nilgiri Hills (Hohenacker); Anamalai Hills (Fischer); Travancore. From sea-level to 7,000 ft.
In dry and often rocky situations.
6. CYPERUS DIFFUSUS, Vahl; F. B. I. vi. 603.
Rampa Hills at 3,000 ft. (Ramaswami); Palkonda Hills (Jacob); Anamalai Hills (Beddome); Travancore.
7. CYPERUS PUBISQUAMA, Steud.; F. B. I. vi. 604.
Mysore (Meebold) and the W. Coast.
In wet localities and in marshes in evergreen forest.
8. CYPERUS DIFFORMIS, Linn.; F. B. I. vi. 599.
In all districts, in marshy localities; sea-level to 8,000 ft. Vern. Kan. Kari Sanna Jambu Hullu.
9. CYPERUS HASPAN, Linn.; F. B. I. vi. 600.
In all Districts, in marshy localities and in rice-fields; sea-level to 5,000 ft.
10. CYPERUS TENUISPICA, Steud. *C. flavidus* Clarke non Retz.; F. B. I. vi. 600.
Common in all Districts in rice-fields; sea-level to 3,000 ft. Vern. Kan. Honnai Hu Hullu.
11. CYPERUS NIVEUS, Retz.; F. B. I. vi. 601.
N. Circars up to 1,500 ft.; Rampa (Narayanswami).
In dry grass-lands.

12. *CYPERUS LEUCOCEPHALUS*, Retz.; F. B. I. vi. 602.
Dekkan; Madanapalli (Fischer), Cuddapah Dist. (Meebold).
13. *CYPERUS ARENARIUS*, Retz.; F. B. I. vi. 602.
Along the sea-coast and river banks and in other sandy localities at low elevations.
14. *CYPERUS PACHYRRHIZUS*, Nees; F. B. I. vi. 602.
Coastal sands (Wight); Krusadai Island (Parthasarathy).
15. *CYPERUS COMPRESSUS*, Linn.; F. B. I. vi. 605.
In all Districts in moist situations; sea-level to 6,000 ft. The whole plant usually with a grey- or silvery-green sheen. Vern. *Tam.* Kunnagorai; *Kan.* Vusumani Hullu.
16. *CYPERUS ARISTATUS*, Rottb.; F. B. I. vi. 606.
In all Districts in moist sandy or pasture soils; sea-level to 8,000 ft.
17. *CYPERUS IRIA*, Linn.; F. B. I. vi. 606.
In all Districts in rice-fields and wet situations; sea-level to 4,000 ft. Vern. *Kan.* Dabbai Jambu Hullu.
18. *CYPERUS ELEUSINOIDES*, Kunth; F. B. I. vi. 608.
In all the E. and Central Districts; Nilgiri, Pulney and Travancore Hills; sea-level to 6,000 ft.
19. *CYPERUS DISTANS*, Linn. f.; F. B. I. vi. 607.
Dekkan; Carnatic; Nilgiri and Pulney Hills; Travancore; sea-level to 8,000 ft.
20. *CYPERUS NUTANS*, Vahl; F. B. I. vi. 607.
In most Districts inland; 1,000—6,500 ft.
21. *CYPERUS MALACCENSIS*, Lam.; F. B. I. vi. 608.
Quilon (Lawson).
22. *CYPERUS PILOSUS*, Vahl; F. B. I. vi. 609.
Mysore, Nilgiri and Pulney Hills; W. Coast at low elevations.
23. *CYPERUS PROCERUS*, Rottb.; F. B. I. vi. 610.
E. Districts from Nellore southwards, mostly near the sea in rice-fields; Bangalore (Cameron).
24. *CYPERUS ARTICULATUS*, Linn.; F. B. I. vi. 611.
In all the E. Districts; Ganjam (Alcock); Bellary; Cuddapah (Gamble); Mysore (Meebold); usually in standing water; sea-level to 3,000 ft. Vern. *Kan.* Yalai Jambu Hullu.
25. *CYPERUS CORYMBOSUS*, Rottb.; F. B. I. vi. 612. *C. tegetiformis*, Roxb.; F. B. I. vi. 612.
In all E. Districts and Travancore; sea-level to 3,000 ft. Vern. *Tam.* Pangorai. The stems of this and the next species are used for the fine Tinnevely mats.
26. *CYPERUS PANGOREI*, Rottb. *C. tegetum*, Roxb.; F. B. I. vi. 613.
In all Districts; from sea-level to 5,000 ft. Vern. *Tam.* Pangorai.
27. *CYPERUS BULBOSUS*, Vahl; F. B. I. vi. 611.
Dekkan and Carnatic; Beypore in S. Malabar; sea-level to 1,500 ft. Usually in sandy soil.
28. *CYPERUS ROTUNDUS*, Linn.; F. B. I. vi. 614. *C. Fenzelianus*, Steud.; F. B. I. vi. 615. *C. subcapitatus*, C. B. Clarke; F. B. I. vi. 616. *C. tuberosus*, Rottb.; F. B. I. vi. 616.

- In all Districts; sea-level to 6,000 ft. Vern. *Kan*, Bhadra Hullu. A troublesome weed, difficult to eradicate.
29. *CYPERUS ESCULENTUS*, Linn.; F. B. I. vi. 616.
At low levels and also in the Hills; Horsleykonda at 4,000 ft. (Gamble); Nilgiris (Hohenacker); Anamalais (Beddome). Not common. The tubers are sometimes used as food.
30. *CYPERUS STOLONIFERUS*, Retz.; F. B. I. vi. 615.
In coastal Districts, especially in sea-shore sand.
31. *CYPERUS ZOLLINGERI*, Steud.; F. B. I. vi. 612.
Pulney Hills at 7,000 ft. (Bourne); Peermade (Venkoba Rao).
32. *CYPERUS IMBRICATUS*, Retz. *C. radiatus*, Vahl; F. B. I. vi. 617.
Tranquebar (? Retz); Pykara at 6,000 ft. (Gamble); Kodaikanal (Bourne).
33. *CYPERUS EXALTATUS*, Retz.; F. B. I. vi. 617.
In all Districts from Cuddapah (Gamble) and Mysore southwards. In wet situations; sea-level to 3,000 ft. Vern. *Tam*. Paddupai Korai; *Kan*. Kempu Jambu Hullu.
34. *CYPERUS DIGITATUS*, Roxb.; F. B. I. vi. 618.
Bababudan, Nilgiri and Pulney Hills; 2,000—6,000 ft.
35. *CYPERUS ELATUS*, Linn. f.; F. B. I. vi. 618.
Dekkan (Wight).
36. *CYPERUS PLATYPHYLLUS*, Roem. v. Sch.; F. B. I. vi. 618.
E. Coast near the sea. Sriharikota (Gamble); Madras (Wight).

5. *Mariscus*, Vahl.

Erect herbs, usually perennial and glabrous; generally resembling the genus *Cyperus*. *Inflorescence* of a single head or in simple or compound umbels. *Spikelets* usually in compact compressed or terete heads. *Glumes* distichous, persistent on the rhachilla which disarticulates above the two lowest (which are empty and smaller than the rest), leaving a small knob or disk with, sometimes, an annular ridge on its summit. *Stamens* usually 3. *Style* 3-fid, continuous with the ovary; stigmas slender. *Nut* trigonous.

Base of stem thickened by turgid, chestnut-brown sheaths:—

Head solitary (rarely 2—4 together), ovoid, dense, 3—6 in. diam. Stolons 0; stems tufted, 3—20 in. high; leaves shorter or longer, flaccid; bracts 3—5, sometimes up to 9, 2—15 in. long, spikelets ovoid, bearing 2—6 nuts; glumes pale-brown; nuts oblong or subovoid, black.....1. *dubius*.
Spikes cylindric, subcapitate or in a simple umbel. Stolons slender, elongate, clothed in oblong-lanceolate, striate, pale-brown scales; stem solitary, 3—12 in. high; leaves usually shorter; spikes dense, 3—9 together, sessile or shortly peduncled, divaricate, up to 75 in. long; bracts 4—8, 2—7 in. long; spikelets narrowly ellipsoid, spreading at right angles, bearing 1 nut; glumes straw-coloured; nut ellipsoid, dark-brown.....2. *bulbosus*.

Base of stem not thickened by sheaths:—

Spikelets not markedly compressed; glumes not aristate:—

Umbels simple; spikelets bearing 1—3, rarely 4, nuts; transverse veinlets of leaves and bracts not visible:—

Roots producing stolons:—

Spikelets subulate, 1-flowered. Stolons long, scaly; stems slender, usually thickened into a nodule at the base, 2—24 in. long; leaves shorter or longer; bracts 3—6, up to 8 in. long; rays 3—7, 0—1.5 in. long, terminating

in dense cylindric spikes 2—7 in. long; glumes brown, 3rd striate; nut oblong-ellipsoid, often slightly curved, pale-brown.....3. *panicus*. Spikelets 2-flowered. Stolons short, very slender, scaly; stems slender, up to 12 in. long; leaves as long, very slender; bracts 4—5, up to 6 in. long; rays few, 0—1 in. long, spikes cylindric, lax, 3—1 in. long; glumes dusky-green; nut unknown.....4. *tenuifolius*.

Roots without stolons:—

Spikelets erect or suberect:—

Spikelets 2—4-flowered, subulate, often curved; rhachilla developed. Rhizome very short, nodulose; stems 4—24 in. high; leaves shorter or longer, up to 3 in. wide; bracts 4—8, up to 15 in. long and 3 in. wide; rays 5—11; spikes up to 1.5 in. long, sessile or peduncles up to 1.5 in. long; glumes obtuse, not cuspidate; nut obovate-oblong, obtuse, brown, muricate, usually slightly curved.....5. *cyperinus*.

Spikelets 1-flowered; rhachilla minute. Rhizome very short, hardly nodulose; stems 3—12 in. high; leaves shorter or longer, very narrow; bracts 4—7, 1—5 in. long, narrow; spikes cylindric, up to 7 in. long, sessile or up to 3 in. long; when sessile the umbel appears almost capitate; nut-bearing glume cuspidate. Other characters as in the last species.....6. *pictus*.

Spikelets spreading at right angles, cylindric, up to 1.5 in. long. Rhizome short, thick, creeping, clothed in the remains of old leaf-sheaths; stem 2.5—30 in. high; leaves usually much shorter, sometimes as long; bracts 4—11, 1—12 in. long; spikes 5—14, cylindric, up to 1.75 in. long, nearly sessile or peduncles up to 1.25 in. long; spikelets 1—2-flowered; nut-bearing glume cuspidate; nut narrowly elliptic-oblong, apex acute, dark-chestnut or nearly black, minutely muricate, slightly curved.....7. *Sieberianus*.

Umbels compound; spikelets bearing 5—14, rarely 3—4, nuts, 2—4 in. long; transverse veinlets of leaves and bracts more or less raised and distinct:—

Spikes cylindric or ovoid, 6—75 in. long; spikelets narrowly ovate or linear-lanceolate. Rhizome short; stems robust, bluntly trigonous, 1—3 ft. high; leaves shorter or longer, more or less spongy, up to 35 in. wide, margins of leaves and bracts sharply spinulose; bracts about 5, up to 38 in. long and 35 in. wide; primary rays up to 9, up to 3.5 in. long, some simple, others umbelled with 4—6 rays up to 75 in. long with 1—2 bracteoles up to 1 in. long; glumes broadly ovate, obtuse; strongly striate, greyish-brown; nut broadly ellipsoid, apiculate, black.....8. *pennatus*.

Spikes globose, 3—7 in. diam.; spikelets linear-subulate, 2—4 in. long. Rhizome short; stems spongy, terete or nearly so, 1—4 ft. high; leaves as long, up to 5 in. wide, spongy, margins smooth or scabrous; bracts 8 or more, 1.5—44 in. long, up to 5 in. wide, margins spinulose; primary rays 8—14, 75—6 in. long, secondary up to 13, 3—2 in. long, tertiary fewer and shorter; bracteoles up to 2 in. long, about as many as the rays; glumes narrow, much convoluted, subacute, reddish-brown; rhachilla with a broad hyaline wing; nut narrowly oblanceolate-oblong, distinctly beaked, brown, iridescent, minutely muricate.....9. *compactus*.

Spikelets markedly compressed, 6—26-flowered, 3—1.1 in. long; glumes elliptic with a curved arista, brown. Roots fibrous; stems tufted, slender, often capillary, 1.5—7 in. high; leaves as long, filiform; bracts few, up to 6 in. long; umbel subsimple; rays few, usually under 1 in. long; spikes broad-quadrate, usually a few sessile, up to 5 in. long, with 6—20 lax spikelets; nut narrowly oblong, acute, brown.....10. *squarrosus*.

1. *MARISCUS DUBIUS*, Kükenthal n. comb. *Cyperus dubius*, Rottb. Desc. et. Ic. 20. *Mariscus Dregeanus*, Kunth; F. B. I. vi. 620.
In all the E. Districts; Mysore, Nilgiri and Pulney Hills up to 6,000 ft.; Travancore.
2. *MARISCUS BULBOSUS*, C. B. Clarke; F. B. I. vi. 620.
Horsleykonda at 4,000 ft. (Gamble); Chingleput, Salem and Tinnevely Districts.

3. *MARISCUS PANICEUS*, Vahl; F. B. I. vi. 620.
Carnatic; Mysore; N. Coimbatore, Nilgiri, Anamalai and Pulney Hills; Travancore. From near sea-level to 7,000 ft.
4. *MARISCUS TENUIFOLIUS*, Schrad.; F. B. I. vi. 622.
Tinnevely Hills (Beddome).
5. *MARISCUS CYPERINUS*, Vahl; F. B. I. vi. 621.
In all Districts except the wettest; 1,500—7,000 ft.
Var. *bengalensis*, C. B. Clarke; F. B. I. vi. 621.
Umbel contracted into a quasi head; spikelets linear, bearing 2—4 nuts.
Kotagiri in the Nilgiri Hills at 6,500 ft. (Sedgwick).
6. *MARISCUS PICTUS*, Nees; F. B. I. vi. 621.
Mysore and Nilgiris.
7. *MARISCUS SIEBERIANUS*, Nees; F. B. I. vi. 622.
Nilgiri, Anamalai (Beddome) and Pulney Hills; High Wavy Mountains (Jacob); Travancore.
8. *MARISCUS PENNATUS*, Dom. *M. albescens*, Gaud.; F. B. I. vi. 623.
Near the sea on both coasts.
One of the sedges used for mat-making.
9. *MARISCUS COMPACTUS*, Druce. *M. microcephalus*, Presl.; F. B. I. vi. 624.
Rampa Hills (Narayanswami); Mysore (Meebold); Chingleput and Malabar Districts; Travancore; 300—3,000 ft.
10. *MARISCUS SQUARROSUS*, C. B. Clarke; F. B. I. vi. 623.
Chingleput, Coimbatore, Madura and S. Kanara Districts; Cochin and Travancore States; sea-level to 1,500 ft.

6. *Courtoisia*, Nees.

Erect herbs with simple stems and grass-like leaves only near the base. *Inflorescence* of globose, umbelled spikes. *Spikelets* compressed; rhachilla not winged, disarticulating above the 2 lowest glumes. Glumes distichous, the 2 lowest empty, the next 1—6 bearing 2-sexual flowers and dorsally winged, the uppermost empty or sterile. *Stamens* 3. *Style* short, persistent; stigmas 3, linear. *Nut* trigonous, apex acute, continuous with the style.

COURTOISIA CYPEROIDES, Nees; F. B. I. vi. 625.

Kurg; Mysore; Nilgiri Hills; Malabar; Carnatic.

In swampy situations. Vern. *Kan. Bili Sanna Jambu Hullu*. Stems tufted, 3—24 in. high; leaves shorter or longer, narrow, flaccid; bracts 3—7, 2·5—16 in. long; primary rays 5—9, up to 5 in. long, secondary fewer, up to 1 in. long; spikes congested, 2—5 in. diam.; spikelets flat, 1·5 in. long, usually bearing 2 nuts, rarely 1; glumes yellowish-brown, 12 in. long, boat-shaped, flattened, the whole length of the keel winged; nut narrowly fusiform, dark-brown.

7. *Eleocharis*, R. Brown.

Herbs with a stout rhizome or fibrous roots, sometimes stoloniferous. *Stems* simple, tufted, terete, angled or fluted. *Leaves* reduced

to sheaths embracing the base of the stem, rarely with a short herbaceous or membranous limb. *Inflorescence* a solitary terminal, subglobose, ovoid or cylindrical, few- or many-flowered spikelet which is sometimes proliferous. *Glumes* imbricate round the rhachilla in 3—many spirals, the lowest usually empty and bract-like, often longer than the rest but always shorter than the spikelet, the uppermost glumes empty, the intervening 2-sexual. *Stamens* 3—1. *Hypogynous bristles* 3—9, rarely absent, though sometimes small, retrorsely scabrous or spinulose. *Style* 2—3, rarely 4-fid, papillose, base swollen and usually constricted just above the nut, usually persistent. *Nut* obovoid, usually plano-convex when the style is 2-fid and trigonous when it is 3-fid.

Stem robust; spikelets narrower or hardly wider than the stems.

Stolons elongate:—

Glumes smooth, apex rounded or truncate, hyaline margins usually narrow:—

Glumes broadly ovate, straw-coloured, .2—2.5 in. long, midrib strong, usually raised. Stems terete, transversely septate within; septae usually visible outside when dry, 12—41 in. high; spikelets cylindric, .75—2 in. long; bristles 7, as long as the nut or longer, yellow; nut orbicular-obovoid, plano-convex or trigonous, smooth, pale-brown.....1. *plantaginea*.

Glumes closely imbricate, quadrate, straw-coloured, .1—1.25 in. long, without midrib. Stem trigonous upwards, not septate, 12—30 in. high; spikelets cylindric, .6—1 in. long; bristles much shorter than the nut, brown; nut orbicular-obovoid, trabeculate, pale, shining.....2. *spiralis*.

Glumes much striated, elliptic-oblong, brown, .17—2 in. long, apex narrowed, obtuse, hyaline margins usually broad. Stems trigonous upwards, not septate, 6—36 in. high; spikelets cylindric, .5—1.7 in. long; bristles 6, slightly longer than the nut, brown; nut orbicular-obovoid, biconvex, pale- or dark-brown, faintly striate.....3. *fistulosa*.

Stem slender; spikelets markedly wider than the stem:—

Style 2-fid; nut biconvex. Stolons 0:—

Bristles glistening-white. Stems filiform, 1—7 in. high; spikelets ovoid or subglobose, .06—2.5 in. long; glumes broadly ovate-oblong, back green, sides membranous, purplish-brown; bristles 4—7, as long as the nut; nut obovoid, smooth, dark-brown or black, polished.....4. *atropurpurea*.

Bristles reddish-brown. Stems 2—14 in. high; spikelets subglobose or conical-ovoid, .1—2 in. long; glumes orbicular-ovate, membranous, pale-brown, often with a reddish tinge; bristles 4—7, usually longer than the nut, reddish-brown; nut obovoid, dark-brown or black, polished.....5. *capitata*.

Style 3-fid; nut trigonous:—

Stems fluted, hardly angled:—

Nut prominently trabeculate; style-base nearly as broad as the nut. Stolons 0; stems filiform, 1—7 in. high; spikelets narrowly ellipsoid or ovoid, .05—1.5 in. long; glumes 6—8, boat-shaped, subacute, back narrowly green, sides hyaline with a chestnut band; bristles about 6, as long as the nut, pale-brown; nut pale straw-coloured.....6. *Chaetaria*.

Nut smooth; style-base narrow. Stolons slender; stems rigid, 3—18 in. high; spikelets narrowly elliptic or ovoid, .2—4 in. long, frequently producing a branchlet from the axil of the lowest empty glume which may bear a smaller subsidiary spikelet; glumes many, ovate- or elliptic-oblong, lower obtuse, upper subacute, hyaline or green along the midrib, margins reddish- or purplish-brown; bristles 6—7, longer than the nut, pale- or dark-brown; nut obovoid, obscurely trigonous, pale, smooth.....7. *congesta*.

Stems sharply 4- (sometimes 3-) angled, 8—36 in. high. Stolons slender; spikelets narrowly ellipsoid to cylindric-lanceolate, .4—1 in. long; glumes numerous, ovate, obtuse, yellow along the midrib, sides reddish-brown; bristles about 6, longer than the nut, glistening red-brown, very scabrid; nut obovoid, yellow, smooth; style-base elongate-obpyramidal, 4-sided, fuscous, scabrid

8. *tetraquetra*.

1. *ELEOCHARIS PLANTAGINEA*, R. Br.; F. B. I. vi. 625.
Mysore; Coimbatore; Carnatic; Travancore. In swamps, from near sea-level to 3,000 ft.
 2. *ELEOCHARIS SPIRALIS*, R. Br.; F. B. I. vi. 627.
Carnatic; in swamps.
 3. *ELEOCHARIS FISTULOSA*, Schult.; F. B. I. vi. 626.
Mysore; Coimbatore; S. Kanara. In swamps from near sea-level to 3,000 ft.
 4. *ELEOCHARIS ATROPURPUREA*, Kunth; F. B. I. vi. 627.
Carnatic; S. Kanara. At low levels.
 5. *ELEOCHARIS CAPITATA*, R. Br.; F. B. I. vi. 627.
In all Districts in rice-fields and moist sandy localities; from sea-level to 2,000 ft.
 6. *ELEOCHARIS CHAETARIA*, Roem. & Sch.; F. B. I. vi. 629.
Mysore; S. Kanara; Travancore. In drying swamps and rice-fields; from near sea-level to 3,000 ft.
- Var. *subvivipara* Fischer n. comb. *E. subvivipara*, Boeck.; F. B. I. vi. 629. Stems taller, up to 12 in. long; spikelets frequently viviparous. Nilgiri Hills; Travancore.
7. *ELEOCHARIS CONGESTA*, D. Don; F. B. I. vi. 630.
Nilgiri and Pulney Hills; 5,000—7,000 ft.
 8. *ELEOCHARIS TETRAQUETRA*, Nees; F. B. I. vi. 630.
Nilgiri and Pulney (Bourne) Hills; 6,000—7,000 ft.

8. *Fimbristylis*, Vahl.

Herbs, usually erect, with a short rhizome or fibrous roots, rarely stoloniferous. *Stems* usually tufted. *Leaves* narrow, from near the base of the stem, sometimes all reduced to sheaths. *Inflorescence* terminal, umbellate, corymbose or reduced to a few spikelets or a single one. *Spikelets* solitary or clustered, usually many-flowered, the solitary usually pedicelled but frequently one or more in the corymb sessile. *Glumes* usually spirally imbricate but sometimes the lower or all distichous, usually glabrous, deciduous from the base upwards, the lowest 1—3 empty, the uppermost few tabescent, the intermediate 2-sexual. *Stamens* 1—3. *Bristles* 0. *Style* long, 2—3- (rarely 4-) fid, usually more or less pubescent or villous, base dilated and constricted just above the nut, persistent or wholly deciduous leaving no button on the nut. *Nut* biconvex or trigonous, often stalked, smooth or tubercled, often trabeculate by the transverse superficial cells or reticulate by small rounded or hexagonal cells.

Glumes spirally disposed (sometimes distichous in 17. *nigrobrunnea*):—

Spikelets 1—5:—

Style 2-fid; nut biconvex:—

Leafless or nearly so; bracts 0:—

Nut linear-oblong, slightly narrowed below, pale-straw-coloured, .06 in. long, trabeculate in about 9 vertical series, not fluted, stalked, deciduous with the glume. Roots fibrous; stems quadrangular, 4—26 in. high; leaves 0, the uppermost sheath sometimes with a short limb; spikelet solitary, ovoid or conical, .25—.4 in. long, rarely cylindric-conical and up to .8 in. long; glumes oblong or obovate-oblong, rounded, .13 in. long, nearly flat, not keeled.....1. *tetragona*.

Nut subglobose obovoid, transversely fluted:—

Spikelet continuous with the stem, lanceolate, .2—4 in. long. Roots fibrous; stems obtusely quadrangular, 2—12 in. high; leaves 0; glumes ovate, subacute, .14—17 in. long, not plicate, pale with a green excurrent keel; nut .07 in. long, pale-straw-coloured.....2. *acuminata*. Spikelet usually set obliquely on the stem, ovate-lanceolate, .25—5 in. long. Rootstock creeping; roots fibrous; stems terete, 8—18 in. high; leaves 0, sheaths with a very short mucronate, ovate limb bordered with brown; glumes orbicular or very broadly ovate, nearly flat, not keeled, rounded, apiculate, .17 in. long, brown; nut whitish .05—06 in. long
3. *nutans*.

Leaves several:—

Glumes narrowly oblong, nearly flat in flower, boat-shaped in fruit, obtuse, slightly keeled, pale-brown or whitish, sometimes reddish towards the apex, .1 in. long. Root fibres slender; stems slender, striate, 1—15 in. high; leaves $\frac{1}{2}$ to as long, slender; spikelets solitary, oblong-ellipsoid, .2—3 in. long; bracts 0, but the lowest glume sometimes with a leaf-like appendage up to 1 in. long resembling a bract or an extension of the stem; nut obpyriform, apex subtruncate, sessile, .06 in. long, pale- or dark-brown, minutely papillose, papillae often whitish

4. *polytrichoides*.

Glumes suborbicular or very broadly ovate, usually shortly apiculate, slightly concave, not keeled, pale-brown, 1.1—1.4 in. long. Root fibres slender; stems slender, rigid, striate, 3—16 in. high; leaves $\frac{1}{2}$ as long to a little longer, slender; spikelets ovoid, .2—32 in. long, solitary or 2—5 in a simple irregular umbel, 1 or 2 sessile at the forks, the others terminating rays up to 1 in. long; bracts 2, usually shorter than, but sometimes one exceeding the spikelet; nut suborbicular-obovoid, straw-coloured, smooth, .06—08 in. long, stalked.....5. *schoenoides*.

Style 3-fid; nut trigonous, obovoid, apex subtruncate, .05—06 in. long, black or dark-brown, minutely tubercled. Rhizome very short; stems slender, obtusely angled, glabrous or shortly laxly hairy, 3—18 in. high; leaves $\frac{1}{2}$ — $\frac{3}{4}$ as long; slender, usually channelled, shortly hairy; spikelets solitary, ovoid-ellipsoid, .3—6 in. long; bract 0, rarely 1 up to 1.2 in. long; glumes broadly oblong, obtuse, concave, .12—18 in. long, chestnut, not keeled.....6. *Kingii*.

Spikelets many, umbellate (rarely reduced to a few in depauperated specimens):—

Style 2-fid (rarely casually 3-fid); nut flattened:—

Spikelets solitary, the majority peduncled:—

Margins of glumes not white or hyaline:—

Spikelets globose or oblong-cylindric, echinate with the curved awns of the glumes, .25—4 in. long. Roots fibrous; stems slender, .5—6 in. high; leaves usually shorter, sometimes as long, filiform; umbels simple or compound, often dense; rays variable in number, up to 1 in. long; bracts several, filiform, often overtopping the umbel; glumes narrowly elliptic, pale with a green nerve excurrent as a long awn, .06—08 in. long; nut nearly cylindric, .02—03 in. long, brown, glabrous or with a few thick capitate hairs.....7. *dipsacea*.

Spikelets ellipsoid or ovate-oblong:—

Spikelets angled by the prominent keels of the glumes, narrowly ellipsoid, .15—3 in. long. Roots fibrous; stems 1—10 in. high; leaves shorter or as long, narrow, more or less pubescent; sheaths usually pubescent; umbels compound or decompound, rays few to many, up to 1 in. long; bracts shorter or longer than the umbel, more or less pubescent; glumes ovate, reddish-brown, usually puberulous, 1—3-nerved, .06—07 in. long, the midrib forming a conspicuous green keel prolonged into a cusp, sometimes to a short, curved awn; nut broadly obovoid, pale- to dark-brown, smooth, more or less trabeculate, .025—03 in. long.....8. *bis-umbellata*.

Spikelets not angled:—

Glumes glabrous, broadly ovate, concave, keeled, apiculate, .1 in. long, reddish-brown. Rhizome short or 0; stems slightly swollen at base, striate or obscurely angled, up to 24 in. high; leaves usually shorter, sometimes longer, coriaceous, linear, flat, glabrous

or more or less densely pubescent; umbels usually decompound, sometimes contracted; rays few, up to 1.5 in. long; bracts few, shorter or longer than the umbel; spikelets ovoid, acute, .2—3 in. long; nut broadly obovoid, pale-brown, trabeculate, .05 in. long
9. *dichotoma*.

Glumes more or less puberulous:—

Glumes ferruginous-brown, hoary-puberulous outside in the apical half, glabrous and usually paler in the basal half, broadly elliptic-ovate, apiculate, concave, .15—17 in. long, keel green. Rhizome 0 or very short; roots fibrous; stems subangular or slightly flattened, 8—30 in. high; leaves often 0, sometimes up to 6 in. long, narrow, margins scabrous; sheaths thin, glabrous or puberulous, mouth truncate, minutely ciliate; umbels usually simple of 5—10 rays up to 1 in. long; bracts 2—4, shorter or longer than the umbel, up to 4 in. long; spikelets ellipsoid, .35—5 in. long; nut broadly obovoid, umbonate, shortly stalked, smooth, pale-yellow, .06—07 in. long.....10. *ferruginea*.

Glumes brown-puberulous outside all over, ovate, apiculate, hardly keeled, boat-shaped, .08—09 in. long. Rhizome short or 0; roots fibrous; stems subangular or slightly compressed, 10—20 in. high; leaves shorter, up to 12 in. long, few, very narrow, margins smooth; sheaths glabrous, mouth oblique, glabrous or sparsely ciliate; umbels compound; primary rays 8—10, up to 2 in. long, partial rays fewer and shorter; bracts up to 2 in. long; spikelets narrowly ellipsoid, .25—35 in. long; nut broadly obovoid, apex rounded, apiculate, shortly stalked, fuscous-brown, minutely reticulate, .04 in. long.....11. *compressa*.

Margins of glumes broadly white or hyaline. Rhizome short or long; root fibres long; stems rigid, obtusely trigonous, swollen at the base, 2—18 in. high; leaves much shorter, rarely as long, crowded on the rootstock, rigid, narrow, flat or margins incurved, glabrous; umbels simple or compound, often contracted with clustered spikelets; rays up to 1.5 in. long; bracts short, erect, rigid; spikelets ellipsoid or ovoid, .15—25 in. long; glumes broadly ovate, obtuse, sometimes minutely apiculate, keeled, .06—08 in. long, brown; nut obovoid, apex rounded, .04 in. long, black, minutely tubercled.....12. *spathacea*.

Spikelets clustered, all sessile:—

Clusters of spikelets in a single head. Rhizome 0:—

Spikelets cylindric, .17—27 in. long, .06—08 in. wide. Root fibres slender; stems numerous, slender, subtrigonous, 1—8 in. high; leaves usually shorter, very slender, glabrous, canaliculate; bracts 3—5, up to 3 in. long; glumes ovate, subacute, .05 in. long, brown or silvery-grey, keel green; nut orbicularly obovoid, .02 in. long, shortly stalked, pale, exterior cells obscure.....13. *argentea*.

Spikelets ovoid-ellipsoid, .18—2 in. long, .1 in. wide. Root fibres rather stout; stems few, compressed, 6—12 in. high; leaves half as long, narrow, flat; bracts 2, suddenly acute, up to 1 in. long; glumes lanceolate, subacute, boat-shaped, not keeled, .08 in. long, pale-brown or greyish; nut obovate, shortly stalked, .03—04 in. long, exterior cells transverse, conspicuous.....14. *albicans*.

Clusters of spikelets umbelled. Rhizome thick, woody, up to 6 in. long, sometimes branched; stems rigid, terete or slightly angled, glabrous or minutely white-silky, 1.5—8 in. high; leaves $\frac{1}{2}$ as long, numerous, closely imbricating, coriaceous, ligulate, curved, appressed ashy- or brown-silky; umbels simple or compound, one cluster sessile and 2—5 with peduncles (rays) up to 1 in. long; bracts 2—3, silky, up to .75 in. long; spikelets ellipsoid-oblong, acute .2—25 in. long; glumes ovate, subacute, keeled, .13 in. long, ashy-silky; nut obovate, apex rounded, smooth, pale-brown, .06 in. long.....15. *sericea*.

Style 3-fid (rarely casually 2-fid); nut trigonous:—

Spikelets solitary, mostly peduncled:—

Rhizome present, often woody:—

Spikelets not contorted:—

Whole plant glabrous or nearly so (margins of leaves and ribs of rays scabrid in 21. *complanata*):—

Margins of glumes hyaline or scarious:—

Leaves 0 or few, very slender, finely acuminate, longer or shorter than the stem. Rhizome small; root fibres slender; stems weak, angled, up to 30 in. high; umbel decomposed; rays many, slender, up to 3 in. long; bracts filiform, shorter than the umbel; spikelets very numerous, ellipsoid or ovoid, .15—2 in. long; glumes broadly ovate, .07 in. long, keeled, apiculate, pale-brown, margins hyaline; nut globosely obovoid, .02—03 in. long, pale-brown, minutely tubercled, exterior cells transverse.....16. *quinquangularis*.
Leaves several, ligulate, apex obtuse. Stems rigid; margins of glumes scarious, nut obovoid-elliptic, trabeculate

26. *junciformis* var. *abbreviata*.

Margins of glumes neither hyaline nor scarious:—

Stems not markedly flattened:—

Leaves ligulate, flat; spikelets over .25 in. long:—

Spikelets ovoid, sometimes compressed with distichous glumes, .25—55 in. long, .13—16 in. wide. Rhizome short, woody; stem slender, angular, up to 24 in. long; leaves usually much shorter, numerous, narrowly ligulate, tip rounded or suddenly acute; umbel simple or compound; rays 3—6, .5—2 in. long, bearing comparatively few spikelets; bracts very short, rigid, usually erect; glumes broadly triangular-ovate when unfolded, coriaceous, cuspidate, .13—16 in. long, keel slender, very dark-brown, shining; nut broadly obovoid, .04 in. long, pale-brown, minutely tubercled.....17. *nigrobrunnea*.

Spikelets narrowly lanceolate, terete, .75—1 in. long, .15—2 in. wide. Rootstock short; stems slender, angled, up to 24 in. high; leaves much shorter, several, narrowly ligulate, rigid, tip rounded; umbels simple or compound; rays 3—5, rigid, up to 2 in. long, each with 1—3 spikelets; bracts 2—3, shorter than the spikelets; glumes ovate, boat-shaped, .2—25 in. long, rigid, cuspidate, reddish-brown, the slender keel paler, nut broadly obcordate, .05 in. long, apiculate, faces concave, angles rounded, greyish-brown, subtubercled.....18. *insignis*.

Leaves filiform, numerous, $\frac{1}{2}$ — $\frac{3}{4}$, the length of the stems. Rhizome short, woody; stems slender, obtusely angled, up to 2 ft. high; umbels decomposed; primary rays 3—10, very slender, up to 2 in. long; spikelets narrowly oblong or linear-lanceolate, .2—25 in. long; glumes lanceolate, acuminate, cinnamon-brown, margins paler, glandular, .14 in. long; nut narrowly oblong-obovoid, greyish-brown, .03—04 in. long, minutely stalked.

19. *cyperoides*, var. *cinnamometorum*.

Stems distinctly flattened near the umbel, usually 2-edged, 8—36 in. long. Rhizome short, woody, sometimes absent; root fibres wiry; leaves crowded at the base, flat, linear, suddenly narrowed, obtuse or subacute, margins scaberulous near the apex, usually much shorter than the stem, sometimes nearly as long; umbels decomposed, effuse; bracts 2—4, usually shorter than the inflorescence, sometimes as long; rays 5—10, usually flattened, up to 6 in. long, corymbosely branched; spikelets many, ovoid or narrowly oblong, .15—3 in. long; glumes ovate, complicate, brown, keel strong, produced into a distinct mucro, .08—1 in. long; nut obovoid, .02—03 in. long, pale straw-coloured or whitish, minutely tubercled.....20. *complanata*.

Leaf-sheaths and stems more or less hairy; bracts and bracteoles hoary-pubescent. Rhizome short, creeping; stems thickened at the base, 5-angled, usually deeply grooved, 10 in.—5 ft. high; leaves 0; sheaths 3—4, lax, lowest short, coriaceous, upper membranous, longer, uppermost up to 6 in. long, limb short scarious; umbels compound; bracts short, ovate, caudate; rays 3—10, up to 1.5 in. long; partial rays fewer and shorter; spikelets elliptic, nearly terete, .14—25 in. long; glumes broadly ovate, concave, keel usually produced into a short cusp,

chestnut-brown, margins narrowly hyaline, .1—15 in. long; nut globosely obovoid, apiculate, stalked, very pale to pale-brown, trabeculate, .05 in. long.....21. *pentaptera*.

Spikelets contorted, narrowly cylindric, .2—5 in. long. Rhizome stout, woody; stems solitary or twin, rigid, terete, striate or shallowly ribbed, up to 25 in. high; leaves usually much shorter, sometimes as long, numerous, flat, up to .17 in. wide, margins scabrid near the suddenly acute apex; umbels decomposed; bracts 4—5, shorter than the inflorescence, margins scabrid; primary rays 6—8, terete or somewhat compressed, up to 3.5 in. long, partial rays fewer and shorter; glumes broadly ovate when expanded, .1 in. long, subacute, keeled, pale reddish-brown, margins hyaline; nut narrowly obovate, .04 in. long, shortly stalked, pale-brown, exterior cells transversely oblong.....22. *contorta*.

Rhizome absent (unknown in 23. *Arnottiana*):—

Glumes obtuse:—

Spikelets broadly ellipsoid, .2 in. long, .1—12 in. wide. Rootstock and leaves unknown; stem sharply 5-angled, glabrous, up to 14 in. or more long; umbel decomposed; bracts 3—4, very narrow, up to .6 in. long, margins scabrid; primary rays 7—8, up to 1.3 in. long, partial ones fewer and shorter; glumes broadly ovate, concave, sometimes apiculate, hardly keeled, chestnut, .08—0.9 in. long; nut narrowly obovate, minutely apiculate, shortly stalked, .04 in. long, pale-brown, transversely lineolate, faintly tubercled.....23. *Arnottiana*. Spikelets subglobose, .09—11 in. long. Root fibres slender; stems weak, 4—5-angled upwards, 2—20 in. high; leaves shorter or longer, narrow, acuminate; umbel decomposed; bracts 2—3, filiform from a broad base, much shorter than the inflorescence; primary rays 4-many, slender, somewhat compressed, up to 2 in. long, partial ones fewer and shorter; glumes broadly ovate, concave, keeled, .05 in. long, brown or pale-chestnut; nut narrowly obovate, sharply or obtusely 3-angled, minutely tubercled, yellowish-brown, .02 in. long

24. *miliacea*.

Glumes acute, ovate-lanceolate, keel shortly excurrent and strongly incurved at the base, glandular-puberulous or glabrous, .08—1 in. long, brown or yellowish brown, margins scarious. Roots fibrous; stems tufted, 4—5-angled, angles smooth or scabrid, 4—14 in. high; leaves $\frac{1}{2}$ —3 as long, rarely as long, almost filiform; umbels simple or subcompound; bracts 2—3, short, setiform; rays 2—4, up to 1 in. long, bearing 1—3 spikelets; spikelets ellipsoid or oblong-ellipsoid, .15—25 in. long; nut globosely obovoid, .03 in. long, greyish-white, tubercled.....25. *tenera*.

Spikelets clustered, all sessile:—

Umbels decomposed:—

Leaves many, much shorter than the stem, nearly filiform (broader and ligulate in var. *latifolia*), not exceeding .15 in. wide at the base; sheaths short, open. Rhizome woody, short or creeping; stems 4—5-angled or slightly compressed, smooth, 4—18 in. high; bracts 2—4, much shorter than the inflorescence, rigid, erect; primary rays 3—6, up to 2 in. long; spikelets in clusters of 3—6 (solitary in var. *abbreviata*), narrowly oblong or ovoid, .16—25 in. long; glumes ovate, shortly mucronate, keel slender, pale- or fuscous-brown, margins scarious, .08—1 in. long; nut obovoid, brown or pale, .05 in. long, minutely tubercular.....26. *junciformis*. Leaves 0 or several, as long as the stem, narrowly ligulate, .3—5 in. wide at the base; sheaths coriaceous, closed, the uppermost up to 6 in. long. Rootstock unknown; stem swollen at the base, 5-angled, angles scabrid, up to 2 ft. high; bracts lanceolate, caudate, margins setulose-scabrid, much shorter than the inflorescence; primary rays about 8, ribbed, ribs scabrid, up to 2 in. long; spikelets numerous, ellipsoid, .2 in. long; glumes broadly ovate when expanded, .14 in. long, strongly keeled, shortly cuspidate, reddish-brown, margins paler; nut obovoid-elliptic, pale-brown, .05 in. long, trabeculate.....27. *aggregata*.

Umbels simple:—

Glumes ovate, apical half glandular, keel or the whole glume often puberulous, minutely mucronate, dark, margins membranous and paler.

Rhizome oblique; stems slender, obscurely 4—5-angled, up to 15 in. long; leaves $\frac{1}{2}$ — $\frac{3}{4}$ as long, very narrow, usually deeply channelled, margins minutely scabrid near the apex; bracts 3, the lowest sometimes longer than the inflorescence, spinulose-scabrid; the apex often puberulous; rays 5—7, up to 1 in. long; spikelets in clusters of 2—7, sometimes solitary, ovate or ellipsoid, .15— $\frac{1}{4}$ in. long, style sometimes 4-fid; nut minute, depressed-obovoid, dark, trabeculate...28. *paupercula*. Glumes ovate, glabrous, keel shortly produced as a mucro, .12—15 in. long, dark-chestnut, margins narrowly scarious and pale. Rhizome short, woody; stems slender, obscurely angled, 1.5—12 in. long; leaves $\frac{1}{4}$ — $\frac{1}{2}$ as long, subsetaceous, rigid; umbels sometimes contracted into a single head; bracts 1—3, setaceous from a broad base, usually very short, sometimes up to 1.5 in. long; spikelets 2—7 together, very rarely solitary, sessile or with peduncles up to .5 in. long, ellipsoid-oblong, .2—33 in. long; nut obovoid, minutely stalked, pale, smooth, .05 in. long.

29. *uliginosa*.

Glumes distichous:—

Glumes broad, strongly cuspidate:—

Spikelets solitary, sometimes 2—3, broadly ovate, usually much compressed, sometimes slightly contorted, .2—5 in. long, .17—25 in. wide. Rhizome small; stems tufted, very slender, angled, 2—18 in. high; leaves usually $\frac{1}{2}$, sometimes as long or longer, filiform, channelled, smooth; sheaths membranous; bract 0 or 1, erect, shorter than the spikelet or as long; glumes coriaceous, very broadly ovate, strongly keeled, acute, smooth, .15—2 in. long, pale straw-coloured, shining, the empty basal glumes often aristate; nut pear-shaped with a distinct stalk, .08—1 in. long, densely tubercled, the tubercles often showing through the glume.....30. *monostachya*.

Spikelets 2—5 in a simple umbel, rarely solitary, ovate- or oblong-lanceolate, .5—1 in. long, .15—33 in. wide, somewhat compressed, sometimes slightly contorted. Rhizome short, woody; stems rigid, obscurely angled, 9—30 in. high; leaves $\frac{1}{2}$ as long, narrow, rigidly pointed, concave, margins spinulose-scabrid towards the base; sheaths coriaceous; rays 1—4, up to 2.5 in. long; bracts 1—2, erect, rigid, up to 1 in. long, margins usually scabrid; glumes coriaceous, broadly ovate, strongly keeled, smooth, .25—32 in. long, pale-brown or yellowish; nut subglobose obovoid with a long stalk, 3-ribbed, dark-brown, .1—13 in. long, minutely tuberculate.....31. *tristachya*.

Glumes broadly triangular when unfolded, subacute, weakly keeled, not cuspidate, glabrous or the keel minutely scabrid, .08—12 in. long, pale-brown, margins paler, the upper ones sometimes more or less spirally arranged. Rhizome 0; roots fibrous; stems tufted, slender, obtusely quadrangular, 4—8 in. high; leaves very narrowly ensiform, 1.75—4 in. long; rays 1—4, up to 1.2 in. long, capillary; bracts 1 to each ray, up to .25 in. long; spikelets lanceolate, .2—35 in. long; nut obpyramidal, truncate, .025—04 in. long, very pale-brown, white-tubercled.....32. *Narayanii*.

1. *FIMBRISTYLIS TETRAGONA*, R. Br.; F. B. I. vi. 631.

Mysore; Malabar; Coimbatore; Nilgiri Hills; Kambakkam Hills; sea-level to 3,000 ft.

2. *FIMBRISTYLIS ACUMINATA*, Vahl; F. B. I. vi. 631.

Mysore; S. Kanara; Travancore; sea-level to 3,500 ft.

3. *FIMBRISTYLIS NUTANS*, Vahl; F. B. I. vi. 632.

Kambakkam Hills at 200 ft. (Fischer).

4. *FIMBRISTYLIS POLYTRICHOIDES*, R. Br.; F. B. I. vi. 632.

E. Coast from Godavary District southwards; near the sea.

5. *FIMBRISTYLIS SCHOENOIDES*, Vahl; F. B. I. vi. 634.

Mysore; Cuddapah Hills; Carnatic; Courtallam; near sea-level to 3,500 ft. Vern. *Kan. Kadu Gundu Hullu*.

6. *FIMBRISTYLIS KINGII*, C. B. Clarke; F. B. I. vi. 633. *F. trabeculata*, C. B. Clarke; F. B. I. vi. 633.

Nilgiri and Pulney Hills, 6,000 ft. upwards; Artapadi Valley at 5,300 ft. (Fischer).

7. FIMBRISTYLIS DIPSACEA, Benth.; F. B. I. vi. 635.

S. Kanara; Mysore; Carnatic; Quilon.

8. FIMBRISTYLIS BIS-UMBELLATA, Bub. *F. dichotoma*, auc. non Vahl; F. B. I. vi. 635. *F. aestivalis*, Vahl; F. B. I. vi. 637.

In all Districts, especially in rice-fields; near sea-level to 4,000 ft. Vern. *Tam.* Kadu korai; *Kan.* Kadu Sabbasigai Hullu, Niru Sabbasigai Hullu.

Var. *hirtistyla*, Fischer, var. nov. The base of style furnished with villous hairs resembling those of *F. squarrosa*, Vahl.

Mysore; Pulney and Tinnevely Hills.

9. FIMBRISTYLIS DICHOTOMA, Vahl. *F. annua*, Roem. & Sch. var. *diphylla*, Kükenthal. *F. diphylla*, Vahl; F. B. I. vi. 636.

In all Districts; sea-level to 6,000 ft.

10. FIMBRISTYLIS FERRUGINEA, Vahl; F. B. I. vi. 638,

In all Districts, usually in the drier tracts, but also in Malabar and at Quilon; sea-level to 6,000 ft.

11. FIMBRISTYLIS COMPRESSA, Boeck.; F. B. I. vi. 639.

Madras Peninsula (Wight, Roxburgh).

12. FIMBRISTYLIS SPATHACEA, Roth.; F. B. I. vi. 640.

Near the sea on both coasts; Kowdalli in N. Coimbatore (Jacob).

13. FIMBRISTYLIS ARGENTEA, Vahl; F. B. I. vi. 640.

Mysore; Cuddapah; Chittoor; Nilgiris; Malabar; Travancore; Tinnevely; usually at low elevations up to 4,000 ft.; sometimes growing in clefts of rocks. Vern. *Kan.* Bettada Vusamani Hullu.

14. FIMBRISTYLIS ALBICANS, Nees; F. B. I. vi. 641.

Deccan (Wight).

15. FIMBRISTYLIS SERICEA, R. Br.; F. B. I. vi. 641.

Ganjam in coastal sands (Lawson, Gamble).

16. FIMBRISTYLIS QUINQUANGULARIS, Kunth; F. B. I. vi. 644.

Rampa District (Narayanswami); Mysore; Carnatic.

Var. *crassa*, C. B. Clarke; F. B. I. vi. 644. Much more robust; rhizome woody; stems rigid, sharply angled; leaves 0; sheaths long. Nilgiri, Anamalai and Pulney Hills at 6,000 ft.; Mysore at 3,000 ft. (Meebold).

17. FIMBRISTYLIS NIGROBRUNNEA, Thw.; F. B. I. vi. 648.

Nilgiri, Anamalai, Pulney and Tinnevely Hills.

18. FIMBRISTYLIS INSIGNIS, Thw.; F. B. I. vi. 645.

Anamalai Hills (Beddome).

19. FIMBRISTYLIS CYPEROIDES, R. Br., var. *CINNAMOMETORUM*, C. B. Clarke; F. B. I. vi. 650.

Cuddapah (Gamble); Carnatic; Anamalai Hills (Beddome); S. Kanara (Hohenacker); Pulney, Travancore and Tinnevely Hills; near sea-level to 3,000 ft.

20. FIMBRISTYLIS COMPLANATA, Link; F. B. I. vi. 646.

In all Districts; sea-level to 3,000 ft.

21. *FIMBRISTYLIS PENTAPTERA*, Kunth ; F. B. I. vi. 645.
Pulney Hills (Saulière); High Wavy Mountains (Blatter & Hallberg, Jacob).
22. *FIMBRISTYLIS CONTORTA*, Fischer in Kew Bull. 1931, p. 45.
Courtallam.
23. *FIMBRISTYLIS ARNOTTIANA*, Boeck. ; F. B. I. vi. 643.
Cannanore.
24. *FIMBRISTYLIS MILIACEA*, Vahl ; F. B. I. vi. 644.
In all Districts ; sea-level to 5,000 ft.
25. *FIMBRISTYLIS TENERA*, Roem. & Sch. ; F. B. I. vi. 642. *F. monticola*, Steud. ; F. B. I. vi. 642.
S. Kanara ; Mysore ; Bellary ; Chingleput ; Nilgiri and Anamalai (Beddome) Hills ; Travancore.
26. *FIMBRISTYLIS JUNCIFORMIS*, Kunth ; F. B. I. vi. 647.
Vizagapatam ; Cuddapah ; Chingleput ; N. Coimbatore ; Nilgiris ; near sea-level to 3,000 ft.
Var. *latifolia*, C. B. Clarke ; F. B. I. vi. 648.
Leaves broader, flat or slightly concave, curved and twisted ; sometimes some of the spikelets solitary.
Dekkan.
Var. *abbreviata*, C. B. Clarke ; F. B. I. vi. 648.
Leaves narrow, flat ; spikelets mostly solitary, a few sometimes paired.
Anamalai Hills (Beddome) ; Travancore (Bourdillon) ; Courtallam (Jacob).
27. *FIMBRISTYLIS AGGREGATA*, Fischer in Kew Bull. 1931, p. 44.
Anamalai Hills (Beddome).
28. *FIMBRISTYLIS PAUPERCULA*, Boeck. ; F. B. I. vi. 647.
Nilgiri, Pulney, High Wavy and Tinnevely Mountains.
29. *FIMBRISTYLIS ULIGINOSA*, Steud. ; F. B. I. vi. 648.
Nilgiri and Pulney Hills ; 6,000—7,000 ft.
30. *FIMBRISTYLIS MONOSTACHYA*, Hassk. ; F. B. I. vi. 649.
In all Districts except the wettest ; sea-level to 4,000 ft.
31. *FIMBRISTYLIS TRISTACHYA*, Thw. ; F. B. I. vi. 649.
Nellore and Chingleput Districts.
32. *FIMBRISTYLIS NARAYANII*, Fischer in Kew Bull. 1931, p. 46.
Travancore ; Courtallam.

9. *Bulbostylis*, Kunth.

Annual herbs ; rhizome short or 0. *Stems* tufted, leafy only at the base. *Leaves* very narrow, rarely absent ; sheaths usually finely hairy. *Spikelets* of few to many flowers, flattened in umbelled or congested corymbs, sometimes reduced to a solitary one. *Glumes* imbricate on all sides, 1—2 lowest empty, the uppermost few tabescent, the intermediate 2-sexual. *Hypogynous bristles* 0. *Stamens* 1—3, usually 2. *Style* 3-fid, deciduous, as long as the nut, with a small bull-biform base which remains as a minute button on the apex of the nut when the style falls off. *Nut* obovoid, 3-gonous, smooth, hardly stalked.

Spikelets few to many in dense, terminal, globose heads:—

Stems slender, striate, 2—12 in. high; leaves half as long or a little more, glabrous or hispid-puberulous, sheaths pilose; bracts 3, shorter than the head or up to 2 in. long; spikelets linear-oblong, .1—3 in. long; glumes laterally compressed, lanceolate to cymbiform, .06—16 in. long, nearly glabrous, or more or less densely puberulous or minutely hispid, keel strong, straight or sigmoidally curved, mucous, apiculate or produced into a straight or curved awn up to half its length, margins usually hyaline; nut broadly obovoid, obtusely trigonous, smooth, straw-coloured, .025—03 in. long.....1. *barbata*. Stem thick, rigid, curved, often twisted, shallowly grooved, 1—3 in. long; leaves $\frac{1}{2}$ — $\frac{1}{2}$ as long, rigid, channelled, hispid-puberulous; bracts 3, up to .5 in. long; glumes rigid, hispid-puberulous. Other characters as in the last species

2. *subspinescens*.

Spikelets umbelled, rarely reduced to a single spikelet:—

Umbel lax, simple or compound, spikelets nearly all solitary and distant. Stems very slender, glabrous, 1—12 in. high; leaves usually shorter, capillary, apex pungent, glabrous, sheaths slenderly hairy at least near the mouth; bracts lanceolate, cuspidate or caudate, short, one sometimes up to .5 in. long; spikelets ellipsoid, .15—27 in long; glumes compressed, ovate-cymbiform, glabrous, dark-brown, .075 in. long, keel conspicuous, green, mucous or excurrent; nut obovoid, trigonous, .03—04 in. long, smooth, pale-straw coloured or fuscous

3. *capillaris* var. *trifida*.

Umbel usually congested, sometimes lax, spikelets usually closely packed. Stems slender, glabrous or puberulous towards the top, up to 15 in. high; leaves usually less than $\frac{1}{2}$ as long, slender, acuminate, usually puberulous, sheaths finely hairy at least at the mouth; bracts lanceolate, cuspidate, short; spikelets lanceolate, .15—2 in. long; glumes compressed, broadly cymbiform, brown, puberulous, .075 in. long, keel greenish, apiculate; nut broadly obovoid, sharply trigonous, .03—04 in. long, pale-straw coloured, transversely wrinkled.....4. *puberula*.

1. *BULBOSTYLIS BARBATA*, Kunth; F. B. I. vi. 651.

In all Districts; from sea-level to 4,000 ft. Vern. *Tam. Muk-kutikorei*; *Kan. Chavuri Hullu*.

Sometimes the whole plant turns reddish in drying.

2. *BULBOSTYLIS SUBSPINESCENS*, C. B. Clarke; F. B. I. vi. 652.

Waltair (Proudlock).

3. *BULBOSTYLIS CAPILLARIS*, Kunth, var. *TRIFIDA*, C. B. Clarke; F. B. I. vi. 652.

Bababudan, Nilgiri, Pulney and Travancore Hills; 6,000 ft. and upwards.

4. *BULBOSTYLIS PUBERULA*, Kunth; F. B. I. vi. 652.

Near the coasts.

Var. *gracilis*, Fischer. Stems very slender, puberulous; leaves sometimes longer than the stems; 2 of the bracts like the leaves, up to 3 in. long; umbels sometimes lax.

Mundanthorai (Barber); Travancore (Bourdillon); loc. ? (Wight).

10. *Scirpus*, Linn.

Herbs; quite glabrous or the inflorescence slightly hairy. *Rhizome* 0 or creeping. *Leaves* narrow, arising from the base of the stem or from up to $\frac{2}{3}$ of its height, in submerged species from all along the stem, sometimes altogether absent. *Inflorescence* terminal or lateral of 1 to very many spikelets in clusters or umbels or corymbs. *Spikelets* usually many-flowered. *Glumes* spirally imbricate, rarely subdistichous below, 1—3 lowest empty, uppermost few tabescent, the intermediate

1—many with hermaphrodite flowers. *Hypogynous bristles* 0—7 (rarely 8 or 9), usually linear, sometimes broad, retrorsely scabrid, rarely plumose. *Stamens* 1—3, anterior. *Style* 2—3-fid, glabrous, base linear or conic and continuous with the nut. *Nut* sessile or nearly so, obovoid or oblong, trigonous with 3, biconvex with 2 stigmas, apex obtuse or acute, without apical button.

Leaves arising from $\frac{1}{2}$ the height of the stem or higher:—

Stems flaccid, slender, 1·5—12 in. long; leaves filiform, usually numerous, often clothing most of the stem, ·5—2·2 in. long; bracts 0; spikelets solitary, terminal, ovate, ·15—2 in. long; glumes ovate, concave, obtuse, purplish-brown, midrib and margins green, ·08—·09 in. long; bristles 0; style 2-fid; nut obovoid, biconvex, apiculate, almost stalked, ·05 in. long, pale, smooth.....1. *fluitans*.
Stems rigid, erect, trigonous; spikelets 2-many (rarely single) in umbels or corymbs; style 3-fid; nut obovoid, trigonous:—

Glumes broadly ovate, membranous, apex bifid, keel strong and produced into a straight or recurved awn, glabrous or puberulous, brown or golden-brown, ·15—·25 in. long, awn ·05—1 in. long. Rhizome creeping, bearing tubers; stem moderately strong, 1—6 ft. high; leaves often as long, coriaceous, ·15—2 in. wide (wider in tall plants); bracts 3—5 up to 6 in. long; spikelets usually many in a simple or compound umbel, clustered, sometimes reduced to a single spikelet, ovoid or cylindric, ·4—1·7 in. long; bristles 3—6, usually shorter than the nut; nut acute, dark olive-brown, smooth, shining, ·07—12 in. long

2. *maritimus*.

Glumes ovate-oblong, chartaceous, apex entire, obtuse, apiculate, not awned, strongly keeled, dark-brown, glabrous or puberulous, ·1—14 in. long. Rootstock stout, sometimes stoloniferous; stem stout, spongy below, sharply trigonous or 3-winged above, 4—10 ft. high; leaves $\frac{1}{2}$ — $\frac{3}{4}$ as long, up to 1 in. wide; bracts 3, up to 40 in. long and ·5 in. wide; spikelets in large, compound corymbs, solitary on slender, scabrid peduncles, ovoid, ·15—3 in. long; bristles 5—6, sparsely retrorsely hispid, shorter or longer than the nut; nut ·7 in. long with a conical apex, brown, smooth.....3. *grossus*.

Leaves radical or reduced to sheaths:—

Spikelets solitary or in simple clusters (1—2 rays sometimes added in 4, *supinus*):—

Spikelets lateral on the stem:—

Glumes not awned; bracts 0:—

Spikelets clustered; leaves reduced to sheaths:—

Inflorescence borne above the middle of the stem:—

Stems slender, terete:—

Glumes ovate-cymbiform, acute, strongly keeled, usually shortly mucronate, green, margins usually pale-brown, ·08—1 in. long. Stems 3—18 in. high; sheaths sometimes with a very short, erect blade; spikelets 3—12 in sessile clusters, sometimes 1—2 rays added, borne well below the apex of the stem; bristles 0; style 3-fid; nut globosely obovoid, trigonous, ·04—·05 in. long, black, transversely undulate-rugose.....4. *supinus*.

Glumes suborbicular-ovate, acute, keel not prominent, sometimes shortly mucronate, pale-brown, ·12—·14 in. long. Stems flaccid or rigid, 8—33 in. high; sheaths with an oblique, usually shortly cuspidate mouth; spikelets sessile, 2—5 (rarely solitary), in a cluster borne well below the apex of the stem; bristles 5—6, retrorsely hispid, shorter or longer than the nut; style 2-fid; nut broadly obovoid or subcircular, biconvex, apiculate, slightly narrowed at the base, brown or nearly black, ·09—1 in. long, faintly transversely lincolate.....5. *erectus*.

Stems robust, sharply triquetrous or almost 3-winged, 1—6·5 ft. high. Rootstock short with fibrous rootlets or with a stout horizontal rhizome up to 6 in. long; sheaths with oblique rounded mouth; spikelets few to many in a cluster ·5—2 in. below the acute apex of the stem, ovate or subcylindric, ·4—9 in. long; glumes broadly ovate, acute, often apiculate, keel inconspicuous, ·14—18 in. long, pale to reddish-

brown; bristles 5—8, retrorsely hispid, longer or shorter than the nut; style 3-fid, puberulous; nut broadly obovate, apiculate, biconvex, plano-convex or subtrigonus, dark olive-brown, faintly transversely striate and finely vertically lineolate, .08 in. long.....6. *mucronatus*. Inflorescence below the middle of the terete, transversely septate stem, septae visible externally; bristles 0; style 3-fid:—

Stems usually robust, spongy, .5—5 ft. high, over .1 in. diam., usually much more; sheaths lax, mouth oblique and often open; spikelets sessile, few to many in a dense lateral head often arising some distance above the mouth of the sheath, ovoid to cylindric-oblong, .2—75 in. long; glumes broadly ovate, very concave, narrowed, apex acute or subacute, often apiculate, hardly keeled, .17—23 in. long; nut broadly or narrowly obovate, sharply trigonous, apex shortly conical and apiculate, 2 or all 3 sides concave, black, smooth or with 16—20 more or less pronounced transverse wavy lines, .07—09 in. long

7. *articulatus*.

Stems slender, 3—12 in. high, .06 in. diam. or less; sheaths close, mouth oblique; spikelets sessile, few to many in a dense lateral head arising immediately above the mouth of the sheath, ovoid, .15—25 in. long; glumes suborbicular, slightly concave, not keeled, apex rounded, sometimes minutely apiculate, .1—12 in. long and slightly wider, pale-brown; nut obovoid, apex not narrowed, apiculate, obtusely trigonous with a vertical ridge along each angle, sides convex with 8—10 strong transverse undulate ridges, black, .05 in. long.....8. *Jacobi*.

Spikelets solitary, at right angles to the stem and near its apex, oblong, .06—09 in. long. Stems capillary, 1—6 in. high; leaves few, capillary .25—1 in. long; glumes obovate rhomboid, obtuse, densely imbricate, .025 in. long, reddish brown; bristles 0, replaced by 1—2 obovate, hyaline scales as long as the nut; stamen 1; style very shortly 2 fid; nut very narrowly obovoid, biconvex, fuscous, minutely muricate, slightly shorter than the glume.....9. *Isolepis*.

Glumes obovate-rhomboid, .025 in. long, acute, produced into a curved awn longer than itself, reddish-brown, awn brown. Stems filiform, 1—10 in. high; leaves shorter, filiform; bracts 0 or solitary, filiform, up to .5 in. long; spikelets 2—7 (sometimes 1) sessile, in a lateral head .5—2 in. below the apex of the stem, subglobose or ovate, .1—2 in. long; bristles 0; style, minute, 3-fid; nut narrowly obovoid-oblong, trigonous, .02 in. long, brown to black.....10. *squarrosus*.

Spikelets terminal, sessile, 2—6 in a cluster, rarely solitary, narrowly lanceolate, .3—5 in. long. Rhizome short, woody; stem rigid, terete, 2—32 in. high; leaves reduced to short sheaths, mouth oblique with a short cusp or sometimes a blade up to 1 in. long; bract 1, lanceolate, shorter than the spikelets; glumes narrowly ovate, acute, keeled, .18—23 in. long, pale-brown; bristles 5—6, brown, smooth, much longer than the nut; style 3-fid, puberulous; nut narrowly ellipsoid, narrowed at both ends, base of style falling late, sharply trigonous, smooth, brown, .07 in. long.....11. *subcapitatus*.

Spikelets corymbose; umbel lateral; bracts 0:—

Spikelets sessile, 3—many clustered at the ends of the rays, ellipsoid, .2—35 in. long. Rhizome horizontal, 2—4 in. long; stems stout, terete, 2—6 ft. high; leaves reduced to sheaths with a very oblique, cuspidate mouth; rays 3—14, sometimes a few again umbelled, flat, margins smooth, 0—3 in. long; glumes ovate, acute, .15—18 in. long, pale- or rusty-brown, acute, keel strong, produced into a mucro; bristles 0; style 3-fid; nut narrowly obovate, trigonous, apex narrowed, yellow, smooth, .08 in. long.....12. *corymbosus*.

Spikelets seldom, sessile, solitary, oblong-cylindric, .4—7 in. long. Stem stout, trigonous upwards, 2—6 ft. high; leaves grass-like and up to 24 in. long or reduced to sheaths; rays 4—12, some again umbelled, 0—3 in. long, flat, margins scabrid; glumes elliptic-oblong, .12 in. long, apex notched, keel produced into a cusp, red-brown, margins scarious; bristles 2—7, longer than the nut, red-brown, terete or flat, plumose; style 2-fid; nut obovate, bi- or plano-convex, apiculate, dark brown, smooth, .08 in. long.....13. *litoralis*.

1. *SCIRPUS FLUITANS*, Linn.; F. B. I. vi. 653.
Nilgiri and Pulney Hills; 6,500—8,000 ft.
2. *SCIRPUS MARITIMUS*, Linn.; F. B. I. vi. 658.
Mysore, Nellore. Usually near water.
Var. *affinis*, C. B. Clarke; F. B. I. vi. 659. Spikelets 1, or 2—5 clustered in a head, ovoid-lanceolate, 5—7 in. long; glumes pale straw-coloured with paler margins, 27 in. long.
Malabar
3. *SCIRPUS GROSSUS*, Linn.; F. B. I. vi. 659.
Carnatic. In still or running water.
4. *SCIRPUS SUPINUS*, Linn.; F. B. I. vi. 655.
In all Districts; sea-level to 4,000 ft. Often in rice-fields.
5. *SCIRPUS ERECTUS*, Poir.; F. B. I. vi. 656
Nilgiri and Pulney Hills; N. Coimbatore; N. Arcot; up to 6,500 ft.
6. *SCIRPUS MUCRONATUS*, Linn.; F. B. I. vi. 657.
W. Gháts from Mysore to Travancore; 3,000—8,000 ft. Vern. Kan. Hommagali Hullu.
7. *SCIRPUS ARTICULATUS*, Linn.; F. B. I. vi. 656.
In most Districts, especially near the coast; Mysore; sea-level to 3,000 ft. In tanks and marshy places.
8. *SCIRPUS JACOB*, Fischer in Kew Bull. 1931, 103.
Nellore District at Gudur (Jacob); "Pulicat Hills"? Kambakkam (Heyne); Coimbatore District at Virumandampalayam, 700 ft. (Fischer). Often growing with the last species and confused with it.
9. *SCIRPUS ISOLEPIS*, Boeck.; F. B. I. vi. 663.
Mysore (Cameron). Vern. Kan. Sanna Gundu Hullu.
10. *SCIRPUS SQUARROSUS*, Linn.; F. B. I. vi. 663.
In all Districts from Mysore southwards; sea-level to 2,000 ft. Vern. Kan. Kadu Vusamani Hullu.
11. *SCIRPUS SUBCAPITATUS*, Thw.; F. B. I. vi. 661.
Nilgiri and Pulney Hills; 6,000—8,000 ft.
12. *SCIRPUS CORYMBOSUS*, Heyne; F. B. I. vi. 657.
Mysore (Meebold); 2,000—3,000 ft.
13. *SCIRPUS LITORALIS*, Schrad.; F. B. I. vi. 659.
Cuddapah, Kurnool and Chingleput Districts; Travancore; sea-level to 2,000 ft.

11. *Fuirena*, Rottb.

Herbs, usually erect with creeping rhizome or fibrous roots. *Stem* leafy to above the middle or to the top. *Leaves* grass-like with an annular membrane at the mouth of the sheath. *Spikelets* in dense terminal and axillary clusters, many-flowered. *Glumes* spirally imbricate, strongly awned from the back a little below the apex, setose or puberulous at least in the upper half of the back, lowest 1—2 empty, uppermost few tabescent, intermediate bisexual, falling off gradually from the base upwards from the persistent rhachilla. *Hypogynous bristles* 2-seriate, rarely 1-seriate, sometimes 0; the 3 outer opposite the angles of the nut, usually short, linear, the 3 inner opposite the faces of the nut, linear, quadrate, obovate or partite, clawed, usually strongly

3-ribbed. *Stamens* 2—3. *Style* as long as or longer than the nut and continuous with it; stigmas 3, linear, usually long and puberulous. *Nut* ovoid or obovoid, trigonous, apex acute or conical, base more or less stipitate, exterior cells sometimes trabeculate.

Glumes 3-ribbed, not rigid, flat or slightly concave:—

Bristles all setiform or 0; leaves strongly 1-ribbed:—

Nut obovate, bluntly trigonous, .06 in. long, apex pyramidal, testa parchment-like, white, smooth, slightly creased, exterior cells minute, hexagonal. Rhizome short; stem triangular, more or less densely white-pubescent at the apex, up to 3.5 ft. high; leaves rigid, narrowly linear-lanceolate, acuminate, 1.5—8.5 in. long, margins recurved and scabrid, glabrous or more or less pubescent, especially the uppermost one; rhachis of inflorescence white-pilose, bracts linear-lanceolate, white-pilose, up to 1.5 in. long; spikelets sessile, 2—10 in corymbose clusters, ellipsoid, .3—5 in. long; glumes broadly elliptic-oblong, slightly concave, .13—17 in. long, .08—1 in. wide, awn .07—15 in. long, dorsal surface and awn grey hispid or puberulous, when dry pale-brown or fuscous with reddish streaks in the lower $\frac{2}{3}$, apex and awn green, bristles 0

1. *pubescens* var. *pergamentacea*.

Nut broadly obovate or suborbicular, sharply trigonous, .05 in. long, apex conical, shortly stalked, straw-coloured, the angles often dark and erose, faces with 3—5 slender vertical lines, the exterior cells transversely oblong and trabeculate. Rhizome often long, woody; stems up to 5 ft. high, sharply trigonous, slightly pubescent near the apex; leaves and spikelets as in the last species; rhachis of inflorescence glabrous or puberulous; glumes oblong, .1—14 in. long, .06—08 in. wide, awn .06 in. long, dorsal surface and awn grey-puberulous, when dry fuscous or reddish in the lower $\frac{2}{3}$, apex and awn greenish; bristles 0, 3 or 6; when 6, 3 outer very short, 3 inner shorter or longer than the nut, hispid.....2. *Wallichiana*.

Bristles 3 or 6, the 3 inner broad and flat; leaves 3—5-ribbed:—

Rhizome 0; stems slender, up to 16 in. high, striate glabrous below, patently hairy above; leaves linear-lanceolate, acuminate, 1—5 in. long, up to .3 in. wide, usually patently hairy as are the sheaths; spikelets ovoid or oblong, .2—4 in. long; glumes obovate or oblong, rounded, .06—1 in. long, awn .05—06 in. long, the upper half on the back and the awn puberulous, the awn and often the midrib setose, fuscous-brown, awn paler; bristles 6, 3 outer short, setiform, hispidulous, 3 inner quadrate, strongly 3-ribbed or almost 3-keeled, .05 in. long including a straight claw nearly as long as the blade, apex apiculate, outer angles acute or shortly apiculate, basal angles slightly hastate; nut narrowly or broadly obovoid, cuspidate, shortly stalked, .04—05 in. long, sharply trigonous, whitish, smooth or faintly transversely lineolate

3. *glomerata*.

Rhizome creeping, woody; stem rather robust, up to 4 ft. high, strongly striate or ribbed, glabrous or nearly so; leaves linear-lanceolate, acuminate, up to 9 in. long and .65 in. wide, glabrous or more or less pubescent; rhachis of inflorescence densely, softly pilose; spikelets narrowly oblong, .2—3 in. long; glumes obovate-oblong, .09—11 in. long, awn .04—06 in. long, fuscous-brown, the upper half on the back and the awn hispid, the awn sometimes setose; bristles 3 or 6, 3 outer when present short and setiform, 3 inner .05—06 in. long, obovate-oblong with a claw much shorter than the blade and so much S-shaped that the blade appears sessile, apiculate, 3-nerved, glabrous or minutely puberulous; nut broadly obovate, sharply trigonous, acuminate, shortly stalked, .04 in. long, pale- or chestnut-brown, smooth or slightly rugulose.....4. *umbellata*.

Glumes rigid, 7-ribbed, the 2 outer ribs vanishing about the middle, the rest converging into the stiff, usually curved awn, obovate, cymbiform with flat, ciliate margins, .08—11 in. long, awn, .04—06 in. long, keel and awn puberulous or hispidulous. Rhizome 0; stems 1—12 in. high, glabrous below, more or less pubescent above; leaves linear, acuminate, 3—5-ribbed, up to 4 in. long and .2 in. wide, laxly hairy as are the sheaths; spikelets crowded in capitate, simple or lobed clusters, ovoid, .15—2 in. long; bristles 6, 3 outer short, setiform, sparsely retrorsely hispid, 3 inner quadrate or suborbicular with a short straight claw, 3-ribbed, .04—05 in. long, apex 3-toothed, the middle tooth longest, with a

short filiform awn from the back near the apex; nut obovoid, sharply trigonous, acuminate, shortly stalked, .033 in. long, pale-brown or almost white, smooth

5. *uncinata*.

1. *FUIRENA PUBESCENS*, Kunth, var. *PERGAMENTACEA*, Fischer, var. nov.
Pulney Hills (Bourne 3097 type, 1207, 3096; Anglade 2164 at Palamalai 1782).
2. *FUIRENA WALLICHIANA*, Kunth; F. B. I. vi. 665.
N. Coimbatore Hills (Fischer at 4,000 ft., Jacob).
3. *FUIRENA GLOMERATA*, Lam.; F. B. I. vi. 666.
In most Districts; sea-level to 3,500 ft. Vern. *Kan. Petlu Góri Hullu*.
4. *FUIRENA UMBELLATA*, Rottb.; F. B. I. vi. 666.
Ganjam Agency (Barber); S. Kanara, Malabar, Cochin and Travancore; near sea-level to 2,600 ft. In swamps.
5. *FUIRENA UNCINATA*, Kunth; F. B. I. vi. 666.
E. Districts from Ganjam to Chingleput, Salem and Coimbatore; sea-level to 2,000 ft.

12. *Lipocarpa*, R. Brown.

Glabrous herbs; rhizome 0 or short. *Stems* tufted, obtusely triangular. *Leaves* grass-like, from the base of the stem only. *Spikelets* 1—20 in a single terminal bracteate head, many-flowered. *Glumes* spirally imbricate, 1—2 lowest empty, uppermost few tabescent, intervening bisexual, falling away successively from the base of the persistent rhachilla. *Hypogynous bristles* replaced by 2 subequal opposite hyaline scales more or less adherent to the nut. *Stamens* 1—3, usually 2. *Style* short, slender, stigmas 2, sometimes 3. *Nut* sessile, plano-convex or trigonous, obovoid or linear-oblong, smooth, usually minutely punctate.

Glumes pale or fuscous, sides hyaline and usually dotted and streaked with red-brown, spatulate-oblancoate, apex triangular, acute, .1—1.3 in. long. Rhizome 0 or short, vertical; stems rigid, 3—26 in. high; leaves as long in small plants, up to 9 in. long, rigid; bracts usually 3, rigid, unequal, .5—4.5 in. long, base broad; spikelets broadly ovoid, aggregated in heads of 3—10, rarely 1—2, .25—4 in. long; scales narrowly lanceolate, nearly as long as the glumes, longitudinally veined, readily splitting into linear segments, nut narrowly obovate-oblong, plano-convex or biconvex, brown, .04—0.5 in. long.....1. *argentea*. Glumes dark-purple or purple-spotted, cuneate-obovate, suddenly acute, .07 in. long. Rhizome 0; spikelets ovoid, 1—8, commonly 3 aggregated in a bed, .15—2.5 in. long; scales lanceolate, acute or obtuse, nearly as long as the glume; nut narrowly oblong, brown, nearly as long as the scales, very similar otherwise to the last species but smaller and more slender and with flaccid leaves and bracts.

2. *triceps*.

1. *LIPOCARPHA ARGENTEA*, R. Br.; F. B. I. vi. 667.
Mysore, Wynaad, Nilgiri and Pulney Hills; 3,000—7,000 ft. Often confused with *Kyllinga triceps*, Rottb.
2. *LIPOCARPHA TRICEPS*, Nees. *L. sphacelata*, Kunth; F. B. I. vi. 667.
Ganjam District (Gamble), Mysore, Salem District, Carnatic; sea-level to 3,000 ft.

13. *Rynchospora*, Vahl.

Erect herbs; rhizome 0 or woody and short or long, roots fibrous. *Leaves* grass-like, either from the base only or from nodes all along

the stem. *Spikelets* solitary or fascicled, in single or corymbose bracteate heads or in panicles, terminal or axillary added, 1–9-flowered, rarely many-flowered. *Glumes* imbricate all round the rhachilla, lower sometimes more or less distichous, lowest 3–4, sometimes more, smaller and empty, usually enlarging upwards, uppermost few narrow, empty or ♂, intervening bisexual. *Hypogynous bristles* 0–6, sometimes 7–8, when present setiform, often scabrid or plumose. *Stamens* 1–3, rarely 6. *Style* long or short, base dilated; stigmas 2, very short or long. *Nut* ovoid, oblong or subglobose, biconvex or nearly flat, beaked by the persistent, sometimes elongate style-base, sessile or shortly stalked, smooth or transversely undulate.

Leaves from near the base of the stem only; spikelets aggregated in a single globose head, .3–.4 in. diam., lanceolate, acute; glumes 7–8, floral ovate-lanceolate, acuminate, .19–.26 in. long; style long, stigmas very short:—

Nut broadly obovoid, turgidly biconvex, .07–.09 in. long, including a triangular beak $\frac{1}{2}$ – $\frac{1}{3}$ as long and a distinct stalk, black when ripe, smooth, the upper part sometimes minutely scabrid. Stem slender, 6–27 in. high; leaves narrowly linear, acute, flat or complicate, 2–16 in. long; bracts 3–8, unequal, nearly always longer than the head, up to 2.2 in. long, margins and midrib below pilose-ciliate; glumes shining, fuscous- or yellowish-brown; bristles usually 6, sometimes 0, much shorter than the nut, ascendingly hispidulous

1. *Wallichiana*.

Nut narrowly oblong, much compressed, sides nearly flat, .1–.16 in. long, including the narrowly triangular beak and short stalk, .03 in. wide, dark-brown or black, the faces covered with white or pale papillae. Stem, leaves and bracts as in the last species; glumes usually narrower and paler; bristles 5–6, much longer than the nut, sometimes twice as long; style very slender

2. *Wightiana*.

Leaves from nodes throughout the stem; spikelets paniculate or corymbose:—

Stems robust, sharply triangular, 2–5 ft. high; leaves up to 2 ft. long, .5–1 in. wide, acuminate, margins and midrib below scabrid; spikelets narrowly subulate, .2–.5 in. long, numerous in corymbose panicles up to a foot long; bracts like the leaves, often longer than the inflorescence; glumes 6–7, pale-brown, keeled, floral ovate, concave, mucronate or cuspidate, up to .28 in. long; bristles 6, sometimes fewer, about as long as the nut; nut obovoid, truncate, thick, sessile, without the beak about .13 in. long, greyish-brown, the sides somewhat undulate or excavate; faces flattish, punctate, beak elongate-conical from a base as broad as the nut, and as long as or longer than it, up to .25 in. long, acuminate, the faces channelled; style very shortly 2-fid.....3. *corymbosa*.

Stems slender, nearly terete; up to 2 ft. high; leaves very narrow; style-branches long; nut turgidly biconvex:—

Leaves setaceous, 4–12 in. long, smooth; bracts usually very short; spikelets few in lax panicles, solitary on long capillary pedicels, linear-lanceolate, .2–.3 in. long, often bearing 2 nuts; glumes ovate-oblong, .12–.19 in. long, mucous or mucronate, brown with darker dots; bristles 0; nut quadrately obovoid-globose, .07 in. long including the short, broad, basally emarginate beak, ashy, faces with 4–5 strong transverse wavy ridges.....4. *gracillima*.

Leaves flat, sometimes channelled, midrib strong, margins often scaberulous, 3–20 in. long, up to .15 in. wide; bracts usually shorter than the panicles; spikelets few in terminal or corymbose panicles, shortly pedicelled or somewhat clustered, ellipsoid, .15 in. long, often bearing 3 nuts with an empty glume between the 2 upper ones; glumes rotund-ovate, keeled, cuspidate, fuscous-brown, the floral .14–.18 in. long; bristles 5–6, about as long as the nut, not overtopping the beak, ascendingly hispidulous; nut broadly obovate or suborbicular, truncate, .1–.12 in. long including the triangular beak, brown with darker dots in wavy transverse lines or concolorous and faintly transversely undulate-lineate; basal margins of the beak truncate or with a short rounded projection

5. *glauca*.

1. *RYNCHOSPORA WALLICHIANA*, Kunth; F. B. I. vi. 668.
Travancore, in backwaters at Ambalapuzha (K. Rangachari).
2. *RYNCHOSPORA WIGHTIANA*, Steud; F. B. I. vi. 669.
Mysore and W. Coast; sea-level to 3,000 ft.
3. *RYNCHOSPORA CORYMBOSA*, Dom. *R. aurea*, Vahl; F. B. I. vi. 670.
W. Coast and hills; Kollimalai and Sirumalai Hills; sea-level to 2,000 ft. in marshes.
4. *RYNCHOSPORA GRACILLIMA*, C. B. Clarke; F. B. I. vi. 671.
Tinnevely Hills (Beddome).
5. *RYNCHOSPORA GLAUCA*, Vahl; F. B. I. vi. 671.
Nilgiri, Anamalai (Beddome), Pulney and High Wavy (Blatter and Hallberg) Mountains; 5,500—7,500 ft.

14. *Remirea*, Aublet.

Creeping, branched, rigid, glabrous, perennial herbs; rhizome long. *Stems* erect, short, leafy throughout. *Spikelets* in a crowded terminal, solitary or digitate head, 1-flowered. *Glumes* 4, laxly imbricate on all sides, 3 lowest empty, increasing in size upwards, 4th containing a pseudo-terminal bisexual flower. *Hypogynous bristles* 0. *Stamens* 3. *Style* not dilated at the base; stigmas 3, linear. *Nut* linear-oblong or ellipsoid, trigonous, smooth, closely embraced by the floral and the 3rd glumes.

REMIREA MARITIMA, Aubl.; F. B. I. vi. 677.

S. Kanara and Malabar Districts, on the coastal sands.

Rhizome sometimes several feet long, rooting at the nodes and producing erect stems up to 6 in. high; leaves closely spirally imbricate, rigid, linear, channelled, 1—3 in. long, apex triquetrous, pungent; bracts 2—6, like the leaves; spikes ellipsoid, .25—5 in. long; spikelets ellipsoid, .16 in. long; glumes brown, 3 empty coriaceous, ovate, ribbed, floral oblong, very thick, corky, .125 in. long, with a deep groove in which the nut lies; nut linear-oblong, often curved, very shortly beaked, .1 in. long, black, minutely punctate.

15. *Hypolytrum*, L. C. Rich.

Robust, perennial herbs; rootstock woody, stolons long, hardening into rhizomes. *Stems* erect, trigonous, leafy to above the middle. *Leaves* grass-like, linear-ensiform, 3-ribbed. *Bract* long or short. *Spikes* in subumbellate panicles with spreading branches or contracted into a lobed head, ellipsoid or subglobose. *Spikelets* imbricate all round the rachis, 3-flowered, the 2 basal ♂ with each a single stamen and a terminal naked ♀ flower between. *Glumes* 3—7, basal empty, next 2 opposite, membranous or hyaline, each containing a solitary stamen, 0—4 empty glumes intercalated between the ♂ and ♀ flowers. *Bristles* 0. *Style* continuous with the ovary, persistent; stigmas 2, long. *Nut* ovoid or fusiform, turgidly biconvex, often nearly terete, bony, with a more or less conspicuous beak, smooth or rugose.

HYPOLYTRUM LATIFOLIUM, L. C. Rich.; F. B. I. vi. 678. *H. Wightianum*, Boeck.; F. B. I. vi. 678.

W. Coast and Ghâts; 500—3,000 ft.

Stem 2—3 ft. high, trigonous; leaves sometimes longer, acuminate, base narrowed, .5—8 in. wide, margins and midrib below spinulose, especially near the apex; bracts like the leaves, up to 17 in. long; spikes sessile or pedunculate in compound corymbose or contracted panicles, oblong-cylindric in flower, subglobose and lobed in fruit, .2—2.5 in. long; empty glume brown with darker dots, oblong or obovate, rounded or subacute, .07—1.2 in. long, slightly concave, keeled, rigid, ♂ glumes complicate, narrowly boat-shaped or oblanceolate, acute or subacute, .05—1.2 in. long, membranous or hyaline, keel brownish and more or less ciliate, appressed to the ripe nut; intercalated glumes 0; nut either fusiform and acuminate, or broadly ovoid, acute or cuspidate, base narrowed or rounded, turgidly biconvex or nearly terete, .1—1.4 in. long, including the inconspicuous or large and patent sometimes swollen beak which is often longer than the nut itself and as broad or broader, often pale and speckled with brown; nut brown, smooth or rugose, sometimes empty.

16. *Lepironia*, L. C. Rich.

Erect, leafless herb; rhizome horizontal, woody, clothed in scales. *Stems* tufted, terete, transversely septate, septae visible from without when dry, sheathed at the base. *Spike* solitary, lateral near the apex of the stem, sessile. *Bracts* 0. *Spikelets* imbricate all round, 4—10-flowered, 2 basal and 2—8 above ♂ with a single stamen, the terminal a naked ♀. *Glumes* 9—25, lowest empty, rigid, concave, containing the rest, next two opposite, complicate, boat-shaped, each with 1 stamen, 6—21 following with a single stamen or empty, a few narrowly boat-shaped, the others flat, at least 3 or 4 below the terminal empty. *Style* long, continuous with the beak of the ovary; stigmas 3. *Nut* large, bony, broadly ellipsoid, much compressed, ribbed or smooth.

LEPIRONIA ARTICULATA, Dom. *L. mucronata*, L. C. Rich.; F. B. I. vi. 684.

Vicinity of Tranquebar (Koenig). Perhaps only cultivated or a casual escape. Used in Java for mat-making.

Stems up to 36 in. high and .15 in. diam.; sheaths 2—3, striate, up to 8 in. long, mouth oblique, acute; spike ellipsoid, acute, up to .8 in. long, arising .75—2 in. below the finely acuminate tip of the stem; spikelets numerous; rhachilla stout, persistent, lobed by the lenticular scars of fallen spikelets; lowest glume suborbicular, obtuse, .2—2.5 in. long, brown with darker streaks, margins very narrowly hyaline, next two glumes opposite, complicate, narrowly boat-shaped, about .2 in. long, hyaline, keel curved, brown and ciliate, containing a single stamen, the next 6—21 more or less whorled, very narrowly boat-shaped or flat, acute, about .19 in. long, usually hyaline with brown midrib, about 5 containing a single stamen, the rest empty; staminal filaments long, flat; anthers linear about .08 in. long with a sub-

late dark beak $\frac{1}{4}$ as long; nut obovoid, biconvex with one side more turgid than the other, .15—.16 in. long, beak narrow, truncate, brown, smooth or more or less ribbed.

17. *Scleria*, Berg.

Erect herbs with fibrous roots or woody rhizomes. *Stems* usually triquetrous, leafy throughout. *Inflorescence* of copious or restricted panicles or reduced to apparently simple spikes. *Bracts* leaf-like, often setaceous-caudate; bracteoles usually filiform. *Spikelets* fasciated or solitary, androgynous or unisexual, narrow in flower, the ♀ usually shorter and broader. *Glumes* many, imbricate all round; in ♂ or ♀ spikelets 1—4 lowest subdistichous, empty, the next empty or containing a ♀ flower, the following several narrower, not keeled, convolute, containing linear hyaline scales and 1—3 stamens, uppermost tabescent; in ♀ spikelets 2—3 lower glumes empty, the next containing a ♀ flower, the upper glumes empty. *Anthers* often cuspidate. *Disc* below the ovary annular, rarely obscure or 0, often enlarged and cupular or 3—6-lobed. *Style* slender; stigmas 3. *Nut* ovoid, oblong or globose, often obtusely trigonous, very often white and polished like marble, smooth or variously sculptured.

Annuals, rhizome 0 or very small:—

Panicle sparingly branched, glabrous; disc 3-lobed, lobes small, oblong or subquadrate, truncate, rounded or acute; nut subglobose or globose-oblong, often minutely apiculate, .1—12 in. long, white or pale-grey, tessellately longitudinally reticulate. Stems rather slender, 3—36 in. high; leaves up to 12 in. long and .2 in. wide; spikelets few, clustered, .2—25 in. long.....1. *tessellata*. Spikelets few, .2—26 in. long, clustered in a single terminal, peduncled head, peduncle and head hairy; disc small, reflexed, entire or nearly so; nut globose above a rather stout, 6-ribbed, glabrous base, .06 in. diam., whitish or pale-brown, covered with white-pubescent tubercles. Stems slender, 4—12 in. high; leaves as long or shorter, very narrow; glumes setose, villous, more or less cuspidate

2. *Neesii*.

Perennials with woody rhizome:—

Disc 0:—

Leaves .1 in. wide or less, as long as or shorter than the stem; sheaths hairy at least at the mouth. Rootstock hard, elongate, nodular; stems slender, up to 3 ft. high; bracts and bracteoles long, almost capillary; spikelets in small clusters on a filiform rhachis, .16 in. long; nut broadly ellipsoid, obtusely trigonous, .1 in. long, smooth (wrinkled in var. *Roxburghii*), white polished

3. *lithosperma*.

Leaves .5—1 in. wide, up to 3 ft. long; sheaths glabrous. Rootstock stout; stems robust, sharply trigonous, up to 8 ft. high; panicles large, branches trigonous, spreading; bracts like the leaves, bracteoles long, filiform from a dilated base; spikelets very many, clustered, .2 in. long; nut ellipsoid-ovate above a bluntly triangular base, acute, subacute or cuspidate, .12—.16 in. long, white, smooth, polished.....4. *corymbosa*.

Disc developed:—

Disc 3-lobed:—

Nuts smooth:—

Panicles with many capillary bracteoles; lobes of disc triangular, acute, $\frac{1}{4}$ —1 as long as the nut; nut globose or broadly ovoid, .1—12 in. long, white or brownish, minutely puberulous, smooth, polished, sometimes faintly transversely lineolate. Rootstock nodular; stems trigonous, up to 3 ft. high; leaves up to 20 in. long and .3 in. wide; sheaths often winged, mouth with a short, rounded, scarious, usually hairy ligule; panicles small, slender; spikelets solitary or clustered, .15 in. long.....5. *hebecarpa*.

Panicles with few or no capillary bracteoles; nuts glabrous:—

- Disc-lobes small, obtuse; nut nearly globose, apex slightly raised, .14 in. long, white, smooth, polished. Rootstock stout, stoloniferous; stems up to 3 ft. high, trigonous; leaves up to 4 ft. long, .5—1 in. wide; sheaths triquetrous, mouth truncate and with a narrow membrane; spikelets sessile, solitary, distantly spicate on the slender, angled, flexuose branches of a terminal, long-peduncled panicle, .15—16 in. long.....6. *poaeformis*. Disc-lobes broadly ovate or suborbicular, rounded, acute or acuminate; nut oblatly spherical, .1 in. long, .12 in. wide, white, smooth, polished. Stems up to 4 ft. high, rather stout, sharply trigonous; leaves up to 2 ft. long and .4 in. wide; sheaths trigonous, mouth truncate or with a very short, arched ligule; spikelets numerous, sessile or pedunculate, subsolitary on the stiff, straight, angled branches of terminal and axillary oblong panicles, .14 in. long.....7. *laevis*. Nuts reticulate, globose or broadly ellipsoid, obtuse or apiculate, .1—1.5 in. long, white, pale-brown or dark-, sometimes purplish-brown; disc-lobes short, rounded. Stems stout, sharply trigonous, angles scabrid, up to 6 ft. high; leaves up to 2 ft. long and .66 in. wide; sheaths sharply trigonous, those of the midstem often winged, mouth with a short, rounded, coriaceous ligule; spikelets sessile or peduncled, subsolitary in large, long-peduncled, decom-pound panicles, .14 in. long.....8. *cochinchinensis*. Disc cupular, crenate, $\frac{1}{2}$ — $\frac{3}{4}$ as long as the nut. Stem stout, trigonous, angles smooth or scaberulous, up to 8 ft. high; leaves up to 2 ft. long and .75 in. wide; sheaths not winged, mouth truncate; spikelets numerous, sessile or shortly peduncled, solitary on the branches of terminal and axillary oblong panicles, .17 in. long; bracteoles filiform; nut globose, .09—12 in. in diam., brown, closely, rugosely pitted.....9. *sumatrensis*.

1. *SCLERIA TESSELLATA*, Willd.; F. B. I. vi. 686.
Tada, Nellore District (Bourne); Mysore at 3,000 ft. (Meebold); Nilgiri Hills at Kaity (Hohenacker). In swampy situations.
2. *SCLERIA NEESII*, Kunth; F. B. I. vi. 688.
Yeddigarra, Malabar District.
3. *SCLERIA LITHOSPERMA*, Sw.; F. B. I. vi. 685.
In all Districts; sea-level to 4,000 ft.
Var. *Roxburghii*, Thw.; F. B. I. vi. 686. Rather larger; nut transversely wrinkled with ferruginous glands.
Ganjam and N. Coimbatore Districts (Fischer); Pulney Hills (Bourne); Travancore; Tinnevely District.
4. *SCLERIA CORYMBOSA*, Roxb.; F. B. I. vi. 686.
Rampa District at 2,000 ft. (Narayanswami); Godavary, Chingleput and Malabar Districts; Travancore.
5. *SCLERIA HEBECARPA*, Nees; F. B. I. vi. 689.
Rampa Hills at 2,500 ft. (Ramaswami, Narayanswami); W. Coast from sea-level to 2,500 ft.
Var. *pubescens*, C. B. Clarke; F. B. I. vi. 689. Leaves softly villous on both faces.
Travancore (Narayanswami).
6. *SCLERIA POAEFORMIS*, Retz. *S. oryzoides*, Presl.; F. B. I. vi. 691.
Without precise locality (Rottler Collection).
7. *SCLERIA LAEVIS*, Retz.; F. B. I. vi. 694.
Travancore at Karippanthode (Rama Rao).
8. *SCLERIA COCHINCHINENSIS*, Druce. *S. elata*, Thw.; F. B. I. vi. 690.
S. melanostoma, Boeck.; F. B. I. vi. 692.
Mahendragiri in the Ganjam District at 4,300 ft. (Fischer and Gage); Cuddapah forests (Beddome); Gersoppa Falls (Meebold);

Bababudan, Nilgiri, Anamalai, Shevaroy, Pulney, Travancore and Tinnevely Hills; 2,000—7,000 ft.

9. *SCLERIA SUMATRENSIS*, Retz.; F. B. I. vi. 693.
Travancore.

18. *Diplacrum*, R. Brown.

Small, tufted, glabrous, annual herbs. *Stems* leafy throughout. *Spikelets* very small in small, dense terminal and axillary clusters at the mouth of the leaf-sheaths, 1-sexual; ♂ 3—4 at the base, 1—2-flowered with about 3 glumes, stamens 1—2; ♀ terminal, 1-flowered with 2 opposite glumes. *Style* slender; stigmas 3. *Nut* globose or nearly so.

DIPLACRUM CARICINUM, R. Br. *Scleria caricina*, Benth.; F. B. I. vi. 688.

Kambakkam Hills in Chingleput District (Bourne); Mysore at 3,500 ft. (Meebold); S. Kanara and Malabar Districts; Quilon (Wight); near sea-level to 2,500 ft.

Stems slender, 1—14 in. high, clothed with the leaf-sheaths; leaves linear, flat, 5—3 in. long; bracts short, lanceolate, margins minutely scabrid; clusters of spikelets small; spikelets minute, ♂ 3—5 at the base, .05—06 in. long, glumes 3—4, membranous or hyaline, brownish, ♀ narrowly ovate, glumes 2 slightly united at the base and falling with the nut from the minute knobbed pedicel, coriaceous, ribbed, .07 in. long, 3-cuspidate, lobes acuminate, midlobe longest, lateral lobes and part of the margins sometimes hyaline; nut nearly globose, minutely apiculate, .05 in. long, whitish or pale-brown, strongly 15-ribbed, the ribs sometimes anastomosing.

19. *Ascopholis*, Fischer.

Erect, glabrous herbs; roots fibrous. *Stem* solitary, swollen at the base and clothed in fleshy scales, leafy near the base only. *Spikes* sessile, 3-several aggregated in a globose terminal bracteate head. *Spikelets* spirally imbricate, 1-flowered. *Rhachilla* disarticulating above the 2 empty glumes, leaving a knob. *Glumes* 2, opposite, lower empty, upper spatuliform containing a single hermaphrodite flower enclosed in a longer utricular scale which is split down one side about half-way. *Bristle* 0 or 1. *Stamens* 3. *Style* continuous with the ovary, base not enlarged; stigmas 2—3, filiform. *Nut* enclosed in the scale, oblong, sessile, plano-convex or subtrigonus.

ASCOPHOLIS GAMBLEI, Fischer in Kew Bull. 1931, 105.

Ootacamund at 7,000 ft. (Gamble).

Stem striate, 1.5—4 in. high; leaves shorter or longer, filiform or very narrowly linear; spikes oblong, about .4 in. long; bracts 4, linear from a broad base, .4—2.8 in. long; spikelets linear; glumes hyaline and brown-dotted, veined, .1—12 in. long; scale pale-brown often with darker dots, .14—15 in. long; bristle 0 or 1, capillary, white, much shorter than the ovary; nut narrowly oblong, plano-convex or subtrigonus, dark-brown, .1 in. long.

20. *Carex*, Linn.

Herbs, usually erect, with a perennial rhizome. *Stems* leafy mainly at the base. *Leaves* grass-like, the 2—3 lowest usually reduced to sheaths. *Inflorescence* of simple or paniced spikes, rarely reduced to 1 spikelet; flowers unisexual. *Spikelets* usually solitary, rarely all clustered, androgynous or unisexual, rarely dioecious; androgynous spikelets usually with the ♀ flowers below and few to many ♂ above; when unisexual usually 1—few terminal spikelets are ♂ with more numerous ♀ below; sometimes unisexual and androgynous spikelets occur on the same plant. *Glumes* usually numerous, imbricate all round the rachilla, persistent, 1—flowered or empty. *Stamens* 2—3. *Ovary* and nut completely enclosed in an entire or more or less deeply 2-toothed utricle; style slender, sometimes dilated at the base; stigmas 2—3, exserted from the utricle. *Nut* lenticular or trigonous.

Inflorescence spicate (sometimes a little paniculate at the base in 6. *longicruris*):—
Spikelet single, terminal, linear-oblong, .5—57 in. long, 5—6-flowered. Stems 2—3 in. high, base slightly swollen and enclosed in sheaths; leaves shorter, .12 in. wide; glumes broadly oblong, pale-ferruginous, obtuse, margins hyaline, two only with ♀ flowers; stigmas 3.....1. *Christii*.
Spikelets several:—

Spikelets androgynous, ovoid or oblong, more or less crowded in a compound spike; stigmas 2:—

Spike not or hardly interrupted, .5—1.1 in. long, ovate or oblong; bracteoles 1—3, elongate, filiform, up to 6 in. long, rarely all very short. Stem slender, 3—25 in. high; leaves usually shorter, sometimes longer, very narrow, canaliculate or margins involute; spikelets 8—14 in the spike, sometimes more, ovoid, .2—3 in. long; glumes ovate, cuspidate or awned, .15 in. long, pale-brown or ferruginous; utricle .17—2 in. long, lanceolate or ovate-lanceolate below, narrowed into a slender 2-fid beak, margins scaberulous.....2. *nubigena*.
Spike interrupted in the lower part, .9—4 in. long, linear; bracteoles very short, rarely one of them up to 2 in. long, filiform. Stems slender, 4—36 in. high; leaves usually shorter, rarely longer, flat, up to .25 in. wide; spikelets 6—14 or more, distant below, crowded towards the apex, narrowly or broadly ovate, .2—5 in. long; glumes ovate, acuminate, more or less aristate, .1—1.2 in. long, pale-brown; utricle .15 in. long, ovate or ovate-lanceolate below, narrowed into a slender 2-fid beak, margins scaberulous.....3. *foliosa*.

Spikelets linear or cylindric, often elongate, solitary or clustered:—

Utricles distinctly beaked:—

Utricles not tomentose:—

Stigmas 2; spikes androgynous, ♂ portion apical, short:—

♀ glumes ovate or ovate-lanceolate, glabrous, .21—26 in. long including an arista usually nearly as long as the blade, pale straw-coloured, keel and arista green. Stems slender, up to 38 in. high; leaves shorter or longer, 1—2 short ones from mid stem, flat, .1—25 in. wide; bracts very narrow, up to 9 in. long; spikelets solitary, 3—12, distant, on rather long slender peduncles, linear, .5—3 in. long; utricles .2—29 in. long, ellipsoid or ovate below, narrowed into a slender 2-fid beak minutely scabrid on the margins, many-ribbed, glabrous, straw-coloured or green 4. *longipes* var. *dissitiflora*.

♀ glumes not aristate, rarely cuspidate:—

Utricle .15—18 in. long, elliptic below, narrowed into a slender 2-fid beak, base narrowed, dark-brown or cinnamon-coloured, many-ribbed, hispid. Stems slender, up to 42 in. high; leaves usually shorter, .1—2 in. wide; bracteoles very slender, up to 2 in. long; spikelets 4—12, linear, sessile or shortly peduncled, .3—1.25 in. long; ♀ glumes oblong-ovate to lanceolate, obtuse, subacute or acuminate, brown, .1—16 in. long.....5. *brunnea*.

Utricle .13—17 in. long, elliptic-lanceolate below, narrowed into a

slender 2-fid beak scaberulous on the margins, base stipitate, pale-brown, many-ribbed, glabrous. Stems slender, up to 30 in. high; leaves shorter, .1 in. wide; bracteoles filiform up to 1.5 in. long; spikelets numerous, sometimes more or less panicle below, linear, .3—1 in. long; ♀ glumes ovate or oblong-lanceolate, obtuse or acuminate, rarely shortly cuspidate, reddish-brown, .09—16 in. long.

6. *longicruris*.

Stigmas 3:—

♀ glumes aristate or cuspidate:—

Spikelets androgynous:—

Spikelets ovate or ellipsoid, .25—4 in. long, few-flowered, clustered in a few distant short ovoid spikes. Stems slender, up to 3 ft. high; leaves shorter or longer, up to .15 in. wide; bracts longer than the inflorescence; ♀ glumes ovate or ovate-lanceolate, .17—19 in. long, including an arista often nearly as long as the blade, glabrous, striate, very pale-brown, margins often narrowly hyaline; utricles .2—26 in. long, broadly ovate below, narrowed into a 2-toothed beak nearly as long, many-nerved, very pale-brown

7. *leucantha*.

Spikelets numerous, narrowly linear, .7—2.5 in. long, many-flowered, pedicelled in distant clusters, ♂ often numerous. Stems rather stout, up to 3 ft. high; leaves about as long, .2—3 in. wide; bracts shorter than the inflorescence; ♀ glumes lanceolate or linear-oblong, .22—3 in. long including a distinct arista, bright chestnut or brown; utricles .2—24 in. long, narrowly fusiform below, narrowed into a slender 2-fid beak, few-ribbed, glabrous, beak and angles scabrid, olivaceous or ferruginous...8. *Walkeri*.

Spikelets unisexual, 3—5 close together on a radical scape, one terminal ♂, linear, lateral ♀ ovate or oblong:—

Utricles .09—1 in. long, obovate or broadly elliptic below, narrowed into a short, rather wide emarginate beak, many-ribbed, yellowish-green, pubescent, rarely glabrescent. Leaves longer than the peduncles, up to .08 in. wide; bracts longer than the inflorescence, upper filiform; peduncles 2.5 in. high; ♀ glumes obovate, .12—16 in. long including a long scabrid arista, pale straw-coloured, midrib green.....9. *breviculmis*.

Utricles .21—25 in. long, broadly elliptic below, gradually narrowed into a long, conical, deeply 2-fid beak, few to many-ribbed, pale-brown or olivaceous, glabrous. Leaves up to 20 in. long, .1—25 in. wide; bracts .5—1.7 in. long; peduncles slender, 4—11 in. high; ♀ glumes broadly ovate or ovate-lanceolate, .22 in. long including a long glabrous arista, pale-brown.....10. *Jackiana*.

♀ glumes broadly ovate or obovate, obtuse or subacute, .1—2 in. long, pale-brown or green, many-ribbed. Spikelets androgynous, linear, 1—2.5 in. long, ♂ portion apical slender, rather long, ♀ longer and wider, 1—3 on a radical slender scape up to 16 in. high; leaves longer, up to 25 in. long, .1—3 in. wide, flat above, often complicate below; utricles .16—24 in. long, ovate-elliptic and trigonous below, narrowed into a conical shortly 2-fid beak, the two interior margins narrowly winged and ciliate.....11. *speciosa*.

Utricles grey-tomentose, .16—17 in. long, ovate-elliptic below, narrowed into a slender or narrowly conical, deeply 2-fid beak nearly half as long, brown, not ribbed. Stems rather stout, trigonous, leafy to the top; leaves linear, up to 13 in. long, .25—4 in. wide, decreasing upwards into the bracts and downwards into reddish sheaths with or without a short blade, sheaths and upper surface and margins of blades scaberulous; spikelets unisexual, 4—9, solitary, distant, more or less peduncled, one terminal ♂, linear, .3—9 in. long, the rest ♀, cylindric, .4—1.7 in. long; ♀ glumes dense, ovate or oblong, .13—14 in. long, apex narrowed and obtuse with a short arista, ferruginous.....12. *hebecarpa*, var. *ligulata*.

Utricles not or very shortly beaked:—

♀ glumes with a long hispid awn, oblong or ovate, apex deeply emarginate, .1—14 in. long, including the awn, sides pale-brown, midrib and awn green.

Stems up to 40 in. long; leaves shorter or longer, up to 3 in. wide; bracts long, upper filiform; spikelets unisexual, 1 terminal ♂, rest ♀ with sometimes a few ♂ flowers at the tip, linear-cylindric, 1—3.6 in. long, solitary, pedicelled, often drooping; stigmas 2; utricles biconvex, ovate or trapezoid, acute, hardly beaked, usually very shortly stipitate, brown with pale angles, faces covered with white papillae which turn chocolate- or purplish-brown on drying.....13. *phacota*.

♀ glumes not awned:—

♂ spikelet 1, terminal, rest ♀; utricles longer than their glumes:—

Stigmas 2; utricles ovate, compressed, hardly beaked, mouth minutely emarginate, brown, 1 in. long, glabrous. Rhizome very small; stems slender, up to 15 in. high; leaves up to 4 in. long and 1 in. wide; bracts up to 4 in. long; spikelets 3—5, ♂ linear, 1—1.3 in. long, ♀ cylindric 1.6—1.6 in. long, sometimes with a few ♂ flowers at the apex; ♀ glumes oblong, rounded, sometimes apiculate, brown, midrib green, margins sometimes very narrowly hyaline, .08 in. long

14. *pseudo-aperta*.

Stigmas 3; utricles broadly ovoid, subtrigonal, not compressed, beak very short, mouth truncate, .09—1.1 in. long, dark cinnamomous- or purplish-brown when dry, papillose, faces strongly 3—5 nerved. Rhizome short, creeping; stems slender, up to 18 in. high; leaves shorter or longer, up to .35 in. wide; bracts up to 9 in. long; spikelets 3—5, ♂ linear, .5—1.4 in. long, ♀ sometimes with a few ♂ flowers at the apex, cylindric, .3—1.4 in. long; ♀ glumes ovate-oblong, obtuse, sometimes mucronulate, dark-brown, keel green, .06—0.08 in. long

15. *maculata*.

♂ spikelets 3, close together, terminal, linear, .4—7 in. long; ♀ several, distant on long, capillary peduncles, linear, 1—1.75 in. long. Stems slender, about 3 ft. high; bracts very narrow, not sheathing; ♀ glumes oblong, obtuse, .11—12 in. long, purplish-brown, midrib green, margins narrowly hyaline; stigmas 3, sometimes 2; utricles about equalling their glumes, elliptic below narrowed to the stipitate base and to a very short beak, dusky grey, 3—5-nerved, faces granulate.....16. *vicinalis*.

Inflorescence paniced; spikelets androgynous, ♂ portion apical:—

Spikelets 8 in. long or, usually, much less, ♂ portion very short; utricles narrow, beak long, slender:—

Partial panicles pyramidal, slender, expanded. Stems usually stout, up to 5 ft. high; leaves shorter or longer, up to .65 in. wide, widest in the middle, passing into the long sheathing bracts; bracteoles filiform; rhachis of inflorescence hispid; spikelets very numerous in decompound panicles, linear-oblong, .3—5 in. long; ♀ glumes ovate-lanceolate, acute or acuminate, .07—0.09 in. long, reddish-brown; utricles .12—1.6 in. long, narrowly ellipsoid or lanceolate below, narrowed into a very slender, long or short, usually bent beak with a rounded, rarely very shortly bifid mouth, olivaceous, ribbed.....17. *filicina*.

Partial panicles ovoid or oblong; mouth of utricles distinctly bifid:—

Rhachis of inflorescence glabrous, the angles more or less scabrid. Stem stout, up to 30 in. high; leaves often as long or longer, .2—5 in. wide; bracts narrow, up to 9 in. long; bracteoles few, very narrow, up to 3 in. long; spikelets suberect, narrowly linear when young, later oblong or ovate, .3—8 in. long; ♀ glumes ovate, .1—1.5 in. long including usually a short arista, straw-coloured or pale-brown; utricle .16—2.2 in. long, ellipsoid-trigonal below, narrowed into a long-straight beak, margins scabrous...18. *Wightiana*.

Rhachis of inflorescence more or less hairy or pubescent:—

Rhachis appressed pubescent; partial panicles usually contracted. Stems rather stout, up to 3 ft. high; leaves usually shorter, sometimes longer, up to .5 in. wide, minutely puberulous, upper sheaths puberulous at least at the mouth; bracts up to 8 in. long; bracteoles narrowly ensiform, scabrid-puberulous; spikelets crowded, oblong or linear-oblong, .3—4 in. long; ♀ glumes .1—1.8 in. long, lanceolate, usually scabrid-cuspidate or -aristate, reddish-brown, keel green; utricles .15—2.4 in. long, lanceolate or ellipsoid below, narrowed into a long slender beak with scabrid margins, obscurely ribbed.....19. *Lindleyana*.

Rhachis and peduncles shortly, rather densely, patent hairy; partial

panicles expanded. Stems rather stout, up to 30 in. high; leaves shorter, up to 3 in. wide, glabrous or minutely puberulous, uppermost sheaths sometimes puberulous at the mouth; bracts up to 8 in. long; bracteoles very slender, very short; spikelets usually at right angles to the rachis, oblong, 3—5 in. long; ♀ glumes narrowly ovate, .09—12 in. long, acute, cuspidate or rarely scabrid-aristate, ferruginous; utricles spreading, .19—23 in. long, ovate or elliptic below, narrowed into a slender beak nearly as long, several-ribbed, glabrous.....20. *raphidocarpa*.

Spikelets elongate, rarely less than 1 in. long; ♂ portion often as long as ♀:—

Utricles gibbous, broadly ovoid, obscurely trigonous, coriaceous, .16—18 in. long, beak short, 2-fid, strongly many-ribbed, brown to dark red-brown, glabrous or the beak slightly hispidulous. Stems robust, up to 5 ft. high; leaves often longer, up to 5 in. wide; bracts up to 12 in. long; spikelets linear, up to 2.5 in. long; ♀ glumes broadly ovate, .13—17 in. long, obtuse or acute, sometimes distinctly scabrous-aristate, ferruginous or brown, usually with a broad hyaline margin, ribbed.....21. *baccans*.

Utricles not gibbous, hardly trigonous, membranous, .14—18 in. long, elliptic below, narrowed into a moderately long, 2-fid beak, narrowed to the base, hardly ribbed, pale-brown or greenish, margins usually spinulose; ♀ glumes ovate, lanceolate, acute, usually scabrid-aristate, .15—19 in. long, pale-brown, not or hardly ribbed, margins seldom narrowly hyaline. Stems, leaves, bracts and spikelets as in the last species.....22. *myosurus*.

1. *CAREX CHRISTII*, Boeck.
Nilgiri Hills (*vide* Kükenthal).
2. *CAREX NUBIGENA*, D. Don; F. B. I. vi. 702.
Nilgiri, Anamalai (Beddome) and Pulney Hills; 6,000—8,000 ft.

ROYAL BOTANIC GARDENS, KEW ;
21st November, 1934.

FLORA OF MADRAS

Family CLXXVI. GRAMINEAE.

Erect, decumbent or creeping, sometimes floating herbs, or tall reeds, shrubs or trees or climbers; annual or perennial by means of rhizomes. Stems simple or more commonly branched from the base, generally terete and hollow between the nodes. *Leaves* alternate, commonly 2-ranked, nearly always with a sheathing base split down one side; ligule at the junction of the blade (or petiole) and the sheath consisting of a membrane or a fringe of hairs, rarely absent; blades usually long and narrow, rarely ovate parallel-nerved, sessile or sometimes petioled. *Inflorescence* terminal, rarely terminal and lateral, composed of paniced, racemose, simply or compoundly spicate, or capitate spikelets, rarely reduced to a single spikelet; rarely dioecious. *Flowers* solitary or 2—many aggregated in a spikelet. *Spikelets* homogeneous or differing in sex and shape; 1-sexual or 2-sexual with all the florets 2-sexual or 2-sexual with ♂ only or ♀ and ♂ in the same spikelet. The two, seldom more, lowest bracts of the spikelet (*glumes*), one sometimes absent, empty, the rest (*lemmas*) containing a naked floret or sometimes empty by reduction, usually with a smaller bract (*palea*) between the floret and the axis. Usually there are 2, rarely 3—several, hyaline, usually minute scales (*lodicules*) within the palea, representing the reduced perianth. *Stamens* 3, rarely 6, 4, 2 or 1, very rarely more than 6; filaments slender, often very long, free, rarely united; anthers versatile with 2 parallel cells. *Ovary* entire, 1-celled; styles 2, rarely 3 or 1, free or connate at the base, usually clothed above with simple or branched stigmatic hairs; ovule solitary, erect, anatropous. *Fruit* a grain, free within the lemma and palea or adnate to either or both. *Seed* erect, albumen copious, floury; embryo minute or large, at the base of and outside the albumen. Mature spikelets falling entire from the tips of their pedicels or together with the pedicel or a part of it or with a part of the rhachis, or else breaking up above the glumes into separate false fruits, rarely persistent and shedding the grain.

The genera are those adopted by Stapf in the 'Flora of Tropical Africa' wherever possible, and the key to the genera is based on that in the same work. For the necessary modifications much assistance was derived from Haines's 'Botany of Bihar and Orissa,' Cooke's 'Flora of the Bombay Presidency,' together with Blatter and McCann's revision thereof, and Melle. A. Camus's key in 'Flore générale de l'Indo-Chine.'

Mr. C. E. Hubbard, of Kew, has given much help and advice, but he is in no way responsible for the ultimate result.

The measurements given for culms exclude the inflorescence; those of the leaves refer to the blades only, and those of the glumes and lemmas exclude cusps, aristas or awns if present, unless otherwise stated.

Sexes in different inflorescences or if in the same then ♀ few at the base and ♂ above:—

Monoecious; leaves flat, not spiny; ♂ paniced or spicate:—

Sexes in separate inflorescences; ♂ in large panicles, ♀ spikes in an axillary sheath, fused together to form a spongy body.....1. *Zea*.

Sexes in the same inflorescence; ♂ in several pairs, ♀ solitary or few:—

♀ solitary within a closed, globose, stony bract.....2. *Coix*.

♀ 1—several, each embraced by the oblong, dorsally compressed, coriaceous lower glume which is open ventrally.....3. *Chionachne*.

Dioecious; leaves involute, rigid, spiny; inflorescence in globose heads

4. *Spinifex*.

Sexes mixed:—

Mature spikelets falling entire from or with their pedicels or with the contiguous joint of the rhachis, all alike or differing in sex and structure, perfect ones with 2 heteromorphous florets, lower ♂ or empty, upper bisexual:—(5—67).

Spikelets usually in pairs, one sessile, the other, rarely both, pedicelled, rarely 3-nate or solitary on the axes of variously arranged, often spiciform racemes; glumes firmer than the lemmas; lemmas membranous, often hyaline, the upper sometimes awned or reduced to an awn:—(5—44).

Joints and pedicels not bulbous, not adnate to one another, if thick then the spikes digitate or in spathaceous panicles:—(5—38).

All spikelets alike in shape and sex or if dissimilar then paleas very short or absent:—

Spikes in compound panicles or racemose on an elongate common axis; spikelets 1-flowered:—

Rhachis tough; all spikelets pedicelled:—

Panicle thyrsoid; callus long-silky-hairy; spikelets 2-nate, one long, one short-pedicelled:—

Panicle narrow-thyriform, silvery hairy; lemmas awnless

5. *Imperata*.

Panicle broadly fan-shaped, brownish-hairy; lemmas usually awned

6. *Miscanthus*.

Panicle narrow; spikelets solitary; glumes shortly brown-hairy

7. *Cleistachne*.

Rhachis readily disarticulating; spikelets 2-nate, one sessile, the other pedicelled:—

Spikelets awnless. Leaves not narrowed to the base, not petioled:—

Glumes membranous or chartaceous at the base only. Panicles wide, more or less silvery-plumose.....8. *Saccharum*.

Glumes chartaceous or coriaceous throughout. Panicles narrow, rufous-hairy, not plumose.....9. *Eriochrysis*.

Spikelets awned. Leaves narrowed at the base, often long petioled

10. *Spodiopogon*.

Spikes digitate or solitary; spikelets 1-flowered, or if 2-flowered then the lower glumes channelled:—

Rhachis inarticulate; spikelets not paired.....11. *Dimeria*.

Rhachis articulate:—

Spikes solitary, capillary; spikelets 2-awned.....12. *Pogonatherum*.

Spikes digitate; spikelets 1—2-awned:—

Rhachis fragile; pairs of spikelets always one sessile and one pedicelled; glumes $\cdot 1$ in. or more long; upper lemma much wider than its awn.....13. *Eulalia*.

Rhachis more or less persistent; pairs of spikelets often both pedicelled; glumes less than $\cdot 1$ in. long; upper glume hardly wider than its awn:—

Lower glume flat or depressed on the back, not channelled

14. *Pseudopogonatherum*.

Lower glume deeply channelled on the back.....15. *Microstegium*.

Sessile and pedicelled spikelets dissimilar, sessile bisexual, pedicelled ♂, empty or 0, or if similar (*Pollinidium*) then the paleas well-developed and the rhachis compressed:—

Fertile spikelets 2-flowered:—

Pedicelled spikelets present:—

Both spikelets awned; joints of rhachis and pedicels flattened or thickened; paleas well developed:—

Rootstock and base of culm clothed with woolly sheaths; rhachis flattened; spikelets all similar and homogamous...16. **Pollinidium**. Culm not woolly at base; joints and pedicels stout; spikelets heterogamous:—

Spikes clustered or digitate; lower glumes not channelled
17. **Ischaemum**.
Spikes solitary; lower glumes channelled on the back

18. **Sehima**.
Sessile spikelet awnless; lower glumes 3-toothed...19. **Lophopogon**.
Pedicelled spikelets suppressed, pedicels only present:—

Spikes usually 2; margins of glumes smooth...20. **Apocopis**.

Spikes solitary; margins of lower glumes spinulose- or bristle-pectinate...21. **Eremochloa**.

Fertile spikelets 1-flowered:—

Panicles not subtended by spathes:—

All pairs of spikelets alike:—

Upper lemma awned from the back below the middle; spikes digitate...22. **Arthraxon**.

Upper lemma awned from the tip or the sinus:—

Upper lemma reduced to the hyaline stipitiform base of the awn; joints and pedicels filiform with a translucent longitudinal depression:—

Racemes in compound panicles...23. **Capillipedium**.

Racemes subdigitate, fascicled or verticillate on an elongate axis...24. **Amphilophis**.

Upper lemma not reduced, 2-fid, awned from the sinus; joints and pedicels solid:—

Raceme of many pairs of spikelets:—

Primary branches of the panicle whorled; lower glumes coriaceous, muricate or tuberculate...25. **Vetiveria**.

Primary branches not whorled; lower glumes chartaceous, smooth...26. **Pseudosorghum**.

Raceme of few pairs of spikelets, rarely 6, sometimes reduced to 1 sessile and 2 pedicelled:—

Spikelets dorsally compressed; pedicelled spikelet sometimes reduced to a pedicel only; sessile spikelet awned or not
27. **Sorghum**.

Spikelets laterally compressed, raceme nearly always reduced to 1 sessile and 2 pedicelled spikelets on the tips of slender peduncles, all awned...28. **Chrysopogon**.

Lowest 1 or more pairs of spikelets homogeneous and differing from all above them:—

Spikes digitate, rarely solitary; sessile spikelets dorsally compressed; callus of lemma short...29. **Dichanthium**.

Spike solitary; sessile spikelets subcylindric; callus elongate, pungent...30. **Heteropogon**.

Panicles subtended by spathes; spikes usually 2, or 1, rarely more, on a common peduncle sheathed by a spatheole:—

Spikes reduced to 1 or a few nodes with or without a surrounding involucre of modified ♂ or empty spikelets:—

Involucre of modified spikelets present:—

Involucral spikelets persistent, the rest jointed on the rhachis and falling separately...31. **Themedia**.

Involucral spikelets jointed on the peduncle and falling together with the rest...32. **Iseilema**.

No involucre present:—

Callus of spikelet not inflated...33. **Pseudanthistiria**.

Callus much inflated...34. **Apluda**.

Spikes many-noded, not reduced nor involucred:—

Spikes solitary in each spatheole:—

Joints and pedicels slender...35. **Eremopogon**.

Joints and pedicels thickened upwards to a cupped apex, often with a dentate terminal appendage...36. **Schizachyrium**.

Spikes twin in each spatheole:—

All pairs of spikelets similar; racemes terminating the culms

Lowest pair of spikelets of one or both spikes homogeneous; 37. *Andropogon*.

lowest joint sometimes much thickened; plant often aromatic; panicles decompound.....38. *Cymbopogon*.

Joints of the rhachis and often the pedicels much swollen, sometimes joint and pedicel fused to form a cylindric axis in which the lower glume is sunk; pedicelled spikelet sometimes suppressed:—

Sessile and pedicelled spikelets very unlike, sessile, globose

39. *Hackelochloa*.

Spikelets more or less alike and compressed or the pedicelled suppressed:—

Spike readily disarticulating:—

Lower glumes convex; pedicelled spikelets suppressed; pedicels fused with the joints.....40. *Ophiuros*.

Lower glumes flat; ends of joints hollowed out:—

Pedicelled spikelets as large as or only slightly smaller than the sessile:—

Raceme terete; lower glumes of sessile spikelets not or very narrowly winged, awnless.....41. *Rottboellia*.

Raceme compressed; lower glume of sessile spikelets broadly winged or if only winged in upper half then 1—2-awned

42. *Manisuris*.

Pedicelled spikelets rudimentary; sessile spikelets deeply sunk in opposite cavities.....43. *Mnesithea*.

Spike with cohering joints with truncate tips, compressed

44. *Hemarthria*.

Spikelets in usually continuous spikes, racemes or panicles; glumes herbaceous or membranous, the lower generally smaller, sometimes minute or absent; lower lemma generally resembling the upper glume, the upper always fertile, ultimately rigid, chartaceous or crustaceous, muticous, mucronate or awned:—

Upper floret only fertile; lower lemma not hardened:— (45—66)

Inflorescence of usually slender, spiciform, digitate, subdigitate or distant, very rarely solitary racemes; fruiting lemma usually with flat thin margins with the usually minute lower palea attached to its base:—

Spikelets muticous; lower lemmas with 5—7 close, prominent nerves

45. *Digitaria*.

Spikelets awned or aristate; lower lemma smooth.....46. *Alloteropsis*.

Inflorescence usually different, various; fruiting lemma with more or less inrolled margins; lower palea not attached to the upper lemma:—

Spikelets falling entire and singly from the persistent pedicels, rarely falling with the contiguous joints of an articulate rhachis (51. *Stenotaphrum*):— (47—64)

Spikelets muticous, or if awned then subsessile in false second spikes with the awns from the entire or the very slightly notched tips of the upper glumes and the lower lemmas, or the tips of the lower or both glumes; fruiting lemmas crustaceous:— (47—63)

Inflorescence never an open or contracted-cylindric panicle:—

Back of fruit turned away from the axis:—

Spikelets strongly laterally compressed; lower glume herbaceous, as long as the spikelet.....47. *Pseudechinolaena*.

Spikelets more or less dorsally compressed; lower glume never herbaceous:—

Bases of spikelets with a swollen annular callus formed by the rudimentary lower glume and the base of the rhachilla

48. *Eriochloa*.

Bases of spikelets devoid of swollen callus, lower glume distinct

49. *Brachiaria*.

Back of fruit turned towards the axis:—

Lower glume absent or reduced to a scale; spikelets usually conspicuously plano-convex with the flat side turned away from the rhachis.....50. *Paspalum*.

Lower glume well developed:—

Rhachis flat, articulated; spikelets in cavities of the rhachis, ultimately falling with the contiguous joint

51. *Stenotaphrum*.

Rhachis not articulated; spikelets falling from their pedicels:—

Glumes muticous:—

Fruiting lemmas acute, not mucronate; spikelets solitary, their sides contiguous.....52. *Paspalidium*.

Fruiting lemmas obtuse, abruptly mucronate; spikelets paired or if solitary then their backs contiguous

53. *Urochloa*.

Glumes, at least the upper, caudate or awned:—

Leaves linear; glumes entire, the lower awnless

54. *Echinochloa*.

Leaves lanceolate; glumes slightly notched, the lower awned.....55. *Oplismenus*.

Inflorescence an open or a contracted, cylindric spiciform panicle:—

Spikelets not supported by bristle-like branchlets, rarely replaced by a minute bristle (57. *Holcolemma*):—

Spikelets not gibbous, or if slightly so then not in cylindric, spiciform racemes:—

Panicles open, or if contracted the branches spreading, not spiciform:—

Glumes similar, subequal, shorter than the spikelet:—

Rhachis branched, branches long; base of rather broad leaves rounded; glumes lanceolate, acuminate, prominently nerved; fruiting lemmas smooth.....56. *Ottochloa*.

Rhachis simple; base of very narrow leaves narrowed; glumes broadly ovate, subacute, not prominently nerved; fruiting lemmas finely transversely rugulose

57. *Holcolemma*.

Glumes dissimilar, the lower much the shorter, rarely absent

58. *Panicum*.

Panicles contracted, dense, branches appressed spiciform

59. *Hymenachne*.

Spikelets distinctly gibbous and oblique, or if only slightly so then in cylindric, spiciform racemes:—

Spikelets laterally much compressed.....60. *Cyrtococcum*.

Spikelets turgid, not compressed.....61. *Sacciolepis*.

Spikelets, at least the upper of each branch, supported by bristle-like branchlets:—

Terrestrial, erect; panicle contracted, usually spiciform; bristles many, not produced beyond the terminal spikelet

62. *Setaria*.

Aquatic, decumbent; panicle open; bristle solitary, much produced beyond the terminal spikelet.....63. *Pseudoraphis*.

Spikelets finely awned or mucronate from the sinus of the distinctly notched upper glumes and lower lemmas, the latter rarely muticous, delicately pedicelled, paniced; lower glume minute; fruiting lemma rigidly membranous.....64. *Rhynchelytrum*.

Spikelets involucrate with spines or bristles, falling in groups, seldom singly:—

Involucre of free, naked or feathery bristles.....65. *Pennisetum*.

Involucre of spines or rigid bristles united into a hard cup

66. *Cenchrus*.

Both florets fertile, or if the lower ♂ then its lemma hardened and more or less resembling the upper.....67. *Isachne*.

Mature spikelets breaking up, leaving the persistent or subpersistent glumes on the rhachis or pedicels, or if falling entire then not consisting of 2 heteromorphic florets:—

Blades of leaves not transversely veined or articulate on the sheaths, or if so (112. *Lophatherum*, 113. *Centothea*) not large woody shrubs or trees:— (68—126)

Awn of fertile floret if present kneed and twisted below the knee (rarely straight in reduced forms):—(68—85)

Spikelets 2—several-flowered:—

Florets 2 only, dissimilar; lower lemma awnless; awn of upper lemma, when present, from the entire tip:—

Tall reeds; leaves distichous; panicles large, decompound; spikelets very small, jointed on the pedicels; upper lemma awnless

68. *Thysanolaena*.

Small or moderate-sized plants; leaves not distichous; panicles small, not decompound; spikelets not jointed on the pedicels; upper lemma usually awned, sometimes also with 2 setae.....69. *Arundinella*.

Florets 2—several, all alike or the uppermost reduced; lemmas membranous, often with hyaline margins; awn, when present, from the back or the sinus or from between bristles:—

Small or moderate-sized plants; panicles not decompound; rhachilla rarely jointed between the lemmas:—

Florets 2—several; lemmas 2-cleft, usually awned from the back below the sinus:—

Perennials; spikelets moderate-sized, erect or suberect; glumes usually 1—3-nerved.....70. *Avenastrum*.

Annuals; spikelets large, pendulous; glumes 7—9-nerved

71. *Avena*.

Florets 2 only; lemmas entire:—

Weak marsh plants; glumes not keeled; rhachilla elongate between the lemmas; upper lemma the longer, coriaceous

72. *Coelachne*.

Rigid, erect, terrestrial plants; glumes keeled; rhachilla short between the equal, chartaceous lemmas.....73. *Zenkeria*.

Very tall reeds; panicles decompound; rhachilla jointed between the lemmas:—

Lemmas silky-hairy; rhachilla elongate, glabrous or short-hairy at the base:—

Lemmas hairy all over the back below the middle.....74. *Arundo*.

Lemmas hairy from the nerves on the sides only.....75. *Neyraudia*.

Lemmas glabrous; rhachilla short, long-hairy.....76. *Phragmites*.

Spikelets 1-flowered:—

Inflorescence paniced:—

Panicles dense, oblong-spiciform or lobulate.....77. *Polypogon*.

Panicles effuse or narrow, not dense or spiciform:—

Lemma cylindric, coriaceous, tightly enfolding the grain, awned, awns often 3.....78. *Aristida*.

Lemma lanceolate, membranous or cartilaginous, not enfolding the grain:—

Spikelets not jointed on the pedicels; awn, when present, from the back of the lemma.....79. *Agrostis*.

Spikelets jointed on the pedicels; usually awned from the tip of the lemma.....80. *Garnotia*.

Inflorescence spicate or racemose:—

Racemes 2—3, seldom solitary; rhachis broad, flat, disarticulating; spikelets mixed with rigid flowerless glumes.....81. *Trachys*.

Racemes solitary; rhachis narrow, not flat, not articulated; flowerless glumes absent:—

Upper glume 5-ribbed, armed with hooked spinules.....82. *Tragus*.

Glumes neither ribbed nor spinulose:—

Rhachis straight; spikelets spreading:—

Spikelets minute, shaped like a shoe or a bird's head, awnless

83. *Lopholepis*.

Spikelets larger, narrowly lanceolate; glumes tapering into a long fine awn.....84. *Perotis*.

Rhachis flexuous, forming recesses into which the spikelets are appressed.....85. *Zoysia*.

Awn of the fertile floret, when present, never kneed:—

Lemmas typically 3-nerved:—

Inflorescence panicle, or if spicate (some *Eragrostis*) then not secund:—

Spikelets 1-flowered, very small; glumes and lemmas very similar, awned.....86. **Sporobolus.**

Spikelets 2—many-flowered, or if only 1-flowered then glumes and lemmas dissimilar:—

Lemmas entire:—

Glumes rigid, coriaceous, awned.....87. **Myriostachya.**

Glumes membranous or cartilaginous, not awned, at most caudate-acuminate:—

Upper glumes 1-nerved:—

Spikes short, straight, crowded; spikelets closely packed.....88. **Desmostachya.**

Spikes slender, long, flexuous; spikelets distant.....89. **Leptochloa.**

Upper glumes 3—5-nerved:—

Lower glume 1-nerved, upper 3-nerved; lemmas moderately rigid; rachilla glabrous.....90. **Eragrostis.**

Lower glume 3-nerved, upper 5-nerved; lemmas coriaceous; rachilla joints bearded.....91. **Halopyrum.**

Lemmas emarginate:—

Spikelets laterally compressed, sessile or subsessile, few—many-flowered; rachilla not produced beyond the lemmas.....92. **Diplachne.**

Spikelets terete, pedicelled, 1-flowered; rachilla produced beyond the lemma into a filiform arista.....93. **Dichætaria.**

Inflorescence of sessile or subsessile spikelets in 2-ranked, secund, usually dense, solitary, digitate or racemose arranged spikes:—

Spike solitary, rarely twin:—

Spikelets more or less sunk in the rachis.....94. **Oropetium.**

Spikelets not sunk in the rachis:—

Spikelets awnless.....95. **Microchloa.**

Spikelets awned:—

Spikelets 1—2-flowered in pedicelled, articulate clusters; rachilla produced beyond the upper lemma.....96. **Melanocenchris.**

Spikelets 1—many-flowered, sessile, not in clusters:—

Spikelets 3—many-flowered; lower glume usually lodged in a furrow in the rachis; rachilla not produced beyond the terminal lemma.....97. **Tripogon.**

Spikelets 1—3-flowered; lower glume not lodged in the rachis; rachilla produced beyond the uppermost lemma.....98. **Enteropogon.**

Spikes digitate, umbelled or racemose, very rarely solitary or if so then lemmas obovate:—

Spikelets 1-flowered; spikes always digitate.....99. **Cynodon.**

Spikelets 2—several-flowered, sometimes only 1—2 fertile:—

Fertile florets 1—3 with 1 or more imperfect above or below; spikes umbelled or racemose, rarely solitary; lemmas awned or aristate.....100. **Chloris.**

Fertile florets 2—several, none imperfect:—

Spikes digitate or subdigitate or capitate, usually rigid; glumes shorter than lemmas:—

Spikes terminated by a spikelet; glumes and lemmas muticous or obscurely mucronate.....101. **Eleusine.**

Spikes terminating in a sharp point; upper glume and lemmas rigidly mucronate or cuspidate.....102. **Dactyloctenium.**

Spikes racemose, slender, spreading or deflexed; glumes much longer than the lemmas

Lemmas typically 5—many-nerved:—

[103. **Dinebra.**

- Lemmas broad, 4—9-lobed:—
 Inflorescence a contracted panicle; lemmas 9-nerved and -awned
 104. *Enneapogon*.
 Inflorescence a simple spike; lemmas spirally arranged in a cone,
 4-nerved, and lobed, 1—5-awned.....105 *Pommereuilla*.
 Lemmas entire or 2-, rarely 3-lobed:—
 Spikelets in compact, subcapitate or cylindric, often interrupted,
 spikes:—
 Leaves flat, neither distichous nor pungent, usually long; spikes
 cylindric, often interrupted.....106. *Elytrophorus*.
 Leaves convolute, distichous, rigid, pungent, 1—2 in. long; spikes
 capitate.....107. *Aeluropus*.
 Spikelets not compact, in spikes, racemes or panicles:—
 Inflorescence paniced:—
 Glumes absent, or minute or setaceous; fertile floret solitary:—
 Lower florets represented by 2 scales or bristles; glumes minute,
 scale-like or subulate.....108. *Oryza*.
 Lower florets suppressed; glumes 0 or reduced to a rim:—
 Glumes represented by an entire or 2-lobed rim; lemmas
 awnless.....109. *Leersia*.
 Glumes suppressed; lemmas awned.....110. *Hygrophiza*.
 Glumes, at least the upper, developed:—
 Two lower lemmas 2-lobed, awned from below the sinus
 111. *Anthoxanthum*.
 Lemmas entire:—
 Leaves flat, lanceolate, with numerous transverse venules:—
 Spikelets not compressed; fertile floret 1, with several closely
 sheathing, cuspidate empty lemmas above
 112. *Lophatherum*.
 Spikelets compressed; fertile florets 1—3, empty lemmas
 0—1-several, usually with erect or deflexed bulbous-based
 bristles; muticous.....113. *Centotheca*.
 Leaves usually narrow, no transverse venules:—
 Lower 1—3 lemmas bisexual, those above empty, enfolding
 each other to form a clavate or oblong terminal body
 114. *Melica*.
 Upper lemmas not in a terminal sterile body:—
 Glumes and lemmas muticous; spikelets laterally com-
 pressed:—
 Panicles expanded; glumes and lemmas subequal:—
 Spikelets ovate or triangular; pedicels capillary;
 glumes and lemmas broadly ovate, obtuse, not keeled
 115. *Briza*.
 Spikelets oblong; pedicels not capillary; glumes and
 lemmas ovate-lanceolate, acute, keeled.....116. *Poa*.
 Panicles narrow; spikelets elongate-oblong; glumes
 much shorter than the strongly nerved lemmas
 117. *Glyceria*.
 Glumes and lemmas caudate, aristate or awned:—
 Panicles contracted; spikelets in dense clusters;
 rhachilla short between the lemmas.....118. *Dactylis*.
 Panicles more or less expanded; spikelets not clustered;
 rhachilla elongate between the lemmas:—
 Lower glume much the shorter; lemmas subulate,
 not keeled.....119. *Vulpia*.
 Glumes subequal; lemmas oblong or lanceolate:—
 Lemmas rounded on the back or keeled only in
 the upper half, .25 in. or less long...120. *Festuca*.
 Lemmas sharply keeled throughout, .28 in. or more
 long.....121. *Bromus*.
 Inflorescence a simple spike or raceme:—
 Leaves narrowed into a petiole; lemmas convolute, acutely 2-fid
 122. *Streptogyne*.

Leaves not petioled; lemmas entire:—

Spikelets distant on the rhachis:—

Rhachis straight, not recessed; spikelets nearly terete, not distichous.....123. **Brachypodium.**

Rhachis flexuous, recessed; spikelets much compressed, distichous.....124. **Lolium.**

Spikelets aggregated into a dense oblong head:—

Spikelets solitary at the nodes, without involucre outer glumes.....125. **Triticum.**

Spikelets 3-nate at the nodes; outer glumes of each cluster together forming a quasi involucre.....126. **Hordeum.**

Blades of leaves usually transversely veined, articulate on their sheaths; large woody shrubs or trees with large culm-sheaths with an imperfect blade:—
Bamboos.

Paleas differing from the lemmas, 2-keeled, or if not keeled then the stamens monadelphous:—

Staminal filaments free:—

Stamens 3.....127. **Arundinaria.**

Stamens 6:—

Spikelets in globose congested heads.....128. **Dendrocalamus.**

Spikelets not in globose congested heads:—

Imperfect blade of culm-sheath broadly triangular, erect; paleas 5—7-nerved between the keels; pericarp thin, adnate to the seed
129. **Bambusa.**

Imperfect blade linear-ensiform, recurved; paleas 1-nerved between the keels; pericarp crustaceous, free from the seed

130. **Teinostachyum.**

Staminal filaments united into a tube; stamens 6.....131. **Oxytenanthera.**

Paleas 0 or resembling the lemmas, not keeled; stamens usually numerous; filaments free or united.....132. **Ochlandra.**

1. *Zea*, Linn.

Tall, stout, annual herbs. *Leaves* large, flat. *Inflorescence* monoeious; ♂ spikelets in large terminal subdigitate or racemose panicles of spiciform racemes; axes of ♀ spikes fused into a spongy, subcylindric core in axillary sheaths. ♂ spikelets 2-nate, one pedicelled, the other sessile, 2-flowered. *Glumes* subequal, membranous. *Lemmas* similar, hyaline, their paleas similar. *Lodicules* 2, fleshy. *Stamens* 3. ♀ spikelets 2-nate in 4—11 longitudinal rows, slightly immersed in the axis; florets 2, the lower reduced to an empty lemma. *Glumes* similar, very broad, fleshy below, hyaline above. *Lemmas* like the glumes; paleas short, broad, the lower sometimes wanting. *Lodicules* 0. *Styles* long, 2-fid at the tip, exserted in long silky tassels from the sheathing bracts. *Grain* subglobose, surrounded by the dried-up glumes, lemmas and paleas.

ZEAL MAYS, Linn.; *F. B. I.* vii. 102.

A S. American plant cultivated in many localities for its edible grain and its fodder leaves. Maize or Indian Corn.

Stems robust, up to 10 ft. or more high; leaves up to 3 ft. long and 4 in. wide; ♂ spikelets 25—35 in. long; styles several inches long. Vern. *Ur.* Mokka; *Tel.* Mokka jounalu; *Tam.* Makka cholam, Turaka cholam; *Mal.* Makka cholam; *Kan.* Makkai jola.

2. Coix, Linn.

Annual or perennial, tall, erect or floating plants. *Leaves* flat. *Inflorescence* of fasciated axillary and terminal spiciform racemes, consisting usually of one ♀ spikelet completely enclosed in a globose or ovoid basal bract through which the rhachis grows out and bears the ♂ spikelets above. *Bract* eventually stony and polished, sometimes continued into a leafy blade, rarely a second bract above. ♂ *spikelets* imbricate in pairs or threes, one of them pedicelled. *Glumes* subequal, herbaceous, the lower flat with 2 lateral winged keels, the upper boat-shaped with a median keel. *Florets* 2, both staminate or the upper empty. *Lemmas* similar, membranous, the upper shorter; *paleas* hyaline. *Lodicules* 2, cuneate, fleshy. *Stamens* 3. ♀ *spikelets* enclosed in the bract with 2 bare pedicels. *Glumes* hyaline-membranous and inflated below, contracted into an acute cartilaginous beak, the upper acutely keeled between 2 deep grooves. *Florets* 2, the lower usually reduced to an empty lemma resembling the lower glume, *upper lemma* resembling the upper glume, with a broad palea. *Lodicules* 0. *Stamens* 3, rudimentary. *Style* long, deeply 2-fid, exerted from the mouth of the sheathing bract. *Grain* subglobose or ellipsoid, enclosed in the bract; embryo as long.

Annual; culms up to 5 ft. high; leaves linear-lanceolate, 5—18 in. long, .5—2 in. wide, base cordate, rarely narrowed; peduncles up to 3 in. long; ♀ bract .3—5 in. long; ♂ racemes .4—2 in. long; spikelets 2—3-nate; wings of lower glume .03—0.7 in. wide.....1. *Lacryma-Jobi*.
 Perennial; culms up to 15 ft. high; leaves linear, 1—4 ft. long, .1—7 in. wide, base narrowed or slightly rounded, not cordate; peduncles up to 7 in. long; ♂ racemes .7—2.5 in. long; spikelets usually 3-nate; wings of lower glume .02—0.5 in. wide.....2. *gigantea*.

1. COIX LACRYMA-JOBI, Linn.; F. B. I. vii. 100; S. I. G. fig. 126.

In all Districts except the hottest and driest localities; from near sea-level to 7,000 ft. Job's tears.

Sometimes cultivated by hill tribes for the grain. The stony bracts are strung by the hillmen into necklaces and other ornaments. The leaves are readily eaten by cattle. Vern. *Hind*. Sankru; *Tam*. Kattu-kundamani.

2. COIX GIGANTEA, Roxb. *C. Lacryma-Jobi*, Linn. var. *gigantea*, Stapf; F. B. I. vii. 100.

In the same localities as the last species.

3. Chionachne, R. Br.

Annual or perennial erect herbs. *Leaves* flat, narrow. *Inflorescence* of spiciform racemes; racemes entirely ♂ or with 1 or more ♀ spikelets at the base, at first enclosed in spathiform bracts; rhachis articulate at the base and above each ♀ spikelet. ♂ *spikelet* 2-flowered, solitary or 2-nate and then one pedicelled. *Glumes* dissimilar, lower herbaceous, shallowly concave with a narrow membranous wing on each side, upper chartaceous or rarely herbaceous, narrower. *Lemmas* similar, membranous, paleate, both staminate or the upper empty. *Lodicules* 2, cuneate. *Stamens* 3. ♀ *spikelets* oblong, dorsally compressed, 2-flowered. *Glumes* very dissimilar; lower thickly coriaceous,

embracing but not concealing the rhachis between its inflexed margins, enclosing the upper glume and floret; upper membranous or chartaceous. *Lemmas* delicately hyaline; the lower empty, paleate or not; the upper narrow, its palea wrapped round the pistil. *Lodicules* 0. *Styles* very long. *Grain* orbicular, compressed, ventrally channelled, free inside the hardened lower glume.

Culms up to 2 ft. high; leaves up to 12 in. long, .1—25 in. wide; spathes always closed, 1—1.5 in. long, muticous or mucronate; racemes solitary; ♀ spikelets 2—5, .27—34 in. long; ♂ spikelets usually many; wings of lower glume glabrous, not ciliate.....1. *semiteres*.

Culms up to 8 ft. high; leaves up to 3 ft. long, .22—65 in. wide; spathes chaffy, at first plicate, soon opening out, .5—1 in. long with an arista .2—5 in. long; racemes umbelled; ♀ spikelets solitary, .19—3 in. long; ♂ spikelets usually few; wings of lower glumes more or less puberulous, ciliate.....2. *Koenigii*.

1. *CHIONACHNE SEMITERES*, C. E. C. Fischer n. comb. *Polytoca semiteres*, Benth. ex Hook. f.; F. B. I. vii. 101.

S. Arcot District (Barber); Tinnevely District at Palamcottah (Wight).

2. *CHIONACHNE KOENIGII*, Thw. *Polytoca barbata*, Stapf ex Hook. f.; F. B. I. vii. 102; S. I. G. fig. 127.

Northern Districts as far as S. Bellary and Cuddapah; Nilgiri, N. Coimbatore and Travancore Hills; 200—3,500 ft. Vern. *Kan. Suku dabha*.

4. *Spinifex*, Linn.

Gregarious, much-branched, woody shrubs. *Leaves* rigid, thickly coriaceous, involute, spreading and recurved. *Inflorescence* dioecious, in large, terminal, globose, bracteate heads with radiating spiciform racemes. *Spikelets* articulate on the short pedicels; ♂ several, distichous in each raceme, 2-flowered; ♀ solitary, 1-flowered. *Glumes* chartaceous, acute, subequal or the upper slightly longer. *Lemmas* subequal, paleate; in ♂ both staminate or the lower empty; in ♀ the lower empty, the upper fertile. *Lodicules* 2, large, connate below, strongly nerved. *Stamens* 3. *Styles* 2, long, united below. *Staminodes* sometimes present in ♀ floret. *Grain* clavate, tipped with rigid style-base, free within the hardened lemma and palea.

SPINIFEX LITTOREUS, Merr. *S. squarrosus*, Linn.; F. B. I. vii. 63; S. I. G. figs. 105, 106.

Sea-shore sands in all coastal districts.

Whole plant pale grey or glaucous; stems forming thickets; leaves channelled, up to 13 in. long; ♂ heads up to 6 in. diam., bracts and rhachises pungent, spikelets .36—4 in. long; ♀ heads up to 13 in. diam.; bracts pungent up to 8 in. long, spikelets hidden at the base of the bracts, up to .52 in. long.

A useful sand-binder. Vern. *Ur. Gudukanko*; *Tel. Ravani suruni misalu*; *Tam. Ravanan meesai*.

5. *Imperata*, Cyrill.

Erect, perennial herbs; culms leafy, solid. *Leaves* narrow. *Inflorescence* a terminal, spiciform or thyrsiform panicle. *Spikelets* all alike, generally 2-nate, one short-, the other long-pedicelled,

disarticulating from the pedicels; 2-flowered, the lower usually reduced to an empty lemma, rarely ♂. *Glumes* subequal, membranous, enveloped in long silky hairs from the obscure callus and from the lower half of the glume. *Lemmas* hyaline, mucous; the lower usually much smaller than the glumes; the upper still smaller, with a broad palea. *Lodicules* 0. *Stamens* 1—2. *Styles* 2, connate below. *Grain* oblong; embryo half as long or longer.

IMPERATA, CYLINDRICA, Beauv.

Var. *Koenigii*, Dur. et Schinz. *I. arundinacea*, Cyr.; F. B. I. vii. 106 in part.; S. I. G. fig. 128.

In all Districts, usually in wet situations; sea-level to 7,000 ft. Root-stock stoloniferous, often creeping; culms 1—4 ft. high; leaves 2—2·5 in. long, 1—6 in. wide; panicles 1—8·5 in. long, narrow, white-silky hairy. Cotton grass.

Eaten by cattle only when young and tender. Vern. *Hind.* Dabh.; *Tel.* Dharba, Modewa gaddi; *Tam.* Tharpai pullu, Dharbai pul; *Kan.* Sanna dabbai hullu.

6. *Miscanthus*, Anderss.

Tall, perennial herbs. *Leaves* flat, narrow, long. *Inflorescence* terminal, of numerous spiciform racemes crowded into a usually nodding, fan-shaped corymb; rhachis slender, not articulated. *Spikelets* in similar pairs at the nodes, one long- the other short-petioled, 1-flowered, the callus with long hairs forming a quasi involucre. *Glumes* chartaceous, subsimilar. *Lemmas* hyaline; the lower empty; the upper narrower, 2-toothed or 2-lobed, usually with an awn from the sinus; palea usually minute, containing a bisexual floret. *Lodicules* 2. *Stamens* 2—3. *Styles* 2, free. *Grain* oblong; embryo half as long.

MISCANTHUS NEPALENSIS, Hack.; F. B. I. vii. 107.

Nilgiris at Ootacamund; 7,500 ft. (Narayana and Raju, possibly introduced); without precise locality (Ramaswami). Culms up to 6 ft. high; leaves up to 18 in. long and 6 in. wide; corymbs up to 9 in. long; callus of spikelets very short, bearing numerous fine, brown hairs up to 34 in. long; glumes brown, 08—12; awns 14—42 in. long.

7. *Cleistachne*, Benth.

Annual or perennial erect herbs. *Leaves* flat, elongate. *Panicles* narrow. *Spikelets* solitary, all alike; pedicels slender with thickened tips. *Glumes* subequal and similar, more or less coriaceous. *Lemmas* hyaline; the lower empty, without palea; the upper shorter, entire or 2-toothed, with a stout geniculate awn; palea short, containing a bisexual floret. *Lodicules* 2, cuneate, ciliate. *Stamens* 3. *Styles* 2, free. *Grain* oblong to obovoid-oblong, free; embryo half as long.

CLEISTACHNE STOCKII, Hook. f.; F. B. I. vii. 162.

Bababudan Hills (Law); Travancore at Santhapara, 4,000 ft. (Meebold).

Culms up to 4 ft. high; leaves 10—16 in. long, 2—3 in. wide, more or less soft-hairy, margins spinulose; panicles 6—10 in.

long, rhachis and pedicels slender, rufous-hairy; glumes 15—18 in. long, dark-brown, rufous-hairy; awns 5—1 in. long.

8. *Saccharum*, Linn.

Erect, perennial, tall or very tall herbs; culms usually solid. *Leaves* narrow, flat, sometimes rolled up when dry. *Inflorescence* of large terminal panicles of racemes, often very silky and showy; rhachis articulate and fragile. *Spikelets* usually surrounded by long silky hairs from their bases, 2-nate, one pedicelled and falling from the pedicel, the other sessile and falling with the joints of the rhachis; florets 2. *Glumes* 2, equal, often subcoriaceous or chartaceous below, membranous to hyaline upwards. *Lemmas* hyaline; the lower empty; the upper sometimes awned, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free or shortly connate. *Grain* oblong to subglobose; embryo half as long or shorter.

Callus-hairs at least twice as long as the spikelets; glumes glabrous on the back; lemmas not cuspidate:—

Glumes uniform, whitish throughout, 12—15 in. long. Culms up to 20 ft. high; leaves up to 5 ft. long and 2 in. wide; panicles up to 3 ft. long, densely silvery.....1. *officinatum*.

Glumes coriaceous and brown below, subhyaline and white in the upper $\frac{2}{3}$, 14—17 in. long. Culms up to 15 ft. high; leaves 1—4 ft. long, 2—5 in. wide; panicles up to 2 ft. long, usually rather contracted, silvery.....2. *spontanum*.

Callus-hairs much shorter than the spikelets; glumes uniformly membranous, pale or brown with darker tips, white- or yellowish-villous on the lower $\frac{2}{3}$ of the back; lemmas cuspidate:—

Leaves up to 6 ft. long, 8—2 in. wide. Culms up to 20 ft. high; panicles effuse, white villous, up to 30 in. long; joints of rhachis 18—2 in. long, pedicels shorter, both white-villous; glumes 12 in. long, acute, white-villous except the glabrous upper one of the sessile spikelets.....3. *arundinaceum*.

Leaves up to 3.5 ft. long, 1—2.5 in. wide. Culms up to 10 ft. high; panicles rather contracted, yellowish-villous, up to 16 in. long; joints of rhachis and pedicels 1—12 in. long, yellowish-villous; glumes 15—19 in. long, acuminate, yellowish-villous.....4. *ciliare*.

1. *SACCHARUM OFFICINARUM*, Linn.; F. B. I. vii. 118.

Cultivated in most Districts. The Sugar-cane.

The sap is extracted from the culms by crushing and boiled down to sugar. The residue after crushing can be utilized for paper making and for cordage. The leaves are used as fodder. Vern. *Hind.* Ukh; *Ur.* Aku; *Tel.* Cheruku; *Tam.* Karumbu; *Mal.* Karimbu; *Kan.* Khabbu.

2. *SACCHARUM SPONTANEUM*, Linn.; F. B. I. vii. 118; S. I. G. fig. 129.

In all Districts, usually near water; sea-level to 5,000 ft.

A good fodder for buffaloes; the leaves are used for thatching. Vern. *Hind.* Kans; *Tel.* Rellu gaddi.

3. *SACCHARUM ARUNDINACEUM*, Retz.; F. B. I. vii. 119.

Tinnevely District and Travancore.

The culms are used for hut walls and for screens. Vern. *Tam.* Pi Karumbu; *Kan.* Hodakai hullu.

4. *SACCHARUM CILIARE*, Anderss. *S. arundinaceum* Retz.; F. B. I. vii. 119 in part.

Ganjam District.

9. *Eriochrysis*, Beauv.

Perennial herbs. *Leaves* mostly crowded at the base, very narrow. *Inflorescence* a contracted, hairy panicle of spiciform racemes; rhachis articulate, fragile. *Spikelets* 2-nate, one sessile, the other pedicelled, differing usually slightly in size and often in sex, the pedicelled falling from its pedicel, the sessile falling with the contiguous joint of the rhachis and the pedicel. *Florets* 2, the lower reduced to an empty lemma, the upper bisexual or sometimes in the pedicelled spikelet the stamens 0 or rudimentary. *Glumes* subequal, chartaceous or coriaceous. *Lemmas* hyaline, without paleas. *Lodicules* 2, minute. *Stamens* 3. *Styles* 2, free. *Grain* obovoid to ellipsoid-globose; embryo half as long.

ERIOCHRYSIS RANGACHARII, C. E. C. Fischer in Kew Bull. 1932, 246.

At Pykara, Nilgiri Hills; 6,000 ft. (K. Ranga Achari).

Culms wiry, 5–12 in. high; leaves very narrow, plicate or more or less expanded above with involute margins, basal up to 9 in. long and 2 in. wide, softly villous; racemes 3–4; spikelets narrowly lanceolate, 15–25 in. long, surrounded by long, dense, rufous hairs; glume-margins long rufous-ciliate; florets of both spikelets usually bisexual.

10. *Spodiopogon*, Trin.

Tall, usually perennial herbs. *Leaves* flat, often petioled. *Inflorescence* of paniced 2–3-nate spikelets; rhachis jointed. *Spikelets* usually one sessile and 1–2-pedicelled, 1–2-flowered, the lower ♂, or empty, the upper bisexual. *Glumes* subequal, membranous, sometimes aristate. *Lemmas* hyaline; lower plicate, paleate or not; upper deeply 2-fid or 2-partite with a long slender awn from the sinus, its palea short. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* free, narrowly fusiform.

SPODIOPOGON ALBIDUS, Benth.; F. B. I. vii. 108.

Mysore State; W. Coast and Ghâts; Ramandrug and Hospet in the Bellary District; up to 7,000 ft.

Culms tufted, much branched, straggling, up to 4 ft. high; leaves flaccid, acuminate, often aristate, 2–10 in. long, 4–14 in. wide, base narrowed into a petiole 4–3.5 in. long; panicle at first enclosed in a long spathaceous sheath; rhachis and pedicels more or less densely silky-hairy; glumes 22–27 in. long, sometimes aristate, more or less villous; lemmas 16–24 in. long; awns 5–8 in. long.

11. *Dimeria*, R. Br.

Slender, annular or perennial herbs. *Leaves* narrow. *Inflorescence* of terminal solitary, twin or fascicled slender spikes or, more usually, spiciform racemes; rhachis inarticulate, terete, angular or flat. *Spikelets* solitary, secund, bifarious, laterally strongly compressed, articulate on the rhachis or on a very short, rarely long, pedicel, 2-flowered. *Glumes* 2, rigid, coriaceous, chartaceous or membranous, keeled, often divaricate in flower, subequal or the upper larger, with usually hyaline margins and the keel sometimes winged. *Lemmas* shorter, hyaline; the

lower empty and without palea; the upper complicate, bifid with a slender long awn from the sinus, its palea small, containing a bisexual floret. *Lodicules* 0 or 2, minute, rarely well developed. *Stamens* 2 or 3. *Styles* 2, free. *Grain* linear, compressed, free within the lemmas.

Rhachis of raceme terete or angled; leaves sparingly ciliate; awns geniculate:—Internodes of rhachis less than half as long as the upper glume; glumes coriaceous, upper 2—3 in. long including an arista, winged all down the keel and ciliate. Culms 3—7 in. high; leaves 1—2 in. long; racemes solitary; callus .05 in. long.....1. *avenacea*.

Internodes more than half as long as the upper glume; glumes chartaceous, not winged; callus very short:—

Racemes 2, rarely 3 or 1, .9—1.6 in. long. Culms very slender, 5—8 in. high; leaves 1 in. long; glumes subequal, about .13 in. long; upper lemma .11 in. long; awn .28 in. long.....2. *Hohenackeri*.

Racemes 3—5 or more, 3—5 in. long. Culms 2—3 ft. high; leaves 2—6 in. long; lower glume .14—26 in. long, acuminate, upper .15—28 in. long; upper lemma .13—21 in. long; awn .3—45 in. long.....3. *gracilis*.

Rhachis of raceme flat, sometimes keeled on one face:—

Awns geniculate:—

Glumes not winged or upper sometimes narrowly so at apex only:—

Culms slender or very slender; leaves and sheaths glabrous or sparingly hairy, not villous, .1 in. wide; glumes membranous:—

Margins of rhachis ciliate. Culms 2—20 in. high; leaves 1—2 in. long; sparingly ciliate; racemes solitary or twin, .7—2.5 in. long; glumes ciliate, lower .1—17 in. long, upper .11—2 in. long, often narrowly winged at apex; upper lemma .07—0.9 in. long; awn .28—4 in. long.....4. *Thwaitesii*.

Margins of rhachis glabrous or asperulous; leaves more or less hairy; racemes 2- or 3-nate, .7—2 in. long; glumes not ciliate or the upper at the apex only:—

Rhachis .03 in. wide. Culms 2—10 in. high; leaves 1—3 in. long; lower glume .08—1 in. long, upper .1—2 in. long; upper lemma .07—0.8 in. long; awn .3—4 in. long.....5. *ornithopoda*.

Rhachis very slender. Culms 4—14 in. high; leaves 1—1.5 in. long; lower glume .06—0.7 in. long, upper .07—0.8 in. long; upper lemma .05—0.66 in. long; awn .23—3 in. long.....6. *tenera*.

Culms comparatively robust, up to 2 ft. high; leaves and sheaths usually densely villous, 3—6 in. long, .2 in. wide; racemes usually 2, 2.5—3.5 in. long; rhachis .03—0.5 in. wide, its margins villous; glumes chartaceous, villous, lower .15—1.8 in. long, upper .18—2 in. long, apex sometimes narrowly winged; upper lemma .1—1.4 in. long; awn .3—4 in. long.....7. *pubescens*.

Upper glume distinctly winged, wing corky:—

Racemes usually solitary, .7—1.3 in. long. Culms 2—8 in. high; leaves 1—2 in. long; margins of rhachis ciliate; lower glume .17 in. long, not winged, upper .18—22 in. long, keel narrowly winged throughout and ciliate; upper lemma .12—1.3 in. long; awn .36—45 in. long.....8. *Lawsoni*.

Racemes 2- or 3-nate, .5—1.2 in. long. Culms 7—14 in. high; leaves 2—3 in. long; rhachis glabrous; lower glume .12—1.6 in. long, its keel narrowly winged throughout, upper .13—1.7 in. long, its keel broadly winged and ciliate; upper lemma .1—1.5 in. long; awn .35—42 in. long.....9. *bialata*.

Awns not geniculate, .3—3.3 in. long. Culms 10—18 in. high; leaves 2—6.5 in. long, glabrous or nearly so; racemes 2- or 3-nate, 2—5 in. long; lower glume .1—1.2 in. long, obtuse, upper .13—1.5 in. long, ciliate, sometimes narrowly winged at apex; upper lemma .1—1.2 in. long.....10. *Lehmanni*.

1. DIMERIA AVENACEA, C. E. C. Fischer, n. comb. *D. pusilla*, Thw.; F. B. I. vii. 103.

Mahendragiri, Ganjam District (Fischer); Kambakkam, Nellore District (Bourne); Tranquebar (Koenig *fide* Retzius).

2. DIMERIA HOHENACKERI, Hochst.; F. B. I. vii. 103.

Mangalore (Hohenacker).

In rice fields.

3. *DIMERIA GRACILIS*, Nees; F. B. I. vii. 105.
S. Kanara District.
4. *DIMERIA THWAITESII*, Hack. *D. pusilla*, Thw. var. *pallida*, Thw.;
F. B. I. vii. 103.
W. Coast; Madras; Travancore; sea-level to 3,000 ft.
In rice fields.
5. *DIMERIA ORNITHOPODA*, Trin.; F. B. I. vii. 104 *in part*.
Mysore State, 2,000—3,000 ft. (Meebold); Malabar; Travancore.
6. *DIMERIA TENERA*, Trin. *D. ornithopoda*, F. B. I. vii. 104 *in part*.
Godavari District at Bison Hill (Barber); S. Kanara and Malabar Districts; Bababudan, Mysore, Nilgiri and Travancore Hills; from sea-level to 5,000 ft.
7. *DIMERIA PUBESCENS*, Hack.; F. B. I. vii. 105.
Mysore State, 3,000—3,500 ft. (Meebold).
In wet localities.
8. *DIMERIA LAWSONI*, C. E. C. Fischer n. comb. *D. pusilla*, Thw.
var. *Lawsoni*, Hook. f.; F. B. I. vii. 103.
Mysore (Meebold); Coorg (Lawrie); Wynaad (Lawson); 2,000—3,000 ft.
On granite rocks (Meebold).
9. *DIMERIA BIALATA*, C. E. C. Fischer in Kew Bull., 1933, 351.
S. Kanara District at Siradi (Meebold).
10. *DIMERIA LEHMANNI*, Hack.; F. B. I. vii. 104.
Kambakkam Hills (Bourne).

12. *Pogonatherum*, Beauv.

Slender annual or perennial erect herbs. *Culms* branching, leafy. *Leaves* flat, narrow, suberect. *Racemes* terminal, solitary; rhachis fragile. *Spikelets* 2-nate, one sessile the other pedicelled, 1—2-flowered; callus bearded with fine hairs. *Glumes* membranous; lower truncate, rounded on the back; upper usually longer, keeled, 2-fid with a long slender awn from the sinus. *Lemmas* hyaline; lower usually absent from the pedicelled spikelet; upper 2-fid, with a slender awn from the sinus, its palea broad, containing a bisexual floret. *Lodicules* 0. *Stamens* 1—2. *Styles* 2, free, short. *Grain* oblong, free; embryo $\frac{2}{3}$ as long.

POGONATHERUM PANICEUM, Hack. *P. saccharoideum*, Beauv.; F. B. I. vii. 141.

Godavari District; Mysore State at 2,000 ft. (Meebold); W. Coast and Ghâts; up to 6,000 ft.

Culms 2—12 in. high, tufted; *leaves* .8—2 in. long, .05—1 in. wide; *racemes* .5—1.3 in. long; rhachis subtrigonal, joints and flat pedicels .03—0.05 in. long, long-ciliate; hairs of callus white, .1—1.8 in. long; *glumes* .04—0.09 in. long; *lemmas* .03—0.07 in. long; *awns* .5—1 in. long.

13. *Eulalia*, Kunth

Annual or more often perennial, erect herbs. *Leaves* narrow. *Inflorescence* of digitate or fascicled, rarely solitary, spiciform racemes; rhachis readily disarticulating; joints and pedicels long-ciliate. *Spikelets*

2-nate, similar, one pedicelled, the other sessile. *Glumes* 2, subequal, membranous or chartaceous; lower dorsally flat or depressed with inflexed, more or less keeled margins; upper usually boat-shaped, 1-keeled. *Lemmas* hyaline, dissimilar; lower ♂ or empty, sometimes suppressed, rarely with a palea; upper usually much shorter, rarely entire, usually 2-fid, often deeply so, with a long awn from the sinus, usually without palea, enclosing a bisexual floret. *Lodicules* 2. *Stamens* usually 3. *Styles* 2, free. *Grain* oblong or obovate-oblong; embryo $\frac{1}{2}$ — $\frac{2}{3}$ as long.

Leaves flat, acute, 3—9 in. long, .2—45 in. wide. Culms 2—3 ft. high; racemes 4—8, 2—6 in. long; joints and pedicels .14—16 in. long; glumes .21—24 in. long, lower 4-nerved, at least in the pedicelled spikelet; upper lemma .1—15 in. long, its awn .44—63 in. long.....1. *quadrinervis* var. *Wightii*. Leaves usually convolute, finely acuminate, up to 16 in. long, .1—25 in. wide; lower glume nerveless or 2-nerved:—

Hairs of the racemes white. Culms 9—43 in. high, quite glabrous; lower sheaths glabrous; racemes 2—17, rarely 1, 1.5—8 in. long; joints and pedicels .08—11 in. long; glumes .1—16 in. long; upper lemma .06—1 in. long, hardly wider than its awn; awn .38—54 in. long.....2. *tristachya*. Hairs of the racemes usually reddish-brown, rarely greyish; culms 10—52 in. high, densely white- or brown-silky for a short distance below the inflorescence; lower sheaths usually red-brown tomentose at the base; racemes 2—11, 1—5.5 in. long; joints and pedicels .1—16 in. long; upper lemma .1—17 in. long, decidedly wider than its awn; awn .5—8 in. long.....3. *phaeothrix*.

1. *EULALIA QUADRINERVIS*, O. Kt.

Var. *Wightii*, Hook. f. *Pollinia quadrinervis*, Hack. var. *Wightii*, Hook. f.; F. B. I. vii. 110.

Rampa Hills at 4,500 ft. (Narayanswami); Pulney Hills; 6,000—7,000 ft. (Wight, Bourne).

2. *EULALIA TRISTACHYA*, O. Kt. *Pollinia argentea*, Trin.; F. B. I. vii. 111.

W. Coast and Ghâts; Kambakkam Hills; sea-level to 5,000 ft.

A good fodder when young.

3. *EULALIA PHAEOTHRIX*, O. Kt. *Pollinia phaeothrix*, Hack.; F. B. I. vii. 112.

Rampa Hills (Narayanswami); N. Coimbatore and Sirumalai Hills; W. Ghâts; 3,000—8,800 ft.

Very common in open downs at high elevations.

14. *Pseudopogonatherum*, A. Camus

Annual erect herbs. *Leaves* very narrow, often inrolled. *Inflorescence* of few to many spiciform racemes approximate on a common, persistent axis. *Spikelets* 2-nate, both pedicelled and falling from the pedicels or less often one of them sessile and falling with the pedicel of the other. *Glumes* chartaceous or membranous, lower rounded or flat on the back with inflexed margins, upper often aristate or mucronate. *Lemmas* hyaline, lower ♂, empty or sometimes suppressed, upper narrow, often bifid, with a long awn. *Lodicules* 2. *Stamens* usually 3. *Style* 2, free. *Grain* oblong or obovate-oblong; embryo $\frac{1}{2}$ — $\frac{2}{3}$ as long.

PSEUDOPOGONATHERUM CONTORTUM, A. Camus. *Pollinia articulata*, Trin.; F. B. I. vii. 109.

Goomsur in Ganjam District (Gamble); Kodagundi Reserved Forest in Vizagapatam District (Jacob).

Culms up to 3·5 ft. high; leaves 4—10 in. long, ·05—·07 in. wide; racemes 4—13, 1—2·5 in. long, rhachis and pedicels white-hairy; both spikelets pedicelled; lower glume ·08—·09 in. long, ciliate, upper with a capillary awn ·12—·17 in. long; awn of upper lemma geniculate, ·7—·8 in. long.

15. *Microstegium*, Nees

Annual or perennial, erect or decumbent herbs. *Leaves* flat, narrowed to the base and often petioled. *Inflorescence* of fascicled, spiciform racemes; rhachis readily disarticulating; joints and pedicels usually long-ciliate. *Spikelets* 2-nate, one sessile, the other pedicelled, similar. *Glumes* membranous or chartaceous, the lower dorsally longitudinally channelled, with more or less keeled margins, upper boat-shaped, medially keeled. *Lemmas* hyaline, lower ♂ or empty, rarely paleate, sometimes absent, upper much shorter, 2-fid with a long awn from the sinus, usually without palea. *Lodicules* 2. *Stamens* 1, 2 or 3. *Styles* 2, free. *Grain* oblong or obovate-oblong.

Racemes 2—10, fascicled, 1·5—3 in. long; margins of joints and pedicels densely ciliate; callus shortly bearded. Culms up to 4 ft. high; leaves sometimes shortly petioled, 1—4·5 in. long, ·2—·5 in. wide; glumes of sessile spikelet ·14—·15 in. long; awns very slender, ·2—·4 in. long.....1. *ciliatum*. Racemes 3—6, somewhat distant, 1—4 in. long; joints and pedicels slender, glabrous or slightly ciliate at the base only; callus not bearded, Culms up to 5 ft. high; leaves 1—2 in. long, ·3—·5 in. wide; glumes of sessile spikelet ·15—·18 in. long; awns capillary ·5—·7 in. long.....2. *nudum*.

1. *MICROSTEGIUM CILIATUM*, A. Camus. *Pollinia ciliata*, Trin.; F. B. I. vii. 116.

Pulney and Travancore Hills; 6,000 ft.

2. *MICROSTEGIUM NUDUM*, A. Camus. *Pollinia nuda*, Trin.; F. B. I. vii. 117.

Pulney Hills; 5,000—7,000 ft.

16. *Pollinidium*, Stapf ex Haines

Densely tufted perennial herbs; rootstock and basal sheaths woolly. *Leaves* convolute, wiry. *Inflorescence* of more or less paniced, digitate or fascicled, spiciform racemes; rhachis compressed, articulated, fragile. *Spikelets* 2-nate, one sessile, the other pedicelled, similar; callus densely clothed with long brown hairs. *Glumes* 2; lower flattened, 2—3-toothed, 5—7-nerved, margins inflexed, hairy on the back at the base; the upper cymbiform, cuspidate or aristate, 3—5-nerved. *Lemmas* hyaline; lower elliptic, its palea finely ciliate; upper narrow, conduplicate, entire or 2-toothed, finely awned from the tip or the sinus, its palea broad, nearly as long, densely ciliate at the apex. Other characters as in *Ischaemum*.

POLLINIDIUM BINATUM, C. E. Hubbard. *Ischaemum angustifolium*, Hack.; F. B. I. vii. 129.

Ganjam, Vizagapatam and Godavari Districts.

Culms 1—3 ft. high; leaves up to 3 ft. long and ·16 in. wide; the old sheaths white-woolly at the base; racemes 1—4, 1—2 in. long; joints slender, ·12—·16 in. long, glabrous or with a line

of hairs, densely rusty- or golden-villous at the base, pedicels similar, shorter; lower glumes chartaceous, 13—16 in long; upper lemmas 13—15 in. long; awns 16—28 in. long.

Used for paper-making and locally for fibre, cordage and mats. Eaten by cattle when young. Vern. *Hind.* Bhabar, Sabai; *Ur.* Babuli.

17. *Ischaemum*, Linn.

Usually perennial. *Leaves* convolute when young, eventually flat, usually narrow, sometimes petioled. *Inflorescence* of twin, digitate, fascicled or corymbose spiciform racemes; rhachis compressed, readily disarticulating; joints and pedicels flattened or subconcave on the inner side, often stout. *Spikelets* 2-nate, one sessile or with a short pedicel and falling with the contiguous joint, the other long-pedicelled and falling from the pedicel, the pairs alike or differing only in sex or more or less heteromorphous; florets 2, generally the lower ♂, the upper bisexual, rarely ♂ or empty in the long pedicelled spikelet. *Glumes* subequal, lower flattened or somewhat convex, rarely concave on the back, coriaceous below, chartaceous and sometimes strongly nerved towards the apex, seldom chartaceous throughout, entire or 2-fid and cuspidate, with more or less keeled, inflexed margins; upper glume boat-shaped, medially keeled at least towards the apex, sometimes awned. *Lemmas* hyaline to rigidly membranous; lower muticous; upper of sessile spikelet usually 2-fid and geniculately awned from the sinus, rarely mucronate or muticous; that of the long-pedicelled spikelet sometimes similar but more often entire and awnless; the paleas hyaline, subequal to the lemmas. *Lodicules* 2. *Stamens* 3, sometimes small or rudimentary in the fertile florets. *Styles* 2, free. *Grain* oblong or lanceolate, dorsally compressed; embryo about half as long.

Sessile spikelets, at least, awned:—

Margins of lower glume of sessile spikelets expanded below the middle, incurved at the base, apex 2-toothed or -cuspidate; upper lemmas of both spikelets 2-lobed to about the middle with an awn from the sinus:—

Racemes 2, rarely 3:—

Lower glume of sessile spikelet distinctly winged at apex, 15—18 in. long, upper glume and lower pedicelled spikelet 1-keeled and winged at the apex. Culms often creeping at the base, 2—30 in. high; leaves rounded or narrowed at the base, sessile, 1.5—9.5 in. long, .05—5 in. wide, sparsely to densely hairy; awns 3—5 in. long.....1. *aristatum*.

Lower glume of sessile spikelets not winged. Culms slender, up to 3 ft. high:—

Lower leaves, at least, acute at base, hairy, 1—3.2 in. long, .2—5 in. wide, often narrowed into a rather broad petiole up to .75 in. long; racemes .8—2.5 in. long; rhachis distinctly undulate; lower glume of sessile spikelets 13—18 in. long, ribbed at the apex, more or less hirsute, upper glume minutely 2-lobed, mucronate or cuspidate, keeled upwards, not winged; awns of sessile spikelets 28—54 in. long, of pedicelled shorter and finer.....2. *timorense*.

Leaves rounded or attenuate at base, 2—4 in. long, .15—2.5 in. wide, glabrous or with a few ciliae, sometimes the lowest tapering into a petiole up to 1 in. long; racemes 1—2 in. long; rhachis nearly straight; lower glume of sessile spikelets 14—26 in. long, strongly nerved at apex, bristly in the middle or hirsute below the middle, upper glume keeled and narrowly winged upwards, with a tuft of hairs below the wing, apex

minutely 2-toothed with an arista .1—28 in. long; awns of both spikelets .4—1 in. long.....3. *Thomsonianum*.
 Racemes corymbose, 7—12, rarely as few as 3 or up to 16, 1.5—3.5 in. long, silvery hirsute. Culms robust, rooting below, up to 24 in. high; leaves sessile, usually narrowed at base, sometimes rounded, 2.5—9.5 in long, .2—7.5 in. wide, softly hairy, rarely glabrous; lower glume of sessile spikelets not winged; awns of both spikelets .3—4.5 in. long.....4. *nilagiricum*.

Margins of glumes narrowly inflexed, not expanded below; lower glume of pedicelled spikelets flat, 2-keeled:—

Lower glume, at least, of pedicelled spikelet, winged, its upper lemma entire, awnless; Racemes 2—3, rarely 1:—

Lower glume of sessile spikelets .34—36 in. long with 3—4 nodules on each margin in the lower part, sometimes connected by rounded transverse ridges, keels narrowly winged. Whole plant glabrous; culms robust; leaves rounded or emarginate at the base, sessile, up to 15 in. long and 1.3 in. wide; racemes 3, up to 4.3 in. long; joints .1 in. wide; lower glume of pedicelled spikelets smooth, with a wide wing on one keel; lemmas brown, awn of sessile spikelets .36 in. long.....5. *Koenigii*.

Lower glume of sessile spikelets .16—28 in. long; rhachis of racemes, at least, hairy:—

Pedicels usually more than $\frac{1}{2}$ as long as the sessile spikelets, rarely only $\frac{1}{4}$. Culms slender, erect, 5—36 in. high; leaves rounded or emarginate at base and sessile or narrowed into a petiole up to 2 in. long, more or less hairy, .8—6 in. long, .12—7 in. wide; racemes 1—2.8 in. long; lower glume of sessile spikelets smooth or with 1—3 shallow marginal nodules usually joined by shallow curved, transverse ridges, keels narrowly winged above, glabrous, lower glume of pedicelled spikelets smooth, one keel widely winged, the other wingless or very narrowly winged at apex; awn .3—5.4 in. long.....6. *commutatum*.

Pedicels less than half as long as the sessile spikelet:—

Leaves, at least the lower, cordate or sagittate at base:—

Pedicels and joints plano-convex, ciliate to densely villous; lower glume of sessile spikelets with 3—6 marginal nodules below the middle, usually connected by transverse ridges, sometimes smooth, keels usually narrowly winged at apex:—

Leaves, at least some, petioled, base deeply cordate to acutely sagittate, .8—3.5 in. long, .2—5 in. wide. Culms slender, often decumbent at base, up to 20 in. high; racemes 1—2 in. long; lower glume of sessile spikelets narrowly lanceolate, transverse ridges usually irregular and shallow, rarely regular and deep; lower glume of pedicelled spikelets similar but more often smooth or the nodules and ridges more shallow and one keel broadly winged; awn .42—9 in. long.....7. *semisagittatum*.

Leaves all sessile, shallowly cordate, 2—6.5 in. long, .15—4 in. wide. Culms rather stout, up to 36 in. high; racemes 2—4.6 in. long; lower glume of sessile spikelets ovate- or lanceolate-oblong; lower glume of pedicelled spikelets smooth or sometimes faintly noded, one keel with a wide crescent-shaped wing; awn .4—76 in. long.....8. *molle*.

Pedicels and joints acutely trigonous, outer angle long-ciliate. Culms erect from a prostrate base, 10—16 in. high; leaves more or less cordate at base, sessile or petioled, .8—3.4 in. long, .12—4 in wide, petioles up to 1 in. long; racemes 1—2.8 in. long; lower glume of sessile spikelets obliquely linear-lanceolate, margins in basal $\frac{2}{3}$ with 2—5 horny, large almost keeled nodules, quite smooth between the margins, in the apical $\frac{1}{3}$ one keel broadly, the other narrowly winged; lower glume of pedicelled spikelets similar but smooth; upper lemma of sessile spikelets usually 2-lobed to below the middle, its awn .4—68 in. long, that of the pedicelled spikelet tapered into a fine arista .1—15 in. long.....9. *Rangacharianum*.

Leaves not cordate or sagittate:—

Lower glume of sessile spikelets with 5 horny, usually sharp, deep, regular, seldom irregular, transverse ridges in the lower part, the

keels unequally winged in the upper part. Culms stout, 12—45 in. high; leaves tapered to an acute base, 6—13 in. long, .15—.4 in. wide; racemes 1—3.2 in. long; joints and pedicels plano-convex, stout, outer margin hairy; lower glumes of pedicelled spikelets smooth or more or less ridged, one keel with a wide crescent-shaped wing; lemma of sessile spikelet 2-lobed to below the middle; awn .5—8 in. long.

10. *rugosum*.

Lower glume of sessile spikelets with marginal nodules not extended across the glume or if meeting the ridges very shallow and irregular; lower glume of pedicelled spikelets with one broad and one narrow wing. Culms rather stout, up to 3 ft. high:—

Lower glume of sessile spikelets not or very narrowly winged at apex, below with 2—6 rounded marginal nodules sometimes joined by shallow irregular transverse ridges. Leaves 2.5—6 in. long, .4—.65 in. wide, base rounded, sometimes with a short tomentose petiole; racemes 2.5—4.5 in. long; joints and pedicels obtusely trigonous, glabrous or sparsely hairy on the back; lower glume of pedicelled spikelets oblong, smooth or rugulose; awn up to .62 in. long, sometimes short or even absent.....11. *travancorensis*.

Lower glume of sessile spikelets oblique, the basal $\frac{2}{3}$ with 2—5 marginal nodules, smooth between the margins, one keel broadly the other narrowly winged at apex. Leaves tapering to the base, 1.5—9.5 in. long, .1—2.5 in. wide; racemes 1.5—4 in. long; joints and pedicels acutely trigonous, up to .1 in. wide, one angle hairy; lower glume of pedicelled spikelets lanceolate, smooth; awn .23—.52 in. long.....12. *mangaluricum*.

Glumes not winged. Rhizome stoloniferous; culms erect, up to 4 ft. high; leaves 2—14 in. long, .15—.33 in. wide; racemes 3—6, rarely only 2, 3—8 in. long; joints and pedicels subclavate, compressed, yellow- or brownish-pilose; lower glumes of both spikelets narrowly lanceolate; awn slender, .3 in. long; upper lemma of pedicelled spikelets shortly 2-lobed, with a slender arista .1—.2 in. long.....13. *pilosum*.

Both spikelets awnless. Rhizome creeping, stout; culms erect, slender, 7—20 in. high; leaves 1—5.4 in. long, .15—.5 in. wide, base rounded or shallowly cordate, sometimes very shortly petioled; racemes 2, .9—1.5 in. long; joints and pedicels stout, sharply trigonous, more or less ciliate; lower glumes of both spikelets smooth, shining, .25 in. long, narrowly winged at apex; lemma of sessile spikelet shortly 2-lobed, usually with a mucro.....14. *muticum*.

1. *ISCHAEMUM ARISTATUM*, Linn. *I. ciliare*, Retz.; F. B. I. vii. 133; S. I. G. figs. 135, 136.

Common in all Districts; sea-level to 8,000 ft.

Vern. *Tel.* Erruthota gaddi; *Kan.* Mobbu ganjalu garikai hullu.

Var. *Barberi*, C. E. C. Fischer n. var. More robust, nearly glabrous, more coriaceous; lower glume of sessile spikelet with wide ear-shaped wings at apex; upper lemma of pedicelled spikelets with a slender arista .1—.2 in. long.

Mangalore (Barber No. 4803).

2. *ISCHAEMUM TIMORENSE*, Kunth; F. B. I. vii. 136.

W. slopes of Nilgiris; N. Coimbatore Hills; W. Coast in Malabar and Travancore; up to 3,000 ft.

Vern. *Kan.* Nilamunga hullu.

Var. *villosum*, C. E. C. Fischer n. var. Joints of rhachis, pedicels and lower glume of sessile spikelets densely villous.

3. *ISCHAEMUM THOMSONIANUM*, Stapf MS., n. nom. *I. murinum*, Hook. f. non Forst.; F. B. I. vii. 135.

Mysore; Cochin; Travancore; up to 3,000 ft.

4. *ISCHAEMUM NILAGIRICUM*, Hack. *I. hirtum*, Hook. f. non Hack.; F. B. I. vii. 135 *in part*.
Kistna (Barber) and Salem Districts; Nilgiri and Pulney Hills; up to 6,500 ft.
5. *ISCHAEMUM KOENIGII*, Stapf MS. n. comb. *I. aristatum*, Hook. f. non Linn. subsp. *Koenigii*, Hook. f.; F. B. I. vii. 127.
Precise locality unknown (Koenig).
6. *ISCHAEMUM COMMUTATUM*, Hack.; F. B. I. vii. 131.
W. Ghâts, 2,000—7,000 ft.
7. *ISCHAEMUM SEMISAGITTATUM*, Roxb.; F. B. I. vii. 130. *I. conjugatum*, Roxb.; F. B. I. vii. 131.
W. Coast and Ghâts; up to 4,000 ft.
8. *ISCHAEMUM MOLLE*, Hook. f.; F. B. I. vii. 128.
Mysore State, 2,000—3,500 ft. (Meebold); W. Coast, near sea-level.
9. *ISCHAEMUM RANGACHARIANUM*, C. E. C. Fischer in Kew Bull., 1933, 352; *I. aristatum*, Ranga Achariar et Tadulingam non Linn.; S. I. G. fig. 130.
Malabar and Travancore; at low elevations.
10. *ISCHAEMUM RUGOSUM*, Salisb.; F. B. I. vii. 127; S. I. G. fig. 132.
In all Districts; up to 6,000 ft.
Eaten when young by horses and cattle; grain occasionally eaten by the poor. Vern. *Tam.* Kadukken pillu.
11. *ISCHAEMUM TRAVANCORENSE*, Stapf ex C. E. C. Fischer in Kew Bull., 1933, 353.
Wynaad and Travancore.
12. *ISCHAEMUM MANGALURICUM*, Stapf MS. n. comb. *I. aristatum*, Hook. f. non Linn. var. *mangaluricum*, Hack.; F. B. I. vii. 127; S. I. G. fig. 131.
Mysore State (Meebold); S. Kanara and Malabar Districts; up to 2,000 ft.
13. *ISCHAEMUM PILOSUM*, Hack.; F. B. I. vii. 130; S. I. G. figs. 133, 134.
Deccan.
A moderate fodder. Vern. *Tel.* Kundara gaddi, Urranki.
14. *ISCHAEMUM MUTICUM*, Linn.; F. B. I. vii. 132.
S. Kanara and Travancore.
Usually growing in water; also among coastal sands.

18. *Sehima*, Forsk.

Annual or perennial erect, tufted herbs. *Leaves* convolute when young, later expanded. *Racemes* solitary, often much curved; rachis jointed, fragile; joints and pedicels plano-convex. *Spikelets* compressed, 2-nate, one sessile, the other pedicelled; 2-flowered; lower floret ♂, upper bisexual in the sessile spikelet, ♂ or neuter in the pedicelled. *Glumes* subequal, usually chartaceous; lower of sessile spikelets usually deeply grooved, rarely flat, 2-toothed or -cuspidate, keeled upwards and often winged on the keels; upper boat-shaped, often aristate. *Lemmas* hyaline; the lower entire and muticous; the upper 2-fid with a geniculate awn from the sinus. *Lodicules* 2. *Stamens* 3. *Grain* oblong, obtusely trigonous; embryo half as long.

Joints and pedicels .14—.18 in. long, ciliate on both edges; lower glume of sessile spikelets .25—.28 in. long, strongly 4-nerved, the 2 median branched, diverging and converging again with a deep depression between; callus .04—.05 in. long; upper glume .21—.26 in. long, entire, keel narrowly winged at the apex, with a setaceous arista .43—.6 in. long; awns 1.2—1.6 in. long. Culms up to 4 ft. high; leaves 3—20 in. long, .1—3 in. wide.....1. *nervosum*.
 Joints and pedicels .18—.26 in. long, ciliate on one margin only; lower glume of sessile spikelets .28—.34 in. long, strongly 4-nerved, the 2 median straight, close together with a groove between; callus .05—.08 in. long; upper glume .23—.27 in. long, 2-cuspidate, not winged, with a setaceous arista .36 in. long; awns 1—1.8 in. long. Culms weak, up to 2 ft. high; leaves 3.5—6 in. long, .1—.2 in. wide.....2. *sulcatum*.

1. SEHIMA NERVOSUM, Stapf. *Ischaemum laxum*, R. Br.; F. B. I. vii. 136; S. I. G. fig. 137.

In all Districts except the W. Coast; sea-level to 6,000 ft.

A good fodder. Vern. *Hind.* Chota shadai ghans; *Tam.* Kura itti; *Kan.* Sinna shadai hullu, Nalai hullu.

2. SEHIMA SULCATUM, A. Camus. *Ischaemum sulcatum*, Hack.; F. B. I. vii. 137.

Nellore and Kistna Districts (Bourne).

19. Lophopogon, Hackel

Small, perennial, densely tufted herbs. *Leaves* very narrow. *Inflorescence* of terminal, solitary, binate or fascicled, spiciform racemes; rhachis articulate, more or less fragile; joints often cupular at the tip. *Spikelets* 1—2-flowered, 2-nate, one sessile the other pedicelled. *Sessile spikelet* with a short callus, dorsally compressed. *Glumes* chartaceous; the lower truncate, irregularly toothed; the upper longer, acute, apiculate or narrowed into a straight awn. *Lemmas* hyaline; the lower with a linear palea and empty or ♂ with 1—2 stamens; upper often 2-fid with setiform lobes, often aristate from the sinus, its palea quadrate, containing a bisexual or ♂ floret with 2 anthers. *Lodicules* 0. *Pedicelled spikelet* laterally compressed or nearly terete, 2-flowered, the lower floret often ♂, the upper ♀.

LOPHOPOGON TRIDENTATUS, Hack.; F. B. I. vii. 149; S. I. G. fig. 141.

Cuddapah, Nellore, Chittoor and Chingleput Districts; Mysore State; sea-level to 2,000 ft.; usually in dry localities.

Culms very slender, capillary at apex, often densely white-silky at the base, 3—20 in. high; leaves 1—6 in. long; racemes usually 2, .3—.9 in. long; lower glumes narrowly obcuneate, 3-toothed or mucronate and lobulate, with a tuft of rufous hairs in the middle, .17—.19 in. long; upper glume narrowly boat-shaped, .18—.22 in. long, narrowed to a fine arista .25—.4 in. long, margins with long rufous hairs; awns .6—.9 in. long.

20. Apocypis, Nees

Annual or perennial herbs. *Leaves* flat. *Racemes* terminal, solitary or 2—3-nate; rhachis not readily disarticulating. *Spikelets* secund, closely imbricate, compressed, solitary, sessile, often accompanied by a pedicel without spikelet. *Glumes* 2, chartaceous or membranous; lower broadly cuneiform, nearly flat, truncate, rounded or emarginate;

upper narrower, usually laterally 2-keeled with broadly inflexed margins. *Lemmas* hyaline; lower oblong, its palea nearly as long, enclosing a ♂ floret or empty; upper very narrow, entire or shortly 2-lobed with a long geniculate awn, its palea much shorter, wrapped round a ♀ or bisexual floret. *Lodicules* 0. *Stamens* 2 or 3. *Styles* 2, free. *Grain* linear or fusiform; embryo half as long.

APOCOPIS WIGHTII, Nees; F. B. I. vii. 142; S. I. G. figs. 139, 140.

In all Districts, except in the driest localities; sea-level to 3,000 ft.

Culms often densely tufted, 2·5–24 in. high; leaves densely imbricate or distant, ·5–5 in. long, ·05–·25 in. wide, more or less hairy from bulbous bases; racemes usually 2, ·5–1·7 in. long, rhachis and pedicels rufous-hairy; lower glume obcordate or obovate truncate, yellow with a red-brown tip or dark-brown with a yellowish tip, glabrous to densely rufous- or fuscous-hairy, ·14–2 in. long; awn geniculate, ·75 in. long.

21. *Eremochloa*, Buesé

Perennial herbs. *Leaves* more or less equitant, rigid, flat. *Inflorescence* a terminal, solitary, spiciform raceme; rhachis articulated, fragile. *Spikelets* secund, solitary owing to the pedicelled spikelets being reduced to a rudimentary pedicel, sessile, imbricating, dorsally compressed, 2-flowered. *Glumes* chartaceous or coriaceous; lower nearly flat, oblong to subcircular, 2-keeled, the margins pectinate with long spinules or rigid hairs, often winged at the apex; upper elliptic or oblong-lanceolate, 3–5-nerved. *Lemmas* hyaline, muticous, paleate; lower ♂; upper smaller ♀ or bisexual. *Lodicules* 2. *Stamens* 3. *Grain* elliptic or ovoid, flattened on one side; embryo half as long.

EREMOCHLOA MURICATA, Hack.; F. B. I. vii. 140; S. I. G. fig. 138.

Chingleput and S. Arcot Districts.

Culms 5–24 in. high; leaves densely tufted below, ·15–·27 in. wide, exactly linear, sometimes with a few ciliae near the rounded base; raceme 2·5–4·5 in. long; lower glume thickly coriaceous, broadly ovate, acute, the upcurved marginal spinules up to ·07 in. long, apex with a broad triangular or fan-shaped wing on both sides, wider across than the width of the rest of the glume.

22. *Arthraxon*, Beauv.

Annual or perennial, sometimes decumbent herbs. *Leaves* linear-lanceolate to ovate, base usually cordate or amplexicaul, margins more or less ciliate from bulbous bases. *Inflorescence* of twin, digitate, fascicled or subpanicled simple or branched racemes or spikes; rhachis articulated, fragile. *Spikelets* laterally compressed, 2-nate, one sessile, the other pedicelled, similar or differing in sex mainly owing to reduction, or else solitary and sessile with or without an often very rudimentary pedicel. *Glumes* equal, chartaceous to coriaceous, rarely membranous; lower 2-keeled or rounded on the back and sides and not keeled, sometimes bearing rows of tubercles or spines on the margins; upper thinner, much compressed, keeled upwards, in all our species complicate-boat-shaped. *Lemmas* hyaline; lower empty, usually

without palea; upper subentire with a dorsal or basal, more or less well-developed awn, rarely awnless, enclosing a bisexual floret, palea minute or 0. *Lodicules* 2. *Stamens* 2—3. *Grain* narrowly linear or fusiform; embryo half as long. *Pedicelled spikelet*, when present, usually ♂ and awnless.

Lower glume of sessile spikelets 2-keeled, margins inflexed, back nearly flat:—

Glumes glabrous or nearly so; keels not winged:—

Keels of lower glume of sessile spikelets tubercled or toothed; pedicelled spikelets more or less developed:—

Lower glume of sessile spikelets .2 in. or less long with pectinately toothed keels; joints of rhachis .1—12 in. long, ciliate:—

Lower glume of sessile spikelets lanceolate .18—2 in. long, back smooth.

Rootstock and lowest 1 or 2 sheaths tomentose; culms comparatively robust, up to 36 in. high; leaves lanceolate to linear-lanceolate, .8—3 in. long, .12—65 in. wide, glabrous; awns .26—42 in. long.....1. *lanceolatus*.

Lower glume of sessile spikelets linear or narrowly lanceolate, .2 in. long, nerves on back echinulate, rarely in the lowest spikelets smooth. Rootstock and sheaths not tomentose; culms up to 12 in. high; leaves linear, .8—2.3 in. long, .17—5 in. wide, usually pubescent, rarely quite glabrous; awns .3—4 in. long.....2. *echinatus*.

Lower glume of sessile spikelets .28 in. or more long, narrowly linear-lanceolate, keels with a double row of tubercles, gradually converted to spinules at the apex. Culms 4—10 in. high; leaves ovate to ovate-lanceolate, .8—2.3 in. long, .25—6 in. wide, sparsely hairy; joints .18 in. long, long-ciliate; awns .8 in. long.....3. *Meeboldii*.

Lower glume of sessile spikelets linear-lanceolate, subcoriaceous, .2—26 in. long, keels spinulose-hispid. Culms comparatively robust; leaves rigid, ovate to oblong-lanceolate, cuspidate, 2—3.5 in. long, .5—1 in. wide, glabrous; joints .16—19 in. long, compressed, densely ciliate; pedicelled spikelet reduced to a pedicel; awn .42—48 in. long.....4. *depressus*.

Lower glume of sessile spikelets lanceolate, .22 in. long, back densely villous, keels with narrow, densely ciliate wings. Culms 12 in. or more long; leaves linear-lanceolate, 1.2—2 in. long, .3 in. wide, hairy; joints .14 in. long, long white-ciliate, pedicelled spikelet fully developed; awn .48 in. long.....5. *villosus*.

Lower glume of sessile spikelets compressed-convex, not keeled, margins not inflexed:—

Lower glume entire or minutely 2-toothed; no pedicelled spikelet:—

Paleas about half as long as the upper lemmas, ovate-lanceolate. Culms up to 2 ft. high; leaves linear-lanceolate, acuminate, 1.5—4 in. long, .15—6 in. wide, margins and midrib below ciliate; pedicels .09 in. long, hairy on the back, devoid of spikelets; glumes of sessile spikelets minutely muriculate, lower .2—24 in. long, 5—7-nerved, nerves armed with spinescent tubercles in the upper half, upper longer, keeled, keel spinulose near apex.....6. *rudis*.

Paleas 0:—

Joints subterete, very slender, .07—1 in. long, finely ciliate on one side only; pedicels 0. Culms very slender, 2—18 in. high; leaves linear to elliptic-lanceolate, .4—2.3 in. long, .07—55 in. wide; lower glume .1—15 in. long, nerves minutely scaberulous; upper glume minutely puberulous, not ciliate; awns .23—4 in. long.....7. *Quartinianus*.

Joints plano-convex, slender, .12—18 in. long, glabrous; pedicels .06—14 in. long, linear, flat. Culms 10—20 in. high; leaves lanceolate to ovate, .7—2.3 in. long, .2—7 in. wide; lower glume .15 in. long, nerves hispid; upper glume hispid at apex, its margins ciliate; awns .3—5 in. long

8. *hispidus*.

Lower glume of sessile spikelets lanceolate, .1—13 in. long, minutely puberulous, 2-cuspidate. Culms very slender, straggling, up to 16 in. long; leaves linear-lanceolate to ovate, .5—1.7 in. long, .15—47 in. wide, puberulous and often also sparsely hairy; joints very slender, subterete, .03—08 in. long, densely long-ciliate; pedicels .03—04 in. long flat, long-ciliate, spikelets fully developed; upper glume of sessile spikelets .08—09 in. long, with a mucro .06 in. long; awns .24—4 in. long.....9. *lanceifolius*.

1. *ARTHRAXON LANCEOLATUS*, Hochst.; F. B. I. vii. 143.
Bellary District at Raman Drug; Nilgiri and Pulney Hills;
2,500—6,500 ft.
Vern. *Tel.* Rai gaddi.
2. *ARTHRAXON ECHINATUS*, Hochst. *A. spathaceus*, Hook. f.; F. B. I.
vii. 145.
Cuddapah District (Wight, Gamble); Mysore State (Meebold);
about 2,000 ft.
3. *ARTHRAXON MEEBOLDII*, Stapf.
Mangalore (Meebold).
4. *ARTHRAXON DEPRESSUS*, Stapf ex C. E. C. Fischer in Kew Bull.
1933, 350.
Mysore State at Agalatti (Meebold); 3,500 ft.
5. *ARTHRAXON VILLOSUS*, C. E. C. Fischer in Kew Bull. 1933, 350.
Bababudan Hills (Bourne).
6. *ARTHRAXON RUDIS*, Hochst.; F. B. I. vii. 144.
Mysore State (Meebold); 3,500 ft.
7. *ARTHRAXON QUARTINIANUS*, Nash. *A. ciliaris*, Beauv. a; F. B. I.
vii. 146.
W. Gháts from Coorg to the Pulney Hills; 3,000—7,000 ft.;
Mysore State; Calicut; Bolampatti Valley at 1,700 ft. (Fischer).
Vern. *Kan.* Nela bidaru hullu.

146.
Mysore State at 2,000 ft. (Meebold); Malabar (Barber); Travan-
core (Mayuranathan).
9. *ARTHRAXON LANCIFOLIUS*, Hochst. *A. microphyllus*, Hochst.; F.
B. I. vii. 147.
Rampa Hills at 4,500 ft. (Narayanaswami); Bellary District at
Raman Drug; Mysore State (Meebold); W. Coast.

23. *Capillipedium*, Stapf.

Annual or perennial herbs. *Leaves* flat. *Inflorescence* a rather delicate, usually much divided panicle; main rhachis and branches capillary; racemes 1—4, rarely up to 8-jointed; joints and pedicels slender, longitudinally grooved and translucent in the groove. *Spikelets* 2-nate, one sessile, the other pedicelled, similar in shape, differing in sex. *Sessile spikelets*: *Glumes* subequal, thinly chartaceous to membranous; lower 2-keeled with narrow, inflexed margins, keels usually bristle-ciliate; upper boat-shaped, more or less grooved on each side of the keel. *Lemmas* dissimilar; lower hyaline empty; upper reduced to the linear, hyaline base of a geniculate awn, containing a bisexual floret; palea absent. *Lodicules* 2. *Stamens* 3. *Grain* oblong, slightly dorsally compressed; embryo more than half as long. *Pedicelled spikelet* sometimes with only one 2-keeled glume, the second, if present, shorter or much reduced; one or both lemmas sometimes present, hyaline, awnless, sometimes containing a ♂ floret.

Culms stiff, erect, not or hardly decumbent below:—

Culms usually copiously branched, up to 6 ft. high, or even taller, almost woody; nodes glabrous or short-hairy; panicles usually large, lax; callus of sessile

- spikelets shortly bearded; lower glume .08—1 in. long, glabrous or minutely puberulous; awns .36—5 in. long; lower glume of pedicelled spikelets .1—16 in. long.....1. *glaucopsis*. Culms simple or sparingly branched, up to 4 ft. high, usually slender; nodes usually densely, often long bearded; panicles contracted, rarely somewhat lax; callus of sessile spikelets densely villous; lower glume .1—14 in. long, usually villous all over or only below the middle; sometimes only puberulous or quite glabrous, awns .4—9 in. long; lower glume of pedicelled spikelets .14—17 in. long.....2. *Huegelii*. Culms decumbent and often interlaced, copiously geniculately branched, weak, up to 3 ft. long; nodes shortly hairy; panicles 1—2 in. long, branches few; callus of sessile spikelets densely villous; lower glume .08—12 in. long, glabrous or sparsely hairy below the middle; awns .38—62 in. long; lower glume of both spikelets equal.....3. *filiculmis*.

1. *CAPILLIPEDIUM GLAUCOPSIS*, Stapf. *Andropogon assimilis*, Steud.; F. B. I. vii. 179.

Ganjam (Gamble) and Godavari Districts; Coorg, Wynaad and Travancore; 300—2,000 ft.

2. *CAPILLIPEDIUM HUEGELII*, Stapf. *Andropogon Huegelii*, Hack. F. B. I. vii. 180. *A. Schmidii*, Hook. f.; F. B. I. vii. 180.

W. Ghâts from the Bababudan Hills to Travancore; S. Kanara District; sea-level to 7,000 ft. Often aromatic.

3. *CAPILLIPEDIUM FILICULMIS*, Stapf. *Andropogon filiculmis*, Hook. f.; F. B. I. vii. 181.

Mysore State at Agalatti (Meebold); S. Kanara and S. Malabar Districts.

24. *Amphilophis*, Nash

Perennial herbs. *Leaves* narrow, usually flat. *Inflorescence* of paniced digitate, spiciform, shortly peduncled racemes, usually with a short primary axis, rarely with secondary branches; rhachis of raceme many-jointed, disarticulating horizontally; joints and pedicels filiform, longitudinally grooved and translucent in the groove. *Spikelets* 2-nate, one sessile, the other pedicelled, similar in shape or the pedicelled reduced, differing in sex except the lowermost pair, which may be homogamous (σ or empty). *Sessile spikelets* dorsally compressed, callus small, usually bearded. *Glumes* subequal, chartaceous or membranous; lower 2-keeled with inflexed margins; upper boat-shaped, acutely keeled. *Lemmas* dissimilar; lower hyaline, empty; upper reduced to the linear stipe of a geniculate awn, containing a bisexual floret; paleas 0 or minute. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* oblong, obtuse, slightly compressed; embryo about half as long. *Pedicelled spikelet* similar but awnless; one lemma often present containing a σ floret.

Primary axis of the inflorescence short, much overtopped by the racemes, branches undivided:—

Leaves mostly aggregated near the base, glabrous or hairy, 1—6 in. long, .1—1.5 in. wide. Culms often creeping at the base, up to 30 in. long; racemes 1—10, 1—2.5 in. long; lower glumes usually with a median pit, rarely 2, on the back above the middle, but sometimes quite smooth, .11—14 in. long; awns .36—85 in. long.....1. *pertusa*.

Leaves mostly cauline, elongate:—

Lower glumes devoid of pits:—

Culms stout, up to 5 ft. high, nodes hairy; leaves 3—24 in. long, .15—3 in.

wide; racemes up to 6, 1—4 in. long; lower glume of sessile spikelets more or less long-hairy on the back below the middle, .16—.2 in. long; awns .65—1 in. long.

2. *pseudoischaemum*. Culms comparatively slender, up to 3 ft. high, nodes usually glabrous; leaves often involute, 4—14 in. long, .15—.25 in. wide; racemes few to many, 1—4 in. long; lower glume of sessile spikelets glabrous, often dorsally longitudinally depressed, .14—.17 in. long; awns .5—.85 in. long.

3. *Foulkesii*.

Lower glumes usually pitted, at least in most of the spikelets:—

Lower glume of pedicelled spikelets 2—4-pitted, .16—.2 in. long; that of sessile spikelets 1-pitted. Culms up to 3 ft. high; leaves 6—25 in. long, .12—.3 in. wide; racemes 1—14, 1.5—3.5 in. long; awns .46—.85 in. long.

4. *insculpta*.

Both lower glumes with 1 dorsal pit, seldom unpitted, .14—.19 in. long. Culms often robust, up to 7 ft. high; leaves 4—24 in. long, .12—.4 in. wide; racemes 8—20, sometimes more, flexuous, silky, 1.5—3 in. long; awns .12—.2 in. long.

5. *Kuntzeana*.

Primary axis up to 10 in. long, much longer than the racemes, stronger branches again branched. Culms 2—6 ft. high; leaves often setose at the base, 4—20 in. long, .2—.42 in. wide; racemes numerous, up to 2.5 in. long; lower glume of sessile spikelet with or without a dorsal pit, .12—.16 in. long, glabrous or somewhat hairy on the back below the middle, that of pedicelled spikelets unpitted; awns .4—.75 in. long.

6. *glabra*.

1. *AMPHILOPHIS PERTUSA*, Stapf. *Andropogon pertusus*, Willd.; F. B. I. vii. 173; S. I. G. figs. 152, 153.

In all Districts except the wettest localities; sea-level to 4,000 ft.

Often in saline soils. A good fodder and hay. Vern. *Ur*.

Basana; *Tel*. Janu gaddi, Turri gaddi; *Tam*. Chinna-karai pullu.

2. *AMPHILOPHIS PSEUDOISCHAEMUM*, C. E. C. Fischer n. comb. *Andropogon pseudoischaemum*, Nees; F. B. I. vii. 172.

Deccan and Coromandel; 1,000—2,000 ft.

3. *AMPHILOPHIS FOULKESII*, C. E. C. Fischer n. comb. *Andropogon Foulkesii*, Hook. f.; F. B. I. vii. 174.

Nilgiri, Pulney and Tinnevely Hills; 6,000—8,000 ft.

4. *AMPHILOPHIS INSCULPTA*, Stapf. *Andropogon pertusus*, Willd. var. *insculpta*, Hack.; F. B. I. vii. 174.

W. Ghâts from the Bababudan to the Pulney Hills; 3,600—7,000 ft. Vern. *Kan*. Henu ganjalu garikai hullu.

5. *AMPHILOPHIS KUNTZEANA*, Haines. *Andropogon Kuntzeanus*, Hack.; F. B. I. vii. 175.

Deccan; Carnatic; N. Coimbatore and Nilgiri Districts; sea-level to 2,000 ft. Uncommon.

6. *AMPHILOPHIS GLABRA*, Stapf. *Andropogon intermedius*, R. Br.; F. B. I. vii. 175. *A. montanus*, Roxb.; F. B. I. vii. 176.

N. Circars from Ganjam and the Rampa Hills to the Nallamallais; up to 3,500 ft. Vern. *Ur*. Gonda bena.

25. *Vetiveria*, Thouars

Coarse, perennial herbs with stout rhizomes; culms more or less compressed below. Leaves narrow, conduplicate in bud, ultimately flat; lower leaf-sheaths much compressed. Panicles erect, composed of many-rayed whorls of slender, simple, rarely compound racemes; rhachis 3—many-jointed, fragile; joints and pedicels slender. Spikelets 2-nate, one sessile and one pedicelled, the pairs subsimilar but differing

in sex. *Sessile spikelets* slightly laterally compressed. *Glumes* equal, coriaceous or chartaceous; lower rounded on the back, usually muticous, margins subinflexed; upper boat-shaped, keeled towards apex, mucronate or aristulate. *Lemmas* hyaline; lower 2-nerved, entire, empty; upper minutely 2-toothed, muticous, mucronate or with a more or less developed geniculate awn from the sinus, palea minute, enclosing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2. *Grain* oblong, slightly oblique at the apex. *Pedicelled spikelets* dorsally compressed, with much thinner glumes than those of the sessile spikelets, like the lemmas usually awnless, usually containing a ♂ floret.

Rootstock with spongy aromatic roots; culms tufted, stout, up to 6 ft. high or more; leaves distichous at the base, coriaceous, conduplicate at least below, 12—36 in. long, .15—.4 in. wide, usually glabrous; panicle 6—15 in. long; joints and pedicels glabrous; sessile spikelets with glabrous callus, lower glume muriculate, upper muriculate on the keel; upper lemma entire, muticous or mucromilate

1. *zizanioides*.

Rootstock horizontal, roots not spongy nor aromatic; culms comparatively slender, 1.5—5 ft. high; leaves chiefly subradical, rigidly herbaceous, 3—9 in. long, rarely up to 15 in., .06—.15 in. wide, glabrous or more often sparsely, shortly hairy and distantly ciliolate; panicles 4—8 in. long, narrow; joints and pedicels with a basal tuft of hairs; sessile spikelets with a bearded callus; lower glume narrowly ensiform with a row of marginal tubercles enlarging upwards and becoming spinulose at the tip, upper shorter, 2-fid with a slender arista .3—.5 in. long; upper lemma with a slender awn .8 in. long.....2. *Lawsoni*.

1. *VETIVERIA ZIZANOIDES*, Nash. *Andropogon squarrosus* Hack. non Linn. f.; F. B. I. vii. 186; S. I. G. fig. 154.

In all Districts except on the W. Coast; sea-level to 3,000 ft. The Khas-khas or Cus-cus grass.

A good fodder when young. The aromatic roots are used for making the well-known khas-khas mats for cooling dwellings and for fans. An aromatic and medicinal oil is extracted from the roots. Vern. *Hind.* Khas-khas; *Tel.* Vatti-veru; *Tam.* Vettiver, Virkel, Viyal; *Mal.* Vettiver; *Kan.* Kadu karai, Dhappa sajjai hullu.

2. *VETIVERIA LAWSONI*, Blatter et McCann. *Andropogon Lawsoni*, Hook. f.; F. B. I. vii. 187.

Mysore State; Coimbatore and Nilgiri Districts; 1,400—3,000 ft. Cattle are said to eat the leaves and reject the flowering culms. Vern. *Kan.* Karai hullu; Thoddu karai hullu.

26. *Pseudosorghum*, A. Camus

Annual herbs, decumbent below. Panicles contracted, dense; primary branchlets nearly always solitary, alternate, erect, branching from the base, lower secondary branchlets sometimes verticillate; racemes spiciform, dense, sessile or nearly so; rhachis fragile; joints and pedicels slender, hairy. *Spikelets* 2-nate, one sessile, the other pedicelled, differing only in sex. *Sessile spikelets* much imbricated; *Callus* short, bearded. *Glumes* subequal, chartaceous; lower 2-keeled; upper boat-shaped, 1-keeled. *Lemmas* hyaline; lower nearly as long as the glumes, sometimes paleate, empty; upper narrow, shorter, cleft for half its length into 2 narrow lobes with a geniculate awn from the sinus, enclosing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2,

free. *Pedicelled spikelets* narrower than the sessile, often much reduced, sometimes only 1 glume left: *Glumes* membranous, narrow; lower 2-keeled; upper similar or boat-shaped and 1-keeled. *Lemmas*, when present, hyaline; lower the longer, empty or containing a ♂ floret.

PSEUDOSORCHUM FASCICULARE, A. Camus. *Andropogon fascicularis*, Roxb.; F. B. I. vii. 117.

Ganjam (Gamble), Godavari (Barber) and Coimbatore (Fischer) Districts; Palghat Hills (Beddome); Cochin State (Meebold); sea-level to 4,000 ft.

Culms up to 5 ft. high; leaves sometimes very short but usually long, up to 20 in. long and 3 in. wide; panicles up to 5 in. long; racemes few or many and dense, 1.5–2 in. long; awns 4–6 in. long.

Vern. *Tel.* Konda-jeri.

27. *Sorghum*, Pers. sensu A. Camus

Annual or perennial, tall, sometimes woody. *Leaves* at first convolute, eventually flat. *Panicles* often large, with verticillate or scattered branches, usually lax in the wild species, frequently contracted or compacted in the cultivated ones; rhachis fragile or tough; divisions 1–few-jointed; joints and pedicels slender with ciliate edges. *Spikelets* 2-nate on the lateral nodes, one sessile, the other pedicelled or reduced to a pedicel, differing in shape and sex. *Sessile spikelets* more or less dorsally compressed or subglobose or ovate or elliptic: *Glumes* subequal, often coriaceous; lower 2-keeled at apex with narrowly inflexed margins, involute at base, apex erose or 3-toothed; upper shorter, convex, 1-keeled. *Lemmas* hyaline; lower as long as the glumes or nearly so, empty; upper oblong, 2-toothed or 2-fid, rarely entire, mucicous or mucronate or awned from the sinus, paleas sometimes present, including a bisexual floret. *Lodicules* 2, rather large. *Stamens* 3, very rarely 2. *Styles* 2, free. *Grain* obovate or linear-oblong in wild species, globose in cultivated ones, free; embryo half as long or more. *Pedicelled spikelets* more or less reduced, lemmas when present ♂ or empty.

Rhachis of racemes fragile; sessile spikelets falling together with the contiguous joint and pedicel; spontaneous perennial plants:—

Primary branches of the panicle undivided, up to 4 in. long:—

Culms solitary, stout, 3–8 ft. high; nodes white-silky; leaves 8–21 in. long, 1.5–3 in. wide; panicle ultimately effuse, 4–10 in. long; racemes whorled; peduncles very slender; joints, pedicels and spikelets purplish- or reddish-villous; lower glume of sessile spikelets black and polished when ripe; upper lemma acuminate, truncate or 2-fid for up to $\frac{1}{2}$ its length, mucicous, aristate or with an awn up to .56 in. long.....1. *nitidum*.
Culms tufted, comparatively thin, 6–24 in. high; nodes glabrous; leaves 2–4 in. long, 1.5–6 in. wide; panicles narrow, up to 5 in. long; racemes few, alternate; peduncles rather stout; joints and pedicels densely creamy-villous; glumes of sessile spikelets very coriaceous, tomentose on the back; awns .65 in. long.....2. *Stapfii*.

Primary branches of the panicle branched, up to 10 in. long, panicles usually effuse, 9–17 in. long. Culms solitary, stout, often woody, 3–15 ft. high; nodes glabrous or nearly so; leaves 5–33 in. long, .3–2.2 in. wide; glumes of sessile spikelets more or less hairy on the back; upper lemma cleft for $\frac{1}{2}$ to $\frac{1}{3}$ its length, with an awn .43–.52 in. long, seldom entire and mucicous...3. *halpense*.

Rhachis of racemes tenaceous; sessile spikelets persistent; usually annual, cultivated plants.....Cultivated species.

1. SORGHUM NITIDUM, Pers. *Andropogon serratus*, Thunb.; F. B. I. vii. 185.

In all Districts from Coorg to Travancore; 1,000—7,000 ft. Vern. *Kan.* Chikka narala hullu.

2. SORGHUM STAFFII, C. E. C. Fischer n. comb. *Andropogon Stapfii*, Hook. f.; F. B. I. vii. 184.
Palamkotta (Wight).

3. SORGHUM HALEPENSE, Pers. *Andropogon halepensis*, Brot.; F. B. I. vii. 182.

In all Districts, except on the W. Coast; sea-level to 7,000 ft. A good fodder and hay grass when mature; when young it is said to have sometimes had injurious and even fatal effects on animals eating it. Vern. *Tam.* Kadu-cholam; *Kan.* Kadukambu hullu.

CULTIVATED SPECIES: Various species and races of Sorghum are cultivated in all Districts. Hitherto these have been clubbed under the name *Andropogon Sorghum*, Brot.; F. B. I. vii. 183. The Great Millet.

The cultivated Sorghums are under revision by Mr. J. D. Snowdon, and until the result of his work is published it would be inadvisable to attempt a classification. As far as is known at present the following five species with varieties and races are grown in India: *S. Roxburghii*, Stapf, *S. bicolor*, Moench, *S. Durra*, Stapf, *S. cernuum*, Host, *S. subglabrescens*, Schweinf. et Aschers. The vernacular names, which cannot at present be correlated with the different species, are: *Hind.* Juari, Bajra; *Ur.* Jonna; *Tel.* Jonna, Jonnalu; *Tam.* and *Mal.* Cholam; *Kan.* Jola; with racial names qualifying each.

The plants are of great economic importance as comestible grains and as a fodder, hay and thatch grasses.

28. Chrysopogon, Trin.

Usually perennial, erect herbs. *Leaves* narrow, flat or complicate. *Panicles* terminal, usually lax, branches whorled, rarely 2-nate or solitary, simple or divided at the base. *Spikelets* in threes at the ends of the branches, one sessile and 2 pedicelled, falling together from the thickened, oblique, rarely glabrous tips of the peduncles, rarely 2-nate in 2-jointed racemes and then 1 sessile and 1 pedicelled, the sessile falling with the contiguous joint and pedicel; pedicels (and joints when present) filiform. *Sessile spikelets* usually laterally compressed: *Glumes* subequal, coriaceous or chartaceous; lower complicate or involute, backs rounded or more or less 1-keeled; upper boat-shaped, more or less 1-keeled. *Lemmas* hyaline; lower empty; upper entire or 2-toothed, with a more or less perfect geniculate awn; palea small or 0, enclosing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Grain* linear, laterally compressed; embryo half as long. *Pedicelled spikelets* dorsally compressed: *Glumes* subequal, thin, sometimes awned. *Lemmas* hyaline, muticous, usually enclosing a ♂ floret.

Pedicels half as long as the sessile spikelets or longer:—

Pedicels glabrous. Rootstock woody, creeping; culms 5—20 in. high; leaves mostly basal, .8—6 in. long, .1—25 in. wide, glabrous, panicles 1.5—3.5 in. long, narrow, branches ascending sharply; glumes of sessile spikelets .14—17 in. long, upper mucronate; awns .16—24 in. long; glumes of pedicelled spikelets .14—24 in. long, muticous.....1. *aciculatus*.

Pedicels rufous-hairy; leaves usually puberulous:—

Lower glume, at least, of pedicelled spikelets aristate:—

Leaves conspicuously distichous, sheaths below much compressed and acutely keeled, often beset with bristles from bulbous bases, 3—21 in. long, .1—45 in. wide, often complicate, base semi-amplexicaul. Culms stout, 20—52 in. high; panicles 5—9 in. long, narrow, branches ascending; glumes of sessile spikelets .2—22 in. long, awn of upper .5—85 in. long; awn of lemma 1.7—2.8 in. long; glumes of pedicelled spikelets .33—35 in. long, lower with one awn .33—5 in. long, upper muticous or with an arista .22 in. long
2. *asper*.

Leaves not conspicuously distichous, not bristly, not semi-amplexicaul:—

Culms robust, up to 6 ft. high, lower nodes often bearded; leaves 14—20 in. long, .4—65 in. wide; sparsely pilose at base, finely acuminate, sheaths not keeled; panicles 7—13 in. long, pyramidal, branches ultimately horizontal; sessile spikelet with a callus .04—07 in. long, glumes .21—28 in. long, upper with an awn .32—46 in. long; awn of lemma 1.3—1.7 in. long; glumes of pedicelled spikelets .34—42 in. long, lower with an awn .24—42 in. long, upper muticous.....3. *verticillatus*.

Culms comparatively slender, up to 3 ft. high, nodes glabrous; leaves 1.7—9.5 in. long, .1—3 in. wide, usually abruptly acute, pubescent, rarely glabrous, lower sheaths somewhat compressed and keeled; panicles 5—7 in. long, branches ascending; sessile spikelets with a callus .09—2 in. long, glumes .18—23 in. long, awn of upper .36—66 in. long, awn of lemma 1.5—2.4 in. long; glumes of pedicelled spikelets .26—36 in. long, awn of lower .25—63 in. long, upper finely acuminate, muticous or mucronate.....4. *orientalis*.

Glumes of pedicelled spikelets .37—53 in. long, acuminate or caudate-acuminate, not aristate or awned. Culms 7—36 in. high; leaves 8—14 in. long, .15—6 in. wide, complicate, rather stiff, often densely imbricate at the base; panicles 3—6 in. long, branches erect or spreading; sessile spikelets with a callus .04—06 in. long, glumes .23—26 in. long, upper mucronulate or with an arista up to .26 in. long, awn of lemma 1.25—1.45 in. long...5. *zeylanicus*.

Pedicels less than half as long as the sessile spikelets:—

Leaves glabrous:—

Leaves not distichous:—

Upper glume of sessile spikelets more or less ciliate, usually rufous-hairy on the keel; glumes of pedicelled spikelets usually pubescent or hispid, lower aristate. Rootstock often creeping; culms 9—38 in. high; leaves 1.8—8 in. long, .05—1 in. wide, usually rigid, sometimes ciliate from bulbous bases; panicles 1.5—3 in. long, branches usually spreading; glumes of sessile spikelets .12—22 in. long, upper with an arista .26—33 in. long, awns of lemmas .92—1.1 in. long; glumes of pedicelled spikelets .13—22 in. long, lower with an arista .14—22 in. long (in variety *robusta* all parts larger)

6. *montanus*.

Upper glume of sessile spikelets glabrous; glumes of pedicelled spikelets muticous, glabrous. Culms 6 ft. or more high; leaves 6—36 in. long, .2—3 in. wide, sheaths silky at base, margins often silky-ciliate; panicles 4—6 in. long, branches spreading; glumes of sessile spikelets .17—22 in. long, upper with arista .12—3 in. long, awn of lemmas .76—1.2 in. long; glumes of pedicelled spikelets .17—18 in. long.....7. *Hackelii*.

Leaves conspicuously distichous, 4.5—8.2 in. long, .15—2 in. wide. Rootstock woody, creeping; culms up to 3 ft. high; panicles 3—6 in. long, branches ascending; hairs of pedicels and callus pale straw-coloured, latter slender, glabrous in upper half; glumes of sessile spikelets .22—24 in. long, upper mucronate; awn of lemma .47—56 in. long; glumes of pedicelled spikelets .22 in. long, muticous.....8. *polyphyllus*.

Leaf-sheaths and blades puberulous, blades 5—9 in. long, $\frac{1}{4}$ — $\frac{1}{2}$ in. wide. Culms 1—2 ft. high; panicles 2—3 in. long, branches spreading with sparsely, shortly, white-ciliate apices; glumes of sessile spikelets $\frac{21}{2}$ — $\frac{25}{2}$ in. long, pale, upper more or less rufous-hairy, with an arista $\frac{16}{2}$ — $\frac{28}{2}$ in. long; awn of lemmas 1—2 in. long; glumes of pedicelled spikelets $\frac{15}{2}$ — $\frac{2}{2}$ in. long, muticous, lower rufous-hispid in lower half.....9. *velutinus*.

1. CHRYSOPOGON ACICULATUS, Trin. *Andropogon aciculatus*, Retz.; F. B. I. vii. 188.
In all Districts; sea-level to 2,000 ft. The Love-grass. Eaten by cattle before flowering. Vern. Tel. Putthi gaddi.
2. CHRYSOPOGON ASPER, Heyne ex Hook. f. *Andropogon asper*, Heyne ex Hook. f.; F. B. I. vii. 189; S. I. G. figs. 155, 156.
Cuddapah District; Horsleykonda; Kambakkam Hills; Nilgiri Hills at Naduvattam; 1,000—6,000 ft.
Doubtfully distinct from *C. orientalis*, A. Camus.
3. CHRYSOPOGON VERTICILLATUS, Trin. *Andropogon verticillatus*, Roxb.; F. B. I. vii. 189.
Rampa Hills at 2,000—3,000 ft. (Narayanaswami); Godavari District (Bourne).
4. CHRYSOPOGON ORIENTALIS, A. Camus. *Andropogon Wightianus*, Steud.; F. B. I. vii. 191; S. I. G. fig. 157.
In most Districts from Cuddapah southwards; sea-level to 7,000 ft.
A conspicuous grass owing to the bright red or purple glumes of the pedicelled spikelets.
5. CHRYSOPOGON ZEYLANICUS, Thw. *Andropogon zeylanicus*, Nees; F. B. I. vii. 192.
W. Gháts; 4,000—8,000 ft.
The glumes of the pedicelled spikelets are purple and green. Vern. Kan. Badi hullu.
6. CHRYSOPOGON MONTANUS, Trin. *Andropogon monticola*, Schult.; F. B. I. vii. 192; S. I. G. fig. 158.
In all Districts except the W. Coast; sea-level to 3,000 ft.
Often on laterite soil.
A good fodder grass. Vern. Tel. Gurra batto kelu.
Var. *robustus*, Hook. f.; F. B. I. vii. 193.
Culms stouter and taller; all parts larger.
Godavari, Kistna, Guntur, Bellary and Coimbatore Districts. Vern. Kan. Chello san kanni.
7. CHRYSOPOGON HACKELII, C. E. C. Fischer n. comb. *Andropogon Hackelii*, Hook. f.; F. B. I. vii. 194.
W. Gháts from Coorg to Travancore; 2,000—5,000 ft.
8. CHRYSOPOGON POLYPHYLLUS, Blatter et McCann. *Andropogon polyphyllus*, Hack. ex Hook. f.; F. B. I. vii. 194.
Godavari District; Devypatnam (Gamble) and Kolur Gorge (Bourne).
9. CHRYSOPOGON VELUTINUS, Arn. ex Hook. f. *Andropogon velutinus*, Hook. f.; F. B. I. vii. 194.
Cuddapah District (Wight).

29. *Dichanthium*, Willemet

Perennial, seldom annual, tufted herbs. *Leaves* narrow. *Inflorescence* of subdigitate, rarely solitary, subpanicked or racemously arranged, short-peduncled, spiciform racemes; joints and pedicels slender. *Spikelets* 2-nate, one sessile, the other pedicelled, similar in shape and size, differing in sex, the lowermost 1—2 pairs of the raceme usually homogamous and ♂ or empty. *Sessile spikelets* dorsally compressed: *Glumes* equal, thinly chartaceous; lower usually rounded at the apex, 2-keeled, at least in the upper half; upper boat-shaped, acutely 1-keeled. *Lemmas* usually without palea, sometimes a minute upper one present; lower hyaline empty; upper reduced to a firm pale stipe hyaline at base, passing into a geniculate awn, the stipe rarely very narrowly margined and finely 2-fid at apex; its floret bisexual. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* oblong, obtuse, slightly compressed. *Pedicelled spikelets* awnless; lower lemma present or not, if present sometimes empty, sometimes containing a ♂ floret.

Culms leafy; leaves glabrous or sparsely hairy; glumes .18 in. or less long; upper lemma of sessile spikelets reduced to an awn:—

Stem below inflorescence and peduncles of spikes glabrous:—

Culm nodes patently hairy, rarely glabrous; culms up to 40 in. high; leaves 2—11 in. long, .1—2 in. wide; racemes 2—9, 1—3 in. long; glumes .1—1.5 in. long, lower of sessile spikelets elliptic, apex rounded or narrowed and obtuse; awns .6—1 in. long.....1. *annulatum*. Nodes usually glabrous, seldom somewhat hairy, rarely patently so; racemes solitary or sometimes 2-nate; lower glume of sessile spikelets obovate or obovate-oblong:—

Culms usually erect from a geniculate base, 10—36 in. high, occasionally dwarf and 3—4 in. high; leaves 1.5—4.5 in. long, .05—1.7 in. wide; racemes 1.4—2.2 in. long; glumes .12—1.5 in. long, apex rounded or subacute; awns .6—9 in. long.....2. *caricosum*.

Culms creeping, apical 2—6 in. erect; leaves .9—2 in. long, .05—1 in. wide; racemes .8—1 in. long; glumes .16 in. long, apex rounded; awns .75 in. long.....3. *pallidum*.

Stem below the inflorescence usually and peduncles always softly, patently hairy; culms 1—4 ft. high; nodes usually patently hairy, sometimes glabrous; leaves 3—12 in. long, .1—2 in. wide; racemes 1—6, 2—3.5 in. long; glumes .13—1.8 in. long, lower of sessile spikelets elliptic-oblong to broadly obovate, apex rounded or narrowed and obtuse; awns .7—1.1 in. long.....4. *nodosum*.

Culms naked or with 1—2 reduced leaves, 20—40 in. high, slender; leaves mostly basal, 7—10 in. long, .1 in. wide, the cauline up to 4.5 in. long, softly hairy on both sides, often involute; racemes usually solitary, sometimes 2—3, 2—2.2 in. long; glumes .26—4 in. long, lower of sessile spikelets narrowly elliptic-oblong to lanceolate, acute or obtuse, up to .36 in. long; awns .9—1.2 in. long, their bases with a narrow hyaline margin cleft for about $\frac{1}{2}$ its length into 2 capillary lobes.....5. *polytychum*.

1. *DICHANTHIUM ANNULATUM*, Stapf. *Andropogon annulatus*, Forsk.; F. B. I. vii. 196; S. I. G. figs. 160, 161.

In all the Eastern and Central Districts; at low elevations. A fair fodder.

2. *DICHANTHIUM CARICOSUM*, A. Camus. *Andropogon caricosus*, Linn.; F. B. I. vii. 196; S. I. G. fig. 159.

In all Districts except the W. Coast; near sea-level to 3,000 ft. A fair fodder. Vern. Kan. Urukun hullu.

3. *DICHANTHIUM PALLIDUM*, Stapf MS. n. comb. *Apocopsis pallida*, Hook. f.; F. B. I. vii. 143.
Nilgiri Hills (Foulkes).
This may be an impoverished form of the last species.
4. *DICHANTHIUM NODOSUM*, Willem. *Andropogon caricosus*, Linn. var. *mollicomus*, Hack.; F. B. I. vii. 196.
Mysore State; Godavari, Bellary, Salem and Coimbatore Districts; 1,000—3,000 ft.
5. *DICHANTHIUM POLYPTYCHUM*, A. Camus. *Andropogon polyptychus*, Steud.; F. B. I. vii. 198.
Nilgiri and Pulney Hills (Bourne); 6,000—7,000 ft.

30. Heteropogon, Pers.

Annual or perennial usually branched herbs; branches mostly flowering and gathered into spatheate panicles. *Leaves* narrow, flat. *Racemes* spiciform, usually solitary, terminating the culms or their sometimes fascicled branches; spikelets 2-nate, one sessile, the other pedicelled, the 1—several lower pairs alike, ♂ or empty, the upper pairs differing in sex and strikingly in shape; rhachis many-jointed, not or tardily disarticulating between the homogamous pairs of spikelets, fragile between the heterogamous. *Fertile sessile spikelets* terete or subterete. *Callus* often pungent, densely bearded upwards. *Glumes* equal, coriaceous or chartaceous, obtuse. *Lemmas* hyaline; lower empty; upper very slender, cartilaginous at apex and passing into a usually stout, geniculate awn; palea small or 0, enclosed floret ♀ or bisexual. *Lodicules* 2, large to minute. *Stamens* 3, or rudimentary or 0. *Grain* sublinear, terete; embryo slightly more than half as long. *Lower sessile and pedicelled spikelets* dorsally compressed, often twisted, imbricate: *Glumes* dissimilar; lower 2-keeled, usually winged upwards on one or both keels. *Lemmas* hyaline, often more or less reduced or suppressed, with or without 3 stamens.

Joints and pedicels glabrous; lower glume of fertile spikelets tightly involute, brown-hispid:—

Culms usually tall, comparatively stout; leaves glabrous or more or less setose from tubercles at the base; upper glume of fertile spikelets deeply grooved on both sides of the midrib:—

Leaves basal or basal and cauline, not strikingly distichous, very variable, 2—17 in. long, .1—4 in. wide. Culms 6—45 in. high; racemes 1—2.5 in. long; fertile spikelets with a callus .07—11 in. long, densely rufous-hairy; glumes .15—22 in. long; awns 2—3.5 in. long; lower glume of other spikelets .23—31 in. long, glabrous or more or less densely setose from tubercles, upper glume slightly longer, glabrous or with a few apical setae from tubercles

1. contortus.

Leaves from the middle of the culm, strikingly distichous, rigid, complicate, usually curved, 1—3 in. long, .1—1.3 in. wide. Culms 15—18 in. high, sheathed below; glumes of fertile spikelets .24—27 in. long; awns .21—24 in. long; glumes of other spikelets .36—4 in. long, subequal, glabrous

contortus var. distichus.

Culms slender, 6—9 in. high; leaves 1—2.5 in. long, .05 in. wide, glabrous or puberulous, ciliate at base; racemes .5—1.5 in. long; fertile spikelets with a callus .09—1 in. long, rufous-hairy on one side, glumes .22—23 in. long, upper not channelled, awns 1.6 in. long; glumes of other spikelets .28 in. long, glabrous

2. polystachyos.

Joints and pedicels whitish hairy; lower glume of fertile spikelets not tightly involute:—

Leaves flat, .5—2.6 in. long, .12—22 in. wide, hirsute, margins thickened. Culms slender, almost capillary, 2—12 in. high; racemes sometimes 2-nate, .5—1.5 in. long; lower glume of fertile spikelets .13—16 in. long, oblong, convex, pale silky-hairy at least below the middle, upper boat-shaped, hardly keeled, glabrous; awns 1—1.6 in. long, glabrous in basal half; glumes of other spikelets .14—18 in. long, lower elliptic-oblong, truncate or 3-lobulate, 2-keeled, keels narrowly winged at apex.....3. *oliganthus*.

Leaves tightly involute, filiform, 3—8 in. long, glabrous. Culms wiry, 16 or more in. high; racemes 2—2.5 in. long; glumes of fertile spikelets .23—26 in. long, glabrous, lower narrowly linear-lanceolate, 2-toothed, 2-keeled at apex, with a deep median channel below the middle, glabrous, upper narrowly boat-shaped, not keeled, arista .13—15 in. long, slender, hairy below the middle; glumes of other spikelets .31—34 in. long, narrowly lanceolate, acuminate, 2-keeled, glabrous.....4. *bellariensis*.

1. *HETEROPOGON CONTORTUS*, Beauv. ex Roem. et Schult. *Andropogon contortus*, Linn.; F. B. I. vii. 199; S. I. G. figs. 162, 163.

In all Districts; sea-level to 7,500 ft.

All the awns of a raceme often twisted about each other. A variable and very common, gregarious and very troublesome grass owing to the sharp, barbed callus and the hygroscopic awns which cause the fruit to adhere to and penetrate into the clothing of man and the hairs of animals. The Spear-grass.

A good fodder and suitable for hay-making, but when in fruit the latter should first be separated. Useful for thatching. Vern. *Hind.* Kher; *Ur.* Sinkolo; *Tel.* Eddi gaddi, Kaseri gaddi; *Dubba* gasari gaddi, Yerragoyi; *Tam.* Oosi pullu, Karunsi pullu, Pani pullu; *Kan.* Kari vunugada hullu, Sunkari hullu.

Var. *distichus*, C. E. C. Fischer n. var.

Anamallais at 3,500 ft. (Barber); Kodaikanal, 6,000—7,000 ft. (Bourne).

2. *HETEROPOGON POLYSTACHYOS*, Schult. *Andropogon polystachyos*, Roxb.; F. B. I. vii. 202.

Without precise locality (Wight).

3. *HETEROPOGON OLIGANTHUS*, Blatter et McCann. *Andropogon oliganthus*, Hochst.; F. B. I. vii. 201.

W. Ghâts from Kudrai Mukh to Travancore; 3,000—8,000 ft.

4. *HETEROPOGON BELLARIENSIS*, C. E. C. Fischer n. comb. *Andropogon bellariensis*, Hack.; F. B. I. vii. 201.

Anantapur District on Gooty Fort Hill (Campbell, Wight).

31. *Themeda*, Forsk.

Coarse annual or perennial herbs. Leaves narrow. Inflorescence terminating the culms and their upper branches in short solitary racemes subtended by spathes, crowded in panicle, often, glomerate fascicles; rhachis terete, tough or tardily disarticulating and glabrous between the homogeneous pairs of spikelets, readily disarticulating above them. Spikelets 2-nate, the terminal group 3-nate; 2 lowest pairs persistent, alike, ♂ or empty, sessile or subsessile, closely approximate to form a quasi involucre, the following pairs differing in sex and conspicuously in shape, one sessile, the other on a jointed pedicel, and falling with the upper part of the pedicel. Involucral and pedicelled

spikelets similar, the latter narrower, much dorsally compressed, awnless: *Glumes* usually 2; lower 2-keeled, one or both keels sometimes scariously winged; upper occasionally suppressed. *Lemmas* hyaline; upper often suppressed, both or either with or without a ♂ floret. *Sessile spikelets* above the involucre terete: *Callus* usually acute to pungent, so densely bearded as to conceal more or less the adjacent joint and pedicel bases. *Glumes* equal, coriaceous except the submembranous tips; lower tightly involute, without keel, sometimes grooved down the middle; upper with a deep longitudinal groove on each side, firm between the grooves, margins thin. *Lemmas* dissimilar; lower hyaline, epaleate, empty; upper stipitiform, base hyaline, cartilaginous upwards and passing into a stout geniculate awn, or hyaline throughout and awnless or passing into a more or less reduced awn, paleate or not, containing a bisexual floret. *Lodicules* 2, rather large. *Stamens* 3. *Styles* 2. *Grain* linear-obovate, subterete, grooved on the front; embryo about half as long.

Involucral spikelets all on the same level; only one bisexual spikelet in the raceme:—

Branching strict; clusters of inflorescence very numerous in numerous fascicles:—

Perennial, erect; culms robust, up to 10 ft. high; leaves 10–20 in. long, .1–.55 in. wide; clusters in globose or fan-shaped, drooping fascicles; lower glumes of involucre spikelets .23–.42 in. long, glabrous or more or less setose from tubercles; lower glume of bisexual spikelets .18–.27 in. long, glabrous, pubescent or rarely densely silky, sometimes muriculate, apex usually hispid; awns .6–2.5 in. long.....1. *triandra*.

Annual, erect or more often geniculately ascending and scrambling; culms slender, up to 6 ft. long; leaves up to 12 in. long and .25 in. wide; clusters usually narrow, erect or suberect; lower glumes of involucre spikelets .18–.2 in. long, margins in upper half beset with stiff bristles from large tubercles; lower glumes of bisexual spikelets .16–.17 in. long, puberulous; awns 1.3–1.5 in. long.....2. *quadrivalvis*.

Branching very effuse; clusters few in few, small, superposed fascicles on filiform branches; leaves on the main culms up to 14 in. long and .3 in. wide, tips filiform, upper leaves 3–4 in. long, filiform; lower glumes of involucre spikelets .26–.27 in. long, glabrous except for a very few bristles from tubercles near the apex; lower glumes of bisexual spikelets .18 in. long, glabrous and shining below, hispidulous at apex; awns 1–1.7 in. long.....3. *laxa*.

Involucral spikelets in superposed pairs; often 2 bisexual spikelets in the raceme:—

Panicle racemiform; lower glumes of bisexual spikelets .12–.14 in. long, back longitudinally channelled. Culms usually slender, up to 4 ft. high, leafy, not clothed at base with leaf-sheaths; leaves 3–20 in. long, .1–.55 in. wide; spathules usually finely setose from large tubercles; lower glumes of involucre spikelets .26–.34 in. long; setose from minute tubercles; awns .8–1.3 in. long.....4. *tremula*.

Panicle decompound, thyriform; lower glumes of bisexual spikelets .14–.18 in. long, not channelled. Culms robust, up to 10 ft. high, clothed at the base with broad, coriaceous, equitant leaf-sheaths; leaves up to 4 ft. long and .33 in. wide; spathules slender, glabrous; lower glumes of involucre spikelets .17–.24 in. long, glabrous, rarely setose from minute tubercles, apex hispidulous; awns .6–.9 in. long.....5. *cymbaria*.

1. THEMEDA TRIANDRA, Forsk. *Anthistiria imberbis*, Retz.; F. B. I. vii. 211.

In all Districts; sea-level to 7,000 ft.

Very variable, especially in indumentum. Eaten by cattle only when young. Vern. *Tam. Erigai thattu pullu*; *Kan. Bettanchi hullu*, *Thodda anji hullu*, *Gondamanchi hullu*.

2. *THEMEDA* QUADRIVALVIS, O. Ktz. *Anthistiria ciliata*, Linn. f.; F. B. I. vii. 213.
Ganjam, Kurnool, Bellary, Coimbatore and Tinnevely Districts; Coorg, Mysore State. Ver. Kan. Guntu nalai hullu.
3. *THEMEDA* LAXA, Stapf ex Haines. *Anthistiria laxa*, Anderss.; F. B. I. vii. 213.
Rampa (Narayanswami) and Vizagapatam Districts. (K. Ranga Achariyar), 2,500 ft.
4. *THEMEDA* TREMULA, Hack. *Anthistiria tremula*, Nees; F. B. I. vii. 214; S. I. G. fig. 165.
Hills from Coorg to Travancore; S. Kanara District; near sea-level to 7,000 ft.
5. *THEMEDA* CYMBARIA, Hack. *Anthistiria cymbaria*, Roxb.; F. B. I. vii. 215.
W. Gháts; 1,000—7,000 ft. Vern. Tam. Noshia palai pullu; Kan. Balai hullu.

32. *Iseilema*, Andersson

Annual or perennial; culms compressed, at least at base. *Leaves* narrow with compressed, keeled sheaths. *Panicles* with usually fascicled branches interspersed with spathe-like bracts. *Racemes* fascicled, each in the axil of a complicate spathe with scarious margins. *Spikelets* lanceolate, the four basal whorled to form a quasi involucre as in *Themeda*, but all pedicelled; rhachis short, bearing one sessile and two pedicelled spikelets, or sometimes 2-jointed and then the lower with one sessile and one pedicelled spikelet, disarticulating from the peduncle immediately below the involucre spikelets. *Involucral and upper pedicelled spikelets* similar, the latter usually narrower and with longer pedicels, sometimes much reduced or represented by the pedicel alone: *Glumes* membranous, subequal, more or less 2-keeled, usually strongly nerved. *Lemmas* hyaline, usually only the lower present, epaleate, containing a ♂ floret. *Sessile spikelets* with a very short, more or less bearded callus: *Glumes* subequal, coriaceous or chartaceous; lower lanceolate, truncate, emarginate or 2-toothed; upper more or less boat-shaped, acute. *Lemmas* dissimilar; lower short, hyaline, epaleate, empty; upper a hyaline stipe passing into a geniculate awn, subtending a bisexual floret. *Lodicules* 2. *Stamens* 3. *Grain* oblong, dorsally compressed; embryo half as long.

Pedicels of involucre spikelets longer than broad, glabrous; glumes membranous; glumes of sessile spikelets lanceolate, glabrous on the back; upper pedicels slender, .05—1 in. long, sparsely hairy, their spikelets like the involucre:—

Spathes very narrow, rarely without minute tubercles on the keel and margins; peduncles very slender, .28—5 in. long, often much exserted, hispidulous upwards, minutely tubercular at apex. Culms 4—36 in. high; leaves 1.2—6 in. long, .05—1 in. wide; pedicelled spikelets .14 in. long; glumes of sessile spikelets .11—12 in. long; awns .4 in. long.....1. *prostratum*.
Spathes comparatively broad, devoid of tubercles; peduncles .08—1 in. long, not exserted, devoid of tubercles. Culms 10—40 in. high; leaves 2—8 in. long, .05—15 in. wide; pedicelled spikelets .17—21 in. long; glumes of sessile spikelets .14—2 in. long; awns .45—5 in. long.....2. *laxum*.

Pedicels of involucre spikelets as broad at apex as long, sides and base densely bearded; glumes coriaceous, .23—27 in. long, longitudinally depressed on each

side of midrib. Culms 3—30 in. high; leaves 1—4·5 in. long, ·07—·18 in. wide; spathes usually glabrous, sometimes sparsely ciliate from rather large tubercles; glumes of sessile spikelets beaked, the beak 2-keeled, lower ·22—·24 in. long, back more or less pubescent, upper slightly shorter, more or less 1-keeled; awns ·54 in. long; upper pedicels ·12—·15 in. long, capillary, glabrous, bearing 1 or 2 much reduced glumes or none.....3. *anthephoroides*.

1. *ISEILEMA PROSTRATUM*, Anderss. *I. Wightii*, Anderss.; F. B. I. vii. 218.

Northern and Eastern Districts; Nilgiri and Coimbatore Districts; at low elevations in the drier parts.

An excellent fodder.

2. *ISEILEMA LAXUM*, Hack.; F. B. I. vii. 218; S. I. G. figs. 166—168.

In all Eastern and Central Districts from Ganjam to S. Arcot; Mysore State; sea-level to 2,500 ft.

An excellent fodder. Often confused with the previous species. Vern. *Tel.* Erra chengali gaddi; *Tam.* Tenga nari pillu.

3. *ISEILEMA ANTHEPHOROIDES*, Hack.; F. B. I. vii. 219; S. I. G. figs. 169, 170.

In the coastal Districts from Ganjam to Nellore; Bellary and Cuddapah Districts; sea-level to 1,000 ft.

33. *Pseudanthistiria*, Hook. f.

Annual herbs. *Leaves* narrow. *Panicles* leafy; branches slender, each terminating in a subumbellate fascicle of racemes subtended by a spathe-like bract. *Racemes* subtended by a complicate, acuminate or caudate, keeled spathe, resembling those of *Themeda*, but lacking the involucre spikelets, 2-jointed, the basal with one sessile and one pedicelled spikelet, the upper with one sessile and 2 pedicelled. *Sessile spikelets* with a short, short-bearded callus: *Glumes* subequal; lower chartaceous, slightly narrowed upwards, truncate, margins narrowly inflexed in upper part, broadly involute below; upper membranous, lanceolate acute or obtuse. *Lemmas* dissimilar; lower small, quadrate, empty; upper stipitiform, hyaline below, hardening upwards into a fine geniculate awn, subtending a bisexual floret. *Lodicules* 2, rather large. *Stamens* 3. *Grain* small. *Pedicelled spikelets* with slender pedicels $\frac{1}{2}$ as long: *Glumes* subequal, membranous. *Lemmas* 0, or sometimes one present. *Lodicules* and *stamens* as in the sessile spikelet.

Leaves tapering from base to apex, more or less hairy from tubercles on both sides; primary nerves 3—4 on each side of the midrib distinct from the finer secondaries; peduncles ·04 in. long, pubescent; back of lower glume of sessile spikelets not sulcate; lower glume of pedicelled spikelets usually sparsely setose at apex:—

Spathes ·25—·3 in. long, margins setose, usually from minute tubercles; lower glume of sessile spikelets nerveless or nerves 2 at the apex, ·1—·11 in. long. Culms erect, up to 2 ft. high; leaves 1·5—6 in. long, ·06—·15 in. wide, base slightly narrowed; awns ·6—·76 in. long; lower glume of pedicelled spikelets ·1—·12 in. long.....1. *heteroclita*.

Spathes ·32—·8 in. long, margins only or most of the face in lower half bristly from rather large, sometimes blackish tubercles; lower glume of sessile spikelets ·12—·22 in. long, 7-nerved. Culms erect, up to 3 ft. high; leaves 3—7·5 in. long, ·18—·3 in. wide, base rounded; awns ·9—1·2 in. long; lower glume of pedicelled spikelets ·14—·22 in. long.....2. *hispida*.

Leaves widest near the middle, glabrous, primary and secondary nerves usually indistinguishable, ·9—2·4 in. long, ·1—·3 in. wide. Culms erect from decumbent,

rooting bases, slender, up to 18 in. high; spathes 4—52 in. long, margins finely ciliate from minute tubercles; peduncles .05—12 in. long, hairy; lower glume of sessile spikelets .14—18 in. long, 7-nerved, back slightly sulcate on each side of the midrib; awns .75—1 in. long; lower glume of pedicelled spikelets .2—24 in. long, not setose.....3. *umbellata*.

1. *PSEUDANTHISTIRIA HETEROCLITA*, Hook. f.; F. B. I. vii. 219.
S. Kanara and S. Malabar District; near the coast.
2. *PSEUDANTHISTIRIA HISPIDA*, Hook. f.; F. B. I. vii. 219.
Mysore State; S. Kanara; sea-level to 4,000 ft.
3. *PSEUDANTHISTIRIA UMBELLATA*, Hook. f.; F. B. I. vii. 220.
Godavari District; W. Coast and Gháts, from Coorg southwards; sea-level to 4,000 ft.

34. *Apluda*, Linn.

Annual or perennial, leafy herbs, often geniculate and rooting from the nodes. *Leaves* flat, sometimes petioled. *Panicles* compound, leafy; branchlets clustered, clusters subtended by a spathe. *Spikelets* in threes at the tips of the branchlets, embraced by a boat-shaped bract, 1 sessile and 2 pedicelled, all similar in shape, muticous or the sessile awned, alike in sex or more often the pedicelled ♂ only; the whole falling together with the bulbous basal joint, or else the pedicelled spikelet when fertile disarticulating separately; the terminal spikelet small or almost suppressed, on a broad, flat, glume-like pedicel. *Glumes* equal; lower convolute, margins not or very narrowly inflexed; upper keeled. *Lemmas* hyaline, paleate; lower entire muticous, usually containing a ♂ floret; upper deeply 2-fid, and geniculately awned from the sinus or entire or nearly so and muticous, containing a bisexual floret, or in the pedicelled spikelets with a ♂ floret. *Lodicules* 2. *Stamens* 3. *Grain* oblong, slightly laterally compressed.

Upper lemma of sessile spikelets 2-lobed for half its length or more; awn .26—66 in. long. Culms 1—10 ft. high; leaves 2.5—15.5 in. long, .1—65 in. wide, narrowed at the base and often with a petiole up to 1.5 in. long; bracts .16—34 in. long, aristate; basal joint small and hemispheric or up to .16 in. long and turbinate or cylindric; lower glume of sessile spikelet .12—31 in. long, margins narrowly winged above the middle.....1. *aristata*.

Upper lemma of sessile spikelet entire or very shortly 2-lobed, awnless. Otherwise as in the last species, but more slender, usually smaller in all its parts and more glabrous.....2. *mutica*.

1. *APLUDA ARISTATA*, Linn. *A. varia*, Hack. subsp. *aristata*, Hack.; F. B. I. vii. 150; S. I. G. figs. 142, 143.

In all Districts; sea-level to 7,000 ft.

Common, very variable in the dimensions of all its parts and in indumentum. Often scrambling over bushes.

A fairly good fodder, readily eaten by cattle when young. Vern. *Hind.* Gururna; *Tam.* Manda pillu, Mungil pillu, Sengamanri pillu; *Kan.* Sanna kari kachi hullu, Akku hullu.

2. *APLUDA MUTICA*, Linn. *A. varia*, Hack. subsp. *mutica*, Hack.; F. B. I. vii. 150.
Pondicheri (Perrottet).

35. *Eremopogon*, Stapf

Perennial, rarely annual, erect herbs; culms simple below, more or less branched above, sometimes in fastigate bundles each supported by a bladeless sheath. *Racemes* spiciform, solitary, terminating each branchlet, spatheate; rhachis many-jointed, fragile, joints and pedicels filiform. *Spikelets* 2-nate, one sessile and one pedicelled, similar in shape, differing in sex, except the 1—3 lowest pairs which are homogeneous and ♂ or empty, disarticulating horizontally. *Sessile spikelets* dorsally compressed: *Callus* small, shortly bearded. *Glumes* equal, thinly chartaceous to membranous; lower 2-keeled with narrowly inflexed margins; upper boat-shaped, acutely 1-keeled. *Lemmas* dissimilar; lower hyaline; upper reduced to a slender stipe, hyaline below, passing into a geniculate awn, rarely with a very narrow hyaline margin shortly cleft at the apex, subtending a bisexual floret; paleas 0. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Pedicelled spikelets* similar to the sessile, but awnless. *Lemmas* usually absent, sometimes one hyaline, containing a ♂ floret.

EREMOPOGON FOVEOLATUS, Stapf. *Andropogon foveolatus*, Del.; F. B. I. vii. 168; S. I. G. figs. 148, 149.

In all the hotter parts; Bababudan Hills (Meebold); sea-level to 3,000 ft.

Culms tufted, 6—30 in. high; basal sheaths white- or cream-tomentose; leaves 1·3—6 in. long, almost filiform to 1 in. wide; racemes 6—1·5 in. long; glumes 12—14 in. long, lower ones with a circular median pit above the middle of the back; awns 7—9 in. long. A good fodder.

36. *Schizachyrium*, Nees

Annual or perennial herbs. *Leaves* narrow. *Inflorescence* of terminal, solitary, spiciform racemes supported by or more or less enclosed in narrow spathes, frequently collected into a false panicle; rhachis fragile, many-jointed; joints often stout, thickened upwards with a scarious, cupuliform, more or less toothed terminal appendage. *Spikelets* 2-nate, one sessile, the other pedicelled, differing in sex and often in size and shape, both falling together with the contiguous joint. *Sessile spikelets* dorsally compressed: *Glumes* subequal; lower chartaceous or subcoriaceous. *Lemmas* hyaline; lower empty; upper 2-toothed or 2-fid, rarely entire, awned from the apex or sinus, containing a bisexual floret. *Lodicules* 2. *Stamens* 3, rarely 2. *Styles* 2, free. *Grain* narrowly linear, subterete; embryo short. *Pedicelled spikelets* similar; lower lemma empty; upper if present containing a ♂ floret.

Culms solitary or 2—3 together, 2—30 in. high, divaricately branched from most of the nodes; leaves suddenly narrowed to a sharp point, at least those on the main stems, base rounded and constricted, 7—1·8 in. long, 0·7—2 in. wide; spathes 4—7·5 in. long, usually as long as the raceme; joints 0·8—1·1 in. long, glabrous, with a tuft of hairs at the base; lower glume of sessile spikelets 1—1·2 in. long; minutely puberulous; callus with a tuft of hairs; awns 28—36 in. long

1. *brevifolium*.

Culms tufted, usually densely so, 2—22 in. high, fastigiate branched; leaves tapering from the not or slightly constricted base to the acuminate tip, 1—4 in.

long, .05—1 in. wide; spathes .8—1.7 in. long, often becoming bright red, racemes usually exserted; joints .17—2 in. long, densely long white-hairy on the back; lower glume of sessile spikelets .2—2.2 in. long, back long-white-hairy; awns .4—5.5 in. long.....2. *exile*.

1. *SCHIZACHYRIUM BREVIFOLIUM*, Nees. *Andropogon brevifolius*, Sw.; F. B. I. vii. 165.

Godavari District at Bison Hill (Barber); Nilgiri Hills at Gudalur; Travancore State.

2. *SCHIZACHYRIUM EXILE*, Stapf. *Andropogon exilis*, Hochst.; F. B. I. vii. 166.

Nellore and Anantapur Districts; Travancore State.

37. *Andropogon*, Linn.

Usually perennial, erect herbs. *Leaves* usually flat. *Inflorescence* of paired, rarely solitary, or corymbose, often digitate or subdigitate, spiciform racemes subtended by spathes, terminating the culms or their branches, sometimes collected into false panicles; rhachis articulated, fragile; joints and pedicels very slender, usually plano-convex, thickened upwards, cupped and usually 2—3-toothed at the apex, more or less densely ciliate. *Spikelets* 2-nate, one sessile, the other pedicelled, differing in sex and usually more or less in shape and size, the lowest pair sometimes homogeneous and imperfect. *Sessile spikelets* dorsally or laterally compressed: *Glumes* equal or subequal, membranous to coriaceous; lower flat, concave or channelled on the back, margins inflexed and sharply keeled at least in the apical half, keels sometimes winged; upper boat-shaped, 1-keeled upwards, sometimes aristulate. *Lemmas* hyaline or the upper one firmer, with or without small paleas; lower empty; upper 2-toothed or -fid, awned from the sinus, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Grain* subulate to oblong, subterete or plano-convex; embryo half as long. *Pedicelled spikelets* often very different from the sessile, always more or less dorsally compressed, never concave or channelled on the back, sometimes reduced and small or entirely suppressed: *Glumes* membranous to chartaceous; upper often 2-keeled upwards, keels sometimes narrowly winged; lower mucicous or aristulate. *Lemmas* if present, hyaline, ciliate, mucicous; lower empty; upper containing a ♂ floret.

Leaves not or only slightly narrowed at the base:—

Lower glume of sessile spikelets linear-oblong, back deeply channelled, keels not winged; upper lemma of sessile spikelets shortly 2-fid:—

Culms 4—6 ft. high; lower leaves 1—3 ft. long, upper 10—20 in. long, .2—2.5 in. wide; racemes 3—5, sometimes only 2, 1—2 in. long; lower glume of sessile spikelets .17—1.8 in. long, upper .18—2 in. long with a fine arista .27—3.3 in. long; awn of upper lemma .6—1 in. long; glumes and lower lemma of pedicelled spikelets aristate.....1. *ascinodis*.

Culms 3—24 in. high; leaves 1.5—5 in. long, .05—2 in. wide; racemes 2, second, .5—1 in. long; glumes of sessile spikelets .18 in. long, upper mucronate; awns of upper lemmas .5—6 in. long; glumes and lemmas of pedicelled spikelets mucicous.....2. *pumilus*.

Lower glume of sessile spikelets flat, .28—3 in. long, keels usually winged at the apex. Culms up to 40 in. high; leaves 3—8 in. long, .1—2 in. wide, more or less hairy; racemes 2, 1.6—3 in. long; upper glume of sessile spikelets .26—3 in. long, with an arista .16—2.2 in. long; upper lemma cleft to the middle with an awn .55—7 in. long; lower glume of pedicelled spikelets aristate

3. *longipes*.

Leaves tufted at the base of culms 7—36 in. high, at least the lower tapering to a very narrow, often elongate, almost petioled base, 1·8—8·5 in. long, ·08—·16 in. wide; racemes 1—3, 1·6—2 in. long; glumes livid or purple, lemmas white or reddish-purple; lower glume of sessile spikelets flat, usually with a shallow depression near the base, keels often narrowly winged, apex 2-toothed or -mucronate, ·25—·34 in. long; upper lemmas cleft to the middle, lobes very narrow, awn ·5—8 in. long; glumes and lemmas of pedicelled spikelets muticous, lower glume often narrowly winged at the apex.....4. *lividus*.

1. ANDROPOGON ASCINODIS, C. B. Clarke. *A. apricus*, Hook. f. non Trin.; F. B. I. vii. 169.
Ganjam District at Aska (Gamble); Coorg.
2. ANDROPOGON PUMILUS, Roxb.; F. B. I. vii. 170; S. I. G. figs. 150, 151.
In all the drier tracts; sea-level to 4,000 ft.
Often on black-cotton soil.
3. ANDROPOGON LONGIPES, Hack.; F. B. I. vii. 170.
Nilgiri Hills.
4. ANDROPOGON LIVIDUS, Thw.; F. B. I. vii. 209.
Nilgiri and Pulney Hills, at high elevations; Anaimudi Peak in Travancore at 8,840 ft. (Barnes).
In open downs often burnt over.

38. Cymbopogon, Hack.

Perennial, densely tufted, often aromatic herbs. *Leaves* flat, often very coarse. *Inflorescence* of paired racemes, usually one of them sessile, the other peduncled, subtended by a spatheole, terminating the culms and their branches, collected into a frequently much-branched panicle; rhachis fragile, several-jointed; spikelets 2-nate, one sessile, the other pedicelled, lowest pair of one or both racemes homogamous (♂ or empty), the rest differing in sex and more or less in shape; joints and pedicels filiform, their tips often more or less cupped or auricled, those of the lowest pair sometimes conspicuously swollen, oblong or barrel-shaped. *Sessile spikelets* (except the lowest one) dorsally, rarely laterally compressed: *Callus* very short, obtuse, shortly hairy. *Glumes* subequal, more or less chartaceous; lower flat, slightly depressed, narrowly grooved or broadly channelled on the back, 2-keeled at least from the middle upwards, keels usually narrowly winged; upper boat-shaped, 1-keeled, keel sometimes narrowly winged. *Lemmas* hyaline; lower entire empty; upper 2-fid or -lobed, awned from the sinus or entire and muticous, rarely firmer and stipitiform below the awn; column of the awn smooth; paleas 0, usually containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* oblong, subterete or plano-convex; embryo half as long. *Pedicelled spikelets* differing more or less in shape and size from the sessile, never depressed or grooved on the back: *Glumes* muticous; lower chartaceous; upper thinner. *Lemmas* (usually the lower only present) hyaline, containing a ♂ floret, rarely both suppressed.

The following key is based on Dr. Stapf's in 'Kew Bull.', 1906, 350, and that of Melle. A. Camus in 'Rev. Bot. Appliq.', 1921, i, 271.

Spikelets awnless:—

Lower glume of fertile spikelets lanceolate, acute, back flat, 2-keeled, keels

narrowly winged, .16—18 in. long. Culms up to 5 ft. high; panicles pyramidal or linear-oblong.....1. *Nardus*.

Lower glume of fertile spikelets linear or linear-lanceolate, acuminate, back distinctly concave in lower half, .18—2 in. long. Very like the last species in other respects.....2. *citratus*.

Fertile spikelets bearing a slender, geniculate awn:—

Lower glume of fertile spikelets not channelled, at most slightly depressed or foveolate:—

Lowest pedicel not or hardly stouter than the rest; the longer leaves usually much narrowed to the base:—

Panicle often greyish, lax, with slender, long, flexuous, often drooping branches and comparatively inconspicuous spathes. Culms 3—6 ft. high; leaves 8—60 in. long, .1—8 in. wide; glumes .18—2 in. long, back of lower smooth or 1—2-foveolate.....3. *flexuosus*.

Panicle erect, dense, often interrupted, with rather conspicuous, frequently purplish-brown to blackish spathes. Otherwise hardly distinguishable from the last species, slightly more robust with rather shorter awns

4. *confertiflorus*.

Lowest pedicel of at least the sessile racemes much swollen, back convex, coriaceous. Culms 1—4 ft. high; leaves 6—25 in. long, .06—35 in. long, not narrowed to the base; panicles erect, narrow, often interrupted, hairs of joints and pedicels white, often conspicuously contrasting with the pale-brown spikelets; lower glume of fertile spikelets .15—2 in. long, its back flat or slightly depressed below the middle; awns .3—6 in. long.....5. *coloratus*.

Lower glume of fertile spikelets deeply channelled:—

Channel of glume in lower half, very narrow, corresponding to a rib on the inner side:—

Lowest pedicel of sessile racemes slightly swollen and connate to the base of the rhachis:—

Leaves linear-lanceolate, subcordate or amplexicaul, 3—18 in. long, .2—1.25 in. wide, finely caudate. Culms up to 6 ft. high; panicles 4—12 in. long, turning reddish (often very bright) when mature; glumes .13—16 in. long; awns .45—55 in. long.....6. *Martini*.

Leaves narrowly linear, not caudate or amplexicaul, 3—12 in. long, .15—3 in. wide. Culms up to 3 ft. high; panicles 4—8 in. long, glaucous or straw-coloured when mature; glumes .12—16 in. long; awns .3—7 in. long.....7. *caesius*.

Lowest pedicels not swollen, free from the rhachis. Culms 1—2 ft. high; leaves subcordate, finely acuminate, 2.5—8 in. long, .2—4 in. wide, often purplish near the base; panicles narrow, stiff, spathes often with rudimentary blades, purplish-brown with yellowish scarious margins; spikelets usually green in the lower part and purple in the upper; glumes .18 in. long; awns .4—5 in. long.....8. *polyneuros*.

Fertile glumes wedged between the rather stout joint and the pedicels, deeply channelled for most of its length and all its width between the keels, the channel ceasing abruptly a little above the base, which appears slightly humped, .15—16 in. long, not winged; awns .4—5 in. long. Culms slender, 6—25 in. high; leaves 1.5—15 in. long, .03—26 in. wide.....9. *Gidarba*.

1. CYMBOPOGON NARDUS, Rendle. *Andropogon Nardus*, Linn.; F. B. I. vii. 205: *A. Schoenanthus*, Wall. Pl. As. Rar. t. 28.

Only known in cultivation. Grown for its aromatic oil. The Citronella grass.

2. CYMBOPOGON CITRATUS, Stapf.

Occurring only as a cultivated plant grown for its aromatic oil. The Lemon grass. Vern. *Tel.* Vasana gaddi, Chippa gaddi, Nimma gaddi; *Tam.* Vasana pillu, Karpura pillu; *Mal.* Vasana pullu.

3. CYMBOPOGON FLEXUOSUS, Wats. *Andropogon Nardus*, Linn. var. *flexuosus*, Hack.; F. B. I. vii. 207.

- In all Districts from Bellary and Chingleput southwards, except on the W. Coast; W. Gháts. Also cultivated for the extraction of "Malabar lemon-grass oil." A white and a dark form are distinguished. The Ginger grass. Vern. *Tam.* Chukkunari pillu, Sukkunari pillu; *Mal.* Chukkunari pullu; *Kan.* Anthi balai.
4. CYMBOPOGON CONFERTIFLORUS, Stapf. *Andropogon Nardus*, Linn. var. *nilagiricus*, Hack.; F. B. I. vii. 206.
Rampa Hills (Narayanswami); W. Coast and Gháts; 3,000—6,000 ft. Vern. *Toda* Bambai.
5. CYMBOPOGON COLORATUS, Stapf. *Andropogon Nardus*, Linn. var. *coloratus*, Hook. f.; F. B. I. vii. 206.
In all Districts from Bellary and Nellore southwards except the W. coast; sea-level to 3,000 ft.
Used for thatch. Frequently deformed by a fungus, *Epichloe* sp. Vern. *Tel.* Botha gaddi; *Tam.* Manda pillu, Manakru pillu, Manjin pillu, Sengamani malai pillu, Sengana pillu; *Kan.* Badhai hullu, Karatha anjai hullu.
6. CYMBOPOGON MARTINI, Wats. *Andropogon Schoenanthus*, Linn. var. *Martini*, Hook. f.; F. B. I. vii. 204.
Eastern and Central Districts from Kistna and Bellary to Coimbatore and Salem; Mysore, Nilgiri and Pulney Hills; sea-level to 5,000 ft. The Geranium grass.
The source of Rusa oil, of which there are two kinds, *Motia* and *Sufia*, which though differing chemically appear to be derived from separate, morphologically indistinguishable races of this species. Sometimes cultivated. Vern. *Hind.* Rusa; *Tel.* Kachi gaddi; *Tam.* Kavattan pillu, Kannam pillu; *Kan.* Kasi hullu, Kunthi hullu, Anchet hullu, Nanj hullu, Bili dodda kachi hullu.
7. CYMBOPOGON CAESIUS, Stapf. *Andropogon Schoenanthus*, Linn. var. *caesius*, Hack.; F. B. I. vii. 205; S. I. G. fig. 164.
From Mysore State, Bellary and Kurnool Districts southwards, except on the W. Coast; 500—5,000 ft.
Used for thatching; eaten by cattle only when young. Vern. *Tel.* Kasi gaddi, Kamanchi gaddi; *Tam.* Kamakshi pillu, Mandap pillu, Muchival pillu; *Kan.* Kasi hullu, Kamancha hullu, Anji hullu.
8. CYMBOPOGON POLYNEUROS, Stapf. *Andropogon Schoenanthus*, Linn. var. *versicolor*, Hack.; F. B. I. vii. 205.
Nilgiri Hills; 3,000—7,000 ft.
9. CYMBOPOGON GIDARBA, Haines. *Andropogon Gidarba*, Ham. ex Hook. f.; F. B. I. vii. 208.
Mysore State; Vizagapatam, Cuddapah, Bellary, Nellore and Tinnevely Districts. Vern. *Tel.* Seetha Kasi gaddi, Thigavomi gaddi.

39. Hackelochloa, O. Kuntze

Annual, erect, much-branched, usually low herbs. *Leaves* linear. *Inflorescence* of axillary and terminal, often fascicled, cylindric, spiciform racemes; rhachis fragile, joints hollowed, completely fused with the pedicels. *Spikelets* 2-nate, dissimilar, one sessile, the other with a

pedicel fused to the joint. *Sessile spikelets* globose: *Callus* obconic. *Glumes* subequal; lower cartilaginous, subglobose; upper chartaceous, broadly ovate-oblong, lining the cavity of the joint. *Lemmas* hyaline; lower epaleate and empty; upper paleate, containing a bisexual floret. *Lodicules* 2, broadly cuneate. *Stamens* 3. *Grain* suborbicular; embryo $\frac{2}{3}$ as long. *Pedicelled spikelets* as long as the sessile or longer: *Glumes* equal, ovate, green; lower slightly asymmetrical; upper boat-shaped, prominently 1-keeled. *Lemmas* sometimes wanting, when present hyaline, empty or the upper containing a ♂ floret.

HACKELOCHLOA GRANULARIS, O. Ktz. *Manisuris granularis*, Linn. f.; F. B. I. vii. 159; Roxb. Cor. Pl. t. 118; S. I. G. fig. 147.

In all the central and eastern Districts and in the hills; usually in the drier tracts; sea-level to 4,000 ft.

Culms 1·5–30 in. high; leaves 1·2–7·5 in. long, 1–5 in. wide, hairy, base often cordate; racemes 2–7 in. long; lower glume of sessile spikelets 0·4–0·6 in. long, pitted.

A moderately good fodder. Vern. *Hind.* Trinpali; *Tel.* Kuru jedanai gaddi, *Guru* singu gaddi; *Kan.* Kadu sanna harka hullu.

40. *Ophiuros*, Gaertner f.

Erect, usually much-branched herbs. *Leaves* flat or convolute. *Racemes* spiciform, cylindric, terminal on the usually fascicled branchlets; rhachis horizontally or slightly obliquely fragile, joints completely fused with the pedicels to form deeply hollowed, cylindric recesses for the sessile spikelets. *Sessile spikelets* with a narrow callus fused to the base of the joint: *Glumes* equal; lower thickly coriaceous, nearly flat; upper thinly membranous, boat-shaped. *Lemmas* hyaline, paleate; lower containing a ♂ floret or empty; upper containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Grain* oblong, slightly compressed; embryo $\frac{1}{4}$ as long. *Pedicelled spikelets* entirely suppressed or rudimentary and minute.

OPHIUROS EXALTATUS, O. Ktz. *O. corymbosus*, Gaertn. f.; F. B. I. vii. 160. *Rottboellia corymbosa*, Linn. f.; Roxb. Cor. Pl. t. 181.

Mysore State and the Eastern Districts; sea-level to 3,000 ft. Culms up to 7 ft. high, base tuberous; leaves 4–12 in. long, 1·5–3 in. wide; racemes 1–4 in. long; lower glumes oblong, obtuse, 0·8–1·1 in. long, smooth or more or less pitted in rows. Used for thatching. Vern. *Tel.* Pedda panuku; *Tam.* Kinangu pillu, *Sothu* alagu pillu.

41. *Rottboellia*, Linn. f.

Annual, sometimes perennial, usually tall herbs, branched above, often with tilt-roots from the lowest nodes. *Leaves* large, broadly linear, flat. *Inflorescence* of solitary, slender, cylindric or very narrowly subulate, spiciform racemes; rhachis nearly horizontally to very obliquely fragile; joints fused with the usually shorter pedicels to form a deeply concave, thin-walled recess to receive the sessile spikelets. *Sessile spikelets* pale: *Glumes* subequal, coriaceous; lower slightly convex and closing the cavity; upper deeply boat-shaped. *Lemmas* hyaline,

paleate, nearly as long as the glumes; lower usually enclosing a ♂ floret; the upper a bisexual one. *Lodicules* 2. *Stamens* 3. *Grain* broadly oblong or ellipsoid, compressed; embryo nearly as long. *Pedicelled spikelets* usually shorter than the sessile: *Glumes* green, membranous or chartaceous. *Lemmas* hyaline, both or the upper only containing a ♂ floret or reduced and empty. Joints and spikelets in the upper part of the raceme more and more reduced and forming a tail-like appendage.

ROTTBOELLIA EXALTATA, Linn. f.; F. B. I. vii. 156. Roxb. Cor. Pl. t. 157; S. I. G. fig. 145.

In all Districts except in the driest localities; sometimes growing in water; sea-level to 7,000 ft.

Culms usually several feet, up to 12 ft., high, sometimes quite short; leaves up to 4 ft. long and 1'2 in. wide; racemes 2—6 in. long; joints 2—23 in. long; glumes 15—22 in. long, the lower of sessile spikelets often narrowly winged on both sides near the apex, upper glumes on the keel and the lower glume of pedicelled spikelets on one side. Vern. *Hind.* Barsali; *Tel.* Konda panuku.

42. *Manisuris*, Linn.

Annual or perennial low herbs. *Culms* usually tufted and branched. *Leaves* narrow, conduplicate, ultimately flat. *Racemes* solitary, terminal, compressed; rhachis fragile; joints fused with the pedicels to form a short, truncate, convex internode, hollowed on the inner face to receive the sessile spikelets, falling with the 2 spikelets. *Spikelets* 2-nate, one sessile, the other only appearing so by the fusion of its pedicel with the joint. *Sessile spikelets* dorsally compressed: *Glumes* dissimilar; lower coriaceous, smooth or more or less rugose, muricate or spinulose, its upper half 2-keeled and winged, often 1—2-awned; upper membranous or chartaceous, more or less boat-shaped and 1-keeled. *Lemmas* hyaline, usually paleate; lower empty or containing a ♂ floret; upper containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Grain* oblong; embryo as long. *Pedicelled spikelets* as long as the sessile: *Glumes* coriaceous or chartaceous, smooth, often aristate; lower 2-keeled and usually winged on one keel; upper 1-keeled and variously winged. *Lemmas* hyaline or absent or more or less reduced, when perfect sometimes the upper containing a ♂ floret.

Lower glume of sessile spikelets ovate, acute, not awned, margins winged, wings rounded above, usually narrowed at the middle and expanded at the base; 11—13 in. long, back smooth or shallowly transversely grooved, puberulous; glumes of the pedicelled spikelets muticous. Culms wiry, 6—28 in. high; racemes 1—3 in. long.....1. *Myurus*.

Lower glumes of all spikelets terminated by flat, single or paired and divaricate awns:—

Lower glume of sessile spikelets ovate, 13 in. long, tapering into an acuminate awn up to 36 in. long, its margins winged above the middle, wings narrowly lunate, backs with 3—6 transverse, sometimes slightly warted ridges; lower glume of pedicelled spikelets similar but winged on one side only and the back smooth. Culms slender, 3—12 in. high; leaves 1—3 in. long, very narrow; racemes 1—2 in. long.....2. *acuminata*.

Lower glume of sessile spikelets lanceolate, acute, 1—12 in. long, terminated by 2 divaricate, often unequal awns 22—27 in. long, margins winged, wings

acute below and tapering onto the base of the awns, back below 4—6-grooved, with 5—9 marginal hooked spinules, the back smooth or with spinules or sometimes the spinules fused into crenulate laminae; lower glume of pedicelled spikelets with an awn .27—.42 in. long, upper with an arista .1—16 in. long. Culms slender, 2—10 in. high; racemes .8—2.4 in. long.....3. *forficulata*.

1. *MANISURIS MYURUS*, Linn.; Roxb. Cor. Pl. t. 117. *Rottboellia Myurus*, Benth.; F. B. I. vii. 154; S. I. G. fig. 144.
Carnatic; Coimbatore, N. Arcot, Madura and Tinnevely Districts; usually in dry localities; low elevations to 2,000 ft. Vern. *Tel.* Nalla panuku; *Tam.* Waritsira pillu.
 2. *MANISURIS ACUMINATA*, C. E. C. Fischer n. comb. *Rottboellia acuminata*, Hack.; F. B. I. vii. 155.
Mysore State at Talguppa, 2,000—3,000 ft. (Meebold). On flat rocks.
 3. *MANISURIS FORFICULATA*, C. E. C. Fischer in Kew Bull. 1933, 355. *Rottboellia divergens*, Lisboa non Hack.; F. B. I. vii. 155.
Cochin State at Kavalay; 3,000—4,000 ft. (Meebold).
- Var. *hirsuta*, C. E. C. Fischer in Kew Bull. 1933, 357.
Glumes smaller, densely hirsute, hardly aristate.
Bababudan Hills (Meebold).

43. *Mnesithea*, Kunth.

Perennial erect herbs. *Leaves* narrow. *Inflorescence* of solitary, terminal, spiciform, cylindric racemes; rhachis fragile; joints fused with the pedicels into a terete internode deeply hollowed to receive the two sessile opposite spikelets, separated by a hyaline, often evanescent membrane. *Sessile spikelets* all alike: *Glumes* equal in size and shape; lower coriaceous, convex, closing the cavity; upper rather rigidly hyaline. *Lemmas* hyaline; lower resembling the upper glume, paleate or not, empty; upper oblong, its palea shorter, enclosing a bisexual floret. *Lodicules* 0. *Stamens* 3. *Grain* narrowly oblong, compressed; embryo $\frac{2}{3}$ as long. *Pedicelled spikelets* represented by minute rounded or truncate single glumes, rarely by 2.

MNESITHEA LAEVIS, Kunth; S. I. G. fig. 146. *Rottboellia perforata* Roxb. Cor. Pl. t. 182; F. B. I. vii. 158.

In all the east coast Districts; Mysore State; Shevaroy Hills; W. Gháts from the Nilgiri to the Travancore Hills; sea-level to 3,000 ft.

Culms 1—4 ft. high; leaves 1—20 in. long; .1—1.35 in. wide; racemes 2—8.5 in. long; joints .14—.18 in. long.

Eaten by cattle when young. Vern. *Tel.* Panuku, Kolupu gaddi; *Kan.* Sunku dabbai hullu.

44. *Hemarthria*, R. Brown

Erect or decumbent, perennial herbs. *Leaves* narrow, flat. *Racemes* spiciform, compressed, often curved, tips more or less subulate owing to the slender terminal spikelet, terminating the culms and their fascicled branches, subtended by a spathe; rhachis disarticulating tardily; joints semicylindric owing to their fusion with the pedicels, hollowed out to receive the sessile spikelets. *Sessile spikelets* closing the

cavity in the rhachis: *Glumes* subequal; lower nearly flat; upper boat-shaped, 1-keeled, sometimes adhering to the joint and pedicel. *Lemmas* hyaline, with or without paleas; lower empty; upper containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Grain* oblong, dorsally compressed. *Pedicelled spikelets* very like the sessile: *Glumes* usually more elongate; upper usually mucronate, caudate or aristate.

HEMARTHRIA COMPRESSA, Kunth. *Rottboellia compressa*, Linn. f.; F. B. I. vii. 153; Roxb. Cor. Pl. t. 156.

Godavari, Nellore and Chingleput Districts; usually in wet situations.

Culms 1—5 ft. high, decumbent and rooting below; leaves 1—5 in. long, 1—2 in. wide; racemes 2.5 in. long; lower glume of sessile spikelets 18—23 in. long, 2-keeled, margined or very narrowly winged at apex; upper glume of pedicelled spikelets sometimes narrowly winged on the keel near the apex. Vern. Tel. Shervu panuku.

45. Digitaria, Haller

Annual or perennial, slender herbs. *Leaves* narrow, flat, often flaccid. *Inflorescence* of 2—many digitate or more or less distant, alternate, opposite or whorled spikes or racemes, rarely paniculate; rhachis triquetrous, flat or terete with or without green wings. *Spikelets* usually 2—3-nate, jointed on the pedicels and falling from them entire. *Glumes* dissimilar; lower a minute membranous scale or delicate, evanescent, hyaline membrane or sometimes absent; upper membranous, sometimes very thin, rarely absent. *Lemmas* 2; lower 5—7-nerved, empty or with a minute palea and lodicules; upper chartaceous with hyaline margins, faintly 3-nerved; palea as long as and embraced by the lemma, finely 2-nerved, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* tightly enclosed by the slightly hardened lemma and palea, oblong, plano-convex with rounded angles in section.

Racemes not in a pyramidal panicle with the lower opposite or whorled:—

Spikelets .09 in. or more long. Culms tufted from a geniculate, often rooting base:—

Hairs not clavate-tipped:—

Rhachis flat, up to .04 in. wide, margins winged. Culms up to 2.5 ft. high; leaves up to 10 in. long; racemes 2—14, subdigitate or 2—3-nate on a short common axis, up to 7 in. long, appressed, acutely acuminate; 1—14 in. long; lower glume very small or 0; barren lemma similar to the upper glume and like it with lines of fine appressed, ultimately spreading hairs between the nerves; grain oblong, whitish.....1. *marginata*. Rhachis trigonous, not winged. Culms up to 3 ft. high; racemes 5—13, alternate or opposite, sometimes more or less branched and subverticillate; spikelets 2-nate; upper glumes and barren lemmas more or less silky-hairy. Otherwise as in the last species.....2. *Griffithii*.

Hairs of upper glume and barren lemma clavate-tipped. Culms 6—24 in. high, rarely branched; leaves up to 9 in. long; racemes 2—7, subdigitate on a short common axis, up to 5 in. long; rhachis flat, narrowly winged; pedicels 2—3-nate, hispidulous, the hairs forming a tuft at the tips; spikelets elliptic-oblong, obtuse, .09—.11 in. long, appressed, subimbricate; lower glume 0; upper shorter than the lemmas, 3-nerved with 4 lines of clavate-tipped brownish hairs; barren lemma similar, somewhat shaggy with clavate-tipped

hairs; upper lemma soon becoming dark brown to black; grain ellipsoid, white.....3. *ternata*.

Spikelets .08 in. or less long:—

Hairs not clavate-tipped:—

Rhachis straight, flat, margins winged:—

Fruiting lemmas pale. Culms rising singly or in fascicles from a long creeping and rooting base, slender, 3—14 in. high; leaves .5—2.5 in. long; racemes 2 or 3, digitate, slender, .8—2.5 in. long; pedicels 2—3-nate, flexuous, tips discoid; spikelets elliptic-oblong, .05—0.7 in. long, appressed, subimbricate; lower glume 0 or rudimentary, upper delicate, nearly as long as the spikelet, finely pubescent; barren lemma 7-nerved, appressed-pubescent between nerves; grain ellipsoid, whitish.....4. *longiflora*.

Fruiting lemmas dark brown or black. Culms tufted, base not creeping, 2—20 in. high; leaves 1—4 in. long; racemes 2—5, up to 4 in. long, digitate or when more than 3, 2 or 3 from a lower level; spikelets .06—0.8 in. long. Otherwise as in the last species.....5. *chinensis*.

Rhachis flexuous, trigonous, capillary. Culms tufted, slender, 3—26 in. high; leaves finely acuminate, up to 15 in. long; racemes 3—10, alternate, spreading, sometimes branched, up to 4 in. long; pedicels 2—5-nate, some longer than the spikelets; spikelets elliptic-oblong, acute, .05—0.6 in. long, not imbricate; lower glume 0, upper thinly membranous, pubescent; fruiting lemma elliptic, dark brown, shining.....6. *pedicellaris*.

Hairs on upper glumes and barren lemmas short, clavate-tipped. Culms tufted, 6—24 in. high; leaves up to 6 in. long; racemes 3—15, erect, subdigitate or alternate, up to 4 in. long; rhachis trigonous, slender; pedicels sometimes as long as the spikelets, setulose at least at the apex; spikelets secund, broadly ellipsoid, .04—0.5 in. long; lower glume 0, upper sometimes reduced to a tuft of hairs or $\frac{1}{2}$ the length of the barren lemma; fruiting lemma black, longitudinally striolate.....7. *Royleana*.

Racemes in a pyramidal panicle, the lower opposite or whorled. Culms creeping below, 3—30 in. high; panicles 1.5—5 in. long, common axis slender, subterete; racemes many, up to 3.5 in. long, divaricate; rhachis capillary, usually naked for a short distance at the base; spikelets narrowly lanceolate, acuminate; upper glume and slightly shorter barren lemma several-ribbed, white appressed-hairy between the ribs.....8. *Wallichiana*.

1. DIGITARIA MARGINATA, Link. *D. sanguinalis*, Scop. var. *extensum*, Rang. et Tad., S. I. G. figs. 74, 75. *Paspalum sanguinale*, Lamk. var. *commutatum*, Hook. f.; F. B. I. vii. 15; ditto var. *extensum*, Hook. f.; F. B. I. vii. 15; ditto var. *Rottleri*, Hook. f.; F. B. I. vii. 16.

In all Districts; sea-level to 7,000 ft.

A good fodder. Vern. *Hind.* Takri takra; *Tam.* Arisi pillu, Akki pillu; *Kan.* Henu akkibu hullu.

Var. *fimbriata*, Stapf. *D. sanguinalis*, Scop. var. *ciliaris*, Rang. et Tad., S. I. G. figs. 71, 72. *Paspalum sanguinale*, Lamk. var. *ciliare*, Hook. f.; F. B. I. vii. 15. With the hairs of the mature spikelet spread out horizontally forming a rigid fringe on both sides, often mixed with thick-walled bristles from tubercular bases.

Distribution and vernacular names of the species.

2. DIGITARIA GRIFFITHII, Stapf. *D. sanguinalis*, Scop. var. *Griffithii*, Rang. et Tad., S. I. G. fig. 73. *Paspalum sanguinale*, Lamk. var. *Griffithii*, Hook. f.; F. B. I. vii. 15.

W. Gháts; 2,000—3,000 ft.

3. DIGITARIA TERNATA, Stapf. *Paspalum ternatum*, Hook. f.; F. B. I. vii. 17.

Bababudan, Nilgiri and Mysore Hills; Ramandrug; 3,000—8,000 ft. Vern. *Kan.* Bili akkabu hullu.

4. DIGITARIA LONGIFLORA, Pers. ; S. I. G. figs. 76, 77. *Paspalum longiflorum*, Retz. ; F. B. I. vii. 17 in part.
In all Districts ; sea-level to 6,000 ft. Vern. Tel. Pakuru gaddi ; Kan. Tapari hullu.
5. DIGITARIA CHINENSIS, Hornem. *Paspalum longiflorum*, Hook. f. non Retz. ; F. B. I. vii. 17 in part.
Ganjam, Godavari and Chittoor Districts ; Mysore State ; Nilgiri, Anaimalai and Pulney Hills ; 400—6,000 ft.
6. DIGITARIA PEDICELLARIS, Prain. *Paspalum pedicellare*, Trin. ; F. B. I. vii. 19.
In all Districts, except in the driest and wettest parts ; 2,000—6,000 ft.
7. DIGITARIA ROYLEANA, Prain. *Paspalum Royleanum*, Nees ; F. B. I. vii. 18.
Mysore State at Shimoga (Meebold) ; Ramandrug ; 2,000—3,000 ft. Vern. Kan. Bili akkabu hullu.
8. DIGITARIA WALLICHIANA, Stapf. *Paspalum Perrottetii*, Hook. f. ; F. B. I. vii. 20.
Bababudan, Nilgiri and Pulney Hills ; 4,000—7,000 ft.

46. Alloteropsis, Presl.

Annual or perennial, erect herbs. *Leaves* usually flat. *Racemes* spiciform, digitate or whorled, often compound. *Spikelets* solitary, twin or fascicled, more or less compressed dorsally, articulated on and falling entire from the pedicels. *Glumes* thinly membranous to chartaceous ; the lower the shorter ; the upper nearly as long as the spikelet and densely ciliate. *Lemmas* dissimilar ; the lower as long as or longer than the upper, its palea short, 2-fid or 2-partite, enclosing a ♂ floret ; the upper narrowed into a short mucro or an arista, its palea 2-nerved and 2-keeled with basal auricled flaps, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* elliptic-oblong to sub-orbicular, dorsally compressed, free within the hardened lemma and palea.

ALLOTEROPSIS CIMICINA, Stapf. *Axonopus cimicinus*, Beauv. ; F. B. I. vii. 64 ; S. I. G. figs. 107, 108.

In all Districts ; sea-level to 4,000 ft.

Culms up to 3 ft. high ; leaves lanceolate, base cordate, .5—4.25 in. long, .15—.7 in. wide, glabrous or more or less hairy from tubercles ; racemes few to many, 2—9 in. long ; spikelets .12—.15 in. long ; upper lemma mucronate or with an arista up to .13 in. long. Vern. Kan. Niru sajjai hullu.

47. Pseudechinolaena, Stapf

Annual herbs. Culms slender, erect from a prostrate rooting base. *Leaves* flaccid. *Panicle* simple ; racemes few, spiciform. *Spikelets* pedicelled, 2-nate or more often solitary with or without an accompanying reduced one, secund. *Glumes* herbaceous, subequal or the lower shorter ; lower nearly flat, 3-nerved, smooth or nearly so ; upper boat-shaped, gibbous below, 7-nerved with rows of transparent spots between.

naked or with short or long hooked hairs or bristles from the spots. *Lemmas* chartaceous; lower membranous at the margins and hyaline at a point at the base, oblong-lanceolate, laterally compressed, rounded on the back, as long as the spikelet, its palea more or less convolute, 2-nerved, empty or containing a ♂ floret; upper shorter, broadly lanceolate to oblong, back very convex, faintly 5-nerved, its palea similar, tightly clasped by the lemma when mature, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* oblong, plano-convex, gibbous on the back at the apex.

PSEUDECHINOLAENA POLYSTACHYA, Stapf. *Panicum uncinatum*, Raddi; F. B. I. vii. 58.

W. Ghâts from Mysore to Travancore; 2,000—6,000 ft.

Culms 3—24 in. high; leaves ovate to linear-lanceolate, acuminate, 1—3 in. long, .17—.65 in. wide, more or less hairy or pubescent; panicles up to 7 in. long; racemes up to 2 in. long; spikelets obliquely ovoid, .14—.19 in. long; bristles when present up to .07 in. long.

48. *Eriochloa*, H. B. et K.

Annual or perennial erect herbs. *Leaves* more or less flat. *Inflorescence* racemously paniced; racemes peduncled or the upper sessile. *Spikelets* solitary or 2-nate, secund, ovate-lanceolate to oblong, acute or acuminate, sometimes finely, shortly aristulate, the base thickened into an annular callus, falling entire from the thickened apex of the pedicels. *Glumes* very unequal; lower reduced to a minute cupular rim clasping the callus; the upper membranous, corresponding to the outline of the spikelet, faintly 5-nerved, sometimes aristulate. *Lemmas* dissimilar; lower about equalling and resembling the upper glume, sometimes 2-keeled, empty or enclosing a ♂ floret; the upper chartaceous or almost crustaceous, faintly 5-nerved, with a fine barbelate mucro, its palea 2-keeled, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* dorsally compressed, free within its lemma and palea and the upper glume and lower lemma.

ERIOCHLOA PROCERA, C. E. Hubbard. *E. polystachya*, H. B. et K.; F. B. I. vii. 20; S. I. G. figs. 78, 79.

In all Districts; sea-level to 3,000 ft. Often in rice-fields.

Perennial; culms tufted, 1—5 ft. high; leaves up to 13 in. long, .15—.4 in. wide; racemes numerous, alternate, up to 4 in. long; spikelets .13—.15 in. long; upper glume and lower lemma finely white-silky, sometimes glabrescent in fruit.

Much liked by cattle. Vern. *Tam.* Tandambaran pillu, Mathanka pillu, Karungani pillu.

49. *Brachiaria*, Griseb.

Annual or perennial herbs. *Leaves* narrow, usually flat. *Inflorescence* of spiciform, sometimes branched racemes, sessile on a common filiform, triquetrous or more or less flattened rhachis, rarely paniced; pedicels solitary or twin. *Spikelets* elliptic- to ovate-oblong, more or less dorsally compressed, the convex side turned away from

the rhachis. *Glumes* dissimilar; the lower towards the rhachis and much shorter than the upper. *Lemmas* dissimilar; the lower subequal to and resembling the upper glume, its palea similar, with well-developed incurved flaps below the middle, usually enclosing a ♂ floret; the upper crustaceous or subcoriaceous, with firm, narrowly involute margins, its palea similar and almost as long, 2-keeled, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* broadly oblong or elliptic, more or less flattened, tightly enclosed in the more or less hardened lemma and palea.

Spikelets imbricate or approximate:—

Rhachis flat, margins scaberulous, often setulose; spikelets secund:—

Culms 3—30 in. high, slender, nodes glabrous, rarely puberulous; leaves .6—6.5 in. long, .15—4 in. wide; racemes 2—6, simple:—

Peduncle below the inflorescence more or less hairy; spikelets elliptic-obovate, acute or subacute, .1—12 in. long. Culms prostrate or straggling, 2—20 in. high; leaves .6—2.7 in. long, .15—3 in. wide; racemes 2—4, .9—1.7 in. long.....1. *distachya*.

Peduncle glabrous, rarely puberulous; spikelets elliptic or elliptic-oblong, acute, usually apiculate, .14—16 in. long. Culms usually erect, 12—30 in. high; leaves 3—6.5 in. long, .16—4 in. wide; racemes 4—6, 1—2.6 in. long.....2. *miliiformis*.

Culms 3—8 ft. high, robust, nodes villous; leaves 5—12 in. long, .3—7 in. wide; racemes numerous, 1—3.5 in. long, the lowest at least usually branched; spikelets lanceolate, acute, .12—13 in. long; pedicels usually setose; lower glume .05 in. long, upper .11—12 in. long.....3. *mutica*.

Rhachis trigonous or terete:—

Spikes erect, appressed to the rhachis, 6—11, .2—8 in. long. Leaves softly pilose from bulbous bases, .6—3.5 in. long, .07—22 in. wide, base rounded; spikelets secund, elliptic to broadly oblong, .07—09 in. long; lower glume .02 in. long, glabrous, upper .06 in. long, pilose, rarely glabrous...4. *eruciformis*.

Spikes erecto-patent or horizontal:—

Leaves lanceolate, base subcordate, clasping the culm, 1.7—6 in. long, .15—7 in. wide, glabrous or pubescent, spikes up to 2 in. long; spikelets not secund, broadly elliptic, acute or apiculate, .1—13 in. long; lower glume .04—07 in. long, upper broadly oblong, apiculate, .09—1 in. long, puberulous

5. *ramosa*.

Leaves ovate, base rounded, not clasping, .5—1.8 in. long, .18—55 in. wide, softly villous, margins markedly cartilaginous, often crisped; spikes .4—75 in. long; spikelets secund, elliptic-obovate, .08—095 in. long; lower glume .025—04 in. long, obtuse, upper obovate, obtuse, gibbous, .06—08 in. long, glabrous or puberulous; lower lemma longer than the glumes

6. *semiundulata*.

Spikelets distant; upper glume elliptic-oblong, glabrous:—

Upper lemma broadly stipitate. Culms erect, up to 8 ft. high; leaves ensiform from a narrowed, rounded base, finely acuminate, 4—9 in. long, .27—8 in. wide; spikes numerous, up to 3.5 in. long, lower often verticillate; rhachis usually more or less pubescent; spikelets elliptic, .14—15 in. long; lower glume .05—08 in. long, upper .11—13 in. long; upper lemma usually rugulose

7. *semiverticillata*.

Upper lemma subsessile. Culms weak, decumbent, 1—2 ft. high; spikes not verticillate:—

Leaves narrowly linear, glabrous or slightly puberulous at the narrow base, 2.5—8.5 in. long, .1—13 in. wide, margins and sheaths not ciliate; spikes usually numerous, up to 4 in. long; spikelets elliptic, .1—13 in. long; lower glumes .05—08 in. long, upper .1—11 in. long.....8. *remota*.

Leaves linear-lanceolate to lanceolate, base rounded or subcordate, usually sparsely bristly from bulbous bases, 2—6 in. long, .25—65 in. wide, margins usually ciliate from bulbous bases, at least near the base, sheaths ciliate; spikes usually few. Other characters as in the last species.....9. *Kurzii*.

1. BRACHIARIA DISTACHYA, Stapf. *Panicum distachyum*, Linn.; F. B. I. vii. 37; S. I. G. figs. 97, 98.
In all Districts; sea-level to 3,000 ft. Vern. Tel. Koranna gaddi; Kan. Hambu haraka hullu.
2. BRACHIARIA MILIIFORMIS, Chase. *Panicum distachyum*, Linn.; F. B. I. vii. 37 in part.
S. Kanara and N. Coimbatore Districts; Travancore. Vern. Kan. Kada samai hullu.
Very similar to the last species and often confused with it.
3. BRACHIARIA MUTICA, Stapf. *Panicum muticum*, Forsk.; F. B. I. vii. 34.
Shevaroy Hills (Perrottet); Tinnevely District at Mundanthorai (Barber) and Courtallam (Venkoba Rao).
A native of America and W. Africa, introduced and run wild here and there. An excellent fodder.
4. BRACHIARIA ERUCIFORMIS, Griseb. *Panicum Isachne*, Roth; F. B. I. vii. 28; S. I. G. figs. 80, 81.
In all Districts; sea-level to 6,000 ft.
A moderate fodder. Vern. Tel. Domakalu gaddi.
5. BRACHIARIA RAMOSA, Stapf. *Panicum ramosum*, Linn.; F. B. I. vii. 36; S. I. G. figs. 95, 96.
In all Districts; sea-level to 6,000 ft. Vern. Tel. Eduri gaddi; Kan. Kadu baragu hullu.
6. BRACHIARIA SEMIUNDULATA, Stapf. *Panicum villosum*, Lamk.; F. B. I. vii. 34.
W. Gháts; 5,000—7,000 ft.
7. BRACHIARIA SEMIVERTICILLATA, Alston. *Panicum semiverticillatum*, Rottl.; F. B. I. vii. 38.
Nilgiri, N. Coimbatore, Anamallai, Pulney and Tinnevely Hills; 1,500—6,000 ft. Vern. Kan. Manju hullu, Thapparakai hullu.
8. BRACHIARIA REMOTA, Haines. *Panicum remotum*, Retz.; F. B. I. vii. 38.
Ganjam District at Chatrapur (Fischer); Salem to Tinnevely Districts; Anamallai and Travancore Hills; sea-level to 3,000 ft.
9. BRACHIARIA KURZII, A. Camus. *Panicum Kurzii*, Hook. f.; F. B. I. vii. 38.
Rampa Hills (Narayanaswami).

50. Paspalum, Linn.

Perennial, sometimes annual herbs. *Leaves* narrow, flat or more or less inrolled. *Inflorescence* of solitary, digitate or racemose spikes; rhachis flat and winged or trigonous. *Spikelets* secund, 2-seriate, solitary or paired, sessile or nearly so, orbicular, oblong or ovate. *Lower glume* usually absent, rarely represented by a small scale; upper membranous, about equalling the spikelet, rarely shorter or absent, 3—more-nerved. *Lemmas* dissimilar; lower similar to the upper glume, empty; upper chartaceous to crustaceous, faintly nerved, its palea subequal, similar and embraced by it, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* more or less biconvex, tightly enclosed in the hardened lemma and palea.

Spikelets .09 in. or more long:—

Glume and lemmas glabrous; spikelets normally 2-ranked:—

Spikelets suborbicular or nearly so, obtuse, .09—13 in. long. Rhizome short; culms $\frac{1}{2}$ —3 ft. high, leaves glabrous, up to 18 in. long, .15—4 in. wide; racemes 2—5, rarely solitary, .8—5.8 in. long; rhachis broad, winged, with a median keel, produced at the apex into 2 short rounded or acute lobes; upper lemma and palca crustaceous, latter with wide membranous auricles at the base.....1. *scrobiculatum*.

Spikelets oblong to oblong-lanceolate, acute or subacute. Culms creeping and rooting below:—

Spikelets oblong, subacute, .1—13 in. long; upper lemma nearly as long as the spikelet. Culms up to 3 ft. high; leaves flat, up to 8.5 in. long, .15—25 in. wide, glabrous or more or less densely hairy; racemes 2—3, .8—3.5 in. long.....2. *orbiculare*.

Spikelets oblong-lanceolate, acute, .12—14 in. long; upper lemma $\frac{1}{4}$ — $\frac{1}{2}$ shorter than the spikelet. Culms up to 13 in. high; leaves flat or involute, .9—4.3 in. long, .07—16 in. wide, glabrous; racemes 2, very rarely 3, .5—2 in. long.....3. *vaginatium*.

Glume and barren lemma puberulous or hairy; spikelets normally 4-ranked:—

Racemes usually 7—9, 1.2—3 in. long; spikelets suborbicular, acute, .08—1 in. long. Culms erect, up to 4 ft. high; leaves up to 10 in. long, .15—3 in. wide; rhachis glabrous or nearly so, with setulose margins; glume and barren lemma minutely puberulous.....4. *longifolium*.

Racemes usually 3—5, 2—4 in. long; spikelets broadly ovate, acute, .4—16 in. long. Culms erect, up to 5 ft. high; leaves up to 10 in. long, .4—5 in. wide; rhachis hairy at the base, with minutely scabrid margins; glume and barren lemma sparsely silky, long white-ciliate.....5. *dilatatum*.

Spikelets .06—07 in. long:—

Racemes paired, rarely 3, 1.3—5 in. long; rhachis flat, margins cartilaginous and smooth or scaberulous; spikelets compressed plano-convex, subobtusely apiculate or shortly acute; glume ciliate with rather long white hairs, barren lemma glabrous. Culms erect from often very long rooting runners, up to 3 ft. high; leaves up to 8 in. long, .35—6 in. wide, glabrous.....6. *conjugatum*.

Racemes 6—20, alternate, .15—1 in. long; rhachis subtriquetrous, margins more or less bristly from tubercles; spikelets turgidly plano-convex, obtuse; glumes more or less ciliate with rigid hairs from tubercles; barren lemma more or less bristly. Culms 2—12 in. high; leaves .7—3 in. long, .2—65 in. wide; sparsely hairy on the ribs.....7. *compactum*.

1. *PASPALUM SCROBICULATUM*, Linn.; F. B. I. vii. 10; S. I. G. figs. 69, 70.

In all Districts; sea-level to 7,000 ft. Wild or cultivated. The wild form, which is generally smaller and more slender, is the var. *Commersonii*, Stapf.

The grain is used for food, but requires careful preparation as it is liable to act as a narcotic poison. The straw makes good cattle-fodder. Vern. *Hind.* Kodo; *Ur.* Khoddi; *Tel.* Arugu, Nita ari gaddi, Arikelu. *Tam.* Varagu, Karu varagu; *Kan.* Haraku hullu, Arikel.

2. *PASPALUM ORBICULARE*, Forst. *P. scrobiculatum*, Linn.; F. B. I. vii. 11 in part.

Ganjam, Nellore, Arcot and Coimbatore Districts; sea-level to 2,000 ft.

3. *PASPALUM VAGINATUM*, Sw. *P. distichum*, Linn.; F. B. I. vii. 12.

In sea-shore and river sand; near sea-level.

4. *PASPALUM LONGIFOLIUM*, Roxb. *P. scrobiculatum*, Linn.; F. B. I. vii. 11 in part.

Travancore.

5. *PASPALUM DILATATUM*, Poir.

A S. American fodder-grass; introduced and occasionally run wild.

6. *PASPALUM CONJUGATUM*, Berg.; F. B. I. vii. 11.

Mysore; Wynaad; Travancore; 500—4,000 ft.

7. *PASPALUM COMPACTUM*, Roth.; F. B. I. vii. 12.

Bababudan, Coorg, Nilgiri and Travancore Hills; 4,000—6,000 ft.

51. *Stenotaphrum*, Trin.

Perennial or annual, erect herbs, often creeping or prostrate at the base. *Leaves* flat, with compressed sheaths. *Panicles* spiciform, terminal or sometimes also from the upper axils; rhachis flat, continuous or jointed, bearing 1—8 spikelets sunk in hollows or chambers in its anterior face. *Spikelets* lanceolate to ovate-oblong, falling entire from rudimentary pedicels. *Glumes* 2, dissimilar; the lower smaller, sometimes scale-like; the upper nearly or quite as long as the spikelet, 5—11-nerved. *Lemmas* similar, chartaceous to coriaceous; the lower paleate or not, empty or containing a ♂ floret; the upper with a 2-keeled palea of similar texture, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free or nearly so. *Grain* broadly elliptic-oblong, plano-convex, closely embraced by, but free within the lemma and palea; embryo half as long.

STENOTAPHRUM DIMIDIATUM, Brogn. *S. glabrum*, Trin.; F. B. I. vii. 90.

Travancore State at Ambalapuzha (Ranga Achariyar). Rare. Culms erect from the root or from a slender rhizome, 5—13 in. high; leaves exactly linear, apex rounded, 1·3—3 in. long; 1·5—2 in. wide; panicle 1—3·6 in. long; rhachis alternately narrowly and broadly winged on one side and the other, the broader wing usually with an apical tooth and forming the hollow to receive the spikelet, spikelets 1·5—1·9 in. long; lower glume rounded, 0·5 in. long.

52. *Paspalidium*, Stapf

Perennial terrestrial or semi-aquatic herbs; culms often spongy below. *Leaves* flat or involute. *Inflorescence* of few to many spiciform, sessile or subsessile racemes secund on a common triquetrous rhachis. *Spikelets* ovoid to ovate-lanceolate, turgid or more or less compressed. *Glumes* dissimilar and unequal; the lower much the smaller, turned away from the axis. *Lemmas* dissimilar; lower similar to, but usually longer than the upper glume, margins inflexed, with or without a palea, containing a ♂ floret; the upper elliptic, crustaceous with firm, involute margins, its palea 2-keeled, of the same texture, almost as long, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* tightly enclosed in the more or less hardened lemma and palea.

Spikelets ovoid or subglobose, hardly compressed, obtuse or acute, 0·9—1·3 in. long; lower glume broadly ovate or suborbicular, rounded, 0·5—0·7 in. long; upper glume acute, 0·7—1 in. long; lemmas 0·8—1·2 in. long, smooth. Leaves ciliate near the

base, 1—13 in. long, .1—4 in. wide; racemes usually, the lowest always, shorter than the internodes, distant .3—1.3 in. long.....1. *flavidum*. Spikelets ovate to ovate-lanceolate, acute or apiculate, distinctly flattened; lower glume broader than long, thinly membranous truncate, retuse or undulate, .03 in. long; racemes mostly as long as or longer than the internodes, the lowest sometimes shorter, imbricate, .3—1.6 in. long. Culms often spongy below:—

Upper glume broadly oblong, obtuse, .07 in. long; lower lemma acute or apiculate, .09—11 in. long; upper lemma .09 in. long, distinctly punctate. Leaves 2.2—9 in. long, .1—3 in. wide.....2. *punctatum*.

Upper glume broadly ovate, apiculate, .07—0.8 in. long; lower lemma apiculate, .08—0.9 in. long; upper lemma smooth. Leaves 7—12 in. long, .2—3 in. wide.....3. *geminatum*.

1. PASPALIDIUM FLAVIDUM, A. Camus. *Panicum flavidum*, Retz.; F. B. I. vii. 28; S. I. G. figs. 82, 83.

In all Districts; sea-level to 4,000 ft.

The spikes are sometimes reduced to 1—3 spikelets.

A good fodder. Vern. Hind. Sanka; Tel. Uda gaddi; Tam. Arisi pillu.

2. PASPALIDIUM PUNCTATUM, A. Camus. *Panicum punctatum*, Burm.; F. B. I. vii. 29.

In all the eastern Districts; sea-level to 600 ft. Often in water.

3. PASPALIDIUM GEMINATUM, Stapf. *Panicum paspaloides*, Pers.; F. B. I. vii. 30. *P. fluitans*, Retz.; S. I. G. figs. 84, 85.

In all Districts; sea-level to 3,500 ft. Often in water. Vern. Kan. Gaddai vadavina hullu.

53. Urochloa, Beauv.

Annual or perennial herbs. Leaves linear-lanceolate to ovate, flat. Inflorescence of several racemes sessile or subsessile on a common, more or less triquetrous, rarely strap-shaped axis with a straight or zig-zag keel on the anterior face; pedicels solitary or twin, 2—several seriate. Spikelets broadly ovate to lanceolate, more or less flattened or depressed, the convex side turned towards the axis, falling entire from the disc-tipped pedicels. Glumes membranous, usually very unequal; the lower the shorter, turned away from the axis; the upper either glabrous or more or less densely felted-pubescent. Lemmas dissimilar; the lower closely resembling the upper glume in all respects, empty or holding a ♂ floret; the upper crustaceous or subcoriaceous with narrow involute margins, elliptic-oblong, concave, obtuse and usually with a scabrid or barbellate mucro or cusp, containing a bisexual floret. Lodicules 2. Stamens 3. Styles 2, free. Grain tightly enclosed in the more or less hardened lemma and palea.

Spikelets .13—1.6 in. long; upper lemma distinctly cuspidate:—

Spikelets ovate to elliptic-oblong, acute. Culms up to 3 ft. high; leaves subcordate, clasping the stem, hairy or rarely nearly glabrous, ciliate from tubercles, 1.2—6.7 in. long, .2—7 in. wide; lower glume broadly ovate, clasping the base of the spikelet, acute or obtuse, .04—0.6 in. long; upper glume and lower lemma about the size and shape of the spikelet; upper lemma with a cusp .03 in. long

1. *panicoides*.

Spikelets lanceolate, acuminate. Leaves glabrous, 1.2—4.4 in. long, .3—85 in. wide. Other characters as in the last species.....2. *setigera*.

Spikelets ovate to elliptic, acute or apiculate, .07—0.9 in. long. Culms prostrate or creeping, rather slender, up to 20 in. long; leaves rounded at base, clasping the stem or not, glabrous or minutely pubescent, .5—3.5 in. long, .12—6 in. wide;

lower glume suborbicular, .02—.03 in. long; upper glume and lower lemma elliptic-ovate, acute; upper lemma broadly oblong, apiculate or mucronate, .06 in. long
3. *reptans*.

1. *UROCHLOA PANICOIDES*, Beauv. *Panicum javanicum*, Hook. f. non Poir.; F. B. I. vii. 35; S. I. G. figs. 1, 3, 4, 7, 93, 94.

In all Districts except the wettest; sea-level to 3,000 ft.

The grain is eaten by the poor. A good fodder. Vern. *Hind. Kuri*; *Tel. Salla wudu*; *Kan. Kadu billi samai hullu*.

2. *UROCHLOA SETIGERA*, Stapf. *Panicum setigerum*, Retz.; F. B. I. vii. 36.

Eastern and Central Districts from Kistna to Tinnevely; sea-level to 2,000 ft.

An excellent fodder.

3. *UROCHLOA REPTANS*, Stapf. *Panicum prostratum*, Lamk.; F. B. I. vii. 33; S. I. G. figs. 91, 92.

In all Districts except the wettest; sea-level to 6,000 ft.

The grain is eaten by the poor in times of scarcity. A good fodder much liked by cattle. Vern. *Tam. Shani pillu*.

54. *Echinochloa*, Beauv.

Annual or perennial, often tall herbs. *Leaves* narrow. *Inflorescence* of crowded panicles of loosely arranged, secund, spiciform branches bearing spikelets from the base or near it; rhachis triquetrous. *Spikelets* ovate to elliptic- or lanceolate-oblong, 2-nate or clustered, articulated on and falling entire from the pedicels. *Glumes* membranous, unequal; the lower much the shorter, mucronate, cuspidate or awned; the upper coincident in outline with the spikelet, acute, cuspidate or shortly awned. *Lemmas* dissimilar; the lower equalling the upper glume (excluding cusp or awn), its palea 2-keeled, empty or containing a ♂ floret; the upper subcoriaceous or crustaceous, ovate to elliptic-oblong, obtuse or apiculate, polished, very convex on the back, its palea as long, with rounded sides and flaps, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* broadly elliptic, plano-convex.

Racemes simple, rather distant, .3—1.25 in. long; lower glume and upper lemma about equal; obtuse, acute or cuspidate. Annual, up to 2 ft. high; leaves 2—8 in. long, .15—.45 in. wide, ligule 0; spikelets ovoid, .1—12 in. long; lower glume .04—.05 in. long, upper .09—.11 in. long; lemmas .08—.1 in. long, lower with a ♂ floret.....1. *colona*.

Racemes usually more or less branched, .8—2 in. long; lower glume and upper lemma cuspidate or awned, the latter the longer; lower lemma often awned:—

Annual, up to 3 ft. high; leaves 3—21 in. long, .2—.5 in. wide, ligule 0, junction of blade and sheath glabrous, usually marked by a brown zone; spikelets .15—.18 in. long; lower glume .07—.12 in. long, upper .15—.17 in. long; lower lemma empty, .14—.17 in. long, upper .12—.15 in. long; awn of lower lemma up to 2 in. long.....2. *crus-galli*.

Usually perennial, up to 6 ft. high; culms rooting and often branching from submerged nodes; leaves 3—18 in. long, .2—.4 in. wide, ligule a fringe of stiff hairs, sometimes absent on the uppermost leaf; lower lemma empty or with a ♂ floret. Otherwise as in the last species.....3. *stagnina*.

1. *ECHINOCHLOA COLONA*, Link. *Panicum colonum*, Linn.; F. B. I. vii. 32; S. I. G. figs. 89, 90.

In all Districts, except in the wettest localities; sea-level to 6,000 ft.

An excellent fodder. The grain is eaten by the poorer classes.

Vern. *Hind.* Sawank; *Tel.* Otha gaddi, Kaproda gaddi; *Tam.* Sawu, Sauri, Varsanum pillu, Karum pul.

Var. *frumentacea*, Blatt. & McCann. n. comb. *Panicum Crus-galli*, Linn. var. *frumentaceum*, Hook. f.; F. B. I. vii. 31. A taller and more robust plant with dense, sometimes corymbose panicles. Cultivated for its grain in most Districts. The straw is a valuable fodder. Vern. *Hind.* Shamula, Sanwa; *Ur.* Samu; *Tel.* Bonta shama, Pala oodalu, Sawa, Chamalu; *Tam.* Kudraivalli pillu, Rail pillu; *Kan.* Samai, Savai.

2. *ECHINOCHLOA CRUS-GALLI*, Beauv. *Panicum Crus-galli*, Linn.; F. B. I. vii. 31; S. I. G. figs. 6, 86, 87.

In most Districts; in rice-fields and other wet places; sea-level to 6,000 ft.

The grain is eaten by the poor. A good cattle-fodder and sometimes cultivated for that purpose. Vern. *Hind.* Sanwak; *Tel.* Pedda-wundu; *Kan.* Kadu dabhai hullu.

3. *ECHINOCHLOA STAGNINA*, Beauv.; S. I. G. fig. 88. *Panicum Crus-galli*, Linn.; F. B. I. vii. 31 in part.

In all Districts, in wet places, often partly submerged; sea-level to 3,000 ft.

Often confused with the last species. Vern. *Tel.* Bontha oodu; *Kan.* Kadu dabhai hullu.

55. *Oplismenus*, Beauv.

Annual or perennial herbs, usually decumbent and rooting at the base. Leaves thin, flat, ovate to lanceolate, often rather unsymmetrical. Inflorescence of simple or panicle racemes. Spikelets solitary or fascicled, secund. Glumes subequal, herbaceous or membranous, more or less keeled upwards, both or only the lower awned. Lemmas dissimilar; the lower similar to but longer than the glumes, muticous, mucronate or aristate, its palea perfect, reduced or absent, containing a ♂ floret or empty; the upper chartaceous to subcoriaceous, nearly as long as the lower, muticous, its palea as long as and embraced by the lemma, containing a bisexual floret. Lodicules 2, broadly cuneate, often very delicate. Stamens 3. Styles 2, free. Grain oblong, tightly embraced by the hardened lemma and palea.

Perennial; culms slender to rather robust, up to 3 ft. high; leaves .8—6.5 in. long, .25—1 in. wide; panicles up to 1 ft. long; racemes distant, few to many, sometimes reduced to sessile clusters of spikelets, up to 3 in. long; spikelets .12—1.8 in. long, awns needle-like, smooth, up to .43 in. long.....1. *compositus*. Annual; culms slender, up to 18 in. high; leaves .7—2.2 in. long, .2—5.5 in. wide; panicles up to 4 in. long; racemes distant or close, few, up to .7 in. long; spikelets .09—1 in. long, awns capillary, minutely scaberulous, up to .41 in. long

2. *Burmanni*.

1. *OPLISMENUS COMPOSITUS*, Beauv.; F. B. I. vii. 66. *O. undulatifolius*, Hook. f. non Beauv.; F. B. I. vii. 66.

In all Districts; sea-level to 7,000 ft. Common. Vern. *Tel.* Kodi juttu gaddi, Konda anthrika gaddi.

2. *OPLISMENUS BURMANNII*, Beauv.; F. B. I. vii. 68.

In all Districts; sea-level to 3,000 ft.

Much liked by cattle. A good hay-making grass. Vern. *Tam.* Mungil pillu.

56. *Ottochloa*, Dandy

Perennial herbs, creeping and rooting below, geniculate and scrambling above. *Leaves* narrow, flat, firmly papery. *Panicles* elongate, widely open or contracted; racemes more or less distant, short; rhachis and pedicels filiform. *Spikelets* usually in small, approximate or distant clusters, narrowly oblong, acute, dorsally compressed. *Glumes* 2, similar and subequal, firmly membranous, much shorter than the spikelet. *Lemmas* subequal; the lower membranous, the size and shape of the spikelet, empty; the upper subcoriaceous, margins very narrowly hyaline, its palea similar, embraced by it all along, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* elliptic, almost flat.

OTTOCHLOA NODOSA, Dandy. *Panicum nodosum*, Kunth; F. B. I. vii. 43.

Travancore State; at low elevations and up to 6,000 ft. (Meebold). Culms up to 6 ft. high; leaves narrowed and almost petioled or rounded or subcordate, 1·8—5 in. long, ·32—·5 in. wide; panicles up to 8 in. long, branches up to 5 in. long; spikelets ·13—·15 in. long.

57. *Holcolemma*, Stapf et Hubbard

Annual or perennial herbs. *Leaves* linear, flat. *Panicles* narrow, spiciform. *Spikelets* fascicled or solitary on a slender, simple rhachis, together with setae at the lower nodes or replaced by setae, oblong to lanceolate, back flat and deeply channelled. *Glumes* hyaline or thinly membranous; the lower $\frac{1}{2}$ — $\frac{1}{3}$ as long as the spikelet; the upper slightly longer. *Lemmas* dissimilar; the lower as long as the spikelet, base slightly saccate, membranous with a longitudinal median channel of thinner tissue, its palea as long, 2-keeled, concave and hyaline between the keels, empty or enclosing a ♂ floret; the upper as long as or slightly shorter than the lower, becoming crustaceous, finely granulate and transversely rugose, enclosing its similar palea except at the tip, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* elliptic-oblong, dorsally compressed.

HOLCOLEMMMA CANALICULATUM, Stapf et Hubb. *Panicum canaliculatum*, Nees; F. B. I. vii. 43.

Precise locality unknown (Wight).

Culms slender, weak, up to 4 ft. high; leaves flaccid, 3—6 in. long, ·1—·15 in. wide, finely acuminate; panicles 1·5—4 in. long; spikelets ·12—·14 in. long.

58. *Panicum*, Linn.

Annual or perennial, erect or procumbent, sometimes woody herbs. *Leaves* very diverse. *Inflorescence* of usually open panicles, generally

much divided. *Spikelets* lanceolate to oblong, elliptic or orbicular, rarely somewhat oblique, falling entire or nearly so. *Glumes* herbaceous; the lower rarely absent, sometimes hyaline, usually considerably shorter than the upper, seldom as long; the upper rounded on the back. *Lemmas* dissimilar; the lower similar and subequal to the upper glume, with or without a palea, empty or enclosing a ♂ floret; the upper coriaceous or crustaceous, obtuse or acute, mucous, margins usually involute, its palea similar, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* tightly enclosed in the hardened lemma and palea.

Lower glume distinct, at least $\frac{1}{2}$ as long as the spikelet:—

Leaves linear:—

Leaves not markedly distichous, flat, not rigid or glaucous:—

Glumes equal, .07—11 in. long, obtuse. Culms 1—3 ft. high; leaves 2—3.2 in. long, .2—4 in. wide, closely ribbed; spikelets .08—12 in. long, upper lemma .06 in. long.....1. *oreades*.

Lower glume shorter than the upper:—

Spikelets .06—08 in. long. Culms 1—12 in. high; leaves 1—6 in. long, very narrow; lower lemma distinctly shorter than the upper glume, not much longer than the upper lemma.....2. *humile*.

Spikelets .085 in. or more long:—

Spikelets .2—26 in. long. Culms 1—4 ft. high, softly hirsute below the nodes; leaves tapering from a broad base, 4—14 in. long, .25—8 in. wide, sheaths with long spreading hairs from conspicuous tubercles; upper lemma ovate, .13—15 in. long, brown, shining, usually with 5 pale-brown nerves.....3. *miliaceum*.

Spikelets .16 or less long:—

Upper lemma smooth:—

Annuals; nodes of culms glabrous:—

Spikelets not gaping; keel of glumes not scaberulous; upper lemma acute or subacute:—

Panicles contracted, branches and pedicels moderately slender. Culms 1—2 ft. long; leaves tapering from a broad base, 3—12 in. long, .15—5 in. wide (in cultivated forms sometimes much larger, stout, up to 3 ft. high; leaves up to 2 ft. long and 1 in. wide); spikelets .13—17 in. long; lower glume .04—09 in. long; upper lemma .08—12 in. long, dark brown at maturity, often with 5 paler veins.....4. *miliare*.

Panicles effuse; branches and pedicels capillary. Culms slender, 6—22 in. high; leaves not tapering, 2—8 in. long, .25—35 in. wide; spikelets .1—12 in. long; lower glume .03—05 in. long; upper lemma .06—08 in. long, pale brown or whitish

5. *psilopodium*.

Spikelets gaping, .11—15 in. long; upper lemma obtuse, .07—11 in. long, yellow. Culms 6—36 in. high; leaves usually basal only, not tapering, 1.3—13 in. long, .12—4 in. long, copiously hairy from tubercles, rarely glabrous; panicles often large; lower glume .05—1 in. long, cuspidate, keel scaberulous...6. *trypheron*.

Perennials:—

Lower glume broader than long, obtuse, $\frac{1}{2}$ as long as the spikelets or less. Culms stout, 2—3 ft. high, base creeping or floating and rooting at the lower nodes, nodes glabrous; leaves tapering, 4—11 in. long, .25—4 in. wide, sheaths inflated; pedicels scabrid, usually much enlarged at the apex; spikelets lanceolate, .12—16 in. long.....7. *paludosum*.

Lower glumes ovate, acuminate, $\frac{1}{2}$ — $\frac{3}{4}$ as long as the spikelets. Culms solid, terete, woody below, up to 6 ft. high, nodes thickened, puberulous; leaves very finely acuminate, 6—24 in. long, .25—8

in. wide, sheaths not inflated; panicles large, pedicels slender, not enlarged at the apex; spikelets ovoid, acute, .12—.13 in. long

8. *antidotale*.

Upper lemma transversely rugulose, .08—.1 in. long. Culms usually stout, up to 10 ft. high; nodes hirsute; leaves tapering from a broad, rounded or cordate base, 6—24 in. long, .35—.8 in. wide, margins spinulose; lowest node of the panicle villous; spikelets .11—.16 in. long; lower glume suborbicular, .04—.06 in. long

9. *maximum*.

Leaves distichous, involute, seldom expanded, rigid, glabrous, 2.5—13 in. long, .15—.3 in. wide. Culms creeping at the base, stoloniferous, often nodular, 1—5 ft. high, sterile shoots closely leafy; spikelets .1—.13 in. long; lower glume suborbicular, .04—.05 in. long.....10. *repens*.

Leaves ovate to lanceolate:—

Spikelets .13 in. or less long:—

Leaves ovate, acute, base cordate, amplexicaul, 1—3.2 in. long, .5—1.2 in. wide. Culms decumbent and rooting below, up to 3 ft. long; spikelets .07—.09 in. long; glumes glabrous, puberulous or sometimes pilose from tubercles, upper gibbous, .06—.08 in. long, very slightly longer than the lower; lower lemma about as long, upper very little shorter than the lower glume.....11. *brevifolium*.

Leaves lanceolate, acuminate, base broad, deeply cordate, 3.5—8.5 in. long, .4—1.2 in. wide. Culms erect, up to 6 ft. high, base shortly woody; spikelets .1—.13 in. long; upper glume not gibbous, subequal to the lower lemma, a little longer than the lower glume and upper lemma

12. *montanum*.

Spikelets .16—.22 in. long. Culms slender, up to 5 ft. high; leaves ovate-lanceolate, acuminate, base rounded or cordate, 2.5—7 in. long, .35—.1 in. wide; upper glume and lower lemma subequal, larger than the lower glume and upper lemma.....13. *Gardneri*.

Glumes minute or one or both absent. Culms slender, up to 3 ft. high; leaves 2.5—8 in. long, .15—.53 in. wide; panicles large, effuse, branches and pedicels capillary; spikelets .1 in. long; lower lemma 5—7-nerved, glabrous or silky between the nerves, enfolding the slightly shorter upper.....14. *subglume*.

1. *PANICUM OREADES*, Domin *P. acquiglume*, Hook. f. non Hack. et Arehav.; F. B. I. vii. 44.

Nilgiri Hills at 5,000 ft. (Lawson, Bourne).

2. *PANICUM HUMILE*, Nees; F. B. I. vii. 48.

Vizagapatam and S. Kanara Districts; Travancore State.

Considered a good fodder in N. India.

3. *PANICUM MILIACEUM*, Linn.; F. B. I. vii. 45.

Cultivated for its edible grain. The common Millet.

The straw is a useful fodder. Vern. *Hind.* Chena; *Ur.* Rala; *Tel.* Varagalu, Wuragi, Warigalu, Barigalu; *Tam.* Samai, Kadai-kanni; *Kan.* Baragu.

4. *PANICUM MILIARE*, Lamk.; F. B. I. vii. 46.

Much cultivated in all Districts for its edible grain and run wild; sea-level to 7,000 ft. The little Millet.

The straw is a good fodder. Vern. *Hind.* Savan; *Ur.* Suniva; *Tel.* Chamalu, Ganga samalu, Sani, Savai; *Tam.* Samai, Shamai, Peru samai; *Kan.* Shamai, Bili samai hullu; *Mal.* Shama.

5. *PANICUM PSILOPODIUM*, Trin.; F. B. I. vii. 46.

In all Districts; sea-level to 6,000 ft.

Not easily distinguished from the last species, of which it is probably the truly wild form. In salt swamps the whole plant becomes rather stiff, with narrow erect leaves. Vern. *Tam.*

Kadaikanai, Piva pillu, Samai, Uragadam, Pattu pillu, Kalam pillu.

The spikelets are very commonly inhabited by a larva and then they become much hypertrophied, up to 3 in. long. In normal spikelets occasionally a coriaceous linear ensiform appendage $\frac{1}{3}$ — $\frac{2}{3}$ as long as the upper lemma is found attached to the rhachilla between the two lemmas.

6. *PANICUM TRYPHERON*, Schult. ; F. B. I. vii. 47 ; S. I. G. fig. 101.
In all Districts ; sea-level to 6,000 ft. Vern. *Tel.* Adavi satha gaddi ; *Tam.* Samai-karunai ; *Kan.* Kadu karai samai hullu.
7. *PANICUM PALUDOSUM*, Roxb. *P. proliferum*, Hook. f. non Lamk. ; F. B. I. vii. 50.
Ganjam, Cuddapah and Coimbatore Districts ; Mysore State ; Lower Pulney Hills ; Courtallam ; sea-level to 3,000 ft.
8. *PANICUM ANTIDOTALE*, Retz. ; F. B. I. vii. 52.
Bangalore ; Carnatic ; Nilgiri and Shevaroy Hills.
Grazed by cattle only when young. Used medicinally for ulcers (*vide* Koenig), and in throat affections ; the smoke when it is burnt is said to be a disinfectant. Vern. *Tam.* Nassiam pillu, Pinisu pillu.
9. *PANICUM MAXIMUM*, Jacq. ; F. B. I. vii. 49.
A tropical African grass cultivated for its valuable fodder and occasionally found as an escape. The Guinea grass. Vern. *Hind.* Gini ghans ; *Tam.* Ginio pillu ; *Kan.* Gini hullu.
10. *PANICUM REPENS*, Linn. ; F. B. I. vii. 49 ; S. I. G. figs. 102, 103.
In all Districts ; in sandy soil or in standing, including brackish, water ; sea-level to 7,000 ft. The Ginger grass.
Much liked by cattle and alleged to stimulate the yield of milk. Vern. *Ur.* Reda ; *Tel.* Ladda gaddi, Kari gaddi ; *Tam.* Tinci pillu, Inji pillu ; *Mal.* Inchi kanu pullu ; *Kan.* Sonti hullu.
11. *PANICUM BREVIFOLIUM*, Linn. *P. ovalifolium*, Poir. ; F. B. I. vii. 44.
In all Districts ; sea-level to 3,500 ft.
12. *PANICUM MONTANUM*, Roxb. ; F. B. I. vii. 53.
In all Districts ; sea-level to 4,000 ft.
13. *PANICUM GARDNERI*, Thw. *Isachne Gardneri*, Benth. ; F. B. I. vii. 26.
W. Ghâts ; 5,000—7,500 ft.
14. *PANICUM SUBEGLUME*, Trin. ; F. B. I. vii. 51.
In all the Eastern Districts from the Rampa Hills to Tinnevely ; sea-level to 2,000 ft.

59. *Hymenachne*, Beauv.

Stout, erect herbs. *Leaves* broadly linear. *Inflorescence* a thyrsoid panicle with erect, appressed branches ; branchlets spiciform. *Spikelets* very numerous, secund, narrowly lanceolate, acuminate, articulated on minute pedicels ; rhachilla produced between the glumes and between the upper glume and the lower lemma. *Glumes* membranous ; the lower shorter, cuspidate, keeled ; the upper sheathing the rhachilla, prominently 3-nerved, cuspidate or awned. *Lemmas* longer than the

upper glumes; the lower membranous, lanceolate, tapering into an arista, 5-nerved, empty; the upper shorter, oblong, membranous in flower, hardening in fruit, faintly 2-nerved, embracing its palea except at the tip, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* very small, oblong, tip contracted; embryo large, orbicular.

HYMENACHNE PSEUDO-INTERRUPTA, C. Muell. *Panicum Myurus*, H. B. K.; F. B. I. vii. 39.

Near the coast line; not common.

Root stock creeping or floating; culms erect, 2–6 ft. high, rooting at the lower nodes, spongy below; leaves 3·5–18 in. long, 3–75 in. wide, base rounded or cordate; panicle 4·5–12 in. long; spikelets 16–2 in. long; glumes and lower lemma scaberrulous on the ribs; upper glume strongly 3-ribbed, acuminate-caudate, 15 in. long; lower lemma 18–2 in. long, tapering into an arista $\frac{1}{3}$ as long; upper lemma 12–13 in. long.

60. *Cyrtococcum*, Stapf

Perennial, usually weak herbs. *Leaves* usually narrow, sometimes ovate, flat. *Panicles* effuse or contracted. *Spikelets* long- or short-pedicelled, distant or approximate, obliquely obovate to semi-obovate, much laterally compressed. *Glumes* thinly membranous, unequal or subequal. *Lemmas* dissimilar; the lower similar to the upper glume, its palea, if present, narrow, 2-nerved, empty; the upper narrowly boat-shaped, papery to subcrustaceous with firm, narrowly involute margins, as long as the lower or nearly so, its palea subequal to it, narrowly convex on the back, with fine keels and thin flaps, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* small, obovoid, free within the hardened lemma and palea.

Pedicels short, rarely as long as the spikelets:—

Leaves 5–17 in. long, 1–4 in. wide. Culms slender, creeping and branching below, up to 18 in. high; panicle up to 2·5 in. long, branches few; spikelets few, hispid, 06–07 in. long.....1. *trigonum*.

Leaves 2–7·5 in. long, 2–65 in. wide. Culms rather stout, erect from a creeping base, up to 3 ft. high; panicle 2·5–8·5 in. long, branches many; spikelets numerous, glabrous, rarely softly puberulous, 07–09 in. long.....2. *oxyphyllum*.

Pedicels long, usually longer than the spikelets:—

Upper lemma semi-ovate, with a linear or oblong apical pale callus, its palea usually with a small round apical callus; glumes more or less keeled:—

Lower lemma obtuse; glumes usually puberulous or hispidulous; panicles effuse, simply branched:—

Spikelets 09–1 in. long; upper lemma semi-ovate. Culms slender, erect from a creeping, rooting base, 5–12 in. long; leaves linear to linear-lanceolate, 1–4 in. long, 2–35 in. wide.....3. *patens*.

Spikelets 06–08 in. long; upper lemma broadly semi-ovate. Culms up to 18 in. high; leaves ovate to lanceolate, 1–3 in. long, 2–65 in. wide.

Other characters as in the last species.....4. *radicans*.

Lower lemma and glabrous glumes acute or cuspidate. Culms rather robust, up to 3 ft. high from a decumbent base; leaves 3–8 in. long, 25–6 in. wide; panicles up to 1 ft. long, fastigately branched; spikelets 08–09 in. long, less compressed than in any of the previous species.....5. *longipes*.

Upper lemma semi-lanceolate, acute, without apical callus, its palea without callus; glumes not keeled. Culms very slender, up to 18 in. high; leaves 1–2·7 in. long, up to 3 in. wide; panicles laxly effuse, branches and pedicels capillary; spikelets distant, 05–07 in. long.....6. *sparsicomum*.

1. CYRTOCOCCUM TRIGONUM, A. Camus. *Panicum trigonum*, Retz.; F. B. I. vii. 56.
In all Districts; up to 3,000 ft. Usually in shade. Vern. Kan. Abbu karkai.
2. CYRTOCOCCUM OXYPHYLLUM, Stapf. *Panicum pilipes*, Nees et Arn.; F. B. I. vii. 57.
In all Districts; sea-level to 6,000 ft. In open grass lands and woods and in evergreen forest.
3. CYRTOCOCCUM PATENS, A. Camus. *Panicum patens*, Linn.; F. B. I. vii. 57 in part.
Nilgiri, Pulney and High Wavy Mountains; 4,000—6,000 ft.
4. CYRTOCOCCUM RADICANS, Stapf. *Panicum patens*, Linn.; F. B. I. vii. 57 in part.
Mysore State; W. Coast and Gháts; N. Coimbatore Hills; sea-level to 6,000 ft.
Grazed by cattle. Vern. Kan. Akki hullu.
5. CYRTOCOCCUM LONGIPES, A. Camus. *Panicum longipes*, W. et A.; F. B. I. vii. 58.
Godavari District at Bison Hill (Barber); Mysore State; W. Coast and Gháts; 2,000—5,000 ft.
6. CYRTOCOCCUM SPARSICOMUM, A. Camus. *Panicum sparsicomum*, Nees; F. B. I. vii. 58.
Kodaikanal Ghát, about 2,000 ft. (Bourne).

61. Saccolipsis, Nash

Perennial, or sometimes annual herbs. *Leaves* linear, flat or convolute and filiform. *Panicles* effuse or contracted and spiciform. *Spikelets* often small, ovate oblong to conico-lanceolate, subterete or compressed, sometimes more or less oblique, usually somewhat turgid; pedicels filiform. *Glumes* unequal; the lower minute or up to half as long as the spikelet; the upper always very convex, often with a saccate base, 5—13-ribbed. *Lemmas* dissimilar; the lower about half as long as the upper, with a straight back, its palea hyaline, finely 2-keeled, sometimes reduced or rudimentary, empty or containing a ♂ floret; the upper very convex, chartaceous, becoming crustaceous, margins narrowly involute, obscurely 5-nerved, its palea of the same texture and almost as long, tightly embraced by it, hardly keeled, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* tightly enclosed in the hardened lemma and palea, elliptic, dorsally compressed, almost plano-convex in section; embryo about half as long.

Panicles cylindric, spiciform; pedicels short:—

Lower glume less than $\frac{1}{4}$ as long as the spikelet. Culms usually robust and spongy below, up to 6 ft. high; leaves 6—15 in. long, .2—5 in. wide; pseudo spikes 5—13 in. long (in impoverished individuals only 1 in. long); spikelets usually in interrupted, crowded fascicles, narrowly ovoid, .14—19 in. long, glabrous.....1. *interrupta*.

Lower glume half as long as the spikelet; pseudo spikes continuous, rarely interrupted:—

Spikelets ovoid, usually curved, .08—13 in. long, glabrous or more or less densely hispid. Culms slender, 4—24 in. high; leaves 1.2—5.6 in. long, .06—2 in. wide; pseudo spikes .35—3.5 in. long.....2. *indica*.

Spikelets subglobose, .06—08 in. long, glabrous. Culms slender, 6—22 in. high; leaves 4—14 in. long, .05—2 in. wide; pseudo spikes 1.4—10 in. long
 3. *myosuroides*.
 Panicles broad, effuse, up to 4 in. long; pedicels capillary, often longer than the spikelets. Culms slender, 6—20 in. high; leaves 1.5—4 in. long, .1—22 in. wide; spikelets gibbously ovoid, .09—11 in. long, glabrous.....4. *curvata*.

1. *SACCOLEPIS INTERRUPTA*, Stapf. *Panicum interruptum*, Willd.; F. B. I. vii. 40; S. I. G. figs. 99, 100.

In all Districts; sea-level to 6,000 ft. In swampy places.

Grazed by cattle. Vern. Tel. Wolam; Tam. Tandan pillu; Kan. Hodikai hullu.

2. *SACCOLEPIS INDICA*, Chase. *Panicum indicum*, Linn.; F. B. I. vii. 41. In all Districts; sea-level to 6,500 ft. Vern. Kan. Kari korlai hullu.

3. *SACCOLEPIS MYOSUROIDES*, A. Camus. *Panicum myosuroides*, R. Br.; F. B. I. vii. 42.

Ganjam District; Mysore State; Carnatic; sea-level to 3,000 ft. Doubtfully separable from the last species.

4. *SACCOLEPIS CURVATA*, Chase. *Panicum curvatum*, Linn.; F. B. I. vii. 42.

Chingleput and Tinnevely Districts; Travancore; up to 6,000 ft. In marshes and in hedges. A good fodder.

62. *Setaria*, Beauv.

Annual or perennial herbs. *Leaves* narrow, flat. *Panicles* terminal, contracted and cylindric with solitary or clustered spikelets on stunted branchlets which are more or less produced into bristles or divided into a one-sided involucre of bristles, or more or less open panicles with elongated branches and distant spikelets, the bristles present or not. *Spikelets* oblong to ovate, very convex on the back, falling entire, subtended by 1—many bristles. *Glumes* membranous; the lower usually ovate from a clasping base; the upper similar but longer. *Lemmas* dissimilar; the lower corresponding in size and shape with the spikelet, its palea elliptic-oblong, acute, sharply keeled or the keels marginate and narrowly winged, sometimes much reduced, empty or enclosing a ♂ floret; the upper subequal to the lower, very convex on the back or boat-shaped, crustaceous, often transversely rugose or finely pitted, its margins involute and embracing all along the similar palea up to its more or less prominent keels, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* oblong or ellipsoid, tightly enclosed in the hardened lemma and palea.

Leaves plicate, 4—24 in. long, 4—3 in. wide. Perennial; culms erect from a woody rootstock, up to 8 ft. high; panicles usually long, contracted or expanded, up to 2 ft. long, sometimes reduced and subspiciform; branchlets usually ending in a bristle; spikelets ovate-lanceolate, acute or acuminate, .1—15 in. long; upper lemma faintly transversely striate.....1. *palmifolia*.

Leaves flat, not plicate. Annuals:—

Bristles barbellate with erect teeth:—

Upper lemma smooth or faintly transversely striate. Culms up to 5 ft. high; leaves tapering to a long fine point, 6—18 in. long, 4—1.4 in. wide; panicles dense, forming a cylindric, sometimes lobed, continuous pseudo spike up to 12 in. long; branches spiral or more or less whorled; bristles 2—6; spikelets subsistent, broadly oblong or elliptic, .08—11 in. long.....2. *italica*.

Upper lemma distinctly transversely rugose:—

- Panicles continuous, cylindric, 3—6.5 in. long; bristles about 8. Culms up to 40 in. high; leaves 2.5—13 in. long, .15—.4 in. wide; spikelets deciduous, ovate to elliptic-oblong; .09—.12 in. long.....3. *pallidifusca*. Panicles narrow, interrupted, lax, flexuous, 1.5—8 in. long, branches ending in a bristle, lower up to 1 in. long; involucre bristles 3—4. Culms slender, up to 3 ft. high; leaves flaccid, 2—12 in. long, .12—.7 in. wide; spikelets broadly ovate, .07—.08 in. long.....4. *intermedia*. Bristles barbellate with descending teeth. Culms up to 4 ft. high; leaves 3.5—14.5 in. long, .2—1 in. wide; panicles straight or curved, continuous, cylindric, .5—8 in. long; branches ending in a bristle; involucre bristles 1—4; spikelets oblong-ellipsoid, .07—.08 in. long.....5. *verticillata*.

1. SETARIA PALMIFOLIA, Stapf. *Panicum plicatum*, Lamk.; F. B. I. vii. 55.
In all Districts, especially in the hills; near sea-level to 6,000 ft.
2. SETARIA ITALICA, Beauv.; F. B. I. vii. 78.
Widely cultivated and occasionally found as an escape. The Italian Millet. Probably the cultivated form of *S. intermedia*, R. et S. Vern. *Hind.* Kangu; *Ur.* Kora; *Tel.* Kora, Koralu; *Tam.* Tenai; *Mal.* Tena; *Kan.* Kari biragu, Navanai.
3. SETARIA PALLIDIFUSCA, Stapf et Hubbard. *S. glauca*, Beauv.; F. B. I. vii. 78 in part.; S. I. G. fig. 109.
In most Districts; sea-level to 7,000 ft.
Panicles pale-yellow to reddish-brown. A fair fodder. Vern. *Hind.* Bandra; *Tel.* Nakka kora, Kuradakori gaddi, Nakka-toka gaddi.
4. SETARIA INTERMEDIA, Roem. et Sch.; F. B. I. vii. 79; S. I. G. fig. 110.
In all Districts; 2,000—6,000 ft. Vern. *Tel.* Arranki gaddi; *Kan.* Dodda anta purlai hullu, Kari ottai hullu.
5. SETARIA VERTICILLATA, Beauv.; F. B. I. vii. 80; S. I. G. figs. 111, 112.
In all Districts; up to 6,000 ft.
The grain is eaten by the poor; eaten by cattle before the spikes appear. Vern. *Tel.* Chik lenta; *Kan.* Sanna anta purlai hullu.

63. Pseudoraphis, Griffith

Floating or marsh herbs, usually elongate, much branched and rooting at the lower, geniculate nodes. Leaves narrow, flat. Panicles terminal, contracted or effuse, the branchlets produced beyond the uppermost spikelet. Spikelets narrow, obscurely articulated on the short pedicels, persistent. Glumes very unequal; the lower very small, thinly membranous; the upper as long as the spikelet or nearly so. Lemmas smaller and rather firmer than the upper glume; the lower containing a ♂ floret; the upper a bisexual or a ♀; paleas hyaline, cuneiform. Lodicules 2, sometimes only 1 in ♀ florets. Stamens 3, rudimentary in ♀ florets. Styles 2, shortly united at the base. Grain linear-oblong, compressed, free within the subcoriaceous lower and the hyaline upper lemmas.

PSEUDORAPHIS ASPERA, Pilger. *Chamaeraphis spinescens*, Poir.; F. B. I. vii. 62; S. I. G. fig. 104.

Kistna, Cuddapah, Coimbatore and Chingleput Districts; Mysore State; near sea-level to 4,000 ft. (Horsleykonda). Growing in tanks and marshes.

Culms up to 3 ft. long; leaves 1·2—3 in. long, ·1—·22 in. wide, scaberulous; panicles contracted, ultimately effuse, up to 4·5 in. long, branches flattened, undulate, scabrid, the prolongation usually overtopping the uppermost spikelet; spikelets distant, subulate, acuminate, ·23—·31 in. long; upper glume caudate.

64. *Rhynchelytrum*, Nees.

Annual or perennial herbs. *Leaves* linear or filiform, flat. *Panicles* compound or decompound, open or contracted, branches and pedicels capillary, the latter discoid and usually hairy or pubescent at the tips. *Spikelets* linear- to ovate-oblong, laterally compressed, often more or less gaping, usually clothed with soft, shining, often brightly coloured hair. *Glumes* usually separated; the lower minute or small, rarely $\frac{1}{2}$ as long as the spikelet; the upper as long as the spikelet or nearly so, emarginate or 2-lobed, rarely entire, mucicous, mucronate or aristate from the sinus. *Lemmas* dissimilar; the lower resembling the upper glume, usually aristate, its palea 2-keeled, usually containing a ♂ floret; the upper much smaller and not aristate, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* oblong-ellipsoid, closely embraced by the lemma and palea.

RHYNCHELYTRUM VILLOSUM, Chiov. *Tricholaena Wightii*, Nees et Arn.; F. B. I. vii. 65.

Kurnool (Bourne) and Bellary Districts; Bangalore ("weed in a garden," Sedgwick); 1,000—3,000 ft.

Culms up to 2 ft. high; leaves 1—6 in. long, ·1—·25 in. wide; panicles up to 6 in. long; spikelets ·19—·24 in. long, excluding aristas; lower lemma 2-lobed, its arista ·07—·14 in. long with very long whitish or pinkish-purple hairs on the back.

65. *Pennisetum*, L. C. Rich.

Annual or perennial, erect, often tall, simple or branched herbs. *Leaves* narrow, flat or convolute. *Panicles* spiciform, usually dense, branches numerous, short and simple with a solitary spikelet or scantily divided and the spikelets in clusters of 2—5, the single ones or clusters subtended by and deciduous with an involucre of few to many, free, usually unequal, scabrid or plumose, simple, rarely branched bristles. *Glumes* usually small and hyaline; the lower sometimes suppressed; the upper rarely more than half as long as the spikelet. *Lemmas* similar and subequal or dissimilar and the upper smaller, membranous to chartaceous; the lower empty or enclosing a ♂ floret; the upper containing a bisexual floret; paleas subequal and similar to the lemmas, the lower sometimes suppressed. *Lodicules* 2, small or 0. *Stamens* 3; anthers sometimes penicillate at the tip. *Styles* 2, free or more or less connate. *Grain* narrowly oblong to orbicular, enclosed in the slightly hardened lemma and palea; embryo $\frac{1}{2}$ — $\frac{3}{4}$ as long.

Sometimes the spikelets are much reduced (especially in cultivated forms), even to an upper floret with only minute traces of a lower lemma.

Leaves expanded:—

Panicles cylindric, stout, 1·8—9 in. long; rhachis thick, villous; peduncles villous, ·05—·09 in. long; involucre densely packed all round the rhachis, often purplish, bristles sometimes ciliate, up to ·2 in. long. Culms stout, up to 6 ft. high; leaves 4—24 in. long, ·2—1·5 in. wide; spikelets 2, rarely 3, to an involucre, pedicelled, 13—17 in. long; lower glume usually 0, upper very short or 0; lemmas subequal, lower sometimes suppressed, ·12—14 in. long; anther-tips penicillate.....1. *typhoides*.

Panicles linear, slender, 1—8 in. long; rhachis slender, angled, flexuous, glabrous or puberulous; involucre sessile, spirally arranged at short intervals; spikelets usually solitary, rarely 2 in an involucre. Culms stout, up to 3 ft. high; leaves 3—15 in. long, ·2—6 in. wide; anthers not penicillate:—

Inner bristles densely villous, longest up to ·65 in. long; pedicels up to ·07 in. long; lower glume ·05—·07 in. long, more or less villous, upper ·15—·17 in. long, acute, puberulous; lower lemma like the upper glume, 3-toothed at apex, upper chartaceous ·09—11 in. long, its apex and that of its palea fimbriate.....2. *pedicellatum*.

Inner bristles laxly ciliate, longest up to ·5 in. long; spikelets sessile; lower glume minute or suppressed. Other characters as in the last species

3. *polystachyon*.

Leaves convolute, 3—30 in. long, very narrow; panicles linear; spikelets solitary, sessile; anthers not penicillate. Culms up to 3 ft. high:—

Panicles 3—7 in. long; involucre subsessile, bristles scabrid, not plumose, up to ·74 in. long, often purplish; spikelets ·27—·32 in. long; lower glume orbicular ·04 in. long, upper ovate, ·08—15 in. long; lower lemma ·24—·29 in. long

4. *Hohenackeri*.

Panicles 1—4·5 in. long; peduncles up to ·05 in. long; bristles plumose, up to 2·5 in. long, sometimes purplish; spikelets ·45—·55 in. long; lower glume oblate, ·02—·04 in. long, upper lanceolate to oblong, ·14—·2 in. long; lemmas 3—4 in. long.....5. *villosum*.

1. PENNISETUM TYPHOIDES, Stapf et Hubbard. *P. typhoideum*, Rich.; F. B. I. vii. 82.

Cultivated in all Districts for its edible grain and for fodder; here and there found as an escape; near sea-level to 7,000 ft. The Bull-rush Millet, Pearl Millet or Spiked Millet. Vern. Hind. Bajra; Ur. Gantiya; Tel. Sajja, Sajjalu, Gantelu; Tam. Kambu; Mal. Kampam; Kan. Sajjai.

2. PENNISETUM PEDICELLATUM, Trin.; F. B. I. vii. 86.
Godavari District (Barber).

3. PENNISETUM POLYSTACHYON, Schult. *P. setosum*, Rich.; F. B. I. vii. 87.
Godavari District (Barber).

4. PENNISETUM HOHENACKERI, Hochst. ex Steud.; *P. alopecuroides*, Steud.; F. B. I. vii. 84; S. I. G. figs. 113, 114.
Mysore State; Bellary, N. Arcot, Salem, Madura and Malabar Districts; Nilgiri and N. Coimbatore Hills; 1,000—6,000 ft. Vern. Tam. Munja pillu; Kan. Nosai hullu, Manai geddai.

5. PENNISETUM VILLOSUM, R. Br.

Introduced and run wild along road-sides at Ootacamund. *Pennisetum clandestinum*, Hochst., the Kikuyu grass, an excellent tropical African fodder grass, is being cultivated in certain areas to improve the grazing. It is reported to be a good lawn grass and is likely to spread.

66. *Cenchrus*, Linn.

Annual or perennial herbs. *Leaves* flat and flaccid or convolute, short and rigid. *Inflorescence* of simple spikes or paniced. *Spikelets* narrow, solitary or 2—3, rarely 4, enclosed in an involucre of bristles or spines thickened and united at the base into a cup and falling with it. *Glumes* unequal; the lower small; the upper hardly shorter than the spikelet. *Lemmas*, when both present, dissimilar; the lower empty, containing a ♂ floret or entirely suppressed; the upper more rigid, containing a bisexual floret. *Lodicules* 0 or 2, minute. *Stamens* 3. *Styles* 2, often shortly connate. *Grain* oblong, rather hard, enclosed but free within the lemma and palea.

Involucral bristles not spinose, .3—5 in. long, the inner plumose, even if thickened below the tips always filiform. Culms up to 18 in. high; leaves 2—12 in. long, .1—2 in. wide; spikes 1—3 in. long; lower glume .07—11 in. long, upper .1—13 in. long.....1. *ciliaris*.

Involucral bristles spinose, tips not filiform:—

Base of involucre rounded, bristles all erect, not ciliate, hairy within, up to .16 in. long. Culms up to 12 in. high; leaves 4—5 in. long, .15 in. wide; spikes .05—3 in. long; spikelets .17 in. long; lower glume .06—07 in. long, upper slightly longer; lemmas .13—16 in. long.....2. *setigerus*.

Base of involucre turbinate, bristles stout, the outer spreading or recurved, ciliate, up to .33 in. long. Culms 2—18 in. high; leaves 1—6 in. long, .2 in. wide; spikes 1.5—5 in. long; spikelets .22—26 in. long; lower glume usually suppressed, upper .14—2 in. long; lemmas .15—23 in. long.....3. *barbatus*.

1. *CENCHRUS CILIARIS*, Linn. *Pennisetum cenchroides*, Rich.; F. B. I. vii. 88; S. I. G. fig. 115.

Mysore State; Anantapur, Bellary, Chingleput, Salem, Coimbatore and Madura Districts; up to 3,000 ft.

Spikes often purple. An excellent fodder. Attempts are being made to extend it over wider areas. Vern. *Tam.* Kolukkattai pullu.

Var. *echinoides*, Hook. f. *Pennisetum cenchroides*, Rich. var. *echinoides*, Hook. f.; F. B. I. vii. 88; S. I. G. fig. 116. With rather stouter bristles united higher up into a more definite cup.

2. *CENCHRUS SETIGERUS*, Vahl. *C. biflorus*, Roxb.; F. B. I. vii. 89; S. I. G. fig. 117.

Coromandel. Not common.

Spikes sometimes purple.

3. *CENCHRUS BARBATUS*, Schum. *C. catharticus*, Del.; F. B. I. vii. 90; S. I. G. fig. 118.

Northern Circars; Bellary District.

Grazed by cattle before flowering.

67. *Isachne*, R. Br.

Perennial herbs. *Leaves* flat. *Inflorescence* loosely paniced. *Spikelets* small or minute, subglobose or obovoid, not or obscurely articulated on the pedicels. *Glumes* subequal, convex, herbaceous, often falling separately. *Lemmas* subequal or the lower longer and flatter, coriaceous paleate; the lower containing a ♂ or sometimes a bisexual floret; the upper articulated and often stipitate on the rachilla and falling separately, containing a bisexual or sometimes a

♀, rarely a ♂ floret. *Lodicules* 2, very minute. *Stamens* 3, rarely 4—6. *Styles* 2, free. *Grain* free within the hardened lemma and palea.

Glumes, at least the lower, longer than the lemmas, cuspidate or caudate:—

Lemmas subequal:—

Branches of the panicles glabrous or pubescent; margins of leaves thickened and cartilaginous; glumes lanceolate, sparsely setose at apex:—

Leaves ovate to ovate-lanceolate, .6—3.5 in. long, .2—5 in. wide (much wider in var. *latifolia*), base rounded and clasping the stem, sheaths more or less densely long-hairy and ciliate. Culms 3—12 in. high; glumes .1—11 in. long; lemmas .06—0.9 in. long, upper more or less puberulous

1. *Kunthiana*.

Leaves linear to linear-lanceolate, rarely a few narrowly ovate, .6—2.6 in. long, .15—4 in. wide, base narrowed, not clasping the stem, sheaths glabrous, rarely shortly puberulous. Culms 3—40 in. high; glumes .12—15 in. long.

Other characters as in the last species.....2. *Bourneorum*.

Branches of the panicles setose; glumes ovate-orbicular, .09—11 in. long; setose all over the back. Culms 1—5 in. high; leaves lanceolate, .7—2 in. long, .2—4 in. wide, base clasping the stem, margins neither thickened nor cartilaginous, sheaths long-hairy or nearly glabrous, long-ciliate; lemmas hemispheric, .06 in. long, glabrous.....3. *Lisboae*.

Lower lemma elliptic, .08—0.9 in. long, glabrous, upper broadly ovate, .04—0.6 in. long, rather densely pubescent. Culms slender, 1—5 in. high; leaves ovate to ovate-lanceolate, .4—1.2 in. long, .15—4 in. wide, sheaths lax, patently hairy from tubercles; glumes ovate, caudate-acuminate, 7-nerved, setose from large tubercles, .09—12 in. long, lower usually the longer.....4. *setosa*.

Glumes as long as or shorter than the lemmas:—

Spikelets .12 in. or less long:—

Leaves 6.5 in. or less long:—

Stems erect or prostrate, 25 in. or less high:—

Spikelets .07—12 in. long; ligules represented by a line of stiff hairs:—

Lemmas subequal and similar, ovate to elliptic-oblong, rather deeply concave, subcoriaceous, puberulous, .06—0.9 in. long. Culms decumbent, rooting below, up to 24 in. high; leaves asperulous, sometimes softly hairy, 2—5.5 in. long, .2—25 in. wide, usually more or less erect; glumes subequal, broadly ovate to orbicular, glabrous or asperulous and setose upward, .07—11 in. long.....5. *elegans*.

Lemmas markedly unequal and dissimilar, lower elliptic to oblong, shallowly concave, glabrous, membranous:—

Culms prostrate, slender, up to 12 in. long; leaves 1.2—2.3 in. long, .15—3 in. wide; glumes suborbicular or broader than long, .05—0.9 in. long, upper much more deeply concave, glabrous, sometimes asperulous and setulose at the apex; lower lemma as long, upper broadly ovate to suborbicular, semicircular in section, chartaceous, puberulous at least on the margins, .04—0.7 in. long.....6. *miliacea*.

Culms erect from a decumbent, rooting base, rigid, up to 12 in. long; leaves 1—2.5 in. long, .15—4 in. wide; glumes as in the last species; lower lemma .06—1 in. long, upper crustaceous, hard, usually white, puberulous at least on the margins, .05—0.8 in. long.....7. *dispar*.

Spikelets .04 in. long; ligules 0. Culms 1.5—7 in. high, very slender; leaves ovate, .35—1.5 in. long, .2—5 in. wide, flaccid; glumes delicately membranous, elliptic to elliptic-ovate, sparsely setose, .03—0.4 in. long

8. *gracilis*.

Culms straggling, bamboo-like, 4 ft. or more long; leaves 2—6 in. long, .12—25 in. wide, ciliate at base; glumes broadly elliptic-ovate, .08—1 in. long; lemmas boat-shaped, .07—0.8 in. long.....9. *Angladel*.

Leaves 7—14 in. long, .2—4 in. wide, continuous with the sheath, beset with stiff short or long hairs, margins thickened and cartilaginous. Culms erect, rigid, up to 3 ft. high; spikelets globose; glumes suborbicular, sparsely setose at apex, .08—1 in. long; lemmas orbicular, .06—0.7 in. long.....10. *Meeboldii*.

Spikelets .14 in. or more long. Culms often stout, 1—5 ft. high; leaves 2—11.5 in. long, .2—1 in. wide; glumes subequal, ovate to ovate-lanceolate, .14—2 in.

long, glabrous or setulose; lemmas subequal, boat-shaped, .12—.15 in. long, coriaceous.....11. *Walkeri*.

1. *ISACHNE KUNTHIANA*, W. et A.; F. B. I. vii. 21.

W. Gháts; High Wavy Mountains (Blatter and Hallberg); 5,000—8,000 ft.

- Var. *latifolia*, Hook f.; F. B. I. vii. 22. Leaves up to 1 in. wide with 2—4 nerves on either side of the midrib prominent below.

W. Gháts; 5,000—8,000 ft.

- Var. *nana*, C. E. C. Fischer n. var.

Culms only 1—2 in. high; leaves .1—25 in. long, .05—.1 in. wide, margins not cartilaginous; glumes longer than, equal to or rarely shorter than the lower lemma.

Travancore on Anaimudi Peak at 8,840 ft. (Barnes).

2. *ISACHNE BOURNEORUM*, C. E. C. Fischer in Kew Bull. 1932, 324.

Bababudan, Nilgiri and Pulney Hills; 5,000—8,000 ft.; Travancore on Anaimudi Peak at 8,840 ft. (Barnes).

3. *ISACHNE LISBOAE*, Hook. f.; F. B. I. vii. 22.

Bababudan Hills (Talbot, Meebold); 6,000 ft.

4. *ISACHNE SETOSA*, C. E. C. Fischer in Kew Bull. 1932, 247.

Cochin and Travancore States (Meebold); 3,000—6,000 ft.

5. *ISACHNE ELEGANS*, Dalz.; F. B. I. vii. 23.

Mysore, Nilgiri and Pulney Hills; 5,000—7,000 ft. Vern. *Kan. Kadu sanna samai hullu*.

6. *ISACHNE MILIACEA*, Roth; F. B. I. vii. 25.

Godavari District; W. Coast; at low elevations; usually in wet places.

7. *ISACHNE DISPAR*, Trin.; F. B. I. vii. 26. *I. australis*, Hook. f. non R. Br.; F. B. I. vii. 24.

In all Districts; sea-level to 6,000 ft.; often in wet situations. Readily eaten by horses and cattle. A troublesome weed in rice-fields.

- Var. *villosa*, C. E. C. Fischer n. var.

Nodes setose; leaves villous.

High Wavy Mountains (Blatter and Hallberg).

8. *ISACHNE GRACILIS*, C. E. Hubbard in Kew Bull. 1927, 77.

Bababudan Hills at Santaveri (Meebold); 4,000 ft.

9. *ISACHNE ANGLADEI*, C. E. C. Fischer in Kew Bull. 1932, 323.

Pulney and High Wavy Mountains; 4,000—6,000 ft.

10. *ISACHNE MEEBOLDII*, C. E. C. Fischer in Kew Bull. 1932, 323.

Mysore State (Meebold); 2,000—3,000 ft.

11. *ISACHNE WALKERI*, W. et A.; F. B. I. vii. 26.

W. Gháts; 2,500—7,000 ft.

68. *Thysanolaena*, Nees

Tall, reed-like shrubs with solid, terete culms. *Leaves* distichous, broad, flat. *Panicles* compound, large, effuse. *Spikelets* very numerous, linear-oblong, obscurely articulated on their pedicels. *Glumes* membranous, much shorter than the lemmas, the lower shorter than the upper. *Lemmas* similar; the lower without palea, empty; the upper

paleate, containing a bisexual floret. *Lodicules* 2. *Stamens* 2—3. *Styles* 2, free. *Grain* minute, enclosed in the hardened lemma and palea.

THYSANOLAENA MAXIMA, O. Kt. *T. Agrostis*, Nees; F. B. I. vii. 61.

Ganjam, Vizagapatam and Rampa Districts; 1,500—4,800 ft.

Culms up to 12 ft. high; leaves subcoriaceous, finely acuminate, cordate, up to 2 ft. long and 3 in. wide; panicle up to 3 ft. long and 2 ft. across; spikelets .07—.09 in. long; lower glume .02—.03 in. long, upper .04 in. long; lemmas lanceolate, boat-shaped, acuminate, .06—.07 in. long, the upper the shorter, ciliate with long spreading hairs.

69. *Arundinella*, Raddi

Annual or perennial, erect herbs. *Leaves* usually narrow. *Panicles* usually branched, rarely congested. *Spikelets* 1—2, rarely 3-flowered, not or imperfectly jointed at the base; rhachilla not produced beyond the uppermost floret, disarticulating above the glumes. *Glumes* membranous, chartaceous or thinly coriaceous, more or less convex; the lower usually much the shorter, 3—5-, rarely 7-nerved. *Lemmas* dissimilar; the lower usually boat-shaped, 3—7-nerved, its palea linear or oblong, 2-keeled, empty or enclosing a ♂ or a bisexual floret; the upper much shorter, usually chartaceous or crustaceous, articulated at the base and more or less separately caducous, involute, entire or 2-toothed, sometimes provided with two apical setae, usually long awned from the apex or sinus, the awn sometimes very short or absent, geniculate and hygroscopically contorting below the middle, the palea of similar texture, enclosed in the lemma, 2-keeled with wide inflexed flaps (palea sometimes lacking in either or both lemmas), containing usually a bisexual, seldom a ♀ floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free or very shortly united. *Grain* oblong or ellipsoid, free within the lemma and palea; embryo large; albumen rather hard.

Upper lemma awned, hairy at the base; glumes narrow:—

Upper lemma bearing 2 apical setae:—

Inflorescence congested into a crowded ovoid or oblong head .4—1.7 in. long. A weak annual 1—12 in. high; leaves linear to lanceolate, cordate, 1—2 in. long; lower glumes .16—.22 in. long, setose; upper lemmas .16—.22 in. long, pilose, awns .3—35 in. long, portion below the knee flat.....1. *avenacea*.

Panicle of distant spikes or effuse; leaves linear; upper lemma scaberulous:—

Spikelets mostly sessile or very shortly pedicelled, bifariously imbricate in spikes .2—1.5 in. long. Culms slender, 10—24 in. high; leaves 1.4—5.5 in. long, .05—.32 in. wide; panicles up to 5 in. long; glumes bristly from tubercles; upper lemmas .07—.15 in. long, awns .2—.35 in. long

2. *mesophylla*.

Spikelets slenderly pedicelled, not bifarious or imbricate. Culms slender to rather stout, 1—3 ft. high; leaves 3—11 in. long, .1—.3 in. wide; panicles 3—12 in. long; glumes glabrous or setose, ribs often scabrid; upper lemma .08—.12 in. long, awns .25—.37 in. long; setae .06—.14 in. long.....3. *setosa*.

Upper lemma devoid of setae:—

Spikelets small; upper lemma less than .06 in. long:—

Both glumes .07 in. or less long, smooth, glabrous or rarely with a few hairs. A slender annual 4—15 in. high; leaves 4—9 in. long, .15—.82 in. wide; panicles effuse, feathery, 5—8 in. long; upper lemmas .03—.04 in. long, scaberulous, awns .08—.11 in. long, very slender.....4. *pumila*. Glumes usually, upper always, more than .07 in. long, ribs of lower glume scabrid:—

Panicles compact, ovoid or oblong, rarely somewhat effuse, 1.6—8 in. long,

branches .3—1.5 in. long, spikelets crowded. Culms 1—12 in. high; leaves 1.5—7 in. long, .12—42 in. wide; lower glumes .07—13 in. long; upper lemma .04—06 in. long, scaberulous, awns .13—15 in. long

5. *holcoides*.

Panicles open, branches slender, spikelets not crowded:—

Culms very slender, 3—15 in. high; leaves aggregated near the base, distant above, with a naked peduncle to the panicle; leaves .5—1.3 in. long, .03—1 in. wide; rhachis, the 3—6 branches up to 1 in. long and the pedicels capillary; glumes more or less setose, lower .06—08 in. long, upper .1—12 in. long; upper lemmas .04 in. long, puberulous; awns very slender, .1—12 in. long.....6. *pygmaea*.

Culms more robust; leaves mostly more than 2 in. long and .07 or more in. wide:—

Glumes glabrous, lower .06—1 in. long, upper .1—13 in. long. Culms 3—20 in. high; leaves 1—12 in. long, .12—45 in. wide; panicles 2—20 in. long; upper lemmas .04—06 in. long, papillose, awns .1—11 in. long.....7. *Metzii*.

Glumes usually more or less setose, lower .08—11 in. long, upper .13—15 in. long. Culms 1—4 ft. high; leaves 2.5—13 in. long, .07—2 in. wide; panicles decompound, 7—20 in. long, branches slender, up to 6 in. long; upper lemmas .05—6 in. long, scaberulous; awns .16—2 in. long.....8. *Lavii*.

Spikelets larger; upper lemma .07 in. or more long, scaberulous; perennials:—

Panicles narrow, 2—7 in. long, branches spiciform, .5—1 in. long, rarely longer, distant or approximate, spikelets crowded subsessile, rhachis and branches densely villous. Culms 12—28 in. high; leaves mostly radical, flat, channelled or involute, stiff; more or less densely villous, rarely glabrous; glumes villous, lower .25 in. long, upper .28 in. long; upper lemmas .13 in. long; awns .18 in. long.....9. *villosa*.

Panicles effuse, branches long, spikelets pedicelled. Leaves glabrous:—

Branches of panicles distant; spikelets in distant pairs:—

Roots not tuberous, not woolly; culms 15—36 in. high; leaves 6—18 in. long; .32—45 in. wide; panicles 5—16 in. long, branches numerous, slender, up to 6 in. long, sometimes again branched; spikelets numerous, sometimes imbricate; lower glumes .12—15 in. long, ribs scabrid; upper .15—18 in. long; upper lemma .07—1 in. long; awns .11—12 in. long.....10. *nepalensis*.

Roots tuberous, densely woolly; culms slender, 6—33 in. high; leaves 4—8 in. long, .1—2 in. wide; panicles spreading, 4—9 in. long, branches few, distant, very slender, undivided, up to 5 in. long, pedicels long, capillary, spikelets few, distant; lower glumes .1—13 in. long, glabrous or scabrid on the ribs, upper .15—17 in. long; upper lemmas .07—1 in. long; awns .2—23 in. long, capillary.....11. *mutica*.

Branches of panicles close, spikelets crowded, rarely rather open with fewer and distant spikelets, 2.5—6 in. long. Culms 3—24 in. high; leaves 2.3—9.5 in. long, .15—6 in. wide; lower glumes .12—16 in. long, upper .16—21 in. long; upper lemmas .07—09 in. long; awns .15—18 in. long.....12. *fuscata*.

Upper lemma unawned, devoid of setae, without hairs at the base; perennials:—

Rootstock hairy; culms comparatively slender, 1—4 ft. high; leaves 3.5—15 in. long, .15—6 in. wide; panicles 3—13 in. long, branches 1—2.5 in. long; lower glumes .07—09 in. long, upper .1—11 in. long; upper lemmas .05—06 in. long, papillose.....13. *leptochloa*.

Rootstock glabrous; culms rather stout, 20—30 in. high; leaves rigid, 5—11.5 in. long, .3—6 in. wide; panicles 7—19 in. long, branches up to 6 in. long; lower glumes .08—12 in. long, upper .11—15 in. long; upper lemma .07—09 in. long, asperous.....14. *Lawsontii*.

1. ARUNDINELLA AVENACEA, Munro; F. B. I. vii. 69.

W. Ghâts; 2,000—7,500 ft.

2. ARUNDINELLA MESOPHYLLA, Nees; F. B. I. vii. 69.

W. Ghâts; 1,000—7,500 ft.

3. *ARUNDINELLA SETOSA*, Trin.; F. B. I. vii. 70. *A. nervosa*, Nees; F. B. I. vii. 70.

In all Districts; sea-level to 7,000 ft. Vern. *Tel.* Pathi oopagaddi; *Kan.* Hakki varji hullu, Maraga thattu hullu.

Var. *lanifera*, C. E. C. Fischer n. var.

Roots woolly and the setae of the upper lemmas only .02—.025 in. long.

Cuddapa District at Mogilikuppa (Gamble no. 21307), 3,000 ft.

4. *ARUNDINELLA PUMILA*, Steud. *A. tenella*, Nees; F. B. I. vii. 71.

W. Coast and Ghâts; Mysore State (Meebold); sea-level to 6,000 ft.

5. *ARUNDINELLA HOLCOIDES*, Trin. *A. agrostoides*, Trin.; F. B. I. vii. 71

Godavari District at Bison Hill (Barber); Cuddapah Hills (Beddome); Mysore State (Meebold); W. Ghâts; 2,000—6,000 ft. Vern. *Mal.* Molam pullu.

6. *ARUNDINELLA PYGMAEA*, Hook. f.; F. B. I. vii. 72.

S. Kanara at Pulicode.

7. *ARUNDINELLA METZII*, Hochst.; F. B. I. vii. 72.

Mysore State; S. Kanara and N. Malabar Districts; sea-level to 3,000 ft.

8. *ARUNDINELLA LAWII*, Hook. f.

Mysore at Sagar (Meebold); 2,000 ft.

9. *ARUNDINELLA VILLOSA*, Arn.; F. B. I. vii. 72.

Bababudan, Pulney and Tinnevely Hills; Attapadi Valley (Fischer); 2,000—7,000 ft.

10. *ARUNDINELLA NEPALENSIS*, Trin.; *A. brasiliensis*, Hook. f. non Raddi; F. B. I. vii. 73.

Mysore, Pulney and Travancore Hills; 3,500—7,000 ft.

11. *ARUNDINELLA MUTICA*, Nees. *A. capillaris*, Hook. f.; F. B. I. vii. 74.

Cuddapah and Nellore Districts; 300 to 3,000 ft.

12. *ARUNDINELLA FUSCATA*, Nees; F. B. I. vii. 74.

Mysore, Nilgiri, Anamallais and Pulney Hills; 3,000—7,000 ft. An excellent fodder.

13. *ARUNDINELLA LEPTOCHLOA*, Hook. f.; F. B. I. vii. 76.

W. Coast from N. Malabar District southwards; Tinnevely Districts; at low elevations.

14. *ARUNDINELLA LAWSONI*, Hook. f.; F. B. I. vii. 76.

Nilgiri Hills; 3,000 to 6,000 ft. In swamps.

70. *Avenastrum*, Jessen

Erect, usually perennial herbs. *Leaves* usually expanded. *Panicles* effuse. *Spikelets* erect, all alike, 2—8-flowered, not jointed on the pedicels; rachilla articulated at the base and between the lemmas. *Glumes* subequal or the upper longer, dorsally rounded or keeled; the lower 1—3-nerved; the upper 3—5-nerved. *Lemmas* all alike, lanceolate or ovate, usually deeply 2-cleft, sometimes 2-toothed or entire, bearing a geniculate awn with a twisted base from about the middle of the back; the lowest always long-awned, the upper ones with shorter awns

or awnless; paleas narrow, 2-keeled, keels ciliate, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* long, glabrous or hairy above the middle, free within the lemma and palea or adhering to the latter.

AVENASTRUM ASPERUM, C. E. C. Fischer n. comb. *Avena aspera*, Munro; F. B. I. vii. 277.

Nilgiri and Pulney Hills; 6,000—7,500 ft.

Culms up to 4 ft. high; leaves 1—18 in. long, .1—22 in. wide, glabrous or more or less pilose; panicles 3—12 in. long; glumes .26—.42 in. long, the lower 3-nerved; lowest lemma .37—.42 in. long, cleft to the middle; awns .5—.6 in. long.

Var. *Schmidii*, C. E. C. Fischer n. comb. *Avena aspera*, Munro var. *Schmidii*, Hook. f.; F. B. I. vii. 277.

Smaller and more slender; leaves mostly radical and more hairy; panicles smaller and more contracted with shorter branches; glumes .17—.27 in. long, lower 1-nerved; lowest lemma, .26—.3 in. long, entire; awns .32—.42 in. long.

Nilgiri and Pulney Hills; 7,000—8,000 ft.

Var. *polyneuron*, C. E. C. Fischer n. comb. *Avena polyneura*, Hook. f.; F. B. I. vii. 277.

Smaller than the typical species in culms and leaves; panicles very effuse with long spreading lower branches; glumes strongly nerved, .32—.5 in. long, lower 3-nerved; lowest lemma .44 in. long, cleft for about $\frac{2}{3}$ its length, awns .7 in. long.

Doddabetta in the Nilgiri Hills (Gamble); 8,000 ft.

71. *Avena*, Linn.

Annual erect herbs. *Leaves* usually expanded. *Panicles* effuse, contracted or spiciform. *Spikelets* all alike, 2—4-flowered, not jointed on the pedicels; rhachilla articulated at the base and sometimes between the lemmas. *Glumes* subequal or unequal, the lower usually the shorter, dorsally rounded or weakly keeled, broadly ovate or ovate-lanceolate, acute, 5—11-nerved. *Lemmas* all alike, ovate or lanceolate, 2-toothed or deeply 2-cleft, awned from the back below the cleft or awnless, sometimes only the lowest awned; awn geniculate with a twisted base; paleas narrow, 2-keeled, keels scabrid or ciliate, containing a bisexual floret. *Lodicules* usually 2. *Stamens* 3. *Styles* 2, free. *Grain* long, glabrous or hairy at the apex, free within the lemma and palea or adhering to the latter.

Species of this genus—the Oats—occur only as cultivated crops in the Nilgiri Hills and an occasional escape is met with. The following two species have been recorded:

Rhachilla and lemmas glabrous; upper lemmas usually awnless.....1. *sativa*.
Rhachilla hairy; lemmas hairy on the back below the middle; all the lemmas awned
2. *sterilis*.

1. *AVENA SATIVA*, Linn.; F. B. I. vii. 275.

2. *AVENA STERILIS*, Linn.

A more slender plant than the first.

72. *Coelachne*, R. Br.

Small, erect or trailing marshland herbs. *Leaves* short, flat, convolute or involute. *Inflorescence* of open, contracted or spiciform panicles or a single spiciform raceme. *Spikelets* all alike, sessile or pedicelled, not articulated, 2-flowered, both florets perfect or one or both unisexual, if both unisexual the upper ♀. *Glumes* subequal, membranous, orbicular or elongate. *Rhachilla* articulated above the persistent glumes, more or less elongate between the two lemmas, not produced above the upper. *Lemmas* dissimilar; the lower glabrous or nearly so, considerably longer than the upper, containing a bisexual or a ♂ floret; the upper coriaceous, more or less hairy, containing a bisexual or a ♀ floret; both paleate. *Lodicules* 2. *Stamens* 2—3. *Grain* fusiform or oblong, terete or plano-convex, free within the lemma and its palea.

Rhachis, pedicels and rhachilla terete. Nodes of culms pubescent; spikelets numerous; grain subterete, .03—.04 in. long:—

Panicles interrupted, spiciform, .4—3.5 in. long, branches appressed and congested or spreading and scattered, up to .35 in. long, usually shorter, bearing up to 9 ovoid spikelets. Culms erect or decumbent, 2.5—15 in. high; leaves usually flat, .4—17 in. long, filiform to .13 in. wide; glumes .04—.06 in. long, suborbicular; lower lemmas .06—.09 in. long, upper .04—.06 in. long, puberulous

1. *pulchella* var. *simpliuscula*.

Panicles open, 1—2 in. long, branches spreading, distant, up to .7 in. long, bearing 1—4 lanceolate spikelets. Culms erect, 4—6 in. high; leaves flat, .5—1.1 in. long, up to .06 in. wide; glumes .05—.08 in. long, ovate-oblong; lower lemma .1—.11 in. long, upper .07—.09 in. long, puberulous.....2. *perpusilla*.

Rhachis, pedicels and rhachillas flat. Culms very slender, flaccid, trailing, up to 18 in. long, nodes glabrous, flowering culms 2—4 in. high, unbranched; spikelets in pairs, one sessile and one pedicelled; glumes .11—.14 in. long, the lower ensiform, the upper oblong, concave; lower lemma .16—.17 in. long, upper .08—.09 in. long, broadly oblong, margins shaggily hairy; grain .06 in. long, plano-convex

3. *Meeboldii*.

1. *COELACHNE PULCHELLA*, R. Br.; F. B. I. vii. 271.

Var. *simpliuscula*, Hook. f.

Mysore, Nilgiri, Pulney and Travancore Hills; 2,000—6,000 ft.
Vern. Kan. Sanna purlai hullu.

2. *COELACHNE PERPUSILLA*, Thw. *C. pulchella*, R. Br. var. *gracillima*, Hook. f.; F. B. I. vii. 271.

Nilgiri Hills (Schmid).

3. *COELACHNE MEEBOLDII*, C. E. C. Fischer in Kew Bull. 1934, 169.
Cochin State at Chalakudi (Meebold). In tanks.

73. *Zenkeria*, Trin.

Perennial herbs. *Leaves* narrow, flat, convolute or involute. *Panicles* effuse or contracted; branches capillary. *Spikelets* all alike, 2-flowered, laterally compressed, not articulate on the pedicels; rhachilla very short, bearded, disarticulating above the glumes, not or very shortly produced beyond the upper lemma. *Glumes* subequal or the upper longer, 1-nerved, keeled, persistent. *Lemmas* equal and similar, chartaceous, longer than the glumes, usually hairy below the middle, several-veined; paleas shorter, broad, 2-keeled, long-ciliate, enclosing a bisexual floret. *Lodicules* 2, ovate, denticulate. *Stamens* 3. *Styles* 2, free. *Grain* narrowly oblong.

Culms 11—28 in. high; leaves flat or convolute, 2.5—28 in. long, .15—.3 in. wide, narrowed into a long stiff channelled quasi petiole; panicles 3—10 in. long, usually effuse; glumes .07—1 in. long; lemmas acuminate or caudate-acuminate, .14—2 in. long.....1. *elegans*.
 Culms 6—10 in. high; leaves rigid, erect, flat with involute margins, 4—12 in. long, .25—.3 in. wide, not narrowed into a quasi petiole; panicles 2.5—5 in. long, contracted; glumes .1—1.3 in. long; lemmas acute, .16—17 in. long.....2. *Stapfii*.

1. *ZENKERIA ELEGANS*, Trin.; F. B. I. vii. 270.

N. Arcot, Salem, Coimbatore and Tinnevely Districts. Nilgiri and Pulney Hills; 1,500—7,000 ft.

2. *ZENKERIA STAPFII*, Henr.

Nilgiri Hills (Perrottet).

74. *Arundo*, Linn.

Tall, stout, perennial shrubs, often woody below. *Leaves* broad, flat. *Panicles* large, decomposed; branches fascicled. *Spikelets* laterally compressed, not jointed on the pedicels, 2—8-flowered; rhachilla articulated at the base and between the lemmas. *Glumes* 2, persistent, subequal, narrow, acute or acuminate, keeled, 3-nerved. *Lemmas* lanceolate, entire and acuminate or 2-fid with an arista from the sinus, 3-nerved, long-silky hairy on the back below the middle; paleas hyaline, 2-nerved, each containing a bisexual floret. *Lodicules* 2, obovate. *Stamens* 3. *Styles* 2, free. *Grain* oblong.

ARUNDO DONAX, Linn.; F. B. I. vii. 302.

In most Districts except the W. Coast, usually near water; up to 2,000 ft.

Rhizome creeping; culms fistular, reed-like, up to 10 ft. high; leaves ensiform, amplexicaul, 8—24 in. long, .5—2 in. wide; panicles 9—24 in. long; glumes .25—.45 in. long; lemmas 2—4, the uppermost empty when more than 3, lowest .42—.46 in. long, silky pilose.

Not a good fodder though cattle will eat the young leaves. The stems are used in thatch-roofing.

75. *Neyraudia*, Hook. f.

Tall, perennial, leafy herbs or shrubs. *Leaves* flat or sometimes convolute. *Panicles* effuse, decomposed, often nodding. *Spikelets* laterally compressed, 4—8-flowered; rhachilla shortly bearded, jointed at the base or above the first lemma, in which case the latter is entire and empty, and between the lemmas. *Glumes* 2, membranous, subequal or the upper slightly the longer, keeled, 1-nerved. *Lemmas* elongate-subulate, often recurved, acuminate, entire or shortly 2-fid with 2 setae and an often recurved arista from the tip or the sinus, strongly 3-nerved, sides long silky-hairy; paleas short, oblong, 2-keeled, keels scaberulous, all containing a bisexual floret or the lowest empty and glabrous. *Lodicules* 2. *Stamens* 3. *Styles* 2. *Grain* linear-subulate, base acute, loose in the lemma.

NEYRAUDIA ARUNDINACEA, Henr. *N. madagascariensis*, Hook. f.; F. B. I. vii. 305.

Travancore at Devicolam (Meebold); 6,000 ft.

Culms solid, sometimes woody below, 2—8 ft. or more high; leaves 8—24 in. long, .2—1 in. wide; panicles up to 3 ft. high; glumes .08—.13 in. long; lemmas .14—.2 in. long.

76. Phragmites, Adans.

Tall, stout, perennial shrubs; rhizomes creeping, often very long; culms hollow, woody below, leafy nearly to the apex. *Leaves* flat. *Panicles* lax, usually large, decompound. *Spikelets* 3—10-flowered, linear, terete, slightly laterally compressed, not jointed on the pedicels; rhachilla long silky hairy above the lowest lemma, jointed between the lemmas, sometimes shortly prolonged beyond the uppermost. *Glumes* 2, persistent, membranous, unequal, oblong-lanceolate, 3-nerved. *Lemmas* much longer, the lowest linear-lanceolate, empty or containing a ♂ floret, the rest hyaline, narrowly subulate-lanceolate, caudate-acuminate, 3-nerved; callus long, densely long-silky hairy; paleas much shorter, 2 keeled, each containing a bisexual floret, the uppermost sometimes imperfect. *Lodicules* 2. *Stamens* 1—3. *Styles* 2, free. *Grain* oblong, terete.

PHRAGMITES KARKA, Trin., F. B. I. vii. 304.

In all Districts except the W. Coast; usually near water and often gregarious in large colonies; up to 3,000 ft.

Culms robust, sometimes up to 20 ft. high; leaves stiff, semi-erect, up to 25 in. long, .3—1.5 in. wide; panicles up to 25 in. long; lower glumes .12—.16 in. long, upper .22—.24 in. long; lemmas .36—.5 in. long.

The stems are made into pipes; split stems are plaited into mats. The culms and leaves are used for thatching.

77. Polypogon, Desf.

Slender, annual or perennial herbs. *Leaves* flat. *Panicles* spiciform or lobed, dense; rhachis fragile. *Spikelets* minute, uniform, crowded, laterally compressed, 1-flowered, articulate on the pedicels but persistent. *Glumes* 2, subequal, concave, keeled, entire or notched, with a slender arista from the sinus or from the back. *Lemma* much shorter, hyaline, broadly oblong, truncate, toothed, muticous or aristate; palea small, 2-nerved, enclosing a bisexual floret. *Lodicules* 2. *Stamens* 1—3. *Styles* 2, free. *Grain* obovoid, free within the lemma and palea.

POLYPOGON MONSPELIENSIS, Desf.; F. B. I. vii. 245.

Bababudan Hills (Talbot).

Culms tufted, up to 2 ft. high; leaves 1—4 in. long, .1—.15 in. wide; panicles cylindric or oblong, .5—2 in. long; glumes .06—.08 in. long, scaberulous, aristas 2—3 times as long; lemmas .04—.05 in. long.

78. Aristida, Linn.

Annual or perennial, usually slender, tufted herbs. *Leaves* flat or more often convolute, very narrow. *Panicles* branched, contracted or effuse. *Spikelets* all alike, 1-flowered, slender, not articulated on the

short or long pedicels; rhachilla very short, disarticulating above the upper glume. *Glumes* narrow, keeled, 3-nerved, the lower usually considerably the shorter, but sometimes subequal or even longer, frequently aristate, sometimes 2-toothed. *Lemma* with a more or less bearded, usually pungent callus, narrow, involute, more or less cylindric, often attenuate at the apex, terminated by an awn usually consisting of 3 slender, hispidulous, usually subequal setae sessile on the lemma or supported by a short or long, usually twisted column, sometimes the 2 lateral setae shorter than the median or entirely suppressed, the median sometimes plumose, the lemma sometimes jointed at the middle or near the apex or just above the apex of the stamens; palea very narrow, short, embraced by the lemma, sometimes absent, the contained floret bisexual. *Lodicules* 2—3. *Stamens* 3. *Styles* 2, free. *Grain* narrowly cylindric or elongate-ellipsoid; embryo short or long.

Awn sessile; setae always 3, subequal:—

Glumes mucous. Culms slender, up to 2 ft. high; leaves 1.5—10 in. long; lower glume .14—23 in. long, upper .24—36 in. long; callus .02—03 in. long; lemma .23—44 in. long, keeled; setae .44—84 in. long.....1. *depressa*. *Glumes*, at least one, aristate; callus .05—08 in. long; glumes .4—7 in. long (including the aristas):—

Panicles contracted, 3—15 in. long; branches erect, straight, main axis terete, axils glabrous. Culms erect, 4—48 in. high; leaves up to 20 in. long; lemma .38—5 in. long; setae slender, 1—1.5 in. long.....2. *setacea*.

Panicles effuse, 3—9 in. long, branches spreading, flexuous, main axis angled, axils hairy or prominently tumid. Culms usually straggling and curved, up to 2 ft. high; leaves up to 10 in. long; lemma .32—35 in. long; setae rigid, rather wide at the base, 1—1.8 in. long.....3. *Hystrix*.

Awn supported by a column:—

Setae always 3, subequal:—

Lemma .17—23 in. long, elongate-fusiform, attenuate upwards, continuous with the .1—12 in. long column. Culms up to 14 in. high; leaves 1.5—3 in. long, glabrous; panicles usually contracted, 2—4.5 in. long; glumes shortly aristate, .2—32 in. long; callus .02—03 in. long; setae .55—8 in. long.....4. *mutabilis*.

Lemma .08—17 in. long, cylindric, truncate, articulated with the .6—1.4 in. long, scabrid column. Culms up to 2 ft. high; leaves 2.5—5 in. long, flat or convolute, glabrous or puberulous above, thinly pilose near the base; panicles narrow, lax, 1.5—7 in. long; glumes aristate, .7—9 in. long; callus .08 in. long; setae 1.8—2.4 in. long.....5. *funiculata*.

Setae often reduced to 1, .8—1.2 in. long, the lateral when present much finer, .3—4 in. long. Culms tufted, 6—24 in. high; leaves 4—12 in. long; panicle lax, often expanded, 3—12 in. long; glumes shortly aristate, .4—6 in. long, the upper often suppressed; callus .02—04 in. long; lemma .35—6 in. long, continuous and not perfectly articulated with the .38—5 in. long column.....6. *redacta*.

1. *ARISTIDA DEPRESSA*, Retz. *A. adscencionis*, Linn.; F. B. I. vii. 224 in part; S. I. G. figs. 171, 172.

In all but the wettest localities; up to 3,000 ft. Vern. *Tel.* Nari balana gaddi; *Tam.* Kodai balla pullu, Oosi pullu, Shigam pullu, Todapa puvada pullu; *Kan.* Kari sanna hanchi hullu.

2. *ARISTIDA SETACEA*, Retz.; F. B. I. vii. 225; S. I. G. fig. 173.

In all Districts; up to 3,000 ft.

Used for making brooms. Rejected by cattle. Vern. *Kan.* Dodda hanchi hullu, Nai anchi katti.

3. *ARISTIDA HYSTRIX*, Linn. f.; F. B. I. vii. 225; S. I. G. fig. 174.

In all Districts; up to 3,000 ft.

Said to be liked by cattle. Vern. *Kan.* Bili vunugada hullu.

4. *ARISTIDA MUTABILIS*, Trin. et Rupr.; F. B. I. vii. 226; S. I. G. figs. 175, 176.

Cuddapah, Nellore, Anantapur, Coimbatore and Tinnevely Districts; up to 1,400 ft.

5. *ARISTIDA FUNICULATA*, Trin. et Rupr.; F. B. I. vii. 226; S. I. G. fig. 177.

In all the Eastern Districts south of the Kistna River; up to 2,000 ft. Vern. *Tel.* Kundeti gaddi.

6. *ARISTIDA REDACTA*, Stapf.; F. B. I. vii. 227.

Bababudan Hills; Mysore State; Bellary and Kurnool Districts.

79. *Agrostis*, Linn.

Erect, usually perennial herbs. *Leaves* narrow, flat or slightly convolute. *Panicles* contracted or effuse, branches capillary, whorled. *Spikelets* all alike, 1-flowered, not jointed on the pedicels; rhachilla disarticulating above the glumes, not produced beyond the lemma. *Glumes* 2, equal or unequal, lanceolate, acuminate, keeled, muticous, 1-, rarely 3-nerved. *Lemma* shorter, hyaline, truncate, crenate or cleft, often awned on the back; callus short, glabrous or bearded with hairs less than half as long as the lemma; palea usually much shorter, often minute or 0; the contained floret bisexual. *Lodicules* 2. *Stamens* 3. *Grain* free within the lemma.

Lemmas glabrous; callus glabrous or very shortly hairy:—

Glumes .08—1 in. long, keel scaberulous; lemma .06—.08 in. long, 3-toothed or lobulate, awnless, palea 0—.05 in. long. Culms up to 3 ft. high; leaves 1.2—5.5 in. long, .08—.13 in. wide; panicles 3—12 in. long, effuse (contracted in var. *prorepens*).....1. *stolonifera*.

Glumes .11—.14 in. long; keels spinulose-ciliolate, at least in upper half; lemma .06—.1 in. long, rounded or truncate and minutely 2-toothed, bearing a geniculate awn .14—.16 in. long on the back close to the base, palea .06—.1 in. long. Culms 10—18 in. high; leaves 1.2—7 in. long, .05—.17 in. wide; panicles effuse, 5—12 in. long.....2. *peninsularis*.

Lemmas hairy; callus long hairy; palea 0; keels of glumes usually spinulose-ciliolate:—

Rootstock slender; culms 4—26 in. high; leaves 1—8 in. long, .03—.1 in. wide, base not narrowed; panicles effuse, 2.5—7 in. long; glumes .09—.13 in. long; lemma .07—.09 in. long, truncate, lobulate or minutely denticulate, awn .09—.16 in. long.....3. *pilosula*.

Rootstock stout, covered with the old sheaths; culms 8 in. high; cauline leaves few, 1—1.5 in. long, very slender, base not narrowed, radical leaves up to 4 in. long and .15 in. wide, narrowed into a rigid quasi petiole; panicles 1.5 in. long; glumes .13 in. long; lemma .09 in. long, truncate, 2—4-dentate, awn .18 in. long.

4. *Schmidtii*.

1. *AGROSTIS STOLONIFERA*, Linn. *A. alba*, Linn.; F. B. I. vii. 254.

Nilgiri and Pulney Hills; 6,000—7,000 ft.

Var. *prorepens*, Koch.

Rather smaller in all its parts; bearing stolons up to 1 ft. long; panicles contracted.

Nilgiri Hills; 7,000 ft.

2. *AGROSTIS PENINSULARIS*, Hook. f.; F. B. I. vii. 255.

Nilgiri and Pulney Hills; 6,000—7,000 ft.

3. AGROSTIS PILOSULA, Trin. *Calamagrostis pilosula*, Hook. f.; F. B. I. vii. 263.

Nilgiri and Pulney Hills; 3,000—8,000 ft.

4. AGROSTIS SCHMIDII, C. E. C. Fischer n. comb. *Calamagrostis Schmidii*, Hook. f.; F. B. I. vii. 264.

Nilgiri Hills (Schmid).

80. Garnotia, Bogn.

Erect, perennial, rarely annual herbs. *Leaves* flat or convolute. *Panicles* terminal, branches slender. *Spikelets* solitary or twin, articulated on the pedicels, very small, narrowly lanceolate, terete, 1-flowered; rhachilla not produced beyond the lemma. *Glumes* 2, subequal, lanceolate, acute, acuminate, cuspidate, or awned. *Lemma* narrowly lanceolate, entire or notched, awned, sometimes 3-awned, rarely muticous; awns straight or with a twisted base, sometimes geniculate or recurved, palea narrower, often auricled at the base; containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* linear or oblong, free within the lemma and palea; embryo about $\frac{2}{3}$ as long.

Culms tufted, nodes glabrous; leaves mostly basal, not articulated on the sheaths, margins of sheaths often woolly:—

Leaves complicate, glabrous, basal sheaths flattened, equitant; panicles contracted, usually very narrow, lemmas geniculately awned:—

Leaves flexuous, not stiff, 9—18 in. long, .1 in. wide, margins smooth. Culms slender, 6—20 in. high; panicles 2.5—10 in. long; glumes .19—22 in. long, with cusps .03—05 in. long; lemma .16 in. long, awn .4 in. long

1. *Schmidii*.

Leaves straight, rigid, often trigonous in section, 15—26 in. long, .1—15 in. wide, margins scabrid. Culms stout up to 3 ft. high; panicles 8—36 in. long; glumes .16—22 in. long, lower cuspidate, upper muticous; lemma .1—15 in. long, awn .22—28 in. long.....2. *scoparia*.

Leaves flat, pubescent below, narrowed into a long, silky quasi petiole, up to 34 in. long, .3—6 in. wide, sheaths not flattened or equitant, bristly. Culms stout, up to 3 ft. high; panicles up to 20 in. long, effuse; glumes muticous or very shortly cuspidate, .16—2 in. long; lemmas .13—16 in. long, awnless...3. *tectorum*.

Culms not tufted, nodes usually more or less hairy; leaves scattered, flat, articulate on the sheaths:—

Panicles contracted; branches suberect:—

Leaves narrowed to the base, 1—8 in. long, .1—4 in. wide, glabrous or pubescent. Culms often geniculate and rooting below, up to 3 ft. high; panicles 2.5—9 in. high; glumes .08—15 in. long, lower usually muticous, upper usually cuspidate; lemma .07—13 in. long, awn .26—35 in. long

4. *stricta*.

Leaves broad at the base, rounded or subcordate, 3—10 in. long, .36—1 in. wide, often short-hairy below. Culms up to 3 ft. high; panicles 5—12 in. long; glumes .1—12 in. long, both aristulate; lemma .09—12 in. long, awn .2—46 in. long.....5. *arundinacea*.

Panicles lax, 2.5—5.5 in. long; branches in distant fascicles, at length spreading. Culms slender, 3—20 in. high; leaves 1.5—3.5 in. long, .1—3 in. wide, narrowed to the base, pubescent; glumes .1—14 in. long, muticous, sometimes apiculate; lemma .09—11 in. long, awn .14—43 in. long.....6. *courtallensis*.

1. GARNOTIA SCHMIDII, Hook. f.; F. B. I. vii. 242.

Nilgiri Hills (Schmid, Lawson); 4,500 ft.

2. GARNOTIA SCOPARIA, Stapf ex Hook. f.; F. B. I. vii. 242. *G. tenuiglumis*, Stapf ex Hook. f.; F. B. I. vii. 242.

In most localities except the wettest; up to 7,000 ft.

3. *GARNOTIA TECTORUM*, Hook. f.; F. B. I. vii. 242.
Anamallai Hills (Beddome); Travancore State at Devicolam (Meebold); 6,000 ft.
4. *GARNOTIA STRICTA*, Brogn.; F. B. I. vii. 243.
Mysore State, W. Coast and Ghâts; sea-level to 4,000 ft. Sometimes epiphytic.
5. *GARNOTIA ARUNDINACEA*, Hook. f.; F. B. I. vii. 243.
W. Ghâts; up to 6,000 ft. Vern. Kan. Dobrai hullu.
6. *GARNOTIA COURTALENSIS*, Thw.; F. B. I. vii. 244.
Nilgiri, Pulney and Travancore Hills; 6,000—7,000 ft.

81. *Trachys*, Pers.

Annual, diffuse or erect herbs. *Leaves* flat. *Inflorescence* of a solitary spiciform raceme or more usually 2—3 radiating from the apex of a long peduncle; rhachis rigid, flat, broad, jointed, bearing on the underside of each joint shortly peduncled clusters of 1—6 sessile spikelets mixed with small, scale-like, rigid, flowerless glumes. *Spikelets* subglobose. *Glumes* dissimilar; the lower small, coriaceous; the upper elongate, membranous, 3—5-nerved. *Lemmas* dissimilar; the lower broadly ovate to ovate-oblong, rigidly coriaceous, 9- or more-nerved, its palea minute, empty; the upper smaller, chartaceous, ovate-lanceolate to linear-oblong, its palea as long, containing a bisexual floret. *Lodicules* 2, very minute or 0. *Stamens* 3. *Styles* 2, free. *Grain* oblong, compressed, free within the lemma and palea.

TRACHYS MURICATA, Steud. *T. mucronata*, Pers.; F. B. I. vii. 96; S. I. G. fig. 121. *Panicum squarrosus*, Retz.; Roxb. Cor. Pl. t. 206.
In all but the wettest localities, often in sea-shore sand.

Culms diffuse and rooting below or erect and up to 2 ft. high; leaves 1—6·5 in. long, 1—·5 in. wide, more or less softly-villous; racemes 5—2·5 in. long, rhachis 12—17 in. wide, its midrib stout; lower glume 07—11 in. long, upper 13—14 in. long; lower lemma 21—24 in. long, 9—13-nerved, upper 15—16 in. long.

82. *Tragus*, Haller

Annual or perennial, small, rigid, decumbent or erect herbs. *Leaves* short, flat. *Raceme* spiciform, solitary, terminal. *Spikelets* sessile in deciduous clusters usually of 2 facing each other, seldom 3 and very rarely 4 or 5, not or obscurely articulated on a short peduncle, 1-flowered. *Glumes* 2 or the lower suppressed; the lower when present minute, hyaline; the upper narrowly lanceolate, concave, acuminate, 5-ribbed, ribs armed with hooked spinules. *Lemma* solitary, thinly chartaceous, lanceolate, its palea as long, enclosing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* linear-oblong, free within the lemma and palea.

TRAGUS BIFLORUS, Schult. *T. racemosus*, Hook. f. non All.; F. B. I. vii. 97; S. I. G. figs. 122, 123.

In all but the wettest tracts; often in sandy localities; sea-level to 3,000 ft.

Culms 2—8 in. high; leaves rigid, glaucous, glabrous, margins stiffly ciliate, 4—2 in. long, 1—15 in. wide; racemes 7—2·8 in. long; upper glume 16—18 in. long, sometimes purple, white and semi-transparent between the ribs, lemma 1—11 in. long, puberulous.

83. *Lopholepis*, Dcne.

Tufted, erect herbs. *Leaves* small, flat. *Racemes* spiciform, simple, terminal. *Spikelets* minute, 1-flowered, shaped somewhat like the head of a bird, jointed but persistent on the short pedicels. *Glumes* coriaceous; the lower incumbent on the upper, consisting of a globose base and a cymbiform limb, keel with a narrow cartilaginous wing, pectinately ciliate with spinules hooked at the tip; the upper lanceolate, acute, similarly keeled. *Lemma* hyaline, minute, broadly oblong, its palea broad, hyaline, containing a bisexual floret. *Lodicules* 0. *Stamens* 3. *Styles* 2, free. *Grain* subulate, concave in front, base gibbously incurved, free within the rigid glumes.

LOPHOLEPIS ORNITHOCEPHALA, Steud.; F. B. I. vii. 98.

Nilgiri (F. Foulkes) and Madura Hills; Madura and Tinnevely Districts and Travancore near the coast.

Glabrous except the inflorescence; culms slender, 3—14 in. high; leaves imbricate at the base, distant upwards, 4—1·8 in. long, 05—25 in. wide, margins scabrid; racemes 2—6 in. long; pedicels puberulous and with a fringe of stiff hairs on opposite sides; spikelets 07—09 in. long; glumes muricate, reddish-brown at maturity, lower as long as the spikelets, upper shorter; lemma 03—04 in. long, curved.

84. *Perotis*, Aiton

Tufted, wiry herbs, usually geniculate at the base. *Leaves* flat. *Racemes* spiciform, simple, terminal. *Spikelets* minute, subulate, 1-flowered, articulated on short or rudimentary pedicels, falling entire. *Glumes* subequal, narrow, tapering into a long, capillary awn. *Lemma* hyaline, much shorter than the glumes, its palea narrower, containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, shortly connate. *Grain* linear, terete, nearly as long as the glumes and free within them; embryo $\frac{1}{2}$ as long.

PEROTIS INDICA, O. Ktze. *P. latifolia*, Ait.; F. B. I. vii. 98; S. I. G. figs. 124, 125.

Common in all Districts; on sea-shore sands and elsewhere up to 5,000 ft.; usually in dry soils. Vern. *Tel.* Nakka peechu, Nakka toka; *Tam.* Narival, Kudrai-val pillu, Thopparai pillu; *Kan.* Nari misai hullu, Jabburu korlai hullu.

Culms 2—18 in. high; leaves closely imbricate below, rigid, pungently acute, 3—2·2 in. long, 15—4 in. wide, margins spinulose-ciliate; racemes slender, 1·2—7·5 in. long, feathery owing to the long awns; spikelets 06—08 in. long; glumes hispid; awns 3—65 in. long, usually purplish.

85. *Zoysia*, Willd.

Small, rigid herbs. *Leaves* very narrow, convolute, rigid. *Racemes* spiciform, solitary, simple, terminal; rhachis inarticulate, notched. *Spikelets* ovoid, laterally compressed, 1-flowered, articulated on very short, rather stout pedicels appressed to the rhachis. *Glume* single, coriaceous. *Lemma* smaller than and completely enclosed in the glume, hyaline; palea linear-oblong, containing a bisexual floret. *Lodicules* 0. *Stamens* 3. *Styles* 2, very long, connate below. *Grain* oblong, free within the lemma and glume.

ZOYSIA MATRELLA, Merr. *Z. pungens*, Willd.; F. B. I. vii. 99.

In sea-shore sand on both coasts.

Rootstock wiry, creeping, up to 3 ft. long; culms 1—10 in. high; leaves many, 5—2 in. long; racemes 3—1.4 in. long; glumes 1—1.4 in. long.

86. *Sporobolus*, R. Brown

Perennial, rarely annual, erect, prostrate or creeping herbs. *Leaves* narrow, flat or convolute. *Panicles* effuse or spiciform, often pyramidal. *Spikelets* small or minute, all alike, 1-, rarely 2-flowered, jointed on the pedicels or rarely on the rhachis; rhachilla very short, jointed at the base, not produced beyond the upper or the only lemma. *Glumes* membranous, mucous, nerveless or 1—3-nerved, unequal, the lower smaller, sometimes minute, persistent or falling singly. *Lemmas* mucous, ovate or oblong; paleas as long, sometimes emarginate, closely 2-nerved and often splitting between the nerves as the grain matures, enclosing a bisexual floret. *Lodicules* 2, very minute or 0. *Stamens* 2—3. *Styles* 2, free. *Grain* oblong, obovoid or pyriform, free within the lemma and palea; pericarp thin, hyaline, loose; embryo large.

Lower glume distinctly shorter than the lemma:—

Upper glume distinctly shorter than the lemma; leaves glabrous, flat, complicate or convolute mixed:—

Panicles effuse:—

Lemma .06 in. or more long:—

Lemma .06 in. long. Culms up to 30 in. high; leaves 4—12 in. long, .05—15 in. wide; panicles 4—18 in. long; lower glumes .01—0.2 in. long, upper .02—0.4 in. long.....1. *diander*.

Lemma .07—0.8 in. long. Culms up to 3 ft. high; leaves 3—24 in. long, .15—23 in. wide; panicles 6—18 in. long; lower glumes .02—0.3 in. long, upper .04—0.6 in. long.....2. *Walliehi*.

Lemma .04 in. or less long. Culms up to 15 in. high; leaves 5—11 in. long, .1—2 in. wide; panicles 12—20 in. long; lower glumes .01 in. or less long, upper .02 in. long.....3. *minutiflorus*.

Panicles spiciform or narrow, rarely slightly expanded:—

Leaves flaccid, usually flat, not pungent, up to 16 in. long, .1—2.2 in. wide. Not stoloniferous; culms up to 3 ft. high; rather robust; panicles 4—14 in. long, sometimes slightly expanded; lower glumes .02—0.3 in. long, upper .04—0.5 in. long; lemma .06—0.8 in. long.....4. *indicus*.

Leaves rigid, usually convolute, pungent. Stoloniferous:—

Panicles subspiciform, sometimes interrupted and flexuous, .3—4.5 in. long. Culms 7—17 in. high; leaves .33—2.5 in. long, .07—1.4 in. wide; spikelets shortly pedicelled; lower glume .04—0.5 in. long, lanceolate, acute, upper .06—0.8 in. long; lemma .06—1 in. long.....5. *tremulus*.

Panicles strictly spiciform, .7—2.5 in. long. Culms 3—9 in. high; leaves .7—2.7 in. long; spikelets sessile, crowded; lower glumes .02—0.3 in. long, quadrate, truncate, upper .05—0.6 in. long; lemma .07 in. long.....6. *spicatus*.

Upper glume as long as or longer than the lemma:—

Stoloniferous; leaves glabrous, margins minutely serrulate, convolute, rigid, pungent, .7—6 in. long. Culms 2.5—14 in. high; panicles spiciform or narrowly pyramidal, 1—4 in. long; lower glumes .03—0.4 in. long, upper .06—1 in. long; lemma .06—0.8 in. long.....7. *orientalis*.

Not stoloniferous; leaves pilose or bristly, rarely nearly glabrous.

Panicles contracted, subspiciform, 1—3 in. long. Culms tufted, 1—12 in. high; leaves flat or convolute, sparsely softly pilose, margins serrulate, sometimes ciliate from minute tubercles, .6—5.5 in. long, .05—1 in. wide; lower glumes .04—0.6 in. long, upper .06—0.8 in. long; lemma .07 in. long.....8. *piliferus*.

Panicles effuse; leaves flat, base rounded or subcordate, margins cartilaginous, serrulate and ciliate from tubercles:—

Panicles 1.5—5.2 in. long; rhachis and branches smooth. Culms tufted, spreading, 2—20 in. high; leaves glabrous or sparsely hairy from minute tubercles, .4—6.5 in. long, .15—22 in. wide; glumes glabrous, lower .01—0.2 in. long, upper .05—0.7 in. long; lemma .05—0.6 in. long.....9. *coromandelianus*.

Panicles 3—8 in. long, rhachis and branches scaberulous. Culms tufted, 4—20 in. high; leaves bristly from tubercles, 1.5—5 in. long, .18—4.5 in. wide; glumes more or less keeled, scaberulous on the back and keel, lower .04—0.5 in. long, upper .06—0.9 in. long; lemma .05—0.6 in. long.....10. *scabrifolius*.

Lower glume as long as or longer than the lemma. Culms decumbent below, erect portion 7—10 in. high; leaves convolute, rarely flat, rigid, pungent, margins smooth, .7—4 in. long, .1 in. wide; panicles narrow, 1—3 in. long; glumes and lemma subequal .08—1 in. long.....11. *virginicus*.

1. *SPOROBOLUS DIANDER*, Beauv.; F. B. I. vii. 247; S. I. G. fig. 178.
In all Districts except the W. Coast; up to 3,500 ft.
Readily eaten by cattle. Vern. *Kan. Navalu dondi hullu, Thoddu karai kandaka hullu*.
2. *SPOROBOLUS WALLICHII*, Munro ex Hook. f.; F. B. I. vii. 248.
In the central and eastern Districts from Cuddapah southwards; up to 3,000 ft.
3. *SPOROBOLUS MINUTIFLORUS*, Link; F. B. I. vii. 248.
S. Kanara and Chittoor Districts.
4. *SPOROBOLUS INDICUS*, R. Br.; F. B. I. vii. 247.
Kistna, Nilgiri, N. Coimbatore, Madura and Tinnevely Districts; sea-level to 7,000 ft.
A good pasture grass. Hardly distinguishable from some forms of *S. diander*, Beauv.; both may have 2 or 3 stamens.
5. *SPOROBOLUS TREMULUS*, Kunth.; F. B. I. vii. 250; S. I. G. figs. 179, 180.
In all Districts except the W. Coast and Ghâts; up to 2,500 ft.
Vern. *Tam. Uppurutnam pillu*.
6. *SPOROBOLUS SPICATUS*, Kunth; F. B. I. vii. 250.
Deccan, Coimbatore and Tinnevely Districts; up to 1,000 ft.
7. *SPOROBOLUS ORIENTALIS*, Kunth; F. B. I. vii. 251.
Godavari, Kistna, Guntur, Chingleput and Tinnevely Districts; usually in saline soils.
8. *SPOROBOLUS PILIFERUS*, Kunth; F. B. I. vii. 251.
W. Coast and Ghâts; up to 7,000 ft.
9. *SPOROBOLUS COROMANDELIANUS*, Kunth; F. B. I. vii. 252; S. I. G. figs. 181, 182. *S. commutatus*, Kunth; S. I. G. figs. 183, 184.

In all central and eastern Districts ; sea-level to 3,000 ft.

A poor fodder. Vern. *Kan.* Nari balada hennu hullu.

10. *SPOROBOLUS SCABRIFOLIUS*, Bhide ; S. I. G. figs. 185, 186.

Coimbatore and Tinnevely (Wight) Districts ; usually in black cotton soil.

11. *SPOROBOLUS VIRGINICUS*, Kunth ; F. B. I. vii. 249.

Coastal sands ; not very common.

87. *Myriostachya*, Hook. f.

Tall, stout, perennial marsh herbs ; rootstock thick, spongy. *Leaves* narrow, long, flat, equitant. *Panicles* narrow, elongate ; branches racemed, filiform ; pedicels jointed on the branchlets. *Spikelets* very many, strongly laterally compressed, distichously racemed, 4—20-flowered, not jointed on the pedicels ; rhachilla very stout, ultimately fragile at the base and between the slightly distant lemmas, not prolonged beyond the uppermost lemma. *Glumes* 2, coriaceous, persistent, subequal, lanceolate, tapering into a rigid awn, 1-nerved. *Lemmas* coriaceous, ovate-lanceolate, narrowed into a very short, stout, scabrid awn, 3-nerved, keel smooth ; paleas as long, chartaceous, acuminate, 2-toothed, 2-keeled, keels ciliate, containing each a bisexual floret. *Lodicules* 2, very minute. *Stamens* 3 ; anthers very small. *Styles* 2, free. *Grain* obliquely ovoid, subterete ; embryo large.

MYRIOSTACHYA WIGHTIANA, Hook. f. ; F. B. I. vii. 327.

Godavari District at Coringa.

Culms densely tufted, up to 10 ft. high ; rootstock sheathed, sometimes floating ; leaves several feet long, up to 65 in. wide ; panicles 1—2 ft. long ; spikelets 4—8-flowered ; glumes 17—21 in. long.

88. *Desmostachya*, Stapf

Perennial herbs, branched at the base ; branches covered with leathery sheaths at or just above the base. *Leaves* coarse, tufted. *Panicles* terminal, long, spiciform, often interrupted below ; axis stiff ; branches more or less spreading. *Spikelets* linear, strongly laterally compressed, often very many-flowered, sessile or subsessile, closely packed and more or less 2-ranked on the lower side of and often at right angles to the rhachis, straw-coloured or tinged with brown or purple, falling entire. *Glumes* 1-nerved, 1-keeled. *Lemmas* rigidly membranous, ovate, acute or subacute, mucous, 3-nerved, acutely 1-keeled ; paleas slightly shorter, 2-keeled, each containing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* obliquely ovoid, obtusely trigonous, loosely enclosed in the lemma and palea ; embryo about $\frac{1}{3}$ as long.

DESMOSTACHYA BIPINNATA, Stapf. *Eragrostis cynosuroides*, Beauv. ;

F. B. I. vii. 324 ; S. I. G. fig. 226.

Vizagapatam, Kistna, Nellore, Chingleput and Bellary Districts ; usually in sandy soil, often in wet places ; at low elevations.

Culms stout or slender, 7—36 in. high ; stolons stout, covered with shining sheaths ; leaves rigid, tips setaceous, 2—18 in. long, .05—3 in. wide ; panicles 2.5—13 in. long ; glumes .04—06 in. long ; lemmas .06—08 in. long.

89. *Leptochloa*, Beauv.

Annual, usually slender herbs. *Leaves* flat or involute. *Panicles* lax; branches slender, spiciform. *Spikelets* small, sessile or shortly pedicelled, 1—many-flowered, alternate and unilaterally 2-seriate, not jointed at the base; rhachilla jointed at the base, produced and jointed between the lemmas. *Glumes* membranous, oblong or lanceolate, 1-keeled, 1-nerved, the upper the longer. *Lemmas* ovate, obtuse or subacute, sometimes cuspidate, 1-keeled, 3-nerved, the lateral nerves close to the margins, often pubescent; paleas shorter, 2-keeled, each containing a bisexual floret or the terminal imperfect. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* subglobose, oblong-obovoid, compressed or trigonous, closely embraced by the lemma and palea, free or cohering to the latter.

Leaves lanceolate, flat, .9—3.5 in. long, .2—6 in. wide. Culms up to 42 in. high; panicles up to 13 in. long; racemes usually distant, 1—5 in. long; spikelets 1-flowered; glumes linear-lanceolate, acuminate or caudate, .09—1 in. long; grain fusiform, obtusely trigonous, rarely slightly compressed, grooved on one side, .05 in. long.....1. *uniflora*.

Leaves narrowly linear, flat or involute:—

Spikelets 1-flowered. Culms 12—30 in. high; leaves 3—7 in. long, .1—12 in. wide; panicles 6—13 in. long; racemes close, .6—2.3 in. long; glumes lanceolate, obtuse or apiculate, .05—0.6 in. long; grain ovoid, .03—0.4 in. long

2. *polystachya*.

Spikelets 2—7-flowered:—

Glumes lanceolate, acute, acuminate or caudate, .04—0.6 in. long; lemmas pubescent or hairy:—

Culms slender, 3—12 in. high; leaves flat, 1.5—5.4 in. long, .1—16 in. wide; panicles 2—5 in. long; racemes very slender, 1—2.5 in. long; florets usually 2, sometimes 3; grain subglobose, one side gibbous, the other convex, .025 in. long.....3. *filiformis*.

Culms comparatively stout, 1—4 ft. high; leaves flat or involute, 2.5—11 in. long, .1—2.5 in. wide; panicles 6—14 in. long; racemes 2—4.2 in. long; florets usually 3—6, sometimes 2 or 7; grain ellipsoid to oblong, biconvex or compressed.....4. *chinensis*.

Glumes ovate, rounded or retuse, .06—0.8 in. long. Culms up to 8 ft. high; leaves flat, 7—17 in. long, .1—2 in. wide; panicles 4—6 in. long; racemes 2—3.5 in. long; lemmas glabrous with the keel ciliolate; grain oblong or obovate-oblong, rounded, concavo-convex, .05 in. long.....5. *obtusiflora*.

1. *LEPTOCHLOA UNIFLORA*, Hochst.; F. B. I. vii. 297.

Chingleput, S. Coimbatore, S. Malabar, Madura and Tinnevely Districts; Travancore; sea-level to 4,000 ft.

2. *LEPTOCHLOA POLYSTACHYA*, Benth.; F. B. I. vii. 298.

In the eastern Districts from Godavari to Tinnevely; sometimes in marshes; up to 1,000 ft.

3. *LEPTOCHLOA FILIFORMIS*, Roem. et Sch.; F. B. I. vii. 298.

Vizagapatam, Godavari, Chingleput and Tanjore Districts.

4. *LEPTOCHLOA CHINENSIS*, Nees; F. B. I. vii. 299; S. I. G. fig. 212.

In most Districts; often in wet places; sea-level to 3,000 ft. A moderate fodder. Vern. *Tel.* Cheepura gaddi; *Kan.* Kadu sanna kari sajjai hullu.

Some forms of this species are hardly distinguishable from the previous one.

5. *LEPTOCHLOA OBTUSIFLORA*, Hochst.; F. B. I. vii. 299.

Nilgiri and Coimbatore Districts; Cochin State; 1,000—2,000 ft.

90. *Eragrostis*, Beauv.

Annual or perennial, usually erect and slender herbs. *Leaves* narrow, flat, complicate or convolute. *Inflorescence* of terminal open or contracted panicles, rarely of simple spikes. *Spikelets* small, many-, rarely 1—2-flowered, usually strongly laterally compressed, not articulated at the base; rhachilla continuous or articulate between the lemmas, not prolonged beyond the uppermost. *Glumes* 2, usually separately deciduous, broad, obtuse, acute or mucronate, never awned, back rounded, 1-keeled, 1-nerved or the upper sometimes 3-nerved. *Lemmas* imbricate, longer than the glumes which they resemble, sometimes acuminate or emarginate, 3-nerved, ultimately deciduous; paleas deciduous with their lemmas or persistent, broad, 2-keeled, keels smooth, scabrid or ciliate, each containing a bisexual floret or the uppermost and rarely the lowermost imperfect. *Lodicules* 2, very minute or 0. *Stamens* 1—3. *Styles* 2, free. *Grain* minute, globose, oblong-ovoid or obovoid, free within the lemma and palea.

Spikelets paniced:—

Rhachilla more or less jointed, breaking up from the apex downwards:—

Lemmas ciliate:— (1—21)

Lemmas acuminate, mucronate or cuspidate:—

Panicles clavate, dense, sometimes shortly interrupted at the base, rather shining, .8—4 in. long; glumes .06—1 in. long, obtuse; lemmas .1—11 in. long; keels of paleas narrowly winged, long-ciliate. Culms 4—30 in. high; leaves 1.2—5.5 in. long, .1—2.5 in. wide, usually flat.....1. *spicata*.

Panicles cylindric, compact, .8—3 in. long; glumes .04—0.6 in. long, acute; lemmas .08 in. long; keels of paleas not winged, long-ciliate. Culms 8—36 in. high; leaves 2.5—9 in. long, .1—3 in. wide.....2. *ciliata*.

Lemmas obtuse, .04—0.8 in. long; keels of paleas short to long-ciliate. Culms wiry, 4—30 in. high; leaves 1—5 in. long, .15 in. wide; panicles subspiciform, often lobed, dense or somewhat lax, 1.3—5 in. long

3. *coarctata*.

Lemmas not ciliate:—

Panicles spiciform:—

Annuals; culms slender, 5—10 in. high; leaves flat or convolute, usually ascending, 2—3.5 in. long, .1—1.5 in. wide; panicles 1.5—2.5 in. long; lemmas .06—0.8 in. long, their lateral nerves very close to the margins; paleas .05—0.6 in. long, ciliae of keels soft, distinctly longer than the width of the expanded palea.....4. *ciliaris*.

Perennials; culms wiry, 5—20 in. high, leaves often at right angles to the culm; panicles .5—2.2 in. long; lemmas .04—0.65 in. long, their lateral nerves near the middle of the sides; paleas .04—0.5 in. long, ciliae of keels stiff, shorter than the width of the expanded palea.....5. *riparia*.

Panicles more or less effuse:—

Panicles thyriform, 10—24 in. long; branches numerous, capillary, scaberulous, pedicels longer than the spikelets. Culms 8—26 in. high; leaves 8—18 in. long, .2—4 in. wide; glumes .04—0.5 in. long, obtuse; lemmas .06 in. long, obtuse or emarginate; grain subglobose, .02 in. long.....6. *aspera*.

Panicles oblong or linear, not thyriform:—

Grain ovoid, .015—0.2 in. long; stamens 3:—

Culms 2—18 in. high, more or less viscid below the panicle; leaves .7—4.5 in. long, .1—2 in. wide, usually convolute; panicles cylindric or oblong, 1—7 in. long; lower part of rhachis more or less viscid, branches and pedicels with minute glands, scented when fresh; glumes .03—0.5 in. long, obtuse; lemmas .04—0.5 in. long.....7. *viscosa*.

Culms 4—18 in. high, no part of plant viscid or glandular; leaves 3—7.5 in. long, .1—2.5 in. wide; panicles variable, linear, contracted

to oblong and effuse, 1·5—9 in. long; glumes ·03—·05 in. long, obtuse or subacute; lemmas ·04—·06 in. long, obtuse or acute

8. *plumosa*.

Grain obovoid, ·01 in. long; stamens 2; panicles narrow, more or less interrupted:—

Branches of panicles more or less whorled; spikelets 2—7-, sometimes up to 9-flowered. Culm 6—17 in. high; leaves flat or complicate, 4—10 in. long, ·12—2 in. wide; panicles 6—13 in. long; glumes ·016—·04 in. long; lemmas ·035—·05 in. long.....9. *japonica*.

Branches of panicles mostly solitary; spikelets 8—14-, seldom 6- or 7-flowered. Culms 12—24 in. high; leaves as in the previous species, up to 16 in. long, ·25 in. wide; panicles up to 24 in. long; glumes and lemmas as in the previous species.....10. *diarrhena*.

Rhachilla tough, persistent, lemmas falling off from the base upwards:—

Spikelets ovate or ovate-oblong, much compressed, ·16—·8 in. long, ·12—·18 in. wide, up to 80-flowered, pale or purple. Culms 5—25 in. high; leaves 1—7 in. long, ·1—·2 in. wide; panicles oblong or ovoid, ·8—10 in. long; branches usually spreading; glumes ·06—·1 in. long, acute; lemmas usually slightly shorter, broad, mucronate, their lateral nerves prominent; paleas not or very narrowly winged, falling with the lemmas; grain ellipsoid, or obovoid. ·025—·035 in. long.....11. *unioloides*.

Spikelets linear or linear-oblong, slightly compressed, lateral nerves of lemmas weak, or if spikelets flattened and lateral nerves prominent, then the paleas persistent:—

Spikelets more or less fascicled, close, pointing forwards:—

Leaves glaucous, 1·3—12 in. long, ·13 in. wide. Culms 5—56 in. high, often stout; panicles narrow, 2—12 in. long; lemmas ·06—·1 in. long; grain oblong or oblong-fusiform, ·03—·04 in. long.....12. *gangetica*. Leaves not glaucous, 2—5 in. long, ·05—·12 in. wide. Culms 3—36 in. high; panicles contracted or oval and more or less effuse, 3—10 in. long; lemmas ·05 in. long; grain globose or subglobose, ·016—·025 in. long.....13. *nutans*.

Spikelets scattered, spreading or pendulous:—

Upper glume 3-nerved, ·08 in. long, lower shorter. Culms 10—40 in. high; leaves 7—14 in. long, ·18—·32 in. wide, flat, margins usually glandular; panicle oblong, usually open, 4—13 in. long, lateral pedicels ·04—·12 in. long; spikelets linear-oblong, flattish, ·24—·75 in. long, ·08—·12 in. wide; lemmas 19—50, lateral nerves strong.....14. *cilianensis*.

Both glumes 1-nerved:—

Spikelets 4—1·5 in. long, ·08—·09 in. wide; glumes ·06—·08 in. long, acute; lemmas 10—70, ·07—·08 in. long. Culms 6—32 in. high; leaves 3·5—7·5 in. long, ·1 in. wide; panicles ovate, diffuse, 4—12 in. long

15. *tremula*.

Spikelets up to ·8 in. long; lemmas 6—15:—

Panicles rather stiff; lateral pedicels usually less than ·12 in. long:—

Glumes subequal or the upper only slightly the longer:

Leaves 1·5—7 in. long, ·08—·18 in. wide, margins often glandular, mouths of sheaths bearded. Culms 3—22 in. high, tufted; panicles oblong, open, 3—7 in. long; spikelets pale green to dark purplish or olive-grey, ·13—·3 in. long, ·08 in. wide; glumes ·04—·07 in. long; lemmas ·07—·08 in. long; grain globose or ellipsoid-globose ·025—·035 in. long.....16. *poaeoides*.

Leaves 1—7 in. long, ·1 in. wide, margins never glandular, mouths of sheaths naked. Culms 9—19 in. high; panicles oblong, 1·5—6 in. long; spikelets ·2 in. long, ·04—·05 in. wide; glumes ·04—·05 in. long; lemmas ·05 in. long; grain subglobose, ·025 in. long

17. *Rottleri*.

Lower glume ·02—·025 in. long, upper ·05 in. long. Culms very slender, 2—18 in. high; leaves rather rigid, ·4—4·8 in. long, ·04—·1 in. wide, margins sometimes glandular; panicles oblong, open, 1·5—3·5 in. long; spikelets ·3—·6 in. long, ·05 in. wide; lemmas ·06—·07 in. long; grain oblong, truncate at both ends, dorsally flattened and grooved, ·02—·03 in. long.....18. *Willdenoviana*.

Panicles lax, branches slender, flexuous or flaccid; lateral pedicels .12—.36 in. long; lateral nerves of lemmas faint:—

Leaves 2—13.5 in. long, .1—.12 in. wide, mouths of sheaths naked. Culms 4—.36 in. high; panicles oblong to lanceolate, 2—6.5 in. long, branches solitary or 2-nate; spikelets .3—.8 in. long, .06—.08 in. wide; glumes hyaline, lower .02—.025 in. long, obtuse, upper slightly longer, truncate; lemmas obtuse, .07—.08 in. long; grain oblong, dorsally grooved, .05—.06 in. long.....19. *tenuifolia*.

Mouth of sheaths bearded; grain .03—.04 in. long; branches of panicles often whorled:—

Spikelets .16—.3 in. long, .04 in. wide. Culms 2—24 in. high; leaves 2—9 in. long, .1—.12 in. wide; panicles oblong or pyramidal, open or contracted, 4—13 in. long; lower glume .025—.03 in. long, upper .05—.06 in. long; lemmas .08 in. long; grain ellipsoid, base laterally apiculate, .04 in. long.....20. *pilosa*. Spikelets .16—.24 in. long, .08 in. wide. Culms 7—30 in. high; leaves 3.5—17 in. long, .1—.22 in. wide; panicles effuse, 8—16 in. long; glumes .08—.1 in. long, upper slightly the longer; lemmas .1 in. long; grain subquadrate, .03 in. long.....21. *nigra*.

Spikelets secund on a simple spike with a slender rhachis alveolate and hispidulous on the side on which the spikelets are inserted; keels of paleas in all either winged or not:—

Leaves convolute or complicate, very slender, finely acuminate, puberulous above, 1—7.5 in. long. Culms 6—24 in. high; spikes 4—11 in. long; spikelets slightly to much compressed, linear to ovate-oblong, .25—.8 in. long, .08—.18 in. wide; glumes .07—.14 in. long, lower usually acuminate; lemmas 13—53, orbicular or broader than long, convex, keeled, obtuse or apiculate, keels of paleas often distinctly winged; grain broadly ellipsoid or subglobose, often obtusely trigonous, .025 in. long.....22. *bifaria*.

Leaves glabrous above; spikes 3—8.5 in. long; keels of paleas not or very narrowly winged:—

Leaves flat or complicate, rather rigid, apex rounded, .6—4 in. long, .08—.12 in. wide. Culms 4—18 in. high; spikelets nearly terete, .24—.75 in. long, .06—.1 in. wide; glumes .05—.06 in. long, obtuse or subacute; lemmas 9—42, very broadly ovate, obtuse, .08 in. long; grain subglobose-ovoid, .026 in. long.....23. *brachyphylla*.

Leaves convolute or complicate, 7—12.5 in. long, .08—.1 in. wide. Culms 10—15 in. high; spikelets ovate-lanceolate, much compressed, .28—.3 in. long, .1—.12 in. wide; glumes .06—.1 in. long, acute or acuminate; lemmas 12—30, .1—.11 in. long, obtuse or subacute; grain ellipsoid-oblong, .04 in. long.....24. *Walkeri*.

1. ERAGROSTIS SPICATA, Jedwabn. *E. phleoides*, Stapf; F. B. I. vii. 313.
Ganjam, Godavari and Salem Districts; Bangalore; up to 3,500 ft. Vern. Kan. Kadu nawanai hullu.
2. ERAGROSTIS CILIATA, Nees; F. B. I. vii. 313.
Ganjam, Vizagapatam, Rampa and Godavari Districts.
3. ERAGROSTIS COARCTATA, Stapf; F. B. I. vii. 313.
East Coast Districts; Mysore State; up to 2,000 ft.
4. ERAGROSTIS CILIARIS, Link; F. B. I. vii. 314.
Chittoor and S. Arcot Districts.
5. ERAGROSTIS RIPARIA, Nees. *E. tenella*, Roem., et Sch. var. *riparia*, Stapf; F. B. I. vii. 315.
In most Districts; sea-level to 3,000 ft.
A good fodder. Vern. Kan. Kadu kambu hullu.
6. ERAGROSTIS ASPERA, Nees; F. B. I. vii. 314.
Kurnool, Salem, Coimbatore, Nilgiri, S. Arcot, Trichinopoly and Madura Districts; sea-level to 2,000 ft.

7. *ERAGROSTIS VISCOSA*, Trin. *E. tenella*, Roem. et Sch. var. *viscosa*, Stapf; F. B. I. vii. 315.
In all Districts; sea-level to 2,500 ft.
Usually very sticky and scented. Said to be disliked by cattle.
Vern. *Tel.* Bankasigarantha.
8. *ERAGROSTIS PLUMOSA*, Link. *E. tenella*, Roem. et Sch. var. *plumosa*, Stapf; F. B. I. vii. 315.
In all Districts; sea-level to 4,000 ft.
A good fodder liked by horses and cattle. Makes good light hay.
Vern. *Tel.* Chinna garikai gaddi; *Kan.* Sanna purlai hullu.
9. *ERAGROSTIS JAPONICA*, Trin. *E. interrupta*, Beauv. var. *tenuissima*, Stapf; F. B. I. vii. 316.
Godavari, Nilgiri and Tinnevely Districts; Mysore and Travancore States, up to 3,000 ft.
10. *ERAGROSTIS DIARRHENA*, Steud. *E. interrupta*, Beauv. var. *diarrhena*, Stapf; F. B. I. vii. 316.
In the Northern and Eastern Districts; Travancore; up to 1,000 ft.
Var. *Koenigii*, C. E. C. Fischer n. comb. *E. interrupta*, Beauv. var. *Koenigii*, Stapf; F. B. I. vii. 316; S. I. G. fig. 217.
Panicles with short dense branchlets.
In most Districts; sea-level to 3,000 ft.
Readily eaten by cattle. The culms are used for making brooms.
Vern. *Tam.* Kanjara pullu; *Kan.* Kadu gasagasai hullu, Pini hullu.
11. *ERAGROSTIS UNIOLOIDES*, Nees. *E. amabilis*, W. et A.; F. B. I. vii. 317; S. I. G. fig. 218.
In all Districts; often in wet places; up to 7,000 ft.
The glumes are often purple or pink. Vern. *Tel.* Udara gaddi.
12. *ERAGROSTIS GANGETICA*, Steud. *E. elegantula*, Steud.; F. B. I. vii. 318.
In all Districts except on the W. Coast; up to 7,500 ft.
Readily eaten by cattle.
13. *ERAGROSTIS NUTANS*, Nees. *E. stenophylla*, Hochst.; F. B. I. vii. 318.
In all Districts; up to 2,000 ft.
Readily eaten by cattle in the absence of a better grass. Vern. *Ur.* Loocha bena; *Tel.* Nakurmaral, Urenkai, Pedda garikai.
14. *ERAGROSTIS CILIANENSIS*, Link. *E. major*, Host.; F. B. I. vii. 320; S. I. G. figs. 221, 222.
In all Districts except on the W. Coast; up to 4,000 ft.
Said to be liked by cattle. Vern. *Kan.* Bettada akabu hullu.
15. *ERAGROSTIS TREMULA*, Hochst.; F. B. I. vii. 320; S. I. G. figs. 219, 220.
Godavari, Kistna, Anantapur, S. Kanara and Tinnevely Districts.
Said to be a good fodder, but the foliage is too scanty to yield much substance. The slender pedicels allow the spikelets to stir with the slightest movement of the air and in that respect it resembles the European Quaker-grass. The seeds are sometimes eaten by the poor.
16. *ERAGROSTIS POAEOIDES*, Beauv. *E. minor*, Host.; F. B. I. vii. 321.
In the Northern, Central and Eastern Districts; up to 7,000 ft.
Vern. *Tel.* Goob-bai gaddi; *Kan.* Dodda purlai hullu.

17. *ERAGROSTIS ROTTLEI*, Stapf; F. B. I. vii. 321.
Tranquebar (Rottler).
18. *ERAGROSTIS WILLDENOVIANA*, Nees; F. B. I. vii. 322; S. I. G. figs. 223, 224.
In the Central and Eastern Districts from Kistna southwards.
Vern. Kan. Kari jontu hullu.
19. *ERAGROSTIS TENUIFOLIA*, Hochst.; F. B. I. vii. 322.
Mysore State; Bellary, N. Coimbatore, Salem, Madura and Tinnevely Districts; Nilgiri, Pulney and High Wavy Mountains; up to 7,000 ft. Vern. Kan. Thodda karakai hullu.
20. *ERAGROSTIS PILOSA*, Beauv.; F. B. I. vii. 323; S. I. G. fig. 225.
In all Districts except on the W. Coast; up to 7,000 ft.
In some localities said to be much liked by cattle, elsewhere reported to be rejected. Vern. Kan. Kadu sanna samai hullu.
21. *ERAGROSTIS NIGRA*, Nees; F. B. I. vii. 324.
N. Coimbatore, Nilgiri, Pulney and Tinnevely Hills; 2,000—7,000 ft.
22. *ERAGROSTIS BIFARIA*, Wight ex Steud.; F. B. I. vii. 325; S. I. G. fig. 227. *E. coromandeliana*, Trin.; F. B. I. vii. 326.
In all Districts; up to 4,000 ft.
Reported to yield good fodder. Vern. Tel. Gubbikal gaddi, Nooli gaddi, Wooda tallum; Kan. Kodi mara hullu, Nosai hullu.
23. *ERAGROSTIS BRACHYPHYLLA*, Stapf; F. B. I. vii. 327.
In the Central and Eastern Districts, from Vizagapatam to Coimbatore.
24. *ERAGROSTIS WALKERI*, Stapf.
Kurnool District on Cumbum Hill (Bourne).

91. *Halopyrum*, Stapf

Tall, stout, perennial herbs; rootstock creeping, branched, sheathed; roots vermiform. *Leaves* convolute, narrow, rigid. *Panicle* ovoid, elongate; branches alternate, spiciform, short; pedicels not jointed on the branchlets. *Spikelets* large, many-flowered, strongly laterally compressed, sessile or shortly pedicelled, not jointed on the pedicels; rhachilla very short between the lemmas, jointed at the base and between the lemmas, not produced beyond the uppermost one, silky hairy. *Glumes* coriaceous, subequal, ovate-lanceolate, acuminate or apiculate, lower 1—3-nerved, upper 5-nerved. *Lemmas* coriaceous, distichously imbricate, ovate-oblong, cymbiform, 3-nerved; paleas as long, subacute, 2-keeled, each enclosing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* oblong or ellipsoid, compressed, more or less deeply hollowed or concavo-convex, free within the lemma and palea; embryo large.

HALOPYRUM MUCRONATUM, Stapf; F. B. I. vii. 328.

Coast of Tinnevely District and on Krusadai Island.

Culms 5—24 in. high; leaves 4—12 in. long; panicles 6—16 in. long; spikelets 5—9 in. long, 10—17-flowered; glumes 3—35 in. long. Vern. Tam. Uppukarai pullu.

92. *Diplachne*, Beauv.

Tufted herbs. *Leaves* narrow, flat or convolute. *Panicles* lax, erect, simple or nearly so, branches slender, simple. *Spikelets* laterally compressed, sessile or subsessile, few- to many-flowered, not articulated at the base; rhachilla articulated between the lemmas, not prolonged beyond the terminal. *Glumes* membranous, the upper the longer, persistent, oblong-lanceolate, keeled, 1—3-nerved. *Lemmas* rather longer, thin, elliptic-oblong, tip 2—4-toothed 1—3-nerved, mucronate or awned, keeled; paleas oblong, 2-keeled, containing each a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* ovoid-oblong, subtrigonal, free within the lemma and palea.

DIPLACHNE FUSCA, Beauv.; F. B. I. vii. 329.

Kistna, Anantapur, Malabar and Tinnevely Districts; Travancore State; at low elevations.

Culms up to 5 ft. high; leaves 4—18 in. long, rarely flat; panicles 3·5—13 in. long; spikelets 4—13-flowered, 24—5 in. long; glumes ·08—11 in. long; lemmas 12—14 in. long, margins and margins of paleas hairy.

Buffaloes are said to eat it readily. Vern. *Tam. Mandi pillu*.

93. *Dichaetaria*, Nees ex Steud.

Slender perennial herbs. *Leaves* narrow, flat. *Panicles* of a few racemes on a long simple axis. *Spikelets* few, distant, 1-flowered, narrow, terete, pedicelled, not jointed at the base; rhachilla jointed at the base, produced beyond the lemma into a filiform arista bearing a minute empty glume below the middle. *Glumes* 2, equal or unequal, lanceolate, acuminate, 3-nerved, the upper subaristate, separately deciduous. *Lemma* much longer, very narrow, apex bifid with a long recurved awn from the sinus, 3-nerved; callus elongate, bearded; palea as long, finely acuminate, entire or minutely 2-toothed, 2-nerved, containing a bisexual floret. *Lodicules* 2, fleshy. *Stamens* 3. *Styles* 2, free. *Grain* very narrow.

DICHAETARIA WIGHTII, Nees ex Steud.; F. B. I. vii. 300.

Tranquebar (Rottler); rare.

Culms 1—2 ft. high; leaves nearly as long, 1—3 in. wide, mostly basal; panicles 8—18 in. long; racemes slender, up to 4 in. long; glumes 3—4 in. long; lemmas 6—7 in. long; awns 9—1 in. long.

94. *Oropetium*, Trin.

Dwarf, densely tufted, annual or perennial herbs. *Leaves* setaceous. *Spikes* solitary, terminal, slender, 2-ranked. *Spikelets* solitary, sessile, more or less sunk in the alternately distichous hollows in the rhachis, 1—4-flowered; rhachilla slender, disarticulating above the glumes and between the lemmas, when more than one. *Glumes* 2, subequal and persistent in the uppermost spikelet if more than one, otherwise the lower glume very small or 0; upper narrow, rigid, sometimes closing the hollow of the rhachis and concealing the florets. *Lemmas* hyaline, ovate to oblong, 1—3-nerved; paleas as long, 2-keeled, containing a

bisexual floret or, when more than one, the uppermost rudimentary. *Lodicules* 2, minute. *Stamens* 3. *Styles* 2, free. *Grain* oblong, terete, free within the lemma and palea.

OROPETIUM THOMAEUM, Trin.; F. B. I. vii. 366; S. I. G. fig. 228.

Rottboellia Thomaea, Koen.; Roxb. Cor. Pl. t. 132, lower fig.

In all the drier localities; sea-level to 4,000 ft.

Whole plant not exceeding 4 in. high, forming hard tussocks; leaves .25—1 in. long, often curved, more or less hairy; spikes .4—1.5 in. long; rhachis compressed, undulating; upper glumes .08—12 in. long; lemmas semicircular, .05 in. long.

95. *Microchloa*, R. Br.

Slender, usually perennial, tufted herbs. *Leaves* filiform, convolute, subsetaceous, pungent, the lower curved. *Spikes* solitary, terminal, very slender, often curved. *Spikelets* all alike, very small, 1-flowered, alternate and secund in two closely approximate rows, erect, not articulated at the base; rhachilla disarticulating above the glumes, not prolonged beyond the lemma. *Glumes* 2, subequal, subsistent, lanceolate-oblong, 1-nerved, keeled, cuspidate or acuminate. *Lemmas* much smaller, hyaline, oblong; palea nearly as long, 2-keeled, containing a bisexual floret. *Lodicules* 2, truncate. *Stamens* 3. *Styles* 2, free. *Grain* oblong, fusiform, free within the lemma and palea; embryo $\frac{1}{4}$ — $\frac{1}{2}$ as long.

MICROCHLOA INDICA, Beauv. *M. setacea*, R. Br.; F. B. I. vii. 283.

Rottboellia setacea, Roxb. Cor. Pl. t. 132, upper fig.

Godavari and Bellary Districts; Mysore State; Nilgiri and Pulney Hills; sea-level to 6,500 ft.; often growing on walls. Culms very slender, 1—18 in. high; leaves .4—3.5 in. long; spikes 1—7 in. long, purplish; rhachis rounded on the back, channelled in front, with the sessile spikelets inserted on either margin; glumes .1 in. long. Vern. *Tel.* Nagavamu gaddi; *Kan.* Navalu bannada hullu.

96. *Melanocenchris*, Nees

Small, tufted, annual or perennial herbs. *Leaves* rigid, flat or convolute. *Inflorescence* of sessile or shortly peduncled clusters of 4—5 spikelets secund on a flattened, terminal, solitary axis. *Spikelets* sessile, not articulated at the base, 2-flowered; rhachilla jointed at the base and between the lemmas, prolonged beyond the upper and sometimes bearing 1—2 empty scales (abortive lemma and palea of a third floret). *Glumes* 2, coriaceous, narrow, persistent, attenuated into a scabrous arista, the upper broader, with hyaline margins. *Lemmas* thinly membranous, cymbiform or broadly ovate, acute, entire and cuspidate or 3-cuspidate, keeled or nearly flat; paleas narrow, 2-cuspidate, 2-keeled, the lower containing a bisexual floret, the upper a ♂. *Lodicules* 2, minute. *Stamens* 3. *Styles* 2, free. *Grain* oblong, free within the lemma and palea.

Perennial; culms 6—17 in. high; leaves flat, linear or ensiform, mostly aggregated at the base, in elongated culms, narrower cauline ones also present, .7—4 in. long, .05—17 in. wide; rhachis 1.5—3.6 in. long; glumes (including aristas) .23—31 in. long, edges densely ciliate; rhachilla puberulous; lemmas .16—18 in. long, entire or minutely 2-toothed, cuspidate; paleas 2-toothed, back between the keels channelled; grain linear-oblong.....1. *monoica*.

Annual; culms 2—7 in. high; leaves convolute, very narrow, .4—1.7 in. long, not aggregated at base; rhachis .7—1.3 in. long; rhachilla glabrous; lemmas .18—21 in. long, shortly 3-aristate; paleas 2-cuspidate, back between the keels flat; grain elliptic, obtuse, compressed plano-convex; glumes as in *monoica*

2. *Royleana*.

1. *MELANOCENCHRIS MONOICA*, C. E. C. Fischer n. comb. non O. Ktz. *Gracilea mutans*, Koen.; F. B. I. vii. 283; S. I. G. fig. 187. In dry localities from the Kistna River to S. Arcot; Nilgiri District (Petrottet); up to 2,000 ft.

2. *MELANOCENCHRIS ROYLEANA*, Nees. *Gracilea Royleana*, Hook. f.; F. B. I. vii. 284; S. I. G. fig. 188.

Mysore State; Guntur, Bellary, Cuddapah, Chingleput and Kollegal Districts; up to 2,000 ft.

97. *Tripogon*, Roth.

Slender, often densely tufted herbs. *Leaves* mostly basal, very narrow, usually convolute. *Spikes* terminal, solitary, slender. *Spikelets* uniform, sessile, unilaterally 2-seriate, few-many-flowered, not articulated on the rhachis; rhachilla produced between the lemmas, not prolonged beyond the terminal, jointed at the base. *Glumes* membranous, 1-nerved; the lower usually lodged in a furrow of the rhachis, 1-toothed or -lobed on one side; the upper longer, entire or notched at the tip, mucronate or aristate, inserted distinctly higher on the rhachilla. *Lemmas* ovate, dorsally convex, 2-fid and awned from the sinus or 4-fid with the outer lobes awned, the inner lobes membranous and rarely awned, rarely truncate and mucicous, 3-nerved; paleas broad or narrow, complicate, usually truncate, keels ciliate, each containing a bisexual floret except the 1 or 2 terminal which are imperfect. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* very narrow, free within the lemma and palea.

Culms simple, slender, not thickened by the old sheaths; leaves not equitant, rigid or pungent:—

Lemmas 2-fid or entire:—

Lemmas 2-fid, awned or aristate from the sinus:—

Lemmas distinctly shorter than their awns:—

Awns finely capillary, flexuous, .8—1 in. long; lowest lemma .08—1 in. long, 2-fid, lobes acute; paleas not winged. Culms very slender, 1.5—7 in. high; leaves 1.5—10 in. long; spikes 6—14 in. long; spikelets remote, few-flowered; glumes cuspidate or aristate.....1. *capillatus*.

Awns geniculate or straight, not flexuous, .3—6 in. long:—

Lobes of lemma with aristas .16—22 in. long; lemmas puberulous, .11—14 in. long; awns geniculate, .42—6 in. long; paleas not winged. Culms slender, .5—3 in. high; leaves 1—2 in. long; spikes .3—2.5 in. long; spikelets well separated, few-flowered; glumes acuminate, upper .13—2 in. long.....2. *pauperculus*.

Lobes of lemma triangular, acute, lemma .2—25 in. long, awn not geniculate, curved, .3—36 in. long; paleas broadly winged. Culms 4—12 in. high; leaves 3—7.5 in. long; spikes 3—9 in. long; spikelets approximate, many-flowered, .5—1.5 in. long; glumes often 2-toothed and -mucronulate, upper .22—3 in. long.....3. *Wightii*.

Lemma longer than its arista, .13—16 in. long, lobes obtuse, arista .08—12 in. long; paleas narrowly winged. Culms 7—15 in. high; leaves 2—7.5 in. long; spikes 2—9 in. long; spikelets .3—9 in. long, many-flowered; glumes acute, upper .13—16 in. long.....4. *Jacquemontii*.

Lemmas rounded or truncate and minutely 3-toothed, .1 in. long, mucicous or with 1 short arista; paleas not winged. Culms 1—4 in. high; leaves .5—3 in. long; spikes 1—3.5 in. long; spikelets 1—2-flowered; glumes coriaceous, obtuse, upper .13 in. long.....5. *Roxburghianus*.

Lemmas 4-fid, .08—15 in. long, 2 inner lobes short, acute, with an arista from the sinus .08—13 in. long, 2 outer short, bearing aristas .07—1 in. long; paleas not winged. Culms 4—24 in. high; leaves 3—15 in. long, glabrous to densely hairy; spikes 2—11 in. long; spikelets usually close, several-flowered; glumes notched or 2-fid, upper .16—23 in. long.....6. *bromoides*.
 Culms branched, thickened below by the imbricate, old leaf-sheaths, slender and exserted above, 1—8 in. long; leaves .4—2 in. long, equitant, rigid, pungent, minutely hispidulous above; spikes 1.5—2.5 in. long; spikelets approximate, 7—9-flowered; glumes membranous, .12—16 in. long; lowest lemma .1 in. long, 2-fid, its arista .03—04 in. long; paleas not winged.....7. *pungens*.

1. *TRIOGON CAPILLATUS*, Jaub. et Spach.; F. B. I. vii. 285.
Mysore and Cochin States (Meebold); Wynaad (Beddome); 3,000—4,000 ft.; often epiphytic.
2. *TRIOGON PAUPERCULUS*, Stapf; F. B. I. vii. 285.
Bababudan Hills and Mysore State (Meebold); Travancore at Peermade (Venkoba Rao); 2,000—6,000 ft.
Growing on trees and rocks.
3. *TRIOGON WIGHTII*, Hook. f.; F. B. I. vii. 286.
Horsleykonda; Bellary District; Nilgiri Hills; Cochin and Travancore States; 1,000—6,000 ft.
4. *TRIOGON JACQUEMONTII*, Stapf.; F. B. I. vii. 286.
Nilgiri Hills; Coimbatore District; Travancore; up to 8,800 ft.
5. *TRIOGON ROXBURGHIANUS*, Bhide. *Lepturus Roxburghianus*, Steud.; F. B. I. vii. 365.
Guntur, Cuddapah, Anantapur and Bellary Districts.
In dry places among rocks.
6. *TRIOGON BROMOIDES*, Roth; F. B. I. vii. 287.
W. Ghâts; Mysore State; Bellary, Cuddapa and Vellore Districts; Travancore; 1,000—7,500 ft.
Often on rocks.
7. *TRIOGON PUNGENS*, C. E. C. Fischer in Kew Bull. 1934, 170.
S. Coimbatore District at Punachi in the Anamallais (Barber); Pulney Hills at Neutral Saddle (Bourne); 3,000—4,000 ft.

98. *Enteropogon*, Nees

Erect, sometimes tufted, perennial herbs. *Leaves* narrow, usually flat, the upper sometimes involute. *Spikes* slender, solitary or sometimes twin; rhachis flat or trigonous. *Spikelets* all alike, sessile, not jointed at the base, 1—3-flowered; rhachilla jointed at the base, continuous between the lemmas and prolonged beyond the uppermost. *Glumes* persistent, hyaline, acuminate, 1-nerved, keeled, the upper much the longer. *Lemmas* diminishing in length upwards, the lowest rather longer than the upper glume, chartaceous, 3-nerved, more or less keeled, entire or shortly 2-fid, awned from the sinus in continuation of the keel; paleas narrowly lanceolate, obtuse or 2-toothed, 2-keeled, keels scabrid, each containing a bisexual floret. *Lodicules* 2, minute. *Stamens* 3. *Styles* 2, free. *Grain* narrow, free within the hardened lemma and palea.

ENTEROPOGON MONOSTACHYOS, K. Schum. *E. melicoides*, Nees; F. B. I. vii. 284; S. I. G. fig. 189.

In all Districts from Mysore State and Cuddapah southwards except on the W. Coast; sea-level to 2,000 ft.

Culms up to 3 ft. high, densely tufted; leaves 2·5–21 in. long, 1–2·5 in. wide; spikes 4–8 in. long; lower glume 0·9–1·4 in. long, upper 2·2–2·7 in. long; lowest lemma 2·7–3·1 in. long; awns 2·4–3 in. long. Vern. *Tam. Kannai pillu*.

99. *Cynodon*, Pers.

Perennial creeping grasses with erect culms. *Leaves* narrow, flat or complicate. *Inflorescence* of 2–8 fascicled or umbellate spikes; rhachis slender. *Spikelets* all alike, sessile, laterally compressed, alternately 2-seriate, imbricate, not jointed at the base, 1-flowered; rhachilla disarticulating at the base, rarely produced beyond the lemma. *Glumes* 2, thin, keeled, acute or mucronate, persistent or separately deciduous. *Lemmas* broader than the glumes, firmly membranous, boat-shaped, 3-nerved, keel ciliate, awnless; paleas 2-keeled, containing a bisexual floret. *Lodicules* 2, minute. *Stamens* 3. *Styles* 2, free. *Grain* oblong, free within the lemma and palea.

Lemmas longer than the upper glumes, broadly boat-shaped, 0·8–1 in. long:—

Erect culms 2–18 in. high; lower leaves usually flat, the upper often complicate, 4–4·7 in. long, 0·3–1·1 in. wide; spikes 3–7, 0·6–2·5 in. long, usually more or less erect; lower glume 0·5–0·8 in. long.....1. *Dactylon*.

Erect culms 7–40 in. high; leaves narrowly ensiform, flat, 1–4·5 in. long, 1·8–2·7 in. wide; spikes 3–6, usually spreading and curved, 2–4 in. long; lower glumes 0·4 in. long, upper 0·5–0·6 in. long.....var. *intermedius*.

Lemmas shorter than or equalling the upper glume, narrowly boat-shaped, 0·8 in. long, the ciliae on the keel often minutely knobbed. Erect culms 4–9 in. high; leaves flat, 0·6–2·5 in. long, 1–2 in. wide; spikes 3–5, 0·6–2·2 in. long; lower glume 0·4–0·8 in. long, upper 0·8–1 in. long.....2. *Barberi*.

1. *CYNODON DACTYLON*, Pers.; F. B. I. vii. 288; S. I. G. figs. 190, 191.

In all Districts except on the W. Coast; sea-level to 7,000 ft.

Underground stems often very long. Hariali grass.

A highly nutritious fodder, especially for horses. Vern. *Hind.*

Dub. Ur. Dubbula ghanso; *Tel.* Gericha gaddi, Gurka hariali;

Tam. Arugam pillu; *Kan.* Kudi garikai, Karkeri hullu.

Var. *intermedius*, C. E. C. Fischer n. comb. *C. intermedius*, Rang. et Tad.; S. I. G. figs. 192, 193.

Usually without underground stem.

In the same localities as the typical species but less common; up to 3,000 ft. The extreme forms are easily recognized, but the intermediate are not readily distinguishable.

2. *CYNODON BARBERI*, Rang. et Tad.; S. I. G. figs. 194, 195.

In the same region as the former species, but less common; not reported from Travancore.

100. *Chloris*, Sw.

Perennial, rarely annual, erect or decumbent herbs. *Leaves* usually flat, sometimes complicate or convolute. *Inflorescence* of solitary, umbelled or racemosely arranged spikes or spiciform racemes, erect or stellately spreading. *Spikelets* sessile or very shortly pedicelled, unilateral, 2-seriate, not jointed on the rhachis, with 1–4 perfect florets and 1–3 imperfect above; rhachilla articulated above the glumes, prolonged beyond the upper perfect floret and bearing 1–3 empty

lemmas above. *Glumes* 2, membranous, unequal, persistent, narrow, 1-nerved, keeled, mucronate or the upper more or less aristate. *Lemmas* 3-nerved, acute, obtuse or 2-fid, usually awned; paleas 2-nerved, 2-keeled, containing a bisexual floret. *Lodicules* 2, minute. *Stamens* 3. *Styles* 2, free. *Grain* linear-oblong or ellipsoid, compressed or subtrigonal, free within the lemma and palea; often with a loose pericarp.

Spikes solitary, very rarely 2, .8—2.5 in. long, erect. Culms slender, 5—18 in. high; leaves 2—10 in. long; .1—1.5 in. wide; perfect florets 4, lowest lemma .2 in. long, broadly obovate, truncate with an arista .12—1.4 in. long, that of next longer, of the 4th very short or 0; empty lemmas 2, muticous.....1. *tenella*. Spikes 3—many; perfect florets 1—2:—

Spikes umbelled:—

Perfect floret 1:—

Empty lemma above the floret solitary, well-developed or rudimentary:—

Empty lemma represented by a fine arista .18—5 in. long hardly widened at the base. Culms procumbent or erect, 1—5 ft. high; peduncles long; leaves 2—22 in. long, .07—4 in. wide; spikes 3—10, 2—10.5 in. long; upper glumes .2—38 in. long; lemma oblong-lanceolate, glabrous, .17—28 in. long; awn .12—6 in. long.....2. *incompleta*.

Empty lemma oblanceolate, truncate, its arista .16—18 in. long. Culms decumbent, 3—18 in. high; leaves 1.5—7 in. long, .07—11 in. wide; spikes 4—7, .8—2.5 in. long; rhachis hairy; upper glumes .08—16 in. long; lemma obovate, acute, .1—1.2 in. long, apical margin long-ciliate; awn .15—26 in. long.....3. *virgata*.

Empty lemmas above the floret 2 or 3:—

Culms glabrous, 1—3 ft. high; leaves 2—12 in. long, .1—2 in. wide; spikes 4—20, 2—4 in. long, rhachis scaberulous; upper glumes .1—13 in. long; lemma .08—1 in. long, obovate, obtuse, back sparsely hairy, margins densely ciliate above the lower $\frac{1}{2}$, its arista .16 in. long; empty lemmas 2, lower obovate, upper subglobose, their aristas .12—18 in. long...4. *barbata*.

Culms puberulous or hairy for at least a short distance below the spikes:—
Culms 3—30 in. high, hairy for a short distance below the spikes; leaves 1—10 in. long; .02—1 in. wide, glabrous; spikes 3—13, .6—2.8 in. long, rhachis glabrous; upper glumes .08—13 in. long; lemma obovate to oblanceolate, keel glabrous, back sparingly hairy at the sides, margins long-ciliate, .08—1 in. long; awn .16—3.4 in. long; empty lemmas 2—3, lower obovate, truncate, upper subglobose, their aristas .1—3 in. long

5. *montana*.

Culms 3—8 in. long, usually puberulous throughout, sometimes hairy above; leaves .7—1.5 in. long, .05—1 in. wide, densely short-hairy; spikes 3—4, .5—1 in. long, rhachis densely hairy; upper glumes .08—1 in. long; lemma obovate, obtuse, emarginate or 2-toothed, back asperulous, keels and margins long-ciliate, .1 in. long; awn .2—3 in. long; empty lemmas 3, obovate, apiculate, puberulous, their awns .2—3 in. long

6. *Wightiana*.

Perfect florets 2. Culms 1—3 ft. high, minutely puberulous just below the spikes; leaves 1—10 in. long, .05—2 in. wide, glabrous; spikes 3—9, 1.4—4 in. long; upper glume .07—1 in. long; lowest lemma obovate, back scaberulous, keel and margins long-ciliate, .09—16 in. long, awn .16—23 in. long; second lemma broader, shorter with a shorter awn; empty lemmas 2, subglobose, their aristas .08—18 in. long.....7. *Bournei*.

Spikes racemously arranged, 14—30, 1.5—2.5 in. long. Culms 18—30 in. high; leaves 2—6.5 in. long, .1—1.5 in. wide; upper glume .06 in. long; perfect lemma solitary, .06—0.9 in. long, narrowly lanceolate, acute, 2-toothed, sparsely ciliate on the keel and margins above the middle, its awn .33—4.4 in. long; empty lemmas 2, minute, their awns .25—4 in. long.....8. *polystachya*.

1. CHLORIS TENELLA, Roxb.; F. B. I. vii. 290; S. I. G. fig. 197.

Bellary District.

Reputed a good fodder.

2. *CHLORIS INCOMPLETA*, Roth ; F. B. I. vii. 290 ; S. I. G. fig. 196.
In all Districts except on the W. Coast ; often in hedges and scrambling among bushes ; sea-level to 2,500 ft.
Eaten by cattle before flowering. Vern. *Tel.* Kanthari gaddi ; *Kan.* Melamalai hullu.
3. *CHLORIS VIRGATA*, Sw. ; F. B. I. vii. 291 ; S. I. G. fig. 198.
Bellary and Salem Districts ; Mysore State ; 2,000—3,000 ft. Vern. *Tel.* Uppu gaddi.
4. *CHLORIS BARBATA*, Sw. ; F. B. I. vii. 292 ; S. I. G. figs. 199, 200, 201.
In all Districts except on the W. Coast ; sea-level to 2,000 ft.
A good fodder before flowering. Vern. *Tam.* Kodai pillu, Sevarugu pullu ; *Kan.* Hennu manchada kalu hullu.
5. *CHLORIS MONTANA*, Roxb. ; F. B. I. vii. 292 ; S. I. G. figs. 204, 205.
In the central and eastern Districts and southwards to Cape Comorin ; sea-level to 2,000 ft. Vern. *Kan.* Kondai javara hullu
6. *CHLORIS WIGHTIANA*, Nees ; F. B. I. vii. 293.
S. India, without precise locality (Wight).
7. *CHLORIS BOURNEI*, Rang. et Tad. ; S. I. G. figs. 202, 203.
Godavari, Bellary, S. Arcot, Coimbatore and Tanjore Districts ; up to 2,500 ft.
8. *CHLORIS POLYSTACHYA*, Roxb. ; F. B. I. vii. 292.
Bellary District ; Nilgiri, Coimbatore, Pulney and Tinnevely Hills ; Cape Comorin ; up to 2,500 ft.

101. Eleusine, Gaertner

Annual or perennial herbs. *Leaves* flat or complicate. *Inflorescence* of capitate, digitate, whorled or scattered spikes. *Spikelets* small, sessile, 2—3-seriate, secund, imbricate, pointing forwards at an acute angle to the rhachis, with a terminal spikelet or sometimes only an abortive lemma ; laterally compressed, not jointed to the rhachis ; rhachilla continuous between the 2—12 lemmas. *Glumes* persistent, subequal, keeled, acute or cuspidate ; lower 1-nerved ; upper often broader, 1—7-nerved. *Lemmas* resembling the glumes ; the lowest usually the longest, 3-nerved ; paleas complicate, strongly 2-keeled, each containing a bisexual floret or the terminal a ♂ or empty. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* small, free within the lemma and palea ; pericarp loose, hyaline.

Erect ; leaves 3 in. or more long ; spikes umbelled or scattered ; lemmas and paleas glabrous :—

Spikes in one whorl, occasionally 1—2 solitary spikes below the umbel ; glumes entire :—

Rhachis of spike slender, glabrous. Culms not very stout, 6—30 in. high ; leaves 3—20 in. long, .1—2.5 in. wide ; spikes 2—9, .9—5.5 in. long ; lowest lemma .12—1.4 in. long ; paleas not winged ; grain oblong, narrowed at the ends, laterally compressed.....1. *indica*.
Rhachis broad, margins scabrid. Culms usually stout, 1—3 ft. high ; leaves 10—24 in. long, .2—5 in. wide ; spikes 4—many, 1—4 in. long ; lowest lemma .15—1.7 in. long ; paleas winged on the keels ; grain globose.....2. *coracana*.
Spikes 4—30 in 1—several whorls with scattered solitary or twin spikes intermixed, 1.5—5 in. long ; rhachis slender. Culms 1—4 ft. high ; leaves 3—10 in. long, .1—5 in. wide ; glumes usually with notched tips ; lowest lemma .11—1.4 in. long, truncate or 2-toothed caudate ; paleas with ciliolate, wingless keels ; grain oblong-subglobose, grooved down one side, rugose and muriculate

3. *verticillata*.

Prostrate or creeping, spreading and rooting from the nodes; culms 1—9 in. high; leaves .5—1.2 in. long, .05—1.5 in. wide; spikes numerous, crowded into a globose head, .3—5 in. across; lowest lemma .15—.17 in. long, cuspidate, densely hairy on the keel and on the 2 lateral nerves below the middle; paleas densely hairy on the keels; grain ovate to nearly orbicular, concavo-convex, transversely rugose

4. *lagopoides*.

1. *ELEUSINE INDICA*, Gaertn.; F. B. I. vii. 293, S. I. G. fig. 206.
In all Districts; up to 6,500 ft.
A fair fodder. Vern. *Tam.* Thippa ragi.
2. *ELEUSINE CORACANA*, Gaertn.; F. B. I. vii. 299.
Cultivated in the dry and hilly parts of most Districts; up to 5,000 ft. Believed to be the cultivated form of the previous species.
The grain is an important article of food for the poorer classes.
The culms and leaves are a good cattle-fodder. Vern. *Ur.* Mandiya; *Tel.* Ragi, Ragulu, Thamidalu, Chodalu; *Tam.* Ragi, Kalvaragu, Kapai; *Kan.* Ragi.
3. *ELEUSINE VERTICILLATA*, Roxb.; F. B. I. vii. 295.
In all the eastern Districts; Mysore State; Nilgiri and Coimbatore Districts; up to 3,000 ft.
A good fodder. Vern. *Tam.* Kadu kapai.
4. *ELEUSINE LAGOPOIDES*, Mett.; *E. brevifolia*, R. Br.; F. B. I. vii. 294; S. I. G. fig. 207.
Along the E. coast and inland as far as Coimbatore; usually in sandy tracts and salt soils; up to 1,500 ft.

102. *Dactyloctenium*, Willd.

Annual or perennial, usually erect herbs. *Leaves* flat. *Spikes* in one terminal umbel, rarely reduced to a solitary spike. *Spikelets* sessile, laterally compressed, densely imbricate in 2 rows, usually at right angles to the rhachis, which is produced in a rigid point beyond them; rhachilla disarticulating above the lower glume, continuous between the lemmas. *Glumes* deciduous, slightly unequal, 1-keeled, 1-nerved; lower ovate to oblong, acute or obtuse, persistent; upper oblong, obtuse, mucronate or cuspidate. *Lemmas* 3—5, firmly membranous, ovate, 1-keeled, 3-nerved, acuminate, mucronate or cuspidate; paleas 2-keeled, each containing a bisexual floret or the uppermost more or less imperfect. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grains* oblong to globose; pericarp loose.

DACTYLOCTENIUM AEGYPTIUM, Beauv. *Eleusine aegyptiaca*, Desf.; F. B. I. vii. 295; S. I. G. figs. 5, 208, 209.

In all Districts; up to 3,000 ft.

Erect or creeping in poor soils; culms 1.5—30 in. high; leaves 1—10 in. long, .08—.35 in. wide, glabrous or more or less pilose; spikes 1—7, digitately radiating, .3—1.5 in. long; lemmas broad, subfalcate, strongly cuspidate, lowest .12—.14 in. long.

103. *Dinebra*, Jacq.

Annual herbs; culms leafy. *Leaves* flat. *Inflorescence* of slender, spreading or deflexed spikes collected in narrow, pyramidal racemes, sometimes paniced. *Spikelets* crowded, secund, 2-seriate, sessile, 2—3 flowered, not jointed at the base; rhachilla slender, jointed at the base, produced beyond the uppermost floret and bearing an imperfect lemma.

Glumes 2, persistent, subequal or the upper longer, lanceolate, 1-nerved, 1-keeled, awned or cuspidate. *Lemmas* much shorter, hyaline, broadly ovate, subacute or obtuse, 1-nerved; *paleas* as long, hyaline, 2-keeled. *Lodicules* 2, minute. *Stamens* 3. *Styles* 2, free. *Grain* oblong or ovoid, trigonous, free within the lemma and palea; embryo $\frac{1}{2}$ as long.

DINEBRA RETROFLEXA, Panz. *D. arabica*, Jacq.; F. B. I. vii. 297; S. I. G. figs. 17, 210, 211.

In the central and eastern Districts from Godavary to Coimbatore; up to 3,000 ft.

Culms 2—36 in. high; *leaves* 2—10 in. long, $\frac{1}{2}$ —3 in. wide; *inflorescence* 3—16 in. long; *spikes* $\frac{3}{4}$ —2 $\frac{1}{2}$ in. long; *glumes* rigid, $\frac{1}{8}$ — $\frac{1}{4}$ in. long; *lemmas* $\frac{1}{8}$ — $\frac{1}{4}$ in. long; *grains* $\frac{1}{5}$ in. long, acute. Readily eaten by cattle before flowering. Vern. Tel. Wadata toka gaddi; Kan. Nari balada gandu hullu.

104. *Enneapogon*, Desv.

Perennial herbs. *Leaves* narrow, flat or convolute. *Panicles* contracted or spiciform. *Spikelets* distichous, 1—3-flowered, not jointed on the pedicels; *rhachilla* disarticulating at the base. *Glumes* 2, persistent, keeled, 3—9-nerved. *Lemmas* 4—5, shorter, broad, concave, 9-nerved, 9-awned; *awns* subulate, equal or alternately shorter and longer, plumose, ciliate or scaberulous; *paleas* oblong, 2-toothed, 2-keeled, the lowest containing a bisexual floret, the rest gradually shorter and with a ♂ floret or empty, the uppermost rudimentary or reduced to a tuft of hairs. *Lodicules* 2, minute, fleshy. *Stamens* 3. *Styles* 2, free. *Grain* ovoid or oblong, free.

ENNEAPOGON ELEGANS, Stapf. *Pappophorum elegans*, Nees; F.B.I. vii. 301; S. I. G. figs. 215, 216.

In all central and eastern Districts from Kurnool southwards; Coimbatore and Nilgiri Districts; up to 3,000 ft.

Culms slender, wiry, 2—20 in. high, erect from a woody, often thickened base; *leaves* flat or convolute $\frac{1}{2}$ — $\frac{3}{4}$ in. long, $\frac{1}{5}$ — $\frac{1}{4}$ in. wide; *panicles* 2—3 $\frac{1}{2}$ in. long; *glumes* $\frac{1}{6}$ — $\frac{1}{4}$ in. long; lowest lemma $\frac{1}{8}$ in. long, its awns $\frac{1}{3}$ — $\frac{1}{4}$ in. long, the uppermost minute, usually reduced to 3 short aristas.

105. *Pommereulla*, Linn. f.

Perennial creeping herbs; rootstock stoloniferous. *Leaves* linear, flat or complicate; basal sheaths equitant. *Spike* terminal, simple or forked; *rhachis* flattened. *Spikelets* distant or close, sessile, 2—3-flowered; *rhachilla* articulated at the base, very short, continuous between the lemmas, shortly produced beyond the uppermost floret, with or without a rudimentary lemma. *Glumes* membranous, persistent, amplexicaul at the base; the lower 1-nerved; the upper broader and longer, 3-nerved. *Lemmas* 5—6, spirally arranged to form an inverted cone; the lowest with a pungent callus; the 2 lowest epaleate and empty, flabelliform, embracing the upper, 4-lobed, lobes acute, acuminate, mucronate, cuspidate or shortly aristate, the 2 inner narrow, the 2 outer broad, the lemma bearing a slender awn on the middle of the back; the upper lemmas gradually smaller, similar but concave at the base,

3-lobed with the middle lobe entire or 2-cuspidate, the third and fourth or third to fifth lemmas paleate; paleas ovate, flat, 2-keeled with wide flaps, containing each a bisexual floret; the uppermost lemma epaleate and empty. *Lodicules* 2. *Stamens* 2—3. *Styles* 2, free. *Grain* oblong, biconvex or plano-convex, loose within the lemma and palea; pericarp loose; embryo orbicular, small.

POMMEREULLA CORNUCOPIAE, Linn. f.; F. B. I. vii. 300; Roxb. Cor. Pl. t. 131; S. I. G. figs. 213, 214.

Vizagapatam (Narayanswami), Kistna (Barber) and Chingleput Districts.

Stolons several inches long; culms solitary or tufted, 1·5—12 in. high; leaves ·5—4 in. long, ·05—·15 in. wide, apex rounded; spikes partly enclosed in the upper spathiform leaf-sheath or long exerted, ·8—3 in. long; glumes ·3—·5 in. long; callus ·08—·1 in. long, villous; lowest lemma ·25—·33 in. long, silkily villous on the nerves, its awn ·2—·3 in. long; grain ·06 in. long.

106. *Elytrophorus*, Beauv.

Erect, annual herbs. *Leaves* very narrow, flat. *Inflorescence* of densely-packed globose clusters of spikelets continuous in a cylindric mass, lobed or interrupted, on a simple terminal axis. *Spikelets* very small, laterally compressed, sessile, not articulated at the base, 3—6-flowered, subtended by many empty glumes; rhachilla very short, smooth, jointed at the base and between the lemmas. *Glumes* 2, subequal, persistent, membranous, lanceolate, mucronate or aristate, 1-keeled, 1-nerved. *Lemmas* 3—7, rather larger, ovate, aristate, 3-nerved; paleas complicate, truncately 3-lobed, 2-keeled, one or both keels winged, the uppermost empty, the rest containing each a bisexual floret. *Lodicules* 2. *Stamens* 1—3; anthers minute. *Styles* 2, free. *Grain* minute, narrowly oblong or fusiform, compressed; pericarp loose at both ends.

ELYTROPHORUS SPICATUS, A. Camus. *E. articulatus*, Beauv.; F. B. I. vii. 306.

Ganjam, Chingleput, Arcot, Tanjore and Malabar Districts; Mysore State; sea-level to 3,000 ft.

Culms ·05—12 in. high; leaves 1—12 in. long, ·05—·2 in. wide; inflorescence 1·5—9 in. long; glumes and lemmas ·06—·08 in. long, their aristas ·05—·09 in. long. Vern. *Tam.* Vayal tenai; *Kan.* Nela antabu hullu.

107. *Aeluropus*, Trin.

Low, much-branched, rigid, perennial, leafy herbs. *Leaves* distichous, coriaceous, usually convolute, pungent. *Inflorescence* of terminal crowded heads. *Spikelets* minute, sessile, laterally compressed, 6—many-flowered, not articulate at the base; rhachilla obscurely articulate at the base and between the lemmas, not produced beyond them. *Glumes* membranous, persistent, rounded on the back, apiculate, mucronate or cuspidate; lower 1—3-nerved; upper much larger, 5—7-nerved. *Lemmas* membranous, longer than the glumes, 7—9-nerved; paleas as large, broadly cuneate, 3-lobed, lobes erose, 2-keeled, flaps broad, keels nearly

smooth or ciliate, each enclosing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* oblong or obovoid, free within the lemma and palea.

AELUROPUS LAGOPOIDES, Trin. ex Thw. *A. villosus*, Trin.; F. B. I. vii. 334.

Coastal sands and alkaline soils on both coasts; often in marshy places.

Roots long, wiry; culms tufted, 1—14 in. high; leaves sometimes flat, .15—2 in. long, up to .15 in. wide; heads oblong or globose, .3—8 in. long; glumes and lemmas more or less villous, the former .06—08 in. long, the latter .1—11 in. long.

108. *Oryza*, Linn.

Tall, annual or perennial herbs. *Leaves* narrow, flat or convolute. *Inflorescence* spicate or paniced. *Spikelets* strongly laterally compressed, 1-flowered, appearing to be articulated on a short dilated pedicel but actually articulated above 2 abortive glumes. *Glumes* above the articulation 2, minute, subulate or absent. *Lemma* chartaceous or coriaceous, the size and shape of the spikelet, often strongly nerved or ribbed, obtuse, acute or awned, its palea as long, similar, containing a bisexual floret. *Lodicules* 2, entire or 2-lobed. *Stamens* 6. *Styles* 2, free. *Grain* narrowly oblong, free within the lemma and palea.

Lemma, excluding its awn, .35 in. or less long, punctate or granulate, not winged on the back:—

Panicles compound, 2.5—12 in. long, spikelets numerous; glumes oblong, .12—14 in. long, often much shorter in cultivated plants; lemma .25—3 in. long, regularly punctate, hispidulous, with a slender barbellate awn 1.4—5 in. long in wild plants, awnless in cultivated ones. Culms up to 4 ft. high; leaves 4—22 in. long, .1—35 in. wide.....1. *sativa*.

Panicles simple, 1.5—4 in. long, spikelets few; lower glume 0 or minute, upper .04—06 in. long; lemma .22—24 in. long, densely irregularly granulate, glabrous. Culms rather slender, up to 3 ft. high; leaves 3—10.5 in. long, .3—9 in. wide.

2. *Meyeriana*.
Lemmas .45—.5 in. long, excluding a stiff, glabrous arista .13—.17 in. long, keel broadly winged above the middle, smooth, glabrous. Culms up to 6 ft. high; leaves 6—20 in. long, .25—.5 in. wide; sheaths tessellate; panicles spiciform, 4—8 in. long; glumes finely subulate, .16—.21 in. long.....3. *coarctata*.

1. *ORYZA SATIVA*, Linn.; F. B. I. vii. 92.

In all Districts; in marshes; sea-level to 2,000 ft. Much cultivated in all Districts in wet fields for its edible grain and its straw. The Paddy or Rice plant.

There are numerous races of the cultivated form. Vern. *Hind*. Dhan; *Ur*. Dhanho; *Tel*. Vadlu; *Tam*. and *Mal*. Nelli; *Kan*. Batta.

2. *ORYZA MEYERIANA*, Baill. *O. granulata*, Nees et Arn.; F. B. I. vii. 93. In most Districts; up to 4,000 ft.

3. *ORYZA COARCTATA*, Roxb.; F. B. I. vii. 93.

Godavari District at Tallurevu (Barber).

109. *Leersia*, Sw.

Slender, perennial herbs. *Leaves* narrow, flat. *Panicle* contracted, usually flaccid. *Spikelets* imbricate, laterally compressed, 1-flowered.

Glumes 0 or reduced to an obscure, hyaline, entire or 2-lobed rim. *Lemmas* coriaceous or chartaceous, oblong, strongly 1-keeled; *palea* similar in texture and shape, nearly as long but narrower, 1-keeled, containing a bisexual floret. *Lodicules* 2. *Stamens* usually 6, sometimes 3 or fewer. *Styles* 2, free. *Grain* oblong, compressed, free within the lemma and palea.

LEERSIA HEXANDRA, Sw.; F. B. I. vii. 94; S. I. G. fig. 119.

In all Districts; in marshes and lakes; sea-level to 7,000 ft. Culms up to 4 ft. high; leaves usually stiff, 3–8 in. long, 1–4 in. wide; panicles 2–5 in. long; lemma obliquely oblong, 13–15 in. long, keels of lemma and palea bristle-ciliate.

Much liked by cattle. Vern. *Hind.* Jungli dhan; *Mal.* Nir valli pullu; *Kan.* Kadu bili sajjabu hullu.

110. Hygrorhiza, Nees.

Glabrous floating herbs; culms spongy below, emitting capillary roots at the nodes. *Panicles* short, broad. *Spikelets* narrowly lanceolate, 1-flowered, articulate on their pedicels but tardily deciduous. *Glumes* 0. *Lemmas* thinly chartaceous, narrowed into an awn; *palea* similar but narrower, awnless, containing a bisexual floret. *Lodicules* 2, gibbous. *Stamens* 6; anthers long, slender. *Styles* 2, free. *Grain* narrowly oblong, free within the lemma and palea.

HYGRORHIZA ARISTATA, Nees; F. B. I. vii. 95; S. I. G. fig. 120.

Along both coasts; Mysore State at Kumsi (Meebold) at 2,000 ft. Floating culms a foot or more long, erect branches 2–8 in. high; leaves subcoriaceous, ovate to narrowly ovate-oblong, base subcordate, 1–3.1 in. long, 2–7 in. wide; panicles 1–2 in. long; spikelets few, long-pedicelled; lemma narrowly lanceolate, 23–3 in. long, strongly 5-nerved; awn 25–55 in. long, scabrid.

The grain is eaten by the poor. Readily eaten by cattle. Vern. *Tam.* Valli pullu.

111. Anthoxanthum, Linn.

Perennial, erect, usually sweet-scented herbs. *Leaves* flat. *Panicles* spiciform or more or less branched and somewhat lax. *Spikelets* pedicelled, slightly laterally compressed, 3-flowered; rachilla disarticulating above the glumes. *Glumes* 2, persistent, membranous, sometimes chaffy and shining, complicate, sharply keeled; the upper the longer and with a strong rib on each side close to the keel. *Lemmas* 3; the 2 lower similar and subequal, laterally compressed, 1-keeled, hairy, 2-lobed or 3-lobed, sometimes the upper to near the base, the lowest bearing an arista from $\frac{1}{3}$ – $\frac{1}{2}$ way below the tip, usually slightly overtopping it, but sometimes shorter, the second with a geniculate awn from the back; the uppermost lemma shorter, usually complicate and 1-keeled, glabrous. *Paleas* of the 2 lower lemmas, if present, narrow, 2-keeled, empty or containing a ♂, usually 3-stamened floret; the uppermost palea complicate, 1-keeled, enclosing a bisexual floret, usually with 2 stamens. *Lodicules* 0. *Styles* 2. *Grain* elliptic-ovoid, slightly laterally compressed; embryo $\frac{1}{4}$ as long.

ANTHOXANTHUM HOOKERI, Rendle. *Hierochloa Hookeri*, C. B. Clarke ex Hook. f.; F. B. I. vii. 223.

Pulney Hills in the vicinity of Kodaikanal; 6,000—7,000 ft. Possibly an escape from gardens, but I have seen no specimen from a garden.

Rootstock creeping; culms 20—40 in. high; leaves 4—11 in. long, 2—4 in. wide, closely ribbed as are also the sheaths; panicles lax; upper glume 23—27 in. long; 2 lower lemmas 18—22 in. long, brown-hairy; awn 28—4 in. long; uppermost lemma 1—12 in. long, rarely emarginate with a short arista.

Anthoxanthum odoratum, Linn.; F. B. I. vii. 222. The sweet vernal grass is cultivated in gardens in the hills. It differs from the above species through its smaller size; leaves mostly basal; panicles spiciform, short and close; 2 lower lemmas 12—15 in. long, devoid of paleas and empty; uppermost lemma 06—08 in. long.

112. *Lophatherum*, Brogn.

Perennial, leafy herbs. *Leaves* petioled, flat, narrowly lanceolate, tessellate with transverse nerves. *Panicles* subsimple, lax, narrow; branches alternate. *Spikelets* solitary, secund, narrowly lanceolate, terete, 1-flowered, jointed at the base; rhachilla not jointed, produced beyond the floret and bearing several closely-sheathing, cuspidate, empty lemmas. *Glumes* 2, membranous, the upper the longer, rounded on the back or the lower 1-keeled, 5—7-nerved, acute or obtuse, margins often hyaline. Lowest lemma longer, 7—9-nerved, mucronate or cuspidate; palea narrow, 2-keeled, keels narrowly winged, containing a bisexual floret. *Lodicules* 2—3. *Stamens* 3. *Styles* 2, connate at the base. *Grain* oblong and compressed or fusiform and terete, free within the lemma and palea; embryo long.

LOPHATHERUM GRACILE, Brogn.; F. B. I. vii. 331.

Travancore without specific locality (Venkoba Rao).

Culms 2—5 ft. high; leaves 4—10 in. long, 1—1.5 in. wide; panicles 6—18 in. long, branches few; spikelets 33—5 in. long, terminated by the erect or spreading cusps of the empty lemmas.

113. *Centotheca*, Desv.

Perennial, leafy herbs. *Leaves* rather broad, with transverse veins. *Panicles* subsimple, lax; branches long, slender, spiciform; pedicels capillary. *Spikelets* secund, alternate, laterally compressed, all perfect or the 1—several upper empty, perfect ones 1—3-flowered, not articulated at the base; rhachilla very slender, articulated at the base and between the lemmas, rarely produced above the uppermost. *Glumes* 2, persistent unequal, distant at the insertions, ovate-oblong, 3- or 5-nerved. *Lemmas* ovate to oblong, obtuse or acute, rounded on the back, 5- or 7-nerved, the upper ones usually bearing soft, erect, ultimately deflexed, tubercle-based bristles; paleas narrow, 2-keeled, keels ciliolate, containing each a bisexual floret. *Lodicules* 0. *Stamens* 2—3, *Styles* 2, free. *Grain* ovoid, acute, terete, free within the lemma and palea.

CENTOTHECA LAPPACEA, Desv. ; F. B. I. vii. 332.

In most Districts, more abundant in wet localities ; up to 3,000 ft. Culms stout, 1—5 ft. high ; leaves narrowly lanceolate to ovate, 2—10 in. long, .45—1.4 in. wide ; panicles 3.5—14 in. long ; glumes .09—14 in. long, the upper the longer ; lowest lemma .16—.2 in. long.

114. *Melica*, Linn.

Perennial, erect herbs. *Leaves* narrow, flat or convolute. *Panicles* open, spiciform or reduced almost to a raceme, often secund. *Spikelets* few to many, laterally compressed or subterete, 1—5-flowered, jointed on the pedicels or not ; rhachilla disarticulating tardily at the base, readily between the flowering lemmas. *Glumes* 2, membranous, scarious or hyaline, persistent or falling separately, equal or unequal, 3- or 5-nerved or the upper 7-nerved. *Lemmas* firmly membranous, the margins and tips often hyaline, 5—9-nerved ; paleas 2-keeled, the lower 1—3, rarely 4—5, containing each a bisexual floret, the several above smaller, empty, embracing each other to form a clavate or oblong terminal body. *Lodicules* 2, connate. *Stamens* 3. *Styles* 2, free. *Grain* oblong or subcylindric, terete or semi-terete ; embryo small.

MELICA SCABERRIMA, Hook. f. ; F. B. I. vii. 330.

Introduced and escaped from gardens around Ootacamund (Gamble) ; 7,000 ft.

Culms 1—3 ft. high ; leaves 2—3.5 in. long, .1—1.5 in. wide ; panicles often effuse and large ; perfect florets usually 2 or 3, sometimes up to 5 ; glumes ovate-lanceolate or the upper elongate-lanceolate, lower .18—.2 in. long, 1-nerved, upper .21—.25 in. long, 3-nerved ; lemmas .21—.28 in. long, minutely scaberulous.

115. *Briza*, Linn.

Annual or perennial, erect herbs. *Leaves* flat or convolute. *Panicles* effuse, sometimes reduced to a raceme ; branches and pedicels capillary. *Spikelets* pendulous, laterally compressed, few-many-flowered ; rhachilla disarticulating above the glumes and between the lemmas. *Glumes* 2, scarious or firmly membranous, boat-shaped and keeled or saccate and rounded on the back, persistent, subequal, 3—9-nerved. *Lemmas* firmly membranous with scarious margins, shaped more or less like the glumes, obtuse, acute or subaristate, 7—9-nerved, the outer 3 or all the lateral nerves palmately spreading ; paleas much shorter, broad, 2 keeled, keels often winged, each containing a bisexual floret or the upper reduced. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* ovoid, concavo- or plano-convex, usually dorsally compressed ; embryo small.

Spikelets ovate, few, sometimes only 1 or 2, .4—9 in. long, straw-coloured to brown or purplish, 7—20 flowered. Culms 5—26 in. high ; leaves 2—8 in. long, .2—3 in. wide ; glumes very broadly ovate, .2—3 in. long ; lemmas very broadly ovate-cordate, .3 in. long, the upper at least silky-hairy.....1. *maxima*. *Spikelets* numerous, triangular to ovate, often wider than long, .12—15 in. long, green, rarely purplish, 4—9-flowered. Culms 2—15 in. high ; leaves 1.5—5 in. long, .12—.32 in. wide ; panicles broadly obovate, lax, 1.5—3.5 in. long ; glumes .08—.1 in. long, horizontally spreading ; lemmas broadly ovate-cordate, very gibbous below, the scarious margins very broad, .08—.1 in. long, glabrous

2. *minor*.

1. BRIZA MAXIMA, Linn.; F. B. I. vii. 336.

Introduced and run wild about the Nilgiri and Pulney Hill Stations and in Travancore; 7,000—8,000 ft. The Large Quaker- or Quaking-grass.

2. BRIZA MINOR, Linn.; F. B. I. vii. 336.

Introduced and run wild around Ootacamund and Kodaikanal; 6,000—7,000 ft. The Small Quaker- or Quaking-grass.

116. Poa, Linn.

Annual or perennial, usually small herbs. *Leaves* flat or convolute. *Panicles* lax or contracted, rarely spiciform. *Spikelets* laterally compressed, 2—6-flowered, not jointed at the base; rhachilla jointed at the base and between the lemmas. *Glumes* 2, thinly membranous, subequal, acute or obtuse, 1-keeled, 1—3-nerved. *Lemmas* membranous, acute or obtuse, 5—7-nerved; paleas shorter, 2-keeled, each containing a bisexual floret or the uppermost reduced. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* ovoid, oblong or linear, often grooved, free within the lemma and palea or adhering to the latter; embryo small.

Lemmas connected by long, often copious silky wool; .12—16 in. long; rhachilla long-silky-woolly. Culms 1—2 ft. high; leaves 2.5—8 in. long, very narrow, panicles 2—2.5 in. long; glumes acute, lower .08—11 in. long, upper .1—15 in. long.

1. *trivialis*.

Lemmas not connected by wool, .12 in. long; rhachilla glabrous. Culms tufted, 2—12 in. high; leaves 1—4.5 in. long, .1—12 in. wide; panicles 1—2.5 in. long; glumes obtuse, lower .06 in. long, upper .08 in. long.....2. *annua*.

1. POA TRIVIALIS, Linn.

Introduced and escaped around Ootacamund and in the Pulney Hills; 5,000—7,000 ft. The Rough Meadow-grass.

2. POA ANNUA, Linn.; F. B. I. vii. 345.

Probably introduced and escaped around the Hill Stations of the Nilgiri and Pulney Hills; 4,000—7,200 ft. The Annual Meadow-grass.

117. Glyceria, R. Brown

Perennial, rarely annual herbs. *Leaves* flat or convolute. *Panicles* effuse or contracted. *Spikelets* laterally compressed, few- to many-flowered, not jointed at the base; rhachilla jointed between the lemmas. *Glumes* 2, thin, unequal, persistent, 1—5-nerved. *Lemmas* membranous with a broadly hyaline tip, broadly oblong, obovate or fan-shaped, rounded or truncate, rarely subacute, back rounded, 3—9-nerved; paleas 2-keeled, all but the empty uppermost enclosing a bisexual floret. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* terete or compressed, free between the lemma and palea or sub-adherent to the latter.

GLYCERIA FLUITANS, R. Br.; F. B. I. vii. 347.

Introduced and escaped about Ootacamund; 7,000—7,500 ft.; usually in wet situations. The Floating Meadow-grass.

Culms 1—3 ft. high, lax; leaves flaccid, 2.5—11 in. long, .15—35 in. wide; panicles narrow, 4—12 in. long, branches rather distant; perfect florets 7—12; glumes broadly oblong, lower .08—09 in. long, upper .13—14 in. long; lemmas broadly oblong, the lowest .18—22 in. long; paleas 2-toothed, keels narrowly winged upwards.

118. *Dactylis*, Linn.

Stiff, erect, perennial herbs. *Leaves* flat. *Panicles* terminal, unilateral, composed of short, crowded, unilateral spikes. *Spikelets* subdistichous, compressed, not jointed at the base, 3—10-flowered; rhachillas continuous. *Glumes* scarious, persistent, unequal, lanceolate, acuminate, mucronate or caudate; lower 1-nerved; upper 3-nerved. *Lemmas* rather longer, rigid, subaristate, keel scabrid, 5-nerved; paleas 2-fid, 2-keeled, keels ciliolate, each enclosing a bisexual floret, or the uppermost reduced or empty. *Lodicules* 2, fleshy, 2-lobed. *Stamens* 3. *Styles* 2, free. *Grain* oblong, acute, trigonous, dorsally subcompressed, ventrally channelled.

DACTYLIS GLOMERATA, Linn.; F. B. I. vii. 335.

Introduced and run wild in and about Ootacamund; 7,000—8,000 ft. The Cock's-foot grass.

Culms 1—3 ft. high, erect from a short, creeping rootstock; leaves 3—18 in. long, 1—3 in. wide; panicles 1·5—5 in. long; lower glume 1·5—2 in. long, upper 2·5 in. long; lemmas 3—4, lowest 2·6—3 in. long.

119. *Vulpia*, Gmelin

Annual, slender, erect herbs. *Leaves* very narrow, involute or convolute. *Panicles* contracted, narrow, usually more or less secund; pedicels clavate. *Spikelets* laterally compressed after flowering, 1—7-flowered; rhachilla slender, disarticulating at the base and between the fertile lemmas. *Glumes* very unequal; the lower minute or obsolete or like the upper subulate to subulate-lanceolate but much shorter, 1-nerved; the upper usually 3-nerved. *Lemmas* subulate-lanceolate, tapering into a straight awn, back rounded, faintly 5-nerved; paleas entire or minutely 2-toothed, 2-keeled, 1—several lower containing each a bisexual floret, the 1 or 2 uppermost reduced. *Lodicules* 2, hyaline. *Stamens* 1—3. *Styles* 2, free. *Grain* linear, back strongly compressed, concave in front, enclosed within the lemma and palea, adhering to the latter or to both; embryo small.

VULPIA MYUROS, Gmel. *Festuca Myuros*, Linn.; F. B. I. vii. 356.

Introduced and escaped about Ootacamund and Kodaikanal; 6,500—8,000 ft. The Mouse-tail fescue-grass.

Culms 6—18 in. high; leaves setaceous, at least when dry, 1—10 in. long; panicles narrow, spiciform, erect or nodding, 2—10 in. long; lower glume 0·2—0·7 in. long, upper 1·6—2 in. long, acuminate; lemmas 3—5 perfect, 1—2 reduced, lowest 2·3—3·4 in. long, its awn 4·6—7 in. long.

120. *Festuca*, Linn.

Perennial, tufted herbs. *Leaves* flat, folded or convolute, often setaceous; sheaths more or less open, seldom closed. *Panicles* more or less compound, contracted or open, sometimes effuse. *Spikelets* laterally compressed (at least after flowering), 2—many-flowered; rhachilla disarticulating at the base and between the lemmas. *Glumes* subequal,

rarely conspicuously unequal, more or less keeled, 1—3-nerved, the upper rarely 5-nerved. *Lemmas* lanceolate, muticous, mucronate or awned from the tip or very near it, back rounded or keeled towards the apex, 5—7-nerved; paleas more or less 2-toothed, 2-keeled, containing each a bisexual floret, the uppermost usually reduced. *Lodicules* 2, hyaline. *Stamens* 3. *Styles* 2, free. *Grain* oblong, back convex, grooved or concave in front, tightly enclosed in the slightly hardened lemma and palea, free or more or less adhering to the palea or to both; embryo small.

FESTUCA OVINA, Linn.

Introduced and escaped about Ootacamund; 7,000—8,000 ft.

Sheep's fescue-grass.

Culms wiry, 6—15 in. high; leaves convolute and more or less setaceous, 1·3—3 in. long (much longer in the viviparous form); panicles open, 1—3 in. long; glumes 1—18 in. long, the upper about $\frac{1}{2}$ longer than the lower; lemmas lanceolate, 22—25 in. long, 4—7 with perfect florets.

121. Bromus, Linn.

Annual or perennial herbs. *Leaves* narrow, flat. *Panicles* contracted and often dense or open and sometimes effuse or reduced to a raceme. *Spikelets* laterally compressed (at least after flowering), rather large, erect or pendulous, not jointed at the base, usually many-flowered; rachilla disarticulating at the base and between the lemmas. *Glumes* usually unequal, persistent, acute to acuminate; the lower 1—7-nerved; the upper 3—9-nerved. *Lemmas* lanceolate to broadly oblong, back rounded or keeled, 5—13-nerved, usually awned, sometimes 3-awned, median or only awn erect or recurved, sometimes twisted at the base, not kneeled; paleas entire or 2-fid, keels 2, scabrid or ciliate, enclosing each a bisexual floret, the uppermost reduced. *Lodicules* 2. *Stamens* 3, rarely 2. *Ovary* obovoid with a villous 2- or 3-lobed appendage. *Styles* 2, lateral on the appendage. *Grain* linear to linear-oblong, usually concavo-convex, enclosed in and usually adhering to the lemma and palea or at least to the latter; embryo small.

Perennial; culms up to 6 ft. high; leaves 4—18 in. long, 12—5 in. wide, glabrous or more or less hairy; panicles up to 1 ft. long; lower glume 1-nerved, 12—34 in. long, upper 3-nerved, 18—43 in. long; lemmas 3—9, 28—5 in. long, 5—7-nerved, aristate, scaberulous, keeled below the tip.....1. *asper*. Annual; culms up to 28 in. high; leaves 5—15 in. long, 1—3 in. wide, glabrous; panicles narrow, usually nodding, 3—16 in. long; spikelets strongly compressed; glumes keeled, lower 5—7-nerved, 44—58 in. long, upper 7—9-nerved, 49—7 in. long; lemmas 4—10, 5—7 in. long, 9—13-nerved, cuspidate, keeled...2. *catharticus*.

1. **BROMUS ASPER, Murray; F. B. I. vii. 358.**

Nilgiri and Pulney Hills; 5,500—8,000 ft.

Doubtfully indigenous.

2. **BROMUS CATHARTICUS, Vahl. B. unioides, H. B. K.; F. B. I. vii. 357.**
Nilgiri Hills; 6,500—8,000 ft.

An introduced American grass escaped about Ootacamund and Kotagiri; sometimes grown for fodder.

Flowers cleistogamous.

122. *Streptogyna*, Beauv.

Tall, erect, perennial herbs. *Leaves* petioled, flat, with obscure transverse venules. *Spikes* erect, unilateral. *Spikelets* long, narrow, subterete, imbricate, 1—6-flowered, not jointed at the base; rhachilla very long, slender, articulated at the base and between the lemmas. *Glumes* chartaceous, persistent; the lower oblong, tip truncate and erose, 3—7-nerved to the tip; the upper much longer, acuminate, tip entire or 2-toothed, awned. *Lemmas* chartaceous, very narrow, convolute, tip acutely 2-fid and awned from the sinus, 3-nerved; paleas as long, keels 2, close, smooth, each enclosing a bisexual floret. *Lodicules* 3, elongate. *Stamens* 2—3. *Style* single, long, twisted, with 2—3 long, tortuous stigmas. *Grain* linear, free but closely embraced by the lemma and palea.

STREPTOGYNA GERONTOGEA, Hook. f. *S. crinata*, Thw. non Beauv.; F. B. I. vii. 333.

S. Travancore; in moist forest.

Culms 2—6 ft. high; leaves 6—12 in. long, 4—1 in. wide; spikes 4—16 in. long; lower glumes 3—14 in. long, upper $2\frac{1}{2}$ —3 times longer; lowest lemma a little longer than the upper glume, its awn 6—1 in. long.

123. *Brachypodium*, Beauv.

Annual or perennial herbs. *Leaves* flat or setaceously convolute. *Racemes* terminal, simple, spiciform; joints of axis more or less hollowed, at least the lower, opposite the spikelets. *Spikelets* often few, rarely solitary, at first cylindric, later laterally compressed, erect and appressed to the rhachis or spreading, 5-many-flowered; rhachilla disarticulating above the glumes and between the lemmas. *Glumes* 2, persistent, firm, more or less unequal, 3—7-nerved. *Lemmas* oblong to oblong-lanceolate, usually narrowed into a mucro or a straight arista, back rounded, 7—9-nerved, at first imbricate, then spreading; paleas rather broad, obtuse or truncate, 2 keeled, keels rigidly ciliate, each enclosing a bisexual floret, the uppermost more or less reduced. *Lodicules* 2, ciliate. *Stamens* 2 or 3. *Ovary* crowned with a villous appendage. *Styles* 2, lateral. *Grain* linear or linear-oblong, concavo-convex, enclosed in the lemma and palea, more or less adherent to the latter; embryo small.

BRACHYPODIUM SYLVATICUM, Beauv.; F. B. I. vii. 362.

About the hill-stations in the Nilgiris and around Kodaikanal; 5,000—7,000 ft. Probably introduced and escaped.

Culms up to 4 ft. high; leaves 3—8 in. long, 1—3 in. wide, flat and flaccid or convolute; racemes 2—8 in. long; lower glume 16—18 in. long, 3-nerved, upper 26—27 in. long, 5—7-nerved; lemmas 8—14, 29—36 in. long, 7—9-nerved, mucro or arista 4—32 in. long.

124. *Lolium*, Linn.

Annual or perennial, erect herbs. *Leaves* flat or convolute. *Spikes* terminal, simple, solitary; rhachis alternately and distichously hollowed opposite the spikelets. *Spikelets* solitary, 2-ranked, usually more or less

compressed, the lowest lemma appressed to the rhachis, 3—11-, sometimes more-flowered. *Glumes* 2 in the terminal spikelet, equal and similar, in all the other spikelets the lower glume suppressed; upper linear to oblong, persistent, rigid, many-nerved. *Lemmas* shorter, oblong, obtuse, acute or awned, back rounded, 5-many-nerved; paleas as long, 2-keeled, keels sometimes narrowly winged, each containing a bisexual floret or the uppermost reduced. *Lodicules* 2. *Stamens* 3. *Styles* 2, free. *Grain* elliptic- to linear-oblong, tightly enclosed by and adhering to the lemma and palea; embryo short.

LOLIUM PERENNE, Linn.; F. B. I. vii. 365.

Introduced and escaped around Ootacamund and in the Pulney Hills. The Rye grass.

Perennial; culms up to 18 in. high; leaves 3—12 in. long, .05—.15 in. wide, flat or convolute; spikes 3—9 in. long; glumes .34—.4 in. long; lemmas 3—11, .24—.28 in. long.

125. *Triticum*, Linn.

Annual or biennial herbs. *Leaves* flat. *Spikes* terminal, solitary; rhachis excavated opposite the spikelets, articulate or inarticulate. *Spikelets* solitary, distichous, tumid, few-flowered. *Glumes* 2, persistent, rigid, often unequal-sided, obtuse or shortly awned. *Lemmas* oblong or ventricose, back rounded or keeled upwards, muticous or 1—3-awned, 5—9-nerved; paleas as long, 2-keeled, keels ciliate, the lower each containing a bisexual floret, the upper enclosing a ♂ floret or empty. *Lodicules* 2. *Stamens* 3. *Styles* 2. *Grain* oblong, ventrally grooved, often hairy, free within the lemma and palea or adhering to the latter.

TRITICUM DICOCCUM, Schrank. *T. vulgare*, Vill.; F. B. I. vii. 367.

Cultivated here and there for its grain, but not extensively. The Wheat or Corn plant. Vern. *Tel* Godumalu; *Tam*. Godumai; *Mal*. Kotampam; *Kan*. Godi.

126. *Hordeum*, Linn.

Annual or perennial herbs. *Leaves* flat. *Spikes* terminal, solitary, simple, cylindric; rhachis excavate or jointed. *Spikelets* 2—3-nate in the hollows or at the nodes of the rhachis, 1-flowered or the lateral imperfect; rhachilla jointed below the lemma and produced above it as a bristle, sometimes bearing an abortive lemma. *Glumes* 2, persistent, rigid, narrow, the outer ones of each cluster together often resembling an involucre. *Lemmas* lanceolate, tapering into a long straight or recurved awn, back rounded, 5-nerved; paleas about as long, 2-keeled, deeply folded between the keels, containing a bisexual float, or in the lateral spikelets a ♂ floret or empty and much reduced. *Lodicules* 2. *Stamens* 3. *Styles* 2. *Grain* ovoid- or narrow-oblong, grooved in front, tip usually villous, tightly enclosed in the lemma and palea and adhering to the latter or to both; embryo small.

HORDEUM HEXASTICHON, Linn. *H. vulgare*, Linn. var. *hexastichon*, Aitchis.; F. B. I. vii. 371.

Occasionally cultivated in the hills. The Barley plant. Vern. *Tam*. Ganji, *Dorai* ganji.

127. *Arundinaria*, Michaux

Erect or climbing woody shrubs. *Culms* slender; nodes usually prominent. *Culm-sheaths* thin, papery, straw-coloured; imperfect blades narrow, subulate. *Leaves* usually small. *Inflorescence* various, paniculate or racemose. *Spikelets* often long, compressed, often enclosed in bracteate sheaths, 1-many-flowered. *Glumes* 2, membranous, unequal. *Lemmas* longer, concave, many-nerved, obtuse, acute or mucronate; paleas usually shorter, prominently 2-keeled, usually compressed, all containing a bisexual floret, except sometimes the reduced terminal. *Lodicules* 3, ovate or lanceolate, ciliate. *Stamens* 3, rarely up to 6, usually exserted, anthers usually blunt. *Ovary* globular above, often hairy. *Style* short; stigmas 2—3. *Grain* ovate or narrowly oblong, smooth, furrowed on the back, enclosed in the persistent lemma and palea.

Large shrubs; culm-leaves over 4 in. long, distinctly, shortly petioled; spikelets many in large terminal panicles 3—5-flowered:—

Leaves thick with thickened cartilaginous margins, base nearly truncate, 5—11 in. long, 1—1·7 in. wide.....1. *Walkeriana*.
Leaves thin, margins neither thickened nor conspicuously cartilaginous, base usually shortly narrowed, 4—7 in. long, 7—1 in. wide.....2. *Wightiana*.
Small shrubs up to 3 ft. high; leaves densely imbricate, thick, rigid, pungent, margins thickened, cartilaginous, sessile or nearly so, 8—1·5 in. long, 17—3 in. wide; spikelets in racemes on leafy branches, 1-flowered.....3. *densifolia*.

1. *ARUNDINARIA WALKERIANA*, Munro; F. B. I. vii. 377; Gamble Ann. Calc. vii. t. 1.

Pulney Hills (Beddome).

2. *ARUNDINARIA WIGHTIANA*, Nees; F. B. I. vii. 377; Gamble Ann. Calc. vii. t. 2.

Nilgiri, Palghat, Pulney and High Wavy Mountains (Blatter and Hallberg); 3,000—8,000 ft.

Common underwood in the Nilgiri Sholas. Flowering annually; densely gregarious.

- Var. *hispida*, Gamble; F. B. I. vii. 377.

Leaf-sheaths and stems thickly covered with golden hairs from tubercles; internodes more flattened on one side.

Nilgiri Hills; 7,000—7,500 ft.

3. *ARUNDINARIA DENSIFOLIA*, Munro; F. B. I. vii. 379; Gamble Ann. Calc. vii. t. 7.

Anaimudi in Travancore at 8,500 ft. (Beddome).

Densely gregarious.

128. *Dendrocalamus*, Nees

Trees, sometimes large, always unarmed. *Culms* usually erect from a densely branched rootstock, sometimes nearly solid. *Culm-sheaths* often very large, usually elongate, variously auricled; imperfect blades narrowly triangular. *Leaves* sometimes very broad, without transverse veins but frequently with pellucid glands instead. *Panicles* large, compound; the spikelets usually in globose congested heads in long spikes. *Spikelets* ovate, florets few, rarely more than 6, usually bisexual. *Glumes* 2—3, ovate, acute or mucronate, many-nerved. *Lemmas* similar; paleas ovate, acute, truncate, emarginate or 2-cleft, the lower 2-keeled and ciliate,

the uppermost usually rounded on the back and eciliate. *Lodicules* usually 0. *Stamens* 6; filaments free; anthers mucronate or with tufted hairs. *Ovary* ovoid or subglobose, often depressed, hairy above. *Style* long, usually hairy; stigma usually simple. *Grain* small; pericarp crustaceous or hardened.

DENDROCALAMUS STRICTUS, Nees; F. B. I. vii. 404; Bedd. Fl. Sylv. t. 325; Brand. For. Fl. t. 70. Gamble Ann. Calc. vii. tt. 68, 69. *Bambos stricta*, Roxb. Cor. Pl. t. 80.

Gregarious in all the drier hill-tracts; 300—4,800 ft.; absent from the W. Coast. The Male Bamboo.

Variable in size according to climate; culms 20—50 ft. high, 1—3 in. diam., sometimes solid; leaves in very dry localities 1—2 in. long, in moist ones up to 10 in. long, 2—1·2 in. wide; spikelets in dense globose heads 3—1·3 in. diam., spinescent, usually hairy, the fertile intermixed with smaller barren ones; lemmas ending in a short, sharp spine surrounded by ciliate tufts of hairs.

The culms are much used for poles, rafters, lance-shafts, lathies, matting, baskets, etc. Vern. *Hind.* Bans; *Ur.* Salia bhanso, Salimbo bhanso; *Tel.* Sadanapa veduru, Pen veduru, Kanka; *Tam.* and *Mal.* Kal mungil.

129. *Bambusa*, Schreber

Shrubs or trees, rarely climbing, often very large, sometimes thorny. *Culms* from a thick rhizome, sometimes stoloniferous. *Culm-sheaths* usually broad, as also the triangular imperfect blades. *Leaves* small to moderately large, their sheaths variously auriculate. *Inflorescence* usually a large, leafless, compound panicle with the spikelets in heads on spicate branchlets, but sometimes in leafy panicles or paniculate spikes. *Spikelets* 1—many-flowered. *Glumes* 1—3. *Lemmas* ovate-lanceolate, usually mucronate; paleas 2-keeled containing a bisexual floret. *Lodicules* 3, membranous, generally obtuse, ciliate. *Stamens* 6; filaments free, often exserted; anthers narrow, tip obtuse, apiculate or panicillate. *Ovary* oblong or obovate, hairy at the apex. *Style* short or long; stigmas 1—3. *Grain* oblong or linear-oblong, furrowed on one side; pericarp thin, adhering; embryo conspicuous.

Thornless; culms 20—70 ft. high, 2—4 in. diam.; blade of culm-sheath sparingly hairy within; leaves 6—10 in. long, 7—1·5 in. wide; spikelets 1—3 in. long; lemmas 5—1 in. long; ovary hairy.....1. *Tulda*. Branches armed at the nodes with 2—3 recurved spines; culms 80—100 ft. high, 4—7 in. diam.; blade of culm-sheath densely felted with black or dark-purplish hairs within; leaves up to 8 in. long and 1 in. wide; spikelets 5—1 in. long; lemmas 2—35 in. long; ovary glabrous.....2. *arundinacea*.

1. *BAMBUSA TULDA*, Roxb.; F. B. I. vii. 387; Gamble Ann. Calc. vii. t. 29.

Vizagapatam District (Gamble); 1,500—2,000 ft.; Nundydroog (Rottler—perhaps cultivated).

Used for building, scaffolding and the making of mats and baskets. Vern. *Hind.* Peka; *Beng.* Tulda, Talda bans.

2. *BAMBUSA ARUNDINACEA*, Willd.; F. B. I. vii. 395; Roxb. Cor. Pl. t. 79; Bedd. Fl. Sylv. t. 321; Gamble Ann. Calc. vii. t. 48.

In all Districts; 100—4,000 ft. The Thorny Bamboo.

Used for buildings, scaffolding and for many domestic purposes; for floating heavy timber; the split culms are woven into mats, baskets, fans, etc. The grain when available is eaten by the poor. Vern. *Ur.* Konta bhanso; *Tel.* Veduru, Mulla veduru, Bongudu; *Tam.* Mungil, Periya mungil, Peru varai mungil; *Mal.* Mulla, Illi; *Kan.* Dongi, Bidungalu, Hebbidru.

130. *Teinostachyum*, Munro

Shrubs or trees. Culms rather slender, drooping above. Culm-sheaths usually thin; imperfect blades recurved. Leaves usually lanceolate, acuminate. Inflorescence of spicate panicles on leafy branches; the spikelets in bracteate verticels. Spikelets long, narrow, few—many-flowered, the upper and lower florets imperfect, the others bisexual. Glumes 1 or 2, ovate, mucronate. Lemmas similar with longer mucros; paleas convolute, 2-keeled, keels ciliate. Lodicules 3, conspicuous, 3—9-nerved, persistent. Stamens 6; filaments free; anthers exserted, obtuse or obtusely apiculate. Ovary ovate or depressed-globose, produced into a long beak enclosing the style; stigmas 2—3. Grain ovoid, acuminate, beaked; pericarp crustaceous, not adnate to the seed.

TEINOSTACHYUM BEDDOMEI, C. E. C. Fischer n. nom. *T. Wightii*, Bedd.; F. B. I. vii. 410; Bedd. Fl. Sylv. t. 323; Gamble Ann. Calc. vii. t. 87

Nilgiri and Travancore Hills; 3,000—5,000 ft

Culms semi-scandent, 10—20 ft. high, 1—1.5 in. diam.; ends of branches pendulous; culm-sheaths papery, 10—12 in. long; leaves oblong-lanceolate, 6—15 in. long, 1—2 in. wide; panicles large, terminal, drooping, branches spiciform; spikelets 5—1 in. long; glume solitary; lemmas 3—4, 2—3 fertile, the others incomplete. Flowers at long intervals and dies down.

Used by the jungle tribes for mats, baskets and fencing. Vern. *Tam.* Nanyura, Mai ita, Chittu.

131. *Oxytenanthera*, Munro

Scandent or small or medium-sized, unarmed, erect trees. Culms from a thick rhizome, usually creeping underground and stoloniferous. Culm-sheaths and imperfect blades usually narrow. Leaves usually small. Inflorescence a large panicle of spicate heads of few—many spikelets. Spikelets elongate, conical, 1—2—3-flowered, the uppermost usually fertile. Glumes 1—3. Lemmas elongate-ovate, mucronate; lower paleas 2-keeled, the uppermost convolute, only slightly or not at all keeled. Lodicules 0. Stamens 6; filaments united into a tube, thick at first, later membranous, exserted; anthers narrow, acute or apiculate. Ovary ovoid. Style fine; stigmas 1—3. Grain elongate, grooved, beaked by the persistent style; embryo conspicuous.

Glumes densely, often dark-ciliate, 1—1.6 in. long. Leaf-sheaths truncate and rigidly ciliate at the mouth. Spikelets 44—48 in. long; lemmas usually 4, densely ciliate above the middle; 28—46 in. long; grain 25—35 in. long

1. *nigrociliata* var. *Hohenackeri*.

Glumes not or sparingly pale-ciliate:—

Branches climbing, whip-like; culms hollow; culm- and sometimes leaf-sheaths with a separable, coriaceous, bristly ring at the mouth; spikelets .35—.5 in. long, 1-flowered; glumes and lemmas usually sparingly pale-ciliate on the margins; style hairy.....2. *monadelpha*.

Branches not whip-like even though straggling; culm- and leaf-sheaths without bristly ring; spikelets .6—1 in. long; glumes and lemmas eciliate:—

Culms solid or nearly so, densely velvety-tomentose; culm-sheaths thin, papery at the edges; leaf-sheaths without apical calluses; spikelets slender, long, spinose-apiculate, 1-flowered; style glabrous.....3. *monostigma*.

Culms hollow, glabrous; leaf-sheaths with 2 apical calluses; spikelets robust, 3-flowered; style hairy.....4. *Bourdillon*.

1. *OXYTENANTHERA NIGROCILIATA*, Munro; F. B. I. vii. 401.

Var. *Hohenackeri*, C. E. C. Fischer n. var.

Coorg near Mercara (Hohenacker); S. Kanara (Rhodes Morgan, G. F. F. Foulkes).

2. *OXYTENANTHERA MONADELPHA*, Alston. *O. Thwaitesii*, Munro; F. B. I. vii. 402; Bedd. Fl. Sylv. t. 322; Gamble Ann. Calc. vii. t. 64.

W. Ghâts from the Bababudan to the Travancore Hills; 3,500—6,000 ft.

Gregarious, subscandent, reed-like, 10—12 ft. high. Vern. Wattai (Anamallais—*Kadir*?).

3. *OXYTENANTHERA MONOSTIGMA*, Bedd.; F. B. I. vii. 462; Gamble Ann. Calc. vii. t. 65.

Coorg and Anamallai Hills.

Erect; culms up to 15 ft. high. Apparently rare.

4. *OXYTENANTHERA BOURDILLONI*, Gamble; F. B. I. vii. 403; Gamble Ann. Calc. vii. t. 67.

Travancore, near the Cochin boundary; among precipitous rocks; 3,000—5,000 ft. (Bourdillon).

Straggling, forming open clumps; 20—30 ft. high. Vern. *Tam. Kambu*; *Kan. Aramba*.

132. *Ochlandra*, Thwaites

Reed-like woody shrubs or small trees. *Culms* erect, internodes rather long, thin-walled. *Culm-sheaths* thin, persistent. *Leaves* many-veined, margins cartilaginous; sheaths striate, fringed. *Inflorescence* of spikes or spicate panicles terminating leafy branches; spikelets verticelled, some fertile, some sterile. *Spikelets* 1-flowered, often very large. *Glumes* 2—5, variable, usually mucronate. *Lemmas* similar to the uppermost glume, mucronate; paleas membranous, not keeled. *Lodicules* 1—several, conspicuous, variable, usually appressed to the filaments. *Stamens* 6—120; filaments free or united into a tube, exerted; anthers long, usually mucronulate. *Ovary* narrow. *Style* long; stigmas 4—6. *Grain* large or very large, ovoid, long-beaked, supported by the persistent glumes; pericarp very thick, fleshy.

Ligules short:—

Culm leaves 1.7 in. or less wide; inflorescence, when known, of short terminal spikes or spicate panicles on leafy branches; spikelets 1.2 in. or less long; filaments free:—

Culm-sheaths truncate with 2 falcate, long-ciliate auricles, their imperfect blades long-ensiform; spikelets .5—1.2 in. long, glabrous or with a few setae near

the apex of glumes and lemmas. Culms erect, up to 16 ft. high and 1 in. diam.; leaves 4—10 in. long, 4—1 in. wide; glumes 2—6 in. long; lemmas .85 in. long.....1. *scriptoria*.

Culm-sheaths, when known, attenuate into a needle-like blade; spikelets, when known, hirsute:—

Culms and culm-sheaths unknown. Leaves 5—8 in. long, 1—1.5 in. wide, mouth of sheaths with a rounded bristly auricle decurrent on either side; spikelets 1—1.5 in. long, covered with scattered, stiff, bulbous-based, spreading, brown hairs; glumes up to .7 in. long; lemmas up to 1.3 in. long
2. *Beddomei*.

Culms erect or straggling, up to 20 ft. high, .5—7 in. diam.; culm-sheaths persistent, thin, papery, gradually narrowed to a narrow apex, their imperfect blades needle-like, .7—1 in. long; leaves 4—9 in. long, .6—1.7 in. wide. Inflorescence unknown.....3. *setigera*.

Culm-leaves 6—18 in. long, 2—4.5 in. wide, mouth of their sheaths bearing stiff bristles; inflorescence a subverticillate, spicate panicle. Culms erect, 6—20 ft. high, 1—2 in. diam.; spikelets 2—2.5 in. long; glumes up to 2 in. long, mucronate; lemmas 2—2.2 in. long, usually mucous; filaments united

4. *travancorica*.

Ligules membranous, 1—1.8 in. long. Culms and culm-sheaths unknown; leaves 10—25 in. long, 1.5—4.5 in. wide, their sheaths rarely with a few deciduous bristles at the mouth; inflorescence a terminal verticillate spike with a thick rhachis; spikelets 1—1.7 in. long; glumes .44—1.2 in. long with a cusp .1—25 in. long; lemmas 1.4—1.6 in. long, mucronate.....5. *Wightii*.

1. *OCHLANDRA SCRIPTORIA*, C. E. C. Fischer n. comb. *O. Rheedii*, Gamble; F. B. I. vii. 418; Gamble Ann. Calc. vii. t. 107.

Malabar (Wight); Cochin (Johnston); Travancore; at low elevations. Growing in thick clumps on river banks.

Flowers sporadically every year and does not die down.

Used for mat and basket-making. Vern. *Mal.* Ammei, Ottal, Kolanji.

- Var. *sivagiriana*, Gamble; F. B. I. vii. 419; Gamble Ann. Calc. vii. t. 108.

Leaves and spikelets much larger; stamens more numerous, up to 60.

Pulney (Beddome) and Sivagiri Hills.

2. *OCHLANDRA BEDDOMEI*, Gamble; F. B. I. vii. 419; Gamble Ann. Calc. vii. t. 110.

Wynaad (Beddome).

3. *OCHLANDRA SETIGERA*, Gamble; F. B. I. vii. 420; Gamble Ann. Calc. vii. t. 115.

Nilgiri Hills at Gudalur at 3,000 ft. (Gamble).

4. *OCHLANDRA TRAVANCORICA*, Gamble; F. B. I. vii. 419; Gamble Ann. Calc. vii. t. 111. *Beesha travancorica*, Bedd. Fl. Sylv. t. 324.

Anamallai, Tinnevely and Travancore Hills; sea-level to 5,000 ft. Gregarious in evergreen forest, covering large areas with a dense growth. Flowers at long intervals and dies down.

In great demand locally for mat- and basket-making.

A coarse paper is made from it. The leaves are much eaten by elephants and can be fed to horses if grass is scarce. Vern. *Tam.* Eeral, Ecra-katti, Nanal, Odai; *Mal.* Eetta, Kar-eetta, Vei.

Var. *hirsuta*, Gamble ; F. B. I. vii. 420 ; Gamble Ann. Calc. vii. t. 112.
Leaves thicker, margins more cartilaginous, their sheaths with
appressed hairs from bulbous bases ; spikelets thickly clothed
with light-brown velvety pubescence.
Travancore Hills (Beddome).

5. *OCHLANDRA* WIGHTII, C. E. C. Fischer n. comb. *O. Brandisii*,
Gamble ; F. B. I. vii. 420 ; Gamble Ann. Calc. vii. t. 113.
Travancore ; at low elevations and up to 3,500 ft.
Much resembling the previous species.

PART XI
ADDENDA, INDEXES, ETC.

BY
C. E. C. FISCHER
LATE OF THE INDIAN FOREST DEPARTMENT

WITH MAP

REPRINTED UNDER THE AUTHORITY
OF THE GOVERNMENT OF INDIA

CALCUTTA

1956

The supplementary note, explanatory of Part X, appeared as No. VIII in the 'Kew Bulletin' for 1935, p. 143. That for the present Part will be found on p. ix within.

CECIL E. C. FISCHER.

ROYAL BOTANIC GARDENS, KEW ;

9th September, 1935.

ADDENDA

p. 18, line 28 from the bottom, after fascicles add: or cymes.

For line 27 from the bottom, substitute:

Flowers in fascicles or cymes:—

Leaves not at all peltate:—

Petals 6; anthers opening by transverse slits, styles terete; drupes compressed
6. COCCULUS.

Petals 4—6; anthers opening by vertical slits; styles compressed; drupes
nearly terete.....6a. HYP SERPA.

Leaves peltate or subpeltate.....6b. PERICAMPYLUS.

p. 21, after line 11, insert:

6a. HYP SERPA, Miers

Climbing shrubs. *Leaves* elliptic, usually glabrous, 3-ribbed. *Flowers* in axillary racemes, dioecious. ♂ *Sepals* 8—12, 2—3-seriate, outer bractiform, inner 5—6 longer, imbricate. *Petals* 4—6, slightly smaller, fleshy. *Stamens* 6—10; anthers dehiscing vertically. ♀ *Sepals* 8, outer 2, bractiform, imbricate. *Petals* 5—6. *Staminodes* 6, clavate. *Ovaries* 6, rarely 3 or 2; style very short, excentric; stigma linear-oblong, deeply canaliculate. *Drupe*s 2—3, fleshy, transversely ovate; endocarp bony, subglobose, hardly compressed, slightly dorsally keeled, sides radially sulcate, cells lunate. *Seeds* conforming to the cells, back keeled, ventrally flat; embryo nearly annular, included in the fleshy albumen; cotyledons accumbent.

HYP SERPA CUSPIDATA, Miers *Limacia cuspidata*, Hook. f. & T.;
F. B. I. i. 100.

Madgole Hills, Vizagapatam District; 3,000—4,000 ft. (A. W. Lushington).

A woody climber; leaves ovate-oblong to oblong-lanceolate, acuminate, base rounded or acuminate, 2—5 in. long, 1—2.25 in. wide, glabrous, shining; drupes up to .5 in. long.

6b. PERICAMPYLUS Miers

Climbing shrubs. *Leaves* subrotund, peltate or subpeltate, 5—7-ribbed. *Flowers* in axillary cymes, dioecious. ♂ *Sepals* 9 in 3 series, the outer 3 bractiform, minute, inner series successively longer, imbricate. *Petals* 6, very much shorter. *Stamens* 6, embraced by the petals; anthers dehiscing transversely. ♀ *Sepals* 6. *Petals* 6, broader. *Staminodes* 6, filiform. *Ovaries* 3, gibbous; style short, thick; stigma linear, abruptly deflexed. *Drupe*s 3, gibbously ovate, fleshy; endocarp bony, suborbicular, compressed, dorsally crested and echinate; cells horseshoe-shaped. *Seeds* curved, radially sulcate; embryo slender, curved, included in the albumen, cotyledons incumbent.

PERICAMPYLUS INCANUS, Miers; F. B. I. i. 102.

Madgole Hills, Vizagapatam District; 3,000—4,000 ft. (A. W. Lushington).

A woody climber; leaves suborbicular, obtuse, acute or retuse, base truncate or subcordate, more or less peltate, 2—4 in. diam.; drupe red.

p. 51, after line 3, insert:

Var. *major*, Fyson in S. I. H. S. i. 49, a larger plant, much less branched; flower terminal and in the upper axils only.

Nilgiri Hills. Rare.

p. 59, for lines 9—12, substitute:

Axils of leaf-nerves nearly always furnished with glands:—

Nerves of leaves 4—5 pairs; wings of fruit 6—9 in. wide.....2. *racophloea*.
Nerves of leaves 6—12 pairs; wings of fruit 7—1 in. wide.....2a. *canarensis*.

Axils of leaf-nerves never furnished with glands:—

Leaves 5—9 in. long, 1.7—3 in. wide, apex blunt, nerves 7—9 pairs; petals .25 in. long; wings of fruit linear to linear-elliptic, 2.3—3.7 in. long, .5—7 in. wide.....3. *Wightiana*.

Leaves 2.2—4 in. long, 1—1.75 in. wide, acute or acuminate, nerves 4—8 pairs:—

Leaves elliptic-oblong to oblong-lanceolate, acute or acuminate, 2.5—4 in. long, 1—1.75 in. wide; petals .3—3.5 in. long, wings of fruit broadly oblong or oblong-spathulate, 1.75 in. long, .5 in. wide.....4. *glabra*.

Leaves ovate, caudate-acuminate, 2.2—3.4 in. long, 1—1.6 in. wide; nerves 5—6 pairs; petals 1.3—1.5 in. long.....5. *Jacobi*.

For lines 21—26, substitute:

2a HOPEA CANARENSIS, Hole in Ind. For. 1918, 575; Ind. For. Rec. vii, part iii, pl. 1.

S. Kanara (Lodge, McCarthy).

A large tree up to 8 ft. girth. Vern. *Kan. Malai Haiga*.

3. HOPEA WIGHTIANA, Wall.; F. B. I. i. 309; W. & A. 85; Ind. For. Rec. xx, part xv, pl. xiv.

Coorg, S. Kanara, Malabar and Travancore in semi-evergreen deciduous forest, up to 1,500 ft.

A small or moderate-sized tree with a brown wood of rather poor quality, seldom used except for fuel. Vern. *Kan. Nai Irupu*, Beribogi.

4. HOPEA GLABRA, W. & A. 85; F. B. I. i. 310; Bedd. Fl. t. 96; Ind. For. Rec. xx, part xv, pl. xv.

Evergreen forests of S. Kanara, Travancore and Tinnevely; 1,000—4,000 ft. A large tree with good timber used for railway sleepers and house building. Vern. *Tam. Kongu*; *Mal. Irumbakam*.

5. HOPEA JACOBI, C. E. C. Fischer in Kew Bull. 1932, 245.

Coorg (Jacob).

A small tree.

p. 66, for line 4 from the bottom, substitute:

Bracteoles 5, ovate; carpels glabrous or sparsely puberulous:—

Slender plants; corolla and androecium wholly yellow; carpels muricate, without spinules.....1. *procumbens*.

Robust plants, stems 24—40 in. high; corolla yellow with its centre and androecium dark-red-purple; carpels usually spinulose.....1a. *Coxii*.

p. 67, after line 6, insert:

- 1a. PAVONIA COXII, Tad. & Jac. in Journ. Ind. Bot. Soc. v. 11.
Anantapur (Gamble) and Coimbatore Districts.

p. 94, for lines 7 and 6 from the bottom, substitute:

Leaflets nearly glabrous:—

Bracts .08—.12 in. long, nearly glabrous; sepals .2 in. long, nearly glabrous;
seeds prominently ridged, not tubercled; pedicels 0—.1 in. long; stem generally
short.....1. *sensitivum*.

Bracts .2—.32 in. long, long-ciliate from tubercles; sepals .2—.28 in. long,
prominently ciliate from tubercles; seeds spirally ridged and tubercled on the
ridges.....1a. *longibracteatum*.

p. 95, between lines 7 and 8, insert:

Leaflets 15 or more pairs:—

After line 11, insert:

Leaflets 7—10 pairs, lower ovate, 1—2 apical pairs oblong, basal .5 in. long, .38 in.
wide, increasing upwards to 1.38 in. long, .62 in. wide; margins thickened

7. *insignis*.

After line 15, insert:

- 1a. BIOPHYTUM LONGIBRACTEATUM, Tad. & Jac. in Journ. Ind. Bot. Soc.
iv. 87.

Mundanthorai, Tinnevely District (Jacob).

After line 23 from the bottom, insert:

7. BIOPHYTUM INSIGNIS, Gamble in Kew Bull. 1921, 216.

Kodamadi, Tinnevely District (Ranga Achariyar, Jacob).

p. 96, for line 8, substitute:

Spur of lip incurved, tip inflated:—

Leaves quite glabrous, orbicular or reniform, apex not narrowed, lobes of wing-
petals subequal.....3. *Beddomei*.

Leaves pilose above, narrowed to the apex:—

Leaves thick, erect, suborbicular or ovate, base cordate, pilose above, basal-
lobe of wing-petals about half as long as the other two.....3a. *laticornis*.

Leaves thinly membranous, pendulous, elliptic to ovate-lanceolate, base usually
attenuate, sometimes rounded, more or less hairy above, distal- and basal-lobes
of wing-petals subequal, longer than the median.....3b. *dendricola*.

For line 11, substitute:

Spur of lip short:—

Flowers white, blue within; standard broader than long, crenate.....6. *crenata*.

Flowers purplish-red; standard boat-shaped, entire.....6a. *nilgirica*.

For line 17, substitute:

Lip spurless:—

Leaves erect, orbicular or broadly ovate, base equilateral, nerves flabellate;
wing-petals .35—.5 in. long:—

Leaves cordate; flowers reddish-brown; wing-petals 3-lobed, lobes broad,
rounded.....10. *orchioides*.

Leaves not cordate, flowers white; wing-petals 2-lobed, lobes very narrow,
almost filamentous.....10a. *Stocksii*.

Leaves pendulous, ovate or elliptic-ovate, base usually inequilateral, nerves pinnate;
wing-petals .7—1 in. long.....10b. *neo-Barnesii*.

For line 43, substitute:

Stem slender; basal-lobe of wings 0 or short, dorsal auricle filiform:—

Leaves rounded and cordate at base; basal-lobe of wings 0; spur of lip as long
as the rest of the flower.....19. *ligulata*.

Leaves narrowed at the base, not cordate; basal lobe of wings short, falcate;
spur of lip short, subsaccate.....19a. *Aliciae*.

p. 97, for line 7, substitute:

Flowers 33—5 in. long; lip with a short upcurved spur.....31. *tomentosa*.
Flowers 6—8 in. long; lip spurless.....31a. *rufescens*.

p. 98, for lines 21—23, substitute:

Spur of lip long, slender:—

Leaf-base rounded, cordate or emarginate, without glandular ciliae; lateral nerves nearly straight, ascending at a sharp angle; lip boat-shaped; seeds covered with long, spiral hairs.....61. *cordata*.

Leaf-base acute, with 1—3 glandular ciliae; lateral nerves strongly arched, nearly horizontal; lip bowl-shaped; seeds glabrous.....61a. *leptura*.

Spur of lip short:—

Leaves ciliate or apiculate between the marginal teeth:—

Spur of lip stout, tip incurved.....62. *uncinata*.

Spur of lip slender, straight.....63. *verecunda*.

Leaves ciliate or apiculate on the marginal teeth; spur very short, boss-like
63a. *anaimudica*.

For lines 34—35, substitute:

Lip tubiform:—

Flowers scarlet with yellow centre; standard winged on the back; lip narrowed to the long incurved, bugle-shaped, acuminate spur.....68. *phoenicea*.

Flowers scarlet with bright-green lip; standard not winged, its keel hollow; lip saccate, spur short tubular, blunt, upcurved and appressed to the lip
68a. *coelotropis*.

Lip cymbiform or funnel-shaped:—

Lip cymbiform or shortly funnel-shaped; spur short, straight or upcurved
69. *Wightiana*.

Lip deeply funnel-shaped; spur tubular, blunt, curved upwards in a semicircle
69a. *platyadena*.

After line 9 from the bottom, insert:

3a. *IMPATIENS LATICORNIS*, C. E. C. Fischer in Kew Bull. 1930, 154;
S. I. H. S. t. 59.

Nilgiri Kundahs; 8,000 ft. (Barnes).

On wet rocks and tree trunks. Flowers white with yellow or orange hairs or pink with magenta hairs.

3b. *IMPATIENS DENDRICOLA*, C. E. C. Fischer in Kew Bull. 1935, 157.

Coorg; on Thandiadamolu: 4,000 ft. (Barnes).

An epiphyte. Flowers white with a tuft of yellow or orange hairs.

p. 99, after line 3, insert:

6a. *IMPATIENS NILGIRICA*, C. E. C. Fischer in Kew Bull. 1931, 41;
S. I. H. S. t. 60.

Nilgiri Kundahs; 8,400 ft. (Barnes).

Among grass and on rocks.

After line 13, insert:

10a. *IMPATIENS STOCKSII*, Hook. f.; F. B. I. i. 442.

Coorg; on Thandiadamolu and Brahmagiri; 3,500 ft. (Barnes).

10b. *IMPATIENS NEO-BARNESII*, C. E. C. Fischer in Kew Bull. 1930, 330;
S. I. H. S. t. 62. *I. Barnesii*, C. E. C. Fischer *non* Hook. f. in Kew Bull. 1930, 153.

Nilgiri Kundahs; 8,000 ft. (Barnes).

An epiphyte. Flowers cream or nearly white.

p. 99, at the bottom, insert:

- 19a. *IMPATIENS ALICIAE*, C. E. C. Fischer in Kew Bull. 1934, 389.
Travancore; 2,000—5,000 ft. (Barnes).
Flowers deep-pink and white with purple streaks.

p. 100, after line 3 from the bottom, insert:

- 31a. *IMPATIENS RUFESCENS*, Benth, *ex* W. & A.; Wt. Ic. t. 969; S. I. H. S. t. 66.
I. tomentosa, Heyne var. *rufescens*, Hook. f.; F. B. I. i. 449.
Nilgiris, in swamps on the Downs.
Flowers rose-pink or purplish.

p. 103, at end of line 3, add:

- I. Ballardii*, Bedd.; F. B. I. i. 482.

After line 17, insert:

- 61a. *IMPATIENS LEPTURA*, Hook. f.; F. B. I. i. 467.
Travancore; 4,500—5,000 ft. (Beddome, Barnes).
Flowers pink and green.

After line 26, insert:

- 63a. *IMPATIENS ANAIMUDICA*, C. E. C. Fischer in Kew Bull. 1935, 92.
Travancore, on Anaimudi; 8,000 ft. (Barnes).
Flowers crimson.

p. 104, at the start, insert:

- 68a. *IMPATIENS COELOTROPIS*, C. E. C. Fischer in Kew Bull. 1934, 390.
Travancore, on Anaimudi; 6,500—7,500 ft. (Barnes).

After line 5, insert:

- 69a. *IMPATIENS PLATYADENA*, C. E. C. Fischer in Kew Bull. 1934, 393.
Travancore, on Anaimudi; 7,000 ft. (Barnes).
An undershrub. Flowers scarlet and cream.

p. 113, for lines 7—9, substitute:

Leaflets ovate, to ovate-lanceolate, acuminate, base rounded, 2—3 in. long, 1—1.5 in. wide; calyx-lobes 4:—

Branches not conspicuously zigzag; flowers fascicled, ovate in bud; calyx-lobes minute, triangular; stigma globose; berry apiculate.....3. *armata*.
Branches conspicuously zigzag; flowers solitary, cylindric in bud; calyx-lobes distinct, conspicuously auriculate; stigma oblate; berry globose, not apiculate

4. *Beddomei*.

After line 19, insert:

4. *PARAMIGNYA BEDDOMEI*, Tanaka in Journ. Bot. lxxviii. 230.
Anamalais (Beddome).

p. 116, for line 9, substitute:

Leaves simple:—

Small trees; leaves oblong, 4—10 in. long, glabrous; fruiting carpels winged

2. *SAMADERA*.

Small shrubs; leaves linear-spathulate, under 2 in. long; fruiting carpels wingless

2a. *SURIANA*.

p. 117, after line 11, insert:

2a. *SURIANA*, Linn.

Small shrub; branchlets thick, velvety-pubescent. *Leaves* linear-

spathulate, obtuse, velvety. *Flowers* hermaphrodite, terminal, hidden by the leaves. *Calyx* 5-partite, lobes imbricate. *Petals* 5, imbricate. *Disk* inconspicuous. *Stamens* 10, unequal, 5 sometimes barren. *Ovary* of 5 free carpels; styles basilar, filiform; ovules 2 in each carpel, lateral, ascending. Fruit of 5 or fewer carpels covered by the persistent calyx, unwinged. *Seed* solitary, exalbuminous.

SURIANA MARITIMA, Linn.; F. B. I. i. 522.

Krusadai Island near Pambam (Parthasarathy Iyengar).

An insipid littoral shrub.

p. 118, in line 19 delete "*l. squarrosa*." Before line 20, insert:

Anthers several times longer than the very short filaments.....*l. squarrosa*.

Anthers long, as long as or a little shorter than the slender, elongate filaments
la. Wallichii.

After line 14 from the bottom, insert:

la. OCHNA WALLICHII, Planch.; F. B. I. i. 524.

Kollimalais in the Salem District (Latham).

Closely resembling *O. squarrosa*, Linn.

p. 190, after line 19 from the bottom, insert:

Var. *cuneifolia*, DC.; F. B. I. ii. 31. Leaves cuneate at the base, often tomentose beneath.

S. Malabar District; S. Coimbatore District in the Anamalais;

Madura District; 800—2,500 ft. (Fischer). Vern. *Tam.* and *Mal.* Cheru.

p. 346, for lines 8—5 from the bottom, substitute:

Tufts of bristles sessile as are the appendages:—

Branchlets terete, fleshy, glabrous, bluish when dry; leaves oblong-lanceolate, 1—1.5 in. long, .3—5 in. wide, 3-ribbed, lineolate on the upper, nearly glabrous on the lower surface; calyx-lobes ovate, obtuse, bristly at apex, ciliate on the margins.....*7. sublaevis*.

Branchlets quadrangular, not fleshy nor bluish, hairy from bulbous bases; leaves ovate-lanceolate, acute at both ends, 1.4 in. long, .6—1 in. wide, 3-ribbed with an extra lateral nerve on each side from the base; calyx-lobes triangular, their apices and those of the appendages stellate-setose.....*7a. rosea*.

p. 348, after line 18, insert:

7a. OSBECKIA ROSEA, Fyson in Journ. Ind. Bot. Soc. 1932, 49; S. I. H. S. t. 172.

Nilgiri Hills (Fyson).

A small, erect shrub. Flowers pink without trace of purple.

p. 351, for lines 30—32, substitute:

Leaves with one slender pair of nerves from the base:—

Leaves oblong-lanceolate, 1—1.5 in. long, base equilateral, one stronger pair of nerves above the base, bristly-hairy on both sides; capsule smooth, ribbed.....*2. Clarkei*.

Leaves lanceolate, 1.6—4.4 in. long, base very inequilateral, several pairs of nerves above the basal, glabrous or with a few crisped hairs on the nerves; capsule smooth, corky, bluntly 6-ribbed.....*2a. tinnevelliensis*.

For lines 4—1 from the bottom, substitute:

Leaves 3- or 5-ribbed:—

Leaves lanceolate, acute, base narrowed, shortly auricled, conspicuously 3-ribbed from the tip of the short petiole, up to 1.5 in. long; .6 in. wide, sharply serrate,

glabrous; calyx-tube purple, glabrous, smooth, in fruit funnel-shaped from a thick pedicel; petals not clawed.....8. *grandiflora*.
 Leaves ovate to ovate-lanceolate, acute, base rounded, 5-ribbed, ribs connected by obliquely transverse veins, 1—2.2 in. long, .5—1.2 in. wide, sharply, evenly and rather deeply serrate; petioles .16—1.2 in. long; calyx-tube white; petals shortly clawed.....8a. *nemakadensis*.

p. 352, after line 28, insert:

- 2a. *SONERILA TINNEVELLIENSIS*, C. E. C. Fischer in Kew Bull. 1934, 165.
 Travancore (Beddome); Tinnevely District (Barber, Barnes);
 2,000—4,000 ft.
 An erect undershrub. Petals pinkish-mauve.

p. 353, after line 11, insert:

- 8a. *SONERILA NEMAKADENSIS*, C. E. C. Fischer in Kew Bull. 1935, 157.
 Travancore; 6,500 ft. (Barnes).
 A glabrous herb 4—12 in. high. Petals pink-purple.

p. 364, for lines 2—1 from the bottom, substitute:

Erect plants of wet places; petals 4, yellow; seeds with a prominent raphe:—
Leaves and usually the stems and branches hairy; capsules robust, all the seeds alike:—

Sepals and petals .25—4 in. long, not conspicuous; capsules cylindric or narrowly turbinate:—

Stems more or less 4-ribbed, glabrous or hispidulous above; leaves spatulate, linear-lanceolate or narrowly oblong, rounded, acute or acuminate, base cuneate or acuminate, 1.5—3 in. long, .3—6 in. wide, hispidulous; petioles very short, up to .3 in. long, hispidulous; sepals oblong-lanceolate, acute, hispidulous on the 5 ribs outside; petals obovate, .2—2.5 in. long; capsules cylindric, terete, slightly fluted, 1—1.7 in. long, hispidulous...2. *suffruticosa*.
 Stems terete or bluntly angled, grey-villous; leaves narrowly elliptic, narrowed at both ends, usually blunt, 1—2 in. long, .3—5 in. wide, grey-villous; petioles 0—1.5 in. long, villous; sepals ovate, acuminate, .25—4 in. long, villous outside, puberulous within; petals obovate, .3—4 in. long; capsules narrowly turbinate, terete, .8—1 in. long, grey-villous.....3. *villosa*.

Sepals ovate, long-cuspidate, .5 in. long, brown-tomentose without; petals rotund, shortly clawed, .8—1 in. diam. Stems terete or bluntly angled, brown- or rufous-tomentose; leaves elliptic-lanceolate, acuminate at both ends, 1.8—4.5 in. long, .6—1.3 in. wide, crisped-hairy on both faces; petioles .3—6 in. long, brown-tomentose; capsules obcuneate, 4-angled, .8—1 in. long, brown-tomentose.....4. *speciosa*.

Glabrous, branches slender, usually narrowly winged; leaves lanceolate, narrowed at both ends, .5—3 in. long, .25—5 in. wide; sepals very narrow, .08—1 in. long; petals shorter; capsules linear, slender, terete, .6—8.5 in. long, seeds in the lower part differing from the upper and 1-seriate.....5. *linifolia*.

p. 365, for lines 6—10, substitute:

2. *JUSSIEUA SUFFRUTICOSA*, Linn.; F. B. I. ii. 587 in part.
 Mysore, Carnatic, Malabar, Anamallais (Bedd.).
 1—2 ft. high. Vern. *Mal. Karambu* (*fide* Rheede).
3. *JUSSIEUA VILLOSA*, Lam. *J. suffruticosa*, Clarke non Linn.; F. B. I. 587 in part.
 Mysore, Carnatic, S. Kanara; Anamallai, Sirumalai and Pulney Hills; near sea-level to 4,800 ft.
 2—3 ft. high.

4. *JUSSIEUA SPECIOSA*, Ridl. in Journ. Bot. 1921, 259. *J. suffruticosa*, Clarke non Linn.; F. B. I. 587 in part.
Wynaad; 3,000—4,000 ft. (Gamble, Bourne).
4—6 ft. high; flowers conspicuous.

5. *JUSSIEUA LINIFOLIA*, Vahl.
Kuthuparamba in N. Malabar District.
1—2 ft. high, slender.
Presumably introduced from America.

p. 414, for lines 20—18 from the bottom, substitute:

Branchlets glabrous; leaves elliptic to elliptic-lanceolate; petioles about 1 in. long; stipules short; corolla tube 2 in. or more long:—

Ultimate twigs and rhachis of inflorescence puberulous; flowers 2—25 in. long
2. *glabrata*.

Ultimate twigs and rhachis of inflorescence glabrous; flowers 4—45 in. long
2a. *Gamblei*.

p. 415, after line 13, insert:

- 2a. *WENDLANDIA GAMBLEI*, Cowan in Not. Bot. Gard. Edin. xvi. 271.

Ganjam District on Mahendragiri at 4,600 ft.; Vizagapatam District at Ventala; Rampa Hills at 2,000 ft.

A small glabrous tree.

After line 26, insert:

Subsp. *cinnamomea*, Cowan in Not. Bot. Gard. Edin. xvi, 266.
Receptacle lobed; calyx puberulous, not hirsute; leaves cinnamon-coloured below when dry.

Hyderabad State; Kurnool and Nellore Districts.

- p. 446.** 30. *PAVETTA*, Linn.

Dr. C. E. B. Bremekamp has recently made a critical study of this genus and has published a monograph in Fedde's 'Repertorium', xxxvii (1934), pp. 1—208. He has kindly furnished me with an extract and key comprising the species found in S. India and, with his kind permission, the following has been adapted from it and may be substituted for p. 446 (last 34 lines), and the first 32 lines of p. 447. References to the monograph are made under the initials F. R. followed by the page number.

Inflorescence axillary:—

Leaves lanceolate, nerves 10—12 pairs; corolla-tube 26—32 in. long

1. *travancorica*.

Leaves elliptic, nerves less than 10 pairs; or if more than 10 pairs, then corolla-tube 5 in. or more long:—

Nerves 10—12 pairs; corolla-tube 5—56 in. long.....2. *concanica*.

Nerves 6—9 pairs; corolla-tube 26—32 in. long.....3. *laeta*.

Inflorescence terminal:—

Flowering shoots green:—

Calyx-lobes keeled. Flowers large:—

Leaves coriaceous:—

Leaves obovate, puberulous below, nerves 6—8 pairs. Shoots and petioles pubescent.....4. *zeylanica* var. *puberula*.

Leaves oblong or narrowly obovate, scabrid below, nerves 9—10 pairs. Shoots and petioles glabrous.....5. *calophylla*.

Leaves subcoriaceous, usually rather thin:—

Glabrous or subglabrous plants:—

Leaves oblong or elliptic, nerves 6—7 pairs.....6. *siphonantha*.

- Leaves oblanceolate, nerves 8—11 pairs.....7. *oblanceolata*.
 Leaves pubescent or scabrid-pubescent below:—
 Leaves oblong to obovate, nerves 5—6 pairs; inflorescence pubescent.....8. *praeterita*.
 Leaves lanceolate or elliptic, nerves 7—8 pairs; inflorescence hispidulous or puberulous:—
 Leaves lanceolate; inflorescence lax, hispidulous.....9. *hispidula*.
 Leaves elliptic; inflorescence contracted, puberulous...10. *madrassica*.
 Calyx-lobes not keeled, often reduced to teeth:—
 Calyx lobed:—
 Calyx-lobes twice as long as broad. Inflorescence puberulous.....11. *Wightii*.
 Calyx-lobes about as long as broad:—
 Undershrub; leaves oblanceolate or narrowly obovate, acuminate, nerves 8—9 pairs; corolla-tube .6 in. long.....12. *nemoralis*.
 Shrub; leaves lanceolate, obtuse or subacute, nerves 5—7 pairs; corolla-tube .18—5 in. long.....13. *blanda*.
 Calyx toothed:—
 Flowering-shoots consisting of a single internode, often covered with cork in the lower part:—
 Leaves elliptic; corolla about .46 in. long.....14. *breviflora*.
 Leaves obovate or oblanceolate; corolla more than .8 in. long.....15. *Hohenackeri*.
 Flowering-shoots comprising more than one internode:—
 Leaves lanceolate or oblong, glabrous.....16. *Thomsonii*.
 Leaves obovate, pubescent on the nerves below.....17. *bengalensis*.
 Flowering-shoots covered with cork up to the inflorescence:—
 Stipules over .4 in. long; calyx-lobes over .06 in. long.....18. *Brunonis*.
 Stipules under .4 in. long; calyx-lobes under .03 in. long:—
 Flowering-shoots peduncle-like, either consisting of a single internode or the lowest internode much longer than all the others together; calyx-lobes .024 in. long.....19. *tomentosa*.
 Internodes of the flowering-shoots gradually decreasing in length from the base up; calyx-lobes .008 in. long.....20. *indica*.
1. PAVETTA TRAVANCORICA, Brem. in F. R. 81. *P. indica* Linn. var *minor*, Hk. f.; Fl. Madr. 633 in part.
 Travancore (Wight).
 2. PAVETTA CONCANICA, Brem. in F. R. 81.
 Attraimalais (Beddome).
 A glabrous shrub, older branchlets grey.
 3. PAVETTA LAETA, Brem. in F. R. 82. *P. indica* Linn.; Fl. Madr. 633 in part.
 Nilgiri (Perrottet) and Pulney (Saulière) Hills.
 Very similar to the last species.
 4. PAVETTA ZEYLANICA, Gamble.
 Var. *puberula*, Brem. in F. R. 90. *P. zeylanica* Gamble in part; Fl. Madr. 633.
 Courtallam (Beddome).
 5. PAVETTA CALOPHYLLA, Brem. in F. R. 90. *P. zeylanica*, Gamble in part; Fl. Madr. 633.
 Nilgiri Hills (Gamble).
 A glabrous shrub.
 6. PAVETTA SIPHONANTHA, Dalz. *P. hispidula*, W. & A.; Fl. Madr. 633 in part.
 Mangalore (Hohenacker); Travancore, 150 ft. (Venkoba Rao).
 A glabrous shrub.

7. PAVETTA OBLANCEOLATA, Brem. in F. R. 91.
Palghat and Attraimalai Hills (Beddome).
A glabrous shrub; inflorescence subsessile.
8. PAVETTA PRAETERITA, Brem. in F. R. 92. *P. hispidula*, W. & A.;
Fl. Madr. in part.
Courtallam, Quilon (Wight).
A shrub with scabrid-pubescent twigs.
9. PAVETTA HISPIDULA, W. & A.; Fl. Madr. 633.
W. Ghâts.
10. PAVETTA MADRASSICA, Brem. in F. R. 91. *P. indica*, Linn. var.
tomentosa, Hook. f.; Fl. Madr. 633 in part.
Simhachallam, Vizagapatam District (Elliot).
11. PAVETTA WIGHTII, Hook. f.; Fl. Madr. 634.
W. Ghâts, E. side of Nilgiri Hills; 4,000—6,000 ft.
A shrub with rather large obovate leaves, prominently glandular.
12. PAVETTA NEMORALIS, Brem. in F. R. 94.
Cochin State at Kavalai (Meebold).
A glabrous, unbranched undershrub.
13. PAVETTA BLANDA, Brem. in F. R. 94. *P. indica*, Linn. var. *minor*,
Hook. f.; Fl. Madr. 633 in part. *P. breviflora*, DC. var. *sub-*
coriacea, Gamble; Fl. Madr. 634.
W. Ghâts; 4,000—6,000 ft.
A glabrous shrub; stipules persistent.
14. PAVETTA BREVIFLORA, DC.
Var. *glaberrima*, Brem. in F. R. 98. *P. breviflora*, DC.; Fl. Madr.
634 in part. All parts glabrous; calyx not ciliate.
Nilgiri Hills; 4,500—6,000 ft. (Leschenault, Gamble).
Var. *ciliolata*, Gamble ex Brem. in F. R. 98. *P. breviflora*, DC.;
Fl. Madr. 634 in part. Leaves ciliate on the nerves below; calyx
ciliate.
Nilgiri Hills; 5,000—7,000 ft. (Wight, Gamble).
Var. *pubescens*, Brem. in F. R. 98. *P. breviflora*, DC.; Fl. Madr.
634 in part. Leaves above sparsely, below densely pubescent; inflores-
cence densely pubescent.
Nilgiri (Perrottet) and Pulney (Bourne) Hills.
15. PAVETTA HOHENACKERI, Brem. in F. R. 98. *P. indica* Linn.; Fl.
Madr. 633 in part.
Nilgiri Hills near Sispara (Hohenacker).
A glabrous shrub.
16. PAVETTA THOMSONII, Brem. in F. R. 99. *P. indica*, Linn.; Fl.
Madr. 633 in part.
Carnatic (G. Thomson).
A glabrous shrub; corolla-tube sparingly pilose within.
Var. *glaberrima*, Brem. in F. R. 99. Inflorescence glabrous.
Mysore (G. Thomson); Pondicheri (Perrottet).
Var. *puberula*, Brem. in F. R. 99. Inflorescence puberulous.
Shevagiri Hills (Wight); Travancore at Kottayam (Hobenacker).
17. PAVETTA BENGALENSIS, Brem. in F. R. 99. *P. indica*, Linn.; Fl.
Madr. 633 in part.

Mangalore (Hohenacker).

A glabrous shrub.

18. PAVETTA BRUNONIS, Wall.; Fl. Madr. 634.

W. Gháts, N. and W. slopes of Nilgiris at 5,000—6,000 ft.

A softly-tomentose shrub.

19. PAVETTA TOMENTOSA, Linn.; *P. indica* Linn. var. *tomentosa*, Hook. f.; Fl. Madr. 633 in part.

All forest Districts.

20. PAVETTA INDICA, Linn.; Fl. Madr. 633 in part.

Coromandel.

Var. *glabra*, Brem. in F. R. 119.

Coromandel.

Var. *mollis*, Brem. in F. R. 119.

Cuddapah District (Gamble).

p. 471, for lines 4—1 from the bottom, substitute:

Outer involucre bracts long-aristate, spreading or reflexed. Stem brown-pubescent; leaves crenate-serrulate, mucronate:—

Stem terete, strongly ribbed; leaves elliptic-ovate or lanceolate, up to 5.5 in. long and 2.7 in. wide, rugose, reticulate, scabrous; petioles .2—5 in. long; involucre bracts spreading; achenes narrowly turbinate, .12—15 in. long; pappus reddish.....14. *peninsularis*.
Stem quadrangular; leaves ovate or ovate-oblong, 2.4—3.5 in. long, 1—1.6 in. wide; petioles about .2 in. long; involucre bracts recurved; achenes clavate-turbinate; .1 in. long; pappus yellowish.....14a. *recurva*.

p. 473, for lines 13—15, substitute:

Stem and leaves pubescent; leaves thin, often large, outer pappus-hairs very short:—
Stem terete; leaves lanceolate to ovate-lanceolate, acuminate, sharply serrate, densely pubescent below, up to 4 in. long and 2.2 in. wide.....29. *conyzoides*.
Stem quadrangular; leaves membranous, elliptic, shortly acuminate, serrate-dentate, teeth hardened, puberulous on the nerves below, usually about 4 in. long, and 1.4 in. wide, but sometimes up to 7.5 in. long and 2.6 in. wide

30. *membranacea*.

p. 474, after line 21 from the bottom, insert:

- 14a. VERNONIA RECURVA, Bedd. ex S. Moore in Journ. Bot. 1925, 171. Anamalais at 6,000 ft. (Beddome).

p. 475, after line 4 from the bottom, insert:

30. VERNONIA MEMBRANACEA, Bedd. ex S. Moore in Journ. Bot. 1925, 170.

Nilgiri Hills at Sispara; Attrimalais (Beddome).

p. 476, after line 23, insert:

Leaves elliptic-lanceolate to broadly ovate, reticulate veins obscure, midrib below glabrous or only very slightly rusty-puberulous; ripe achenes glandular-warted

1. *Lavenia*.

Leaves deltoid-ovate, reticulate veins distinct, midrib below rather densely rusty-pubescent; ripe achenes glabrous and smooth.....2. *reticulatum*.

In line 24 insert "1" before ADENOSTEMMA.

After line 32, insert:

2. ADENOSTEMMA RETICULATUM, DC. *A. viscosum*, Forst. var. *reticulatum*, C. B. Clarke; F. B. I. iii. 243.

Nilgiri Hills and Courtallam.

Very similar to *A. Lavenia*, O. Kze.

After line 7 from the bottom, insert:

*Leaves ovate, deltoid-ovate or rhomboid-ovate; heads 60—75-flowered; involucre subglabrous; corolla .04—.06 in. long.....1. *conyzoides*.
Leaves deltoid; heads 75—100-flowered; involucre hirsute; corolla .1—.12 in. long; style-branches only exserted.....2. *Houstonianum*.

In line 6 from the bottom, insert "1" before *AGERATUM*.

After last line, insert:

2. *AGERATUM HOUSTONIANUM*, Mill.

Nilgiri and Pulney Hills; 4,500—6,500 ft.

p. 504, for lines 31—34, substitute:

Stems and leaves soft and slightly fleshy:—

Leaves mostly cauline, oblong-lanceolate, acuminate, serrate, 4—8 in. long, 2—3 in. wide, green below; heads .5—.66 in. long, bracts as long, narrow; corolla-tube slender, .3 in. long; achenes sparsely hairy.....2. *Walkeri*.
Leaves mostly radical, obovate, obtuse, irregularly toothed, 2.4—3.2 in. long, 1—2 in. wide, violet below; heads .3—.5 in. long, bracts .2—.32 in. long, linear; achenes pubescent.....3. *shevaroyensis*.

At foot of the page, insert:

3. *NOTONIA SHEVAROYENSIS*, Fyson in Journ. Ind. Bot. 1932, 49; S. I. H. S. t. 290.

Shevaroy Hills, in swamps; 4,500 ft. (Fyson).

A scapigerous, glabrous herb up to 3 ft. high. Corymbs large, yellow.

p. 506, after line 15 from the bottom, insert.

Involucral-bracts 8; florets 8—15, rarely fewer:—

After line 8 from the bottom, insert:

Involucral-bracts 5; florets 5, rarely 6. Leaves broadly ovate, abruptly acuminate, base rounded or slightly cordate, 2—4 in. long, 1.2—3.2 in. wide, hoary-tomentose below.....15a. *Ansteadii*.

p. 508, after line 7 from the bottom, insert:

15a. *SENECIO ANSTEADI*, Tad. & Jac. in Journ. Ind. Bot. Soc. 1930, 40.

Tinnevely Hills; 3,000 ft. (Jacob).

A slender, shrubby climber.

p. 515, to species run wild add *Erechthites valerianifolia*, DC., which has escaped in the Madura Hills and in Travancore.

p. 605, after line 17, insert:

Apical part of corolla-lobes folded back along the middle, purplish, basal part greenish or yellowish:—

After line 22, add:

Corolla-lobes expanded and dark-purplish or -brownish throughout, mucronate, bearing deciduous stoutly spindle- or club-shaped purple hairs near the tips and along the margins.....2a. *stalagmifera*.

For line 31, substitute:

Umbels few-flowered:—

Branches erect; corolla within pale-green, covered with purple hairs, margins fringed.....7. *indica*.

* Extracted from 'The Compositae of the Malay Archipelago,' by J. T. Kusters (1935), 'I. Vernoniae and Eupatoriae,' p. 484.

Branches procumbent; corolla within whitish with concentric purple streaks, glabrous, not fringed.....7a. *procumbens*.

After line 6 from the bottom, insert:

2a. *CARALLUMA STALAGMIFERA*, C. E. C. Fischer in Kew Bull. 1935, 430; Bull. Madr. Gov. Mus. iv. i; t. 1, figs. 4—6.

Vizagapatam and Chingleput Districts; Pudukottai State (Mayuranathan).

An erect, fleshy herb with slender branches.

p. 606, after line 22 from the bottom, insert:

7a. *CARALLUMA PROCUMBENS*, Grav. & Mayur. in Bull. Madr. Gov. Mus. iv, i, 26; t. iv, figs. 13—17.

S. Travancore (Mayuranathan).

Trailing and rooting among rocks, the stem continues to grow after flowering from just below the inflorescence, the latter then appearing lateral.

p. 629, for lines 22—18 from the bottom, substitute:

Branches twiggy, radiating from the root-stock, procumbent or slightly ascending, appressed-hirsute:—

Leaves ovate- or linear-lanceolate, strigosely hirsute, margins flat, .25—.75 in. long; flower-spikes usually very short but sometimes up to 1 in. long; fruit depressed, nutlets subglobose, not horned, bristly.....10. *scabrum*.
Leaves ovate- or oblong-lanceolate, rigidly hirsute, .12—.32 in. long; flowers distant on short extra-axillary branchlets; fruit conspicuously beaked, quadrangular, nutlets shortly, bluntly horned above the base, villous.....11. *cornutum*.

p. 630, at the foot, insert:

11. *HELIOTROPIMUM CORNUTUM*, Johnst. in Contr. Gray Herb. xcii. 90.

Mangalore (Hohenacker).

Very closely resembling *H. scabrum*, Retz. and confused with it.

p. 697, after line 19, insert:

Var. *pusilla*, C. B. Clarke; F. B. I. iv. 369. Small, nearly glabrous herb.

Coorg, near Mercara (Barnes).

p. 827, after line 20, insert:

Chenopodium Moquinianum, Aellen has been found near Madras and is reported to be spreading.

p. 894, at the foot, add:

E. geniculata, Orteg., an American weed, has escaped from gardens round Bangalore and at Nanjangode in Mysore State and is stated to be spreading (Mayuranathan).

p. 959, for line 28, substitute:

Leaves serrate:—

Leaves opposite; stigma ovate, persistent.....9. *CHAMABAINA*.

Leaves alternate; stigma linear, deciduous.....9a. *DISTEMON*.

p. 966, after line 3, insert:

9a. *DISTEMON*, Wedd.

Slender, erect, annual herbs. *Leaves* alternate, petioled, coarsely toothed, 3-nerved and penninerved. *Flowers* monoecious, in small,

bracteate, 3-flowered, androgynous clusters forming slender axillary and long terminal spikes. *Perianth* of ♂ campanulate, 2—3-fid, valvate; of ♀ tubular, ventricose. *Stamens* 2—3. *Pistillode* woolly. *Ovary* included in and more or less adnate to the perianth; stigma linear, deciduous; ovule erect. *Achene* broadly ovoid, acuminate, enclosed in the thickened fleshy or crustaceous perianth; pericarp fragile. *Seeds* copiously albuminous; cotyledons broad.

DISTEMON INDICUM, Wedd.; F. B. I. v. 588.

Upper Godavari (Mayuranathan).

A slender herb 2—3 ft. high; stem subquadrangular. Leaves broadly ovate, acuminate, base cuneate or less often rounded or subcordate, patchy beneath with whitish, cobwebby pubescence between the hairy nerves, 2—3 in. long.

p. 974, for lines 11—18, substitute:

Bracts of ♂ not exceeding .04 in. long, more or less recurved at the edges; fruit very fleshy, pruinose, oblong, obtuse or shortly apiculate, longitudinally wrinkled when dry, 1.2—1.6 in. long, .6—8 in. diam.....1. *ula*.
Bracts of ♂ cylindric, .08 in. long, margins appressed; fruit hardly fleshy, not pruinose, ovate-oblong, narrowed into a pronounced beak, smooth when dry, 1.2—1.4 in. long, .6 in. diam.....2. *contractum*.

1. *GNETUM ULA*, Brogn. *G. scandens*, Hook. f. non Roxb. in part; Fl. Madr. 1392 in part; *G. funiculare*, B. Sm.; Wt. Ic. t. 1955.

In most Districts; up to 4,500 ft.

A large robust climber. Bark thick, brown, rough with scales. Branchlets slender with thickened nodes. Leaves ovate-oblong or elliptic, 3—7 in. long, 1.6—4 in. wide. Ripe fruit reddish-orange. Vern. *Tam. Ana-pendu*.

2. *GNETUM CONTRACTUM*, Markgr. in Bull. Jard. Bot. Buit. ser. iii. x. 470. *G. scandens*, Hook. f. non Roxb. in part; Fl. Madr. 1392 in part.

Nilgiri Hills at 5,000 ft.; Quilon (Wight).

Hardly to be distinguished from the previous species in the vegetative parts, the leaves are usually smaller, up to 4 in. long and 2 in. wide, with more defined nerves and the ♂ spikes rather stouter.

p. 976, for lines 14 and 13 from the bottom, substitute:

Salt-water, submerged herbs:—

Leaves under 6 in. long, ovate or oblong, in pairs from the axil of a scale; ♂ spathe 1-flowered; perianth single.....6. *HALOPHILA*.
Leaves 2—3 ft. long, narrowly linear, 2—3 enclosed in a basal sheath; ♂ spathe many-flowered; perianth double.....7. *ENHALUS*.

p. 979, for lines 7—11, substitute:

Leaves thinly membranous, elliptic to oblanceolate, base more or less decurrent, smooth, 1.5—3 in. long, .35—.55 in. wide; petioles up to 2.7 in. long.....1. *ovalis*.
Leaves firm, elliptic to elliptic-ovate, base rounded or cuneate, not decurrent, minutely papillose, .4—7 in. long, .2—2.2 in. wide; petioles .35—1 in. long

2. *Balfouri*.

1. *HALOPHILA OVALIS*, Hook. f. *H. ovata*, Gaud.; F. B. I. v. 663; Fl. Madr. 1398 in part.

Along the coasts and in back-waters.

A slender, creeping herb.

2. HALOPHILA BALFOURI, Solered. *H. ovata*, Gaud.; Fl. Madr. 1398 in part.

Along the E. Coast.

Similar to the previous species but smaller.

7. ENHALUS, Rich.

Submerged monoecious or dioecious, marine herbs; rootstock crinite with the remains of old leaves. *Leaves* narrowly linear, enclosed in twos or threes in a basal sheath. ♂ *flowers* many, minute, enclosed in a short, compressed, subsessile, 2-leaved spathe. *Sepals* and *petals* 3, broadly elliptic. *Stamens* 3. *Pistillode* 0. ♀ *flowers* much larger, solitary, sessile in a longer spathe on a spiral scape. *Sepals* 3, oblong, imbricate. *Petals* 3, longer, linear. *Ovary* ovoid, long-beaked, almost 6-celled; styles 6, bipartite; ovules anatropous, few on each placenta. *Fruit* ovoid, beaked, indehiscent. *Seeds* few, large, cone-like, testa mucilaginous.

ENHALUS ACOROIDES, Rich. ex Steud. *E. Koenigii*, Rich.; F. B. I. v. 663.

Pambam (Parthasarathy Iyengar).

Rootstock creeping in sand. *Leaves* 2—3 ft. long, .5—.75 in. wide.

♀ *spathes* up to 2 in. long, strigose.

p. 1020, for lines 12—14, substitute:

Lip 3-lobed obovate, in the lower $\frac{2}{3}$ the sides bent up to form a tube.

Flowers about .9 in. long:—

Leaf lobed a little above the middle, midlobe emarginate, glabrous, not fimbriate.

Leaf ovate-cordate, acute or acuminate.....2. *biflora*.

Lip lobed near the apex, midlobe and sometimes also the smaller side lobes fimbriate, beset with white hairs, the midlobe with tubular, sometimes branched processes on the 3 median nerves. Leaf orbicular-cordate, obtuse

2a. *monantha*.

After line 33, insert:

- 2a. NERVILIA MONANTHA, Blatt. in Journ. Bomb. Nat. Hist. Soc. xxxv. 724.

Biligirirangan Hills, 5,000 ft. (Mayuranathan).

Perianth pale-violet (N. Kanara specimens greenish-white with a rosy tinge, the nerves of the midlobe purplish).

- p. 1025, line 2 & 3, for "spike 2—4 in. long," substitute "spike 1—6 in. long"; line 4, for "lower 1 in. long," substitute "lower .7—1.25 in. long"; line 5, after "obtuse" add "ovary beakless:—" and for lines 6 and 7, substitute:

Perianth-lobes not spreading; side lobes of lip usually shorter than the broader midlobe, not diverging; spur less than .4 in. long, shorter than the ovary

20. *Heyneana*.

Perianth-lobes spreading; side lobes of lip as long and wide as the midlobe, diverging nearly at right angles; spur .68—.72 in. long, as long as the ovary

20a. *Barnesii*.

- p. 1026, in line 18, after "spur," for ":", substitute "—:" and for the rest of that line and the next four substitute:

Sepals erect, ovate-oblong, obtuse, concave, .5—.7 in. long; petals as long, linear, obtuse; lip as long, coriaceous, cuneately obovate, obtuse, claw geniculate, 3-lobed for less than $\frac{1}{4}$ its length, side lobes linear-oblong, obtuse, incurved, shorter than the triangular-ovate midlobe; spur subclavate, about as long as the ovary

28. *Perrottetiana*.

Sepals spreading, lanceolate, slightly falcate, obtuse or subacute, flat, 4—5 in. long; petals shorter, linear-ensiform, subfalcate, sub-acute, lip as long as the sepals, coriaceous, sessile, divided nearly to the base into 3 subequal acute lobes, midlobe linear-oblong, side lobes narrowly lanceolate; spur hardly longer than the sepals, shorter than the ovary.....29. *flabelliformis*.

p. 1028, after line 12, insert:

20a. *HABENARIA BARNESII*, Summerhayes n. sp.

Nilgiri Hills at Gudalurmalai (Barnes 890); Travancore at Nemakad Gap (Barnes 814 in part).

Affinis *H. Heyneanae*, Lindl., a qua tepalis patentibus, labelli lobis lateralibus longioribus ab intermedio fere angulo recto divergentibus recurvis, calcar apice dilatato 17—18 mm. longo, staminodiis fere duplo majoribus differt.

p. 1028, after line 9 from the bottom, add:—

29. *HABENARIA FLABELLIFORMIS*, Summerhayes n. sp.

Travancore on Amaimudi slopes; 7,500 ft. (Barnes 629).

Affinis *H. Perrottetianae*, A. Rich., a qua floribus minoribus, labello fere ad basin tripartito portionibus aequilongis intermedio lineari-oblongo acuto lateralibus anguste lanceolatis, calcar brevius differt.

For the last 4 lines of **p. 1077**, and the first 3 of **p. 1078**, substitute:

Panicles short, subsessile, much shorter than the uppermost leaves; fruiting pedicels decurved:—

Stem stout, erect, 8—36 in. high; roots long, fibrous; leaves broadly elliptic or elliptic-lanceolate, acuminate or caudate-acuminate, narrowed into the petiole, puberulous or glabrescent, 3—6.5 in. long, 1—2 in. wide; sheaths glabrous or pubescent, mouth usually ciliate, .6—1.3 in. long; panicles pyramidal; fertile stamens 2; capsules globose, .2—2.5 in. diam.; seeds reticulate.....18. *ovalifolium*. Stem sometimes creeping below and rooting, erect portion up to 20 in. high; leaves ovate-lanceolate, long-acuminate, base narrowed, glabrous; sheaths glabrous or nearly so, .8—1.2 in. long; panicles terminal and among the cluster of leaves, compact, not pyramidal; fertile stamens 3; capsules subglobose, olivaceous, glistening when dry; seeds with deep angular pits in 4 rows separated by prominent zigzag ridges.....18a. *Hallbergii*.

p. 1079, after line 33, insert:

18a. *ANEILEMA HALLBERGII*, Blatt. in Journ. Bomb. Nat. Hist. Soc. xxxiii, 74.

Gersoppa Falls (Hallberg & McCann).

Corolla pale-lilac or whitish; filaments of the fertile stamens: 1 long, stout, purple; 1 shorter, purple; 1 still shorter, white.

p. 1082, for lines 14—8 from the bottom, substitute:

Epiphytic, subscapigerous; flowering stems numerous, slender, 3—10 in. long, rooting below, viviparous at apex; leaves radical and cauline, more or less pilose with rufous hairs, the former linear to linear-lanceolate, 1—5 in. long, .2—4 in. wide, cauline shorter and wider; flowers solitary, twin or 3—4 in an umbel; sepals villous:—

Cauline leaves ovate or elliptic, acute, .2—75 in. long; flowers 2—4 in an umbel on a capillary pilose peduncle, 2-bracteate; petals connate to the middle; filaments naked; capsules oblanceolate, .1 in. long, rufous-hairy; seeds cylindric, smooth.....2. *vivipara*.

Cauline leaves elliptic-oblong, acute, appressed-hairy above, hairs below spreading; flowers solitary or twin; petals free nearly to the base; filaments densely bearded with white, moniliform hairs; capsules cylindric, obtusely trigonous, .14 in. long; seeds sub-cylindric, smooth.....3. *epiphytica*.

p. 1083, after line 3, insert:

3. BELOSYNOPSIS EPIPHYTICA, C. E. C. Fischer n. comb. *Cyanotis epiphytica*, Blatt. in Journ. Bomb. Nat. Hist. Soc. xxxiii. 76.

Above Gersoppa Ghát (Hallberg).

An almost stemless herb. Flowers white.

p. 1099, for lines 25—30, substitute:—

Rhizome stout, up to 2 in. diam.; leaves usually acute at both ends, usually large, veins very numerous, ascending, slightly curved; petioles about as long as to considerably longer than the blades; stipular sheaths acuminate, 2-keeled, up to 7·5 in. long:—

Cataphylls 6—13·2 in. long; leaves oblong-acuminate, 6—22·5 in. long, 1·8—7·5 in. wide; petioles 5·2—42 in. long; peduncles 5—8·4 in. long; spathes narrowly turbinate, 2—10 in. long, strongly twisted upwards, tapering to a subulate tail 1·4—1·8 in. long, dark-purple, smooth below, warted or rugose above.....1. *ovata*. Cataphylls 2·3—5·4 in. long; leaves elliptic- to ovate-lanceolate, acute or sub-acute, 4·4—8·4 in. long, 1·6—3·6 in. wide; petioles 2·4—12 in. long; peduncles 1·2—2·2 in. long; spathes cylindric oblong, usually slightly constricted above the chamber, 1·6—2·3 in. long, 6—8 in. diam., abruptly contracted into a slender, S-curved tail 3·4—5·4 in. long, .05—0·8 in. diam., flesh-coloured or brownish-buff with 5 longitudinal purple stripes below, not contorted, quite smooth or sometimes very slightly warted and hispidulous above the middle

1a. *toxicaria*.

Line 13 from the bottom, delete "*L. toxicaria*, Dalz." At end, add: in part.

After line 9 from the bottom, insert:

- 1a. LAGENANDRA TOXICARIA, Dalz. *L. ovata* Thw.; Fl. Madr. 1576 in part. Travancore; 1,000 ft. (Barnes).

Resembling *L. ovata* Thw. in the vegetative parts and *L. Meeboldii* C. E. C. Fischer in the spathes.

p. 1105, for lines 7 and 8, substitute:

Limb of spathe expanded:—

Appendage of spadix clavate at apex, not stipitate; neuters present:—

Apex of appendage smooth or at most muriculate:—

For lines 25—29, substitute:

Apex of appendage convolutedly tubercled. Leaflets 7—15, sessile, narrowly oblanceolate, 5—12 in. long, .9—3·5 in. wide, finely caudate-acuminate, sometimes the tail filamentous and up to 2 in. long, nerves numerous; petioles up to 26 in. long; spathes 3—6·4 in. long, limb ovate, ending in a pendant, filamentous tail 1·6—6·8 in. long; spadix cylindric, terminated by a subglobose or clavate, convoluted knob 3—6 in. diam.....3a. *tuberculatum*.

Appendage narrowed to the apex, not clavate, at most ending in a very small knob:—

Leaflets 5, sessile or the middle one very shortly petiolulate, elliptic-ovate to -obovate, 1—4 in. long, .5—2 in. wide; limb of spathe ovate-boat-shaped, tapering into a filamentous tail 2—4 in. long; dioecious; neuters 0; appendage shortly stipitate, abruptly swollen at the base and then tapering to a blunt point, recurved in the upper half.....4. *Wightii*. Leaflets usually 7, sometimes 5, all distinctly petiolulate; appendage not stipitate, not abruptly swollen at the base:—

Spathe 3·4—4·4 in. long, limb horizontal, dark-purple, tapering into a filiform tail .3—1·3 in. long, sometimes ending in a small knob. Leaflets elliptic-lanceolate, acuminate at both ends, 3·2—6 in. long, .9—1·9 in. wide, margins entire; spadix straight, narrowly fusiform, tapering into a short tail terminated by a minutely warted small knob.....4a. *Barnesii*. Spathe 1·6—2·8 in. long, limb overarching, bright-green, abruptly narrowed into a filiform tail .3—8 in. long, upcurved at the apex and ending in a small spherical or clavate knob. Leaflets elliptic-lanceolate to -oblanceolate,

acuminate or caudate-acuminate, base acute, 2—10.5 in. long, .66—3.6 in. wide, margins erose; spadix nearly cylindric, narrowed and curved near the apex, ending in a small minutely warted knob; dioecious or the ♀ with a few anthers intermixed; a few, sometimes forked, neuters above the ♀

4b. *tylophorum*.

Limb of spathe cucullate, leaving only a narrowly cordate opening. Leaflets 9—11, sessile, narrowly elliptic-oblongate, finely acuminate, base tapering, 3.6—5.4 in. long, .7—1.2 in. wide, margins erose, revolute; spathe 2.4—2.7 in. long, bearing a terminal, filiform tail 1—1.2 in. long; ♂ spadix fusiform, of the ♀ subulate, both obtuse; a few neuters present above the ♀.....4c. *translucens*.

After line 4 from the bottom, insert:

- 3a. *ARISAEMA TUBERCULATUM*, C. E. C. Fischer in Kew Bull. 1925, No. 2, erratum to p. 167. *A. convolutum*, C. E. C. Fischer non Nakai in Kew Bull. 1934, 167.

Nilgiri Hills; 7,000—7,500 ft. (Barnes).

Tube of spathe white, limb purple with 5—7 white bands tapering to the apex; spadix cream-coloured.

4. *ARISAEMA WIGHTII*, Schott; F. B. I. vi. 507 in part; Fl. Madr. 1585 in part.

Nilgiri Hills; 6,000—7,000 ft. (Wight, King, Barnes).

Petioles and peduncles pale-green; spathe bright-green with 5 white vertical streaks and some fine lines, the apical half of the tail black; spadix white below, purple above.

- 4a. *ARISAEMA BARNESII*, C. E. C. Fischer in Kew Bull. 1933, 342. *A. Wightii*, Schott in Fl. Madr. 1585 in part.

Nilgiris, 6,000 ft. (Barnes); Biligirirangans, 5,000 ft. (Fischer); Coimbatore Anamallais, 3,300 ft. (Fischer).

Tube of spathe vertically striped with dark-purple and whitish bands, limb dark-purple streaked outside with green; spadix dark-purple or pale below and dark at apex.

- 4b. *ARISAEMA TYLOPHORUM*, C. E. C. Fischer in Kew Bull. 1933, 346.

A. Wightii, Schott in Fl. Madr. 1585 in part.

Nilgiris; 6,000 ft. (Viscount Gough, Barnes).

Petioles and peduncles light-green marbled with brownish-pink; tube of spathe white with vertical purple stripes within.

- 4c. *ARISAEMA TRANSLUCENS*, C. E. C. Fischer in Kew Bull. 1933, 344.

Nilgiris; 6,000 ft. (Barnes).

Petioles and peduncles pinkish-purple with brown and pink markings or pink with brown and whitish markings; tube of spathe white with vertical green and purple lines, limb with 6 broad purple bands converging at the apex, translucent between the bands; spadix green with faint purple lines, the apex pure white.

p. 1165, for lines 16—19, substitute:

Spikelets terminal, single, .5—.57 in. long; style 3-fid:—

Stem slender, .2—3 in. high, compressed-triquetrous, base slightly swollen and enclosed in sheaths; leaves a little shorter; spikelets linear-oblong, 5—6-flowered, the 1—2 basal florets ♀; glumes broadly oblong, subobtusate, pale-ferruginous, margins broadly hyaline.....1. *Christii*.

Stem capillary, 8—12 in. high, obscurely triquetrous, not swollen at base; leaves a little shorter, filiform, canaliculate; spikelets at first oblong, later ovate, many-flowered, the 6—12 lowest florets ♀; glumes ovate to subrotund, obtuse, often emarginate, reddish.....1a. *rara*.

p. 1168, after line 24, insert:

- 1a. *CAREX RARA*, Boott; F. B. I. vi. 713.
Ootacamund; 7,000 ft. (Barnes).

p. 1175, after line 10, insert:

Spikes solitary or twin, rarely 3-nate; glumes chartaceous or thinly coriaceous, smooth:—

After line 13, insert:

Spikes corymbose, rarely reduced to 1—3; glumes thickly coriaceous, strongly transversely ribbed or rugose.....21a. *THELEPOGON*.

p. 1180, in line 17 from the bottom, after "lemmas" add ":—" and in line 16 from the bottom, delete "117 GLYCERIA."

After line 17 from the bottom, insert:

Lemmas membranous with broad hyaline tips, broadly oblong, back rounded; perfect florets 7—12.....117. *GLYCERIA*.

Lemmas coriaceous throughout, boat-shaped, keeled; perfect floret 1.
117a. *EHRHARTA*.

p. 1196, after line 14 from the bottom, insert:

21a. *THELEPOGON*, Roth.

Coarse, perennial herbs. *Leaves* lanceolate. *Racemes* few to many, corymbosely fascicled, rarely reduced to 1—3; rhachis flexuous, fragile, joints thick, more or less deeply excavated. *Spikelets* ovoid, one sessile at each node accompanied by a coriaceous, flat, curved pedicel devoid of spikelet. *Glumes* 2, thickly coriaceous, beaked, transversely strongly ridged, rugose or tubercled; upper sunk in the cavity of the joint, 2-flowered. *Lemmas* and *paleas* hyaline; lower nearly as long as the glume, lanceolate, its palea shorter and enclosing usually a ♂ floret; upper 2-cleft to the middle with a long geniculate, twisting awn from the sinus, its narrow palea enclosing a bisexual floret. *Lodicules* 2, broadly cuneate. *Stamens* 3. *Styles* 2, free. *Grain* narrowly oblong, free.

THELEPOGON ELEGANS, Roth.; F. B. I. vii. 148.

Hyderabad State at Ellora (Ralph).

Culms 1—3 ft. high, branched from the base; leaves lanceolate, cordate, amplexicaul, 3—10 in. long, 3—75 in. wide, hispid with hairs from tubercles or nearly glabrous, margins ciliate; racemes 1—2 in. long, joints of rhachis 22 in. long, pedicels 29 in. long; glumes 25—27 in. long; awns 7—1 in. long.

p. 1199, for lines 4—9, substitute:

Culms simple or sparingly branched, up to 4 ft. high, usually slender; nodes usually densely, often long bearded:—

Panicles contracted, rarely somewhat lax; leaves acute; callus of sessile spikelets densely villous, lower glumes 1—14 in. long, usually villous all over or only below the middle; awns 4—9 in. long; lower glume of pedicelled spikelets 14—17 in. long.....2. *Huegelii*.

Panicles with widely spreading branches; leaves setaceous acuminate; callus of sessile spikelet shortly bearded, lower glumes 11 in. long, scaberulous or slightly hairy on the inflexed margins longitudinally slightly depressed along the median line; awns 6—7 in. long; glumes of pedicelled spikelets 11 in. long.....2a. *parviflorum*.

p. 1199, after line 22, insert:

2a. *CAPILLIPEDIUM PARVIFLORUM*. Stapf. *Andropogon micranthus*,
Kunth; F. B. I. vii. 178.

Horsleykonda (Roscoe Allen).

At the end of p. 1280, insert:

117a. *EHRHARTA*, Thunb.

Annual or perennial herbs. *Leaves* narrow, flat. *Panicles* narrow or more or less expanded. *Spikelets* laterally compressed, pedicelled; rhachilla disarticulating between the persistent glumes and the lemmas, sometimes shortly produced. *Glumes* 2, very unequal, membranous. *Lemmas* 3, cartilaginous or coriaceous, boat-shaped, keeled, longer than the glumes, the 2 lower empty, the uppermost containing a bisexual floret; palea narrow, keeled. *Lodicules* 2. *Stamens* usually 6. *Styles* 2, distinct. *Grain* elliptic, much compressed; embryo about $\frac{1}{3}$ as long.

EHRHARTA ABYSSINICA, Hochst.

Nilgiris (Schmid).

Culms slender, 1—3 ft. high; leaves up to 1 ft. long; $\frac{1}{3}$ in. wide; panicles spike-like, up to 6 in. long; lower glumes $\frac{1}{2}$ in. long, acute, 5-nerved; upper $\frac{1}{6}$ in. long, obtuse, 7-nerved; lemmas $\frac{1}{2}$ — $\frac{1}{5}$ in. long, scabrid, the upper empty one minutely tuberculate, often transversely corrugate in the upper half, narrowed at the base into a false pedicel sulcate on the back, the uppermost lemma with a small basal tubercle on each side; stamens 6.

INDEX TO BOTANICAL NAMES

INDEX TO VERNACULAR NAMES

N.B.—Names occurring two or three times on the same page are indicated by (2) or (3). Non-Indian names are in italics.

It must be remembered that there is no definite standard for the spelling of the vernacular names; many have been taken from old herbarium sheets and the spelling is more or less phonetic.
